\* Basically the same countries which are of concern with regard to nuclear proliferation activities are also active in enhancing their capabilities in the production of missiles. The proliferation of ballistic missiles as possible means of delivery for nuclear weapons continues, in spite of efforts in the context of the Missile Technology Control Regime and the Hague Code of Conduct. Not only other regions of the world, but also Europe is increasingly confronted with the security challenges of combined weapons and missile proliferation.

\* The proliferation cases at hand demonstrate that we need new concepts to prevent military abuse of legitimate nuclear energy production. We are faced with a situation where rising energy needs and climate change considerations lead to renewed interest in nuclear power. A growing number of countries is examining the expansion or the launch of civil nuclear programmes. The Director General of the IAEA, Mohamed ElBaradei, spoke of no fewer than 50 countries that have informed the IAEA of considering to introduce nuclear power, with 12 countries actively preparing nuclear energy programmes. Such a “nuclear renaissance” could dramatically increase the number of states that are interested in proliferation sensitive nuclear technology. IAEA Director General ElBaradei has spoken of the emergence of “virtual” nuclear weapon states once countries master the entire nuclear fuel cycle including enrichment and reprocessing. Even if - as we hope - all those countries refrain from any military program, all these additional nuclear facilities need to be secured against terrorists.

February 1, 2009

**Eliot Cohen**

**Former Counselor to State Department & Senior Adviser to Sec. Condoleezza Rice, 2007-09**

Info: This week on Q&A, our guest is Eliot Cohen. He talks about his experiences at the State Department in the Bush Administration serving as a counselor to Secretary of State Condoleezza Rice for the past two years.

He is currently the director of the strategic studies program at Johns Hopkins University's School of Advanced International Studies (SAIS).

*[EXCERPTS]*

COHEN: Well, in February of 2007, Secretary Rice called me, it was a complete call out of the blue because I had not – we had known each other, but not really well. She asked me to come to her office for a talk, we talked about foreign policy things and at the end of the conversation, she offered me the job of counselor of the Department of State. The – it's a very interesting position, not all Secretaries have had counselors, but basically I was an under Secretary ranked official who was her senior advisor. The portfolio she asked me to take on was perhaps not surprisingly the war portfolio. So I have spent the last two years doing a lot of work on Iraq, more I would say on Afghanistan, fair bit on Iran, good bit of time in Pakistan and then there have been other excursions; she asked me to lead the State Department response when we discovered a North Korean nuclear reactor in Syria. I spent a couple of weeks traveling with her when the Russians invaded Georgia and – I kind of led the charge on dealing with Somali pirates. So it's been a pretty exciting couple of years and totally unexpected.

*[deletia]*

BRIAN LAMB, HOST, C-SPAN Q&A: Give us some of the things that fascinated you.

COHEN: Well, I think it – it's a little bit like being a theologian and you get a couple of years to live as a halibut. You spend your whole life studying these things and all of the sudden you're right at the center of them. It was fascinating for me, simply to be working closely with her to be going to the National Security Council, going to the sit room, the situation room in the White House, being embroiled in these quite high level discussions about say what do you do about a fact that you've found a North Korean nuclear reactor in Syria, hammering out Afghanistan policy. So that was fascinating. I spent a lot of time traveling, particularly in Afghanistan, but every three months or so I would go out to the theater with a few other officials and the head of the delegation was the Deputy National Security Advisor for Afghanistan and Iraq, Lieutenant General Lute, and we would travel all over the place and see all kinds of people. That was quite extraordinary.

*[deletia]*

LAMB: I'm being facetious, but I mean what's a good war story from your experience?

COHEN: I think the – it's not a very exciting story, but it's a reassuring story. It was in the spring of 2007, the Secretary called me to her office and she said, 'Well, there are only two people in the State Department who know what I'm about to tell you; I'm one and you're now the other. We think we've found this North Korean nuclear reactor in Syria' and my jaw dropped. And I had been reading a lot of high-speed intelligence, but this had not come up. It was kept in very, very narrow channels, which were just opened a little bit. And she asked me to lead our response to it and what then ensued was a whole summer of discussions in the sit room at the White House and what's called the Deputies Committee level, that is basically the people at the Undersecretary rank more or less and it was a very small group initially, it expanded somewhat as time went on. There was the Undersecretary of Defense for policy, you had the head of plans of the joint staff, you had a couple of senior intelligence officials, one or two people from the NSC staff.

And throughout that summer, we pulled together options for the President and for the principals, in other words the cabinet Secretaries and it was a – and it was an experience I'll never forget because it was done at a very high level of seriousness, obviously, it never leaked. We were all fearful that this would leak. It never leaked. It was done the way it ought to be done; we looked at a range of different options that are clear-cut options, there were arguments pro and con for those options. Those were given to the President and to his most senior advisors, my boss, Secretary Gates and Vice President and so on and at the end of it, I felt we had done a really good job and it's – it may not be much of a war story, but I think it tells you that if you have the right people, the U.S. Government can function the way that it's supposed to function and was done with a high level of professionalism, with collegiality. We disagreed with one another quite forcefully, but always in a collegial spirit. It was quite an encouraging experience.

LAMB: What was your position on the issue?

COHEN: When you go into these things, one of the challenges is to what extent do you represent the institutional position and to what extent do you represent your own position and one of the things I was very grateful to Secretary Rice for was she gave me room to do both. She trusted me to do both. Now, obviously, when her position would always trump my position. I think we – I was initially simply in favor of either letting the Israelis do it or considering should the United States, itself, consider taking out the reactor. She pushed us in the direction of formulating a rather elaborate diplomatic option, which I drafted, with the help of several senior colleagues at State, which we worked here – which was eventually the State position. But it was a long process of – the President's eventual decision was let the Israelis do it and if they don't want to talk about it, we won't talk about it either. Whether or not that was the right decision, we'll see. I mean there were – as with most governmental decisions, these are – they're all 51/49 kinds of decisions and you can't be entirely sure that they were right ones until a long time after the event.

LAMB: You think there is any residual from that decision for the Israelis to take out that nuclear site.

COHEN: Well, there were a number of consequences that flowed from it. In one way, I think was reassuring for the Israelis in terms of re-establishing some of their credibility after the Lebanon war of 2006, partly because they did it, but also partly because they did it and then were quiet about it and to some extent I think it was a sense of this is how the game is supposed to be played in the Middle East, just do it, you don't talk about it. So there was that. I have wondered whether it was a good idea for us not to talk about it immediately in order to put the Syrians on the back foot and in order to put pressure on the North Koreans who had behaved extraordinarily badly. I mean it was a debate about that. The Israelis initially did not want this publicized and I think the fear was of it leading to a broader conflict, which I think was a reasonable fear. The question is a little bit longer after the event, was that the right course of action? But it wasn't my decision to make and I – again, I think one of the wonderful things about working for Secretary Rice is I could give her views with which she disagreed, she would hear them out, we would argue back and forth and she did what a boss is supposed to do, she made a decision, but she never in any way discouraged me from making the arguments and sometimes she listened.

*[Sourcebook note: Dr. Cohen was named counselor to Dr. Rice on 2007-03-02 and assumed the post after the end of the Spring semester at SAIS. In the interim, he served as a consultant to Dr. Rice.]*

## **A Conversation with Mohamed ElBaradei**

Sunday, February 1, 2009; B03 [*Accessed 2009-01-31T13:50Z*]

As director general of the International Atomic Energy Agency (IAEA), did Mohamed ElBaradei soft-pedal Iran's nuclear ambitions to ensure that the Bush administration wouldn't attack that country? That's what many in the former administration, as well as nonproliferation experts of various political backgrounds, assert. Last week, at the World Economic Forum in Davos, Switzerland, ElBaradei sat down with Newsweek-Washington Post's Lally Weymouth to defend his record. Excerpts:

*[EXCERPT]*

**[Weymouth:]** People say you criticized Israel harshly for bombing the nuclear reactor in Syria -- that you weren't tough on Syria for building a nuclear reactor.

**[ElBaradei:]** I have been very harsh on Israel because they violated the rules of international law on the use of unilateral force, and they did not provide us with the information before the bombing, which we could then easily have established whether Syria was building a nuclear reactor. To that extent, the blame is also shared with the U.S., who sat on the information for a year and six months after the bombing. Now we are doing our best to try to see what Syria was doing, but it's like Iran. I cannot jump the gun and say Syria was building a nuclear facility because what we are doing now is trying to verify what was there.

THE INHERITANCE

The World Obama Confronts and the Challenges to American Power

By David E. Sanger

*[EXCERPT]*

Sanger has a knack for getting administration officials to leak like sieves, though he never advertises his access. His discussion of North Korea's lunatic kingdom is especially revealing. Even as United States spy satellites were orbiting in search of Iraq's stockpiles, Koreans were erecting a nuclear reactor less than a hundred miles away in Syria. "Had a few other things on our mind," an American official concedes.

FEBRUARY 2009

INTELLIGENCE COMMUNITY  
ANNUAL THREAT ASSESSMENT

UNCLASSIFIED  
**STATEMENT FOR THE RECORD**

*[EXCERPT]*

On the proliferation side, North Korea has sold ballistic missiles and associated materials to several Middle Eastern countries, including Iran, and, in our assessment, assisted Syria with the construction of a nuclear reactor. We remain concerned North Korea could again export nuclear technology.

## **Israel on the IAEA's Ineffectiveness**

NEWSWEEK

Published Feb 14, 2009

From the magazine issue dated Feb 23, 2009

The director of the International Atomic Energy Agency, Mohamed ElBaradei ("On Nukes, Tread Softly," Feb. 9), has failed to persuade Syria to allow a visit by the IAEA's inspectors to three sites suspected to be part of Syria's covert nuclear program. He has also failed in his feeble demand for a proper investigation of Syria's bulldozing the wreckage and the cleanup operation at the Dair Alzour site, where Syria is suspected of constructing a North Korean nuclear reactor in clear violation of its Non-Proliferation Treaty Safeguards Agreement with the agency. Instead, ElBaradei lashes out at the state of Israel. Unfortunately, this has become a common practice by the director of the IAEA in his efforts to divert attention from his failure to conduct a vigorous and conclusive investigation amid mounting evidence of gross violations of international obligations under the NPT by some of its Middle Eastern members.

Nili Lifshitz, Spokeswoman  
Israeli Atomic Energy Commission  
Tel Aviv, Israel

## **ElBaradei says Iran, Syria not cooperating enough**

(Reuters)

17 February 2009

*[EXCERPTS]*

PARIS - Iran is still not cooperating with efforts to resolve outstanding questions regarding its nuclear programme, International Atomic Energy Agency chief Mohamed ElBaradei said on Tuesday.

*[deletia]*

Turning to the subject of an alleged reactor site in Syria that was destroyed in an Israeli air raid in 2007, ElBaradei repeated that samples from the site were not conclusive and called for greater cooperation from the Syrian authorities.

ElBaradei had said in November that uranium traces found at the Syrian site were not sufficient evidence of undeclared nuclear activity but Syria should be more open to help clarify the issue.

## Board of Governors

**GOV/2009/9**

Date: 19 February 2009

**Restricted Distribution**

Original: English

### For official use only

Item 5(e) of the provisional agenda  
(GOV/2009/6)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. On 19 November 2008, the Director General reported to the Board of Governors on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic (Syria) (GOV/2008/60). The Board requested the Director General to keep it informed of developments, as appropriate. This report covers relevant developments since that date.

## A. Chronology of Events

2. As indicated in the Director General's previous report, analysis of the environmental samples taken from the Dair Alzour site revealed a significant number of anthropogenic natural uranium particles (i.e. produced as a result of chemical processing). Syria has stated that the origin of the uranium particles was the missiles used to destroy the building (GOV/2008/60, para. 8).

3. In order to confirm Syria's assertion about the possible source of uranium particles found at Dair Alzour, the Agency requested Syria, in a letter dated 26 November 2008, to provide access to the site (including the water treatment plant at the site), and any other locations where the debris from the building and equipment, and any salvaged equipment removed from Dair Alzour, had been and/or was currently located, so that the Agency could take samples of, and environmental samples from, these items and materials. In that letter, the Agency also:

- requested that Syria share the results of any assessments that it may have performed regarding the materials used during, or resulting from, the bombing;
- requested, as a transparency measure, that the Agency be permitted to visit additional locations;

- reminded Syria that the requests for information and documentation referred to in the Agency's letter of 3 July 2008, which related, inter alia, to information concerning the destroyed building, remained unanswered; and
- stated that it stood ready to discuss these matters and to conduct the activities referred to above as soon as possible.

4. In a letter dated 17 February 2009, Syria reiterated its statement that the destroyed facility, and the current facility, on the Dair Alzour site were military installations. Syria provided information in response to some of the questions raised in the Agency's letter of 3 July 2008 concerning the purpose of the water pumping station and the water purification station found on the site and procurement efforts in connection with certain equipment and material. However, the responses Syria provided were only partial and included information already provided to the Agency, and did not address most of the questions raised in the Agency's communications. The Agency is now assessing the information provided by Syria.

5. In a letter to Israel dated 26 November 2008, referring to the claims made by Syria about the origin of the uranium particles found at Dair Alzour, the Agency requested Israel to provide information which would enable the Agency to determine whether munitions alleged to have been used by it could have been the source of the uranium particles (GOV/2008/60, paras 8 and 18). With respect to the Agency's request, Israel, in a letter dated 24 December 2008, stated only that "it rejects Syrian claims on the matter" and that "Israel could not have been the source of the uranium particles found on the site of the nuclear reactor".

## **B. Agency Verification**

6. The Agency has continued its analysis of all information available to it as a result of the 23 June 2008 visit to the Dair Alzour site, as well as information from other sources. Additional analyses of the environmental samples taken from the Dair Alzour site have also been carried out by a number of laboratories participating in the Agency's Network of Analytical Laboratories. These analyses have revealed additional particles of anthropogenic uranium. These uranium particles, and those identified as a result of the previous analyses, are of a type not included in Syria's declared inventory of nuclear material.

7. The Agency's current assessment is that there is a low probability that the uranium was introduced by the use of missiles as the isotopic and chemical composition and the morphology of the particles are all inconsistent with what would be expected from the use of uranium based munitions.

8. As indicated in the Director General's previous report (GOV/2008/60, paras 5–7), the Agency has requested from Syria clarification of efforts by Syrian entities to procure materials and equipment which could support the construction and operation of a nuclear reactor. The Agency is continuing to assess the information related to these procurement efforts, including that provided by Syria in its letter of 17 February 2009.

## **C. Summary**

9. The presence of the uranium particles at the Dair Alzour site, the imagery of the site available to the Agency and information about certain procurement activities need to be fully understood. Syria therefore needs to provide additional information and supporting documentation about the past use and nature of the building at the Dair Alzour site, and information about the procurement activities. Syria needs to be transparent by providing additional access to other locations alleged to be related to Dair Alzour. These measures, together with the sampling of destroyed and salvaged equipment and debris, are essential for the Agency to complete its assessment.

10. The Director General calls upon Syria to take the above measures as soon as possible. The Director General also calls on Israel and other States that may possess relevant information to make the information available to the Agency, including satellite imagery, and to agree to the Agency's sharing of such information with Syria.

11. The Director General will continue to report as appropriate.

[http://www.google.com/hostednews/afp/article/ALeqM5h\\_DqCdoqniVZQjatkHZHUZ741K-A](http://www.google.com/hostednews/afp/article/ALeqM5h_DqCdoqniVZQjatkHZHUZ741K-A)

## **IAEA finds graphite, uranium traces at suspect Syrian site**

1 hour ago [Accessed 2009-02-19T19:50Z]

[EXCERPTS]

VIENNA (AFP) — The UN atomic watchdog has found further uranium particles, as well as traces of graphite at a remote desert site in Syria, which the US alleges was a covert nuclear reactor, it emerged Thursday.

UN inspectors detected more unexplained uranium particles at Al-Kibar, the International Atomic Energy Agency said in a restricted report.

And a senior official close to the agency revealed for the first time that particles of graphite had also been found at the site, but that it was too early to determine whether it was nuclear-grade graphite.

[deletia]

But in the restricted report circulated to IAEA member states on Thursday, a copy of which was obtained by AFP, the agency said that new analyses "have revealed additional particles of anthropogenic (man-made) uranium."

There were now around 80 uranium particles in all "of a type not included in Syria's declared inventory of nuclear material," the report said.

[Sourcebook note: The IAEA report above does not specify the number of particles.]

[deletia]

The senior official, speaking on condition of anonymity, said the amount was "significant."

"It's not simple contamination by somebody who spent the day at some nuclear facility somewhere and then went to Al-Kibar," the official said.

"It's nuclear material that hasn't been declared and Syria has to explain" how it got there.

[deletia]

Regarding the graphite, the official said analysis of the samples was still underway.

"We didn't find masses of graphite but we found some particles, some traces. We're still analysing the significance of that and whether that would point to nuclear-grade graphite."

[deletia]

## UN agency finds new uranium traces at Syria site

By GEORGE JAHN

1 hour ago [Accessed 2009-02-19T21:50Z]

[EXCERPTS]

VIENNA (AP) — U.N. nuclear agency samples taken from a Syrian site suspected of being a secretly built reactor have revealed new traces of processed uranium, the agency reported Thursday.

[deletia]

Both [the Iran and Syria] reports — meant for restricted release Thursday only to the 35 nations of the IAEA board — were obtained by The Associated Press ahead of a board meeting starting March 2 that will have the nuclear activities of the two Mideast nations on its agenda.

The documents paint a generally disheartening picture of the agency's efforts to probe the Iranian and Syrian nuclear programs. Iran says its nuclear activities are peaceful; Damascus denies hiding any nuclear program.

[deletia]

The Syria report noted the refusal by Damascus to allow agency inspectors to make follow-up visits to sites suspected of harboring a secret nuclear program.

The brevity of the reports — the one on Iran ran five pages, the one on Syria was just three — reflected the lack of progress in the probes.

Still, a senior U.N. official who asked to remain anonymous in exchange for commenting on the restricted reports, described as significant the find of new uranium traces from samples taken during a visit in June to the Al Kibar site bombed in 2007 by Israeli jets.

Minute traces of processed uranium from those samples were found late last year. The official said additional analysis had found 40 more uranium particles, for a total of 80.

Syria has suggested the traces came from Israel ordnance used to hit the site but the report said the composition of the uranium made that unlikely. Israel has denied it was the source of the uranium.

The official said experts were also analyzing traces of graphite and stainless steel found around the site, although he cautioned it was too early to say whether they were related to nuclear activity.

Inspectors at the Al Kibar site were known to be looking for graphite, an element in the type of North Korean prototype that the United States says the Syrians were trying to build with help from Pyongyang.

[deletia]

## Syria—IAEA Director General's Report

Gordon Duguid  
Acting Deputy Department Spokesman, Office of the Spokesman  
Public Affairs  
Washington, DC

QUESTION TAKEN AT THE FEBRUARY 19, 2009 DAILY PRESS BRIEFING

February 19, 2009

Question: Do you have any comment on the recently released IAEA report on Syria's nuclear program?

Answer: This is the second report by the IAEA relating to Syria's nuclear activities since the Al-Kibar reactor was destroyed in September 2007. The first report was submitted to the Board of Governors in November 2008.

We expect the Board of Governors, during its March 2-6 meeting, to address the mounting evidence and ongoing concerns related to Syria's clandestine nuclear activities noted in the Director General's report. We fully support the IAEA in its investigation and urge the international community to continue insisting that Syria comply with its IAEA obligations and cooperate fully with the IAEA without delay.

In particular, it is imperative that Syria fully cooperate with the IAEA by granting the IAEA unfettered access to any site or information needed for the investigation.

## **U.S. asks for meeting with Syrian ambassador**

**Fri Feb 20, 2009 6:38pm EST**

WASHINGTON (Reuters) - The U.S. government has asked for a meeting with Syria's ambassador to discuss concerns including Damascus's possible nuclear program and support for groups that Washington labels as terrorists, a State Department spokesman said Friday.

The request follows a report by U.N. inspectors Thursday that graphite and more uranium traces were found in samples taken from a Syrian site that Washington says was an almost built graphite nuclear reactor destroyed by Israel in November 2007.

The Syrian ambassador to the United States, Imad Mustafa, has been asked to meet the acting head of Near Eastern Affairs at the State Department next week, spokesman Gordon Duguid said.

"The meeting is an opportunity for dialogue to discuss our concerns with the Syrians," he said.

"There remain key differences between our two governments, including concerns about Syria's support for terrorist groups and networks, Syria's acquisition of nuclear and non-conventional weaponry, interference in Lebanon and a worsening human rights situation."

Relations between Syria and the United States nosedived after the 2005 assassination of former Lebanese Prime Minister Rafik al-Hariri, although Syria denies involvement.

Tensions have lingered over Damascus's support for the Palestinian Islamist group Hamas and the Lebanese Hezbollah movement, accusations that Syria allowed Islamist fighters to infiltrate Iraq and suspicions about a secret nuclear program -- which Damascus also denies.

But Syria hopes for a thaw with Washington under new U.S. President Barack Obama. Syrian President Bashar al-Assad told a British newspaper this week he hoped for better relations and that Obama would send an ambassador to Syria soon.

The United States withdrew its ambassador under President George W. Bush in 2005 after al-Hariri's assassination.

Senator John Kerry, chairman of the U.S. Senate Foreign Relations Committee, will visit Syria over the weekend.

(Writing by John Whitesides; Editing by John O'Callaghan)

## **Israel responds to IAEA reports regarding Iran and Syria**

**20 Feb 2009**

Israel expressed its concerns about Iranian and Syrian nuclear programs.

(Communicated by Ministry of Foreign Affairs)

The director general of the International Atomic Energy Agency (IAEA) published two periodic reports yesterday on investigations that the agency is conducting in Iran and Syria.

The report on Iran indicates that the Iranians are continuing to enrich uranium, in violation of a Security Council resolution, while refusing to cooperate with the IAEA. The agency is trying to determine whether Iran's nuclear program is intended for military purposes, as suspected.

The facts detailed in the report are similar to those in previous reports. However, the ramifications, in the face of Iran's continuation of its nuclear program – particularly the stockpiling of enriched uranium, while ignoring the demands of the international community – are more serious. Israel reiterates its call to the international community and its institutions to increase the pressure on Iran to abandon its program, which threatens to achieve nuclear weapon capability.

Regarding the Syrian facility that was apparently built in secret, Israel expressed concern about the report's findings, which include the presence of uranium at the site, indicating that the facility was nuclear. Israel expects the IAEA and its head to continue its impartial investigations, including visits to additional sites that Syria until now has not allowed to be inspected.

These two states operate clandestinely in the nuclear realm in a way that endangers regional and world peace while flagrantly violating their international commitments.

## **U.S. to prod Syrian envoy on support of terrorism, suspected nuclear program**

By Barak Ravid, Haaretz Correspondent

Last update - 02:08 21/02/2009

*[EXCERPT]*

The State Department is talking with Syria to discuss U.S. allegations that the Arab country supports terror groups and is pursuing nuclear weapons, a department official said Friday.

A meeting with the Syrian ambassador, scheduled for next week at the State Department, will be the first such session since last September and reflects Secretary of State Hillary Rodham Clinton's interest in talking directly with Syria and other countries at odds with the United States, spokesman Gordon Duguid said.

"It's her belief that direct engagement with Syria will advance U.S. interests," Duguid said.

Ambassador Imad Moustapha is to meet with Jeffrey D. Feltman, the acting assistant secretary of state for Near Eastern affairs, at Feltman's request, Duguid said. Clinton is not scheduled to participate.

"Our concerns include Syria's support to terrorist groups and networks, Syria's pursuit of nuclear and nonconventional weaponry, interference in Lebanon and a worsening human rights situation," Duguid said.

The spokesman cited the International Atomic Energy Agency's report Thursday that samples taken from a Syrian site suspected of being a secretly built nuclear reactor have revealed new traces of processed uranium.

SUBJECT: IAEA REPORTS ON IRAN AND SYRIA

CLASSIFIED BY: ISN - C. S. ELIOT KANG, ACTING FOR REASONS 1.4(B) AND (D)

[EXCERPTS]

¶1. (U) This is an action request. See paragraphs 6-9.

-----

SUMMARY

-----

¶2. (SBU) International Atomic Energy Agency (IAEA) Director General (DG) ElBaradei released his latest reports on the status of the IAEA's investigations into Iran and Syria's nuclear programs on 19 February 2009. Both reports conformed to expectations in describing the absence of any meaningful steps by either country to address the serious issues that exist with respect to their nuclear programs.

[deletia]

¶5. (SBU) DG ElBaradei's report on Syria reinforces our conclusion that Syria was engaged in a clandestine effort to construct and operate a nuclear reactor at Al Kibar. The report also helps to confirm that uranium found via environmental samples collected at the site is not naturally occurring, lending credence to the fact that the facility in question was a reactor. Although the report does not categorically dismiss Syria's explanation that the uranium was from Israeli missiles used in the attack on the reactor in September 2007, it suggests that this explanation is highly unlikely. Syria delivered an eleventh-hour letter on 17 February 2009 attempting to demonstrate a degree of cooperation immediately before the report's release. The report notes that the responses in the Syrian letter "were only partial ... and did not address most of the questions raised in the Agency's communications." Importantly, the report also calls on Syria to allow access to other locations and allow inspectors to take samples of the debris removed from Al Kibar as soon as possible, noting that these measures are "essential" for the IAEA to be able complete its assessment.

-----

Action Requests

-----

¶6. (SBU) ACTION REQUEST FOR ALL POSTS: Posts are requested to convey U.S. views regarding the IAEA reports to appropriate host governments. Posts should underscore that these reports demonstrate that neither Iran nor Syria have taken any meaningful steps to cooperate with the IAEA in the past six months. Posts should stress that Syria's refusal to do so only deepens concerns regarding the nature of its clandestine nuclear

activities. With respect to Iran, Posts should emphasize that while Iran has stalled the IAEA's investigation and still refuses to provide the IAEA with requested transparency, its centrifuge program continues to make progress. The net result is that in neither case can the international community have confidence in the exclusively peaceful nature of these nuclear programs. For Iran, the UN Security Council has imposed a mandatory requirement that it suspend all proliferation sensitive nuclear activities and cooperate fully with the IAEA. On Iran, we should stress that with international rights, come responsibilities. Iran needs to live up to those responsibilities. We believe that Iran's continued failure to do so is another opportunity lost.

¶7. (SBU) ACTION REQUEST FOR ALL POSTS CONT: With respect to the upcoming 2-6 March 2009 IAEA Board of Governors' meeting, Posts should stress the need for the following from host governments:

- Strong national statements on Iran and call on Iran to impement its international nuclear obligations without delay. Statements should urge Iran to take advantage of this critical opportunity for engagement by addressing the concerns of the international community and underscore the need for full transparency with the IAEA (including Iran's implementation of the Additional Protocol) and cooperation with the IAEA's investigation, as well as suspension of all proliferation-sensitive nuclear activities;

- Strong national statements on Syria and a demand that Syria cooperate with the IAEA's investigation;

- Strengthened statements on Iran and Syria from regional or other groups, e.g., European Union, the Group of 77 and China, the Non-Aligned Movement, the Group of Latin America and the Carribean; the Africa Group, etc. To the extent possible, Posts should encourage host goverments to instruct their delegations not to accept statements from any group to which they are a member that would downplay the factual reports of the IAEA, or undercut the Agency's ability to obtain the necessary information and access needed to resolve these serious issues; and,

- Board members should support, by vote if necessary, releasing the Syria report to the public. This is essential for the public to appreciate the serious nature of Syria's failure to cooperate with the IAEA.

This report will also demonstrate the level of transparency in IAEA affairs that we believe Syria should manifest in its approach to the IAEA.

¶8. (S) ACTION REQUEST FOR UNVIE: In addition to conveying these messages to local IAEA Missions, UNVIE should continue working to promote support within the IAEA Secretariat and among IAEA Board Members for continuing and expanding the investigation into both Iran and Syria's nuclear activities and pressuring both to cooperate with the respective investigations. Mission is requested to place maximum effort into securing strong national statements demanding Iranian and Syrian cooperation with the IAEA by as many Board members as possible, particularly those in the EU. Mission should also work to support a P5+1 statement on Iran.

Mission's efforts to build support for such statements should begin as soon as possible, and will be facilitated by technical briefings on Iran and Syria's nuclear efforts to Board members in Washington and Vienna the week prior to the Board meeting. These briefings will be provided by State and IC nonproliferation experts. Mission is also requested to ensure that the IAEA Director General's forthcoming report on Syria is made public, including by laying the groundwork for a vote in the Board if necessary. If possible politically and statutorily, Mission should seek the concurrent release of the November 2008 Syria report, which was denied public release by NAM/Arab intervention at the November 2008 Board meeting. Mission should begin coordinating with likeminded Board members at the earliest possible date.

¶9. (S) ACTION REQUEST FOR LONDON, PARIS, MOSCOW, BERLIN, AND BEIJING: In addition to conveying U.S. views regarding the Iran and Syria reports, Posts should stress that the United States believes that the Iran report reinforces the need for a strong P5+1 statement demanding Iran's immediate and full cooperation with the IAEA. Discussions regarding specific texts will be addressed in Vienna and Washington.

-----  
POCS AND REPORTING DEADLINE  
-----

¶10. (SBU) Mission is requested to report on the status of its efforts in advance of the Board. Richard Nephew (202-647-7680) and Matt Goldstein (202-647-4196) are the Department's POCs for this issue.

CLINTON

## **Diplomats: Syria puts missile facility on hit site**

By GEORGE JAHN

6 hours ago [Accessed 2009-02-25T14:40Z]

VIENNA (AP) — Syria's nuclear chief has told the U.N.'s nuclear agency that his nation built a new missile facility on the site of what the U.S. says was a nearly finished nuclear reactor bombed by Israel, diplomats said.

Citing comments by Ibrahim Othman at a closed meeting Tuesday, two diplomats from Western delegations to the International Atomic Energy Agency said the new structure appeared to be a missile control center or an actual launching pad.

The diplomats demanded anonymity for divulging details about what Othman told the agency's 35-nation board.

Israeli warplanes destroyed the site in a remote area of the Syrian desert in September 2007. Israel has not commented on the strike, but Washington subsequently presented intelligence purporting to show that the target was a reactor built with North Korean help that would have been able to produce plutonium once completed.

Syria had previously said only that the site was military in nature and that it was being rebuilt. It has denied secret nuclear activities but has blocked IAEA inspectors from visits beyond an initial inspection to the Al Kibar site.

Environmental samples from that trip have revealed traces of man-made uranium and graphite. But U.N. officials say it is too early to say whether the graphite — a common element in North Korean prototype reactors — had any nuclear applications.

The diplomats quoted Othman as saying that, when IAEA Deputy Director Olli Heinonen visited the site in June, Heinonen was asked whether the Syrians should "put a missile in position" — apparently to demonstrate its present use — with the IAEA official saying no.

One of the diplomats said the briefing was told that the finding of 80 uranium particles in the environmental samples was "significant."

But Othman played down the laboratory results in comments outside the meeting — and denied outright that graphite was found. That denial contradicted comments from U.N. officials familiar with the Syria probe.

"There is no graphite at all," he told reporters. As for the uranium traces, "any analysis has errors," he said. "The smaller the amount the larger the (probability of) error."

One of the two diplomats also said that inside the briefing Othman announced that Syria would no longer accept evidence of apparent nuclear activity resulting from further findings from the samples taken by the agency.

That — and Damascus' continued refusal to allow other visits to the Al Kibar sites and other ones suspected of secret nuclear activity — could cripple the agency's investigative efforts.

Expanding on an IAEA report on the Syria probe circulated to board members earlier this week, agency officials told the meeting that Syria had apparently tried to secretly buy so-called "dual use" materials that can — but do not have to be — part of a nuclear program, said the diplomats.

Among the substances were high-grade graphite — used to control the speed of fission in some reactors — and barium sulfate, a nuclear shielding material. Syria claimed non-nuclear purposes for both substances, the diplomats said.

Israel also has denied assertions by Damascus that the uranium came from Israeli depleted uranium bombs or warheads used to destroy the Al Kibar facility. Depleted uranium is used to harden munitions and increase penetrating power.

## **Syria: Ex-general criticises Damascus for blocking visit by nuclear watchdog**

25 February [2009] 15:54

Damascus, 25 Feb. (AKI) - A retired Syrian general has criticised a decision by the country's Atomic Energy Commission to refuse the United Nations' nuclear watchdog access to inspect the al-Kibar suspected nuclear research centre bombed by Israel in September 2007. Musa al-Zaabi, said the decision by Ibrahim Othman, head of the commission, was a "grave error".

"Western countries and the International Atomic Energy Commission will interpret the Syrian refusal as proof that Syria is hiding something and is working on a banned military programme," Zaabi told Adnkronos International (AKI).

"It would be right and proper for Syria to invite the IAEA, European countries and also the United States to have serious dialogue about this matter."

The former general appealed to Syrian leaders in Damascus to "follow what Iran did with its nuclear programme paving the way for lengthy dialogue."

"There would be nothing bad about Syria asking western countries for technical assistance for a peaceful nuclear programme, if it really wanted to head in this direction," Zaabi said.

Regarding scientific aspects of the programme, he said there was nothing to discuss. "Laboratories, analyses and scientific instruments exist that confirm or deny every doubt and hypothesis, and you cannot be skeptical about these results," he stated.

"It would have been better for Syria to provide the IAEA with responses and realistic proof that would not have given rise to doubts or other accusations," Zaabi said.

Syria has reaffirmed several times that the plant bombed by Israel at al-Kibar in the country's eastern desert was a traditional plant, and denied that it was a nuclear facility under construction.

Last year, the IAEA said a "significant" number of particles of man-made uranium had been found at Al-Kibar.

And in a report last week, the IAEA said more unexplained man-made uranium had turned up in the samples taken from the site and Syria would need to explain how it got there.

An Israeli intelligence operation penetrated the suspected Syrian nuclear programme, which photographs appeared to show had been undertaken with North Korean assistance delivered by sea.

## **Syria and the IAEA**

**Published: February 26, 2009**

When the International Atomic Energy Agency's Board of Governors meets next week, Syria's case will be high on its agenda.

Syria is suspected of having built an undeclared nuclear reactor that was destroyed by an Israeli airstrike in September 2007. The IAEA has found strong evidence to support this accusation but, as yet, has no proof. It has repeatedly asked Syria for greater access on a voluntary basis. Syria has repeatedly refused.

It is time for the atomic energy agency to invoke its most powerful inspection provision, the "special inspection," to make its requests for access legally binding.

Special inspections give the IAEA, when it has a reason, the authority to inspect a country's undeclared sites. Unfortunately, the agency has not tried to invoke this provision since a 1993 request to North Korea, which refused access.

If the IAEA asks for a special inspection, Syria may refuse access. In this case, the Board of Governors would have sufficient grounds to find Syria in noncompliance with its safeguards agreement

Noncompliance would not necessitate the immediate imposition of economic or political sanctions against Syria. But a finding of noncompliance would oblige the board to refer the case to the UN Security Council - although it could delay doing so.

The referral could be "for information purposes only," and not for sanctions, depending on Syria's level of cooperation. If Syria cooperates fully with inspectors, Security Council members could make it clear that Syria will not be sanctioned - even if the suspected site turns out to have been a reactor.

This strategy would make the possibility of consequences for noncooperation more credible without escalating the situation unnecessarily.

Just as important, it would help the IAEA to reassert its right to conduct all necessary inspections and to stop the gradual erosion of its legal and political authority.

For more on this issue, please see [www.carnegieendowment.org](http://www.carnegieendowment.org).

## **The IAEA Should Call for a Special Inspection in Syria**

James Acton, Mark Fitzpatrick, Pierre Goldschmidt

Proliferation Analysis, February 26, 2009

Published: February 26, 2009

When the International Atomic Energy Agency's Board of Governors meets next week, Syria's case will be high on its agenda. Syria is suspected of building, at a site known as Dair Alzour, an undeclared nuclear reactor that was destroyed by an Israeli airstrike in September 2007. The IAEA has found strong evidence to support this accusation but, as yet, no proof. It has repeatedly asked Syria for greater access on a voluntary basis. Syria has repeatedly refused. It is now time for the IAEA to move beyond such voluntary requests and invoke its most powerful inspection provision, the "special inspection," to make its requests for access legally binding. If Syria refuses then the Board should make a formal finding of "non-compliance."

As highlighted in its report of 19 February, the IAEA investigation into Syria has reached something of a dead-end. Inspectors found a number of anthropogenic uranium particles "of a type not included in Syria's declared inventory of nuclear material" but cannot verify whether Syria was conducting nuclear activities at Dair Alzour without more access and information. It is important for Syria to provide the plans for the original building and to answer all of the IAEA's questions promptly. Most crucially, however, inspectors must be able to inspect the three other sites for which the IAEA has intelligence and procurement-related information that suggests a nuclear connection.

As matters currently stand, Syria will succeed in unilaterally and permanently stalling the IAEA investigation by denying access. This situation is unacceptable. To avoid it, the first step is for the IAEA to make its access requests legally binding by invoking its right to conduct a special inspection. Special inspections give the IAEA, when it has a reason, the authority to inspect undeclared sites in a state.

Special inspections ought to be a key element of the IAEA's verification regime but they are not. According to public records, this provision has only been invoked in two cases. In 1992 Romania actually asked to be inspected to build confidence that it had abandoned the Ceausescu regime's nuclear weapons programme. A year later, the IAEA asked for a special inspection in North Korea. North Korea refused, touching off a crisis that left the IAEA hesitant to ask for this access elsewhere—including in additional cases in which it was certainly deserved.

Syria is the textbook definition of a case in which a special inspection is merited. If the IAEA fails to ask for one, it will hand future states suspected of non-compliance an extraordinarily powerful precedent to use in opposing a special inspection request. IAEA officials regularly complain about their lack of legal authority—and rightly so. But, in this instance, they will have only themselves to blame if they let the authority that they do have atrophy.

If the IAEA does ask for a special inspection, Syria may refuse access. In this case the Board of Governors would have sufficient grounds to find Syria in non-compliance with its safeguards agreement because the IAEA would then be "unable to verify the non-diversion of nuclear material" (within the meaning of the agreement "non-diversion" includes the failure to declare nuclear material). Again, if this provision is not used now, it risks becoming unusable.

Unfortunately, in November of last year, while speaking against ceasing technical cooperation on reactor development with Syria, the IAEA Director General seemed to ignore this when he stated that "people and countries are innocent until proven guilty." As eminently fair as this principle is when applied to people, it is not the standard set out in states' comprehensive safeguards agreements—the agreement with the IAEA that all non-nuclear-weapon states party to the Nuclear Non-Proliferation Treaty are obliged to conclude. The principle of "innocent until proven guilty" is dangerous when applied to states because it allows a non-compliant state to avoid its guilt being proven by denying the IAEA access. In contrast, an accused person cannot simply stop a police investigation in the same way.

The limitations of the "innocent until proven guilty" approach have become apparent from recent events in Iran. During the IAEA's six-year long investigation, Iran has frequently failed to provide full and proactive cooperation. Now that the IAEA has turned its attention to alleged activities directly connected with the development of nuclear weapons, Iran's cooperation has almost completely ceased. Indeed, in his last three reports the Director General blamed Iran for the inspectors' inability to make "any substantive progress" on resolving these issues. Yet, Iran has incurred no additional consequences for its lack of cooperation.

Finding Syria in non-compliance, if it refuses a special inspection, would help correct this precedent. It would, however, not necessitate the immediate imposition of economic or political sanctions. Having found Syria in non-compliance the Board would be obliged to refer the case to the Security Council—but it could delay doing so. The referral could be "for information purposes only," and not for sanctions, depending on Syria's cooperation. In particular, if it cooperates fully and proactively with inspectors, Security Council members could make it clear that Syria will not be sanctioned—even if the building at Dair Alzour turns out to have been a reactor. This strategy would make the possibility of consequences for continued non-cooperation more credible without escalating the situation unnecessarily. Just as importantly, it would help the IAEA to reassert its right to conduct all necessary inspections and to stop the gradual erosion of its legal and political authority.

## **Report on Details of Closed Meeting Between IAEA, Syrian Nuclear Energy Chief**

Reports from Vienna by Buthayna Abd-al-Rahman and Damascus by Su'ad Garus: **"Question Marks at IAEA After Syria's Announcement on Building a Rocket Site at Al-Kubr Site. Head of Syrian Energy Agency Says Graphite Traces Were Very Small and Could be From the Air"**

Al-Sharq al-Awsat Online

Friday, February 27, 2009 T17:09:38Z

Journal Code: 1431 Language: ENGLISH Record Type: FULLTEXT

Document Type: OSC Translated Text

Material in the World News Connection is generally copyrighted by the source cited. Permission for use must be obtained from the copyright holder. Inquiries regarding use may be directed to NTIS, US Dept. of Commerce.

The Secretariat of the International Atomic Energy Agency has announced that its Board of Trustees will hold its next sessions at the IAEA headquarters in Vienna starting next Monday morning. The Agenda is headed by the North Korean, Iranian, and Syrian nuclear dossiers, but all the indications are that the Syrian dossier will be the one that dominates during deliberations that will have more political than technical dimensions.

Ibrahim Uthman, the head of the Syrian Nuclear Energy Agency, said at a closed session held the day before yesterday by the Agency's Secretariat with the members of the Board of Trustees that Syria had built a platform for launching rockets at Al-Kubr site, in the area of Dir al-Zur. This statement provoked many question marks and reactions.

Al-Sharq al-Awsat has monitored the reaction to Dr Uthman's statement which has raised questions about the real nature of this site, what is taking place in it, and the reasons that prompted Syria to choose it in particular to build a rocket establishment when the site is still subject to international investigations conducted by the IAEA.

It is known that this location was the target of an attack in April 2007 *[sic]* by Israel that claimed it was an almost-finished nuclear installation. The United States provided the IAEA in September *[sic]* with information it claims confirm the Israeli claim and that the site was an almost-finished nuclear installation. Syria has denied all these allegations. It allowed a team of IAEA inspectors to visit the site a single time but would not permit them to repeat it, despite the IAEA's insistence on the necessity of its inspectors visiting the same site as well as three other related sites. A report submitted last week by the IAEA's director-general, Dr Muhammad ElBaradei, said that traces of graphite had been found in the samples obtained by the inspectors during that visit.

Al-Sharq al-Awsat learned from a source who attended the closed session that Dr Ibrahim Uthman told the IAEA's team that visited the site under Olli Heinonen, deputy director-general and head of the safeguards department, that the site was a military site on which a rocket installation was built. The source told Al-Shraq al-Awsat that Dr Uthman did not answer the questions that focused on the type of the rocket installation, the exact date it was built, whether it had been put into operation, and whether Syria possessed a nuclear installation.

Dr Uthman has denied that the quantities of graphite found by the international inspectors were sufficient proof that the building was constructed of that material. He said that "the graphite samples obtained by the IAEA were very small and it cannot be ruled out that they had existed in the air". He said that it might be "mere carbon from ordinary equipment that was used in constructing the site".

The source said in his interview with Al-Sharq al-Awsat that more than one Western diplomat posed questions to the IAEA's secretariat during the meeting on whether the IAEA had managed to secure the rubble of the building after the Israeli attack. He said that the IAEA's reply explained that it managed to obtain samples allowed by Syria and that the agency was still waiting for Syrian authorities to allow it to visit the site a second time.

Al-Sharq al-Awsat learned within the same context that the Iranian delegate, Ambassador Ali Asghar Sultanyah, had rushed to the defense of the Syrian position. He said that Syria was not hiding anything and that other wise it would not have allowed the inspectors to enter its territory at all. For his part, Egypt's Ambassador asked in a statement before the conferees why the West insists that the installation was a nuclear installation built from graphite even though the IAEA has found only a minute quantity of the element.

Ibrahim Uthman rejected the IAEA's interpretation that "the chemical composition of the uranium particles showed it was not from the ordnance Israel used in bombing the installation". He said "this is an explanation we do not accept. When they claim they found 80 particles per half million tons of soil, I do not know how they can use this figure to accuse somebody of building such an installation". Asked whether Syria would allow other visits by the IAEA to other sites, Uthman said: "No. We shall continue cooperating with the IAEA according to the safety procedures agreement we signed, and this agreement allows the IAEA to visit the sole announced nuclear installation, which is an old research reactor".

Al-Sharq al-Awsat could not obtain any comment in Damascus on Uthman's statements because the issue is related to an off-limits military issue in the military institution, according to the stipulations of the Syrian Publicans Law.

## **Q+A-First U.N. nuclear watchdog meeting under Obama**

By Mark Heinrich

Sun Mar 1, 2009 10:54am GMT

*[EXCERPTS]*

VIENNA, March 1 (Reuters) - The U.N. nuclear watchdog's governing body meets on Monday for the first time since U.S. President Barack Obama took office, a change likely to colour debate on concerns like Iran and Syria.

The following outlines important themes at the International Atomic Energy Agency's board of governors' week-long session.

*[deletia]*

### **A BREAKTHROUGH ON IRAN AND SYRIA?**

Not at this meeting. Iran and Syria both deny wrongdoing but have stonewalled the IAEA's requests for documentation and access to draw conclusions. Both seem to be waiting for Obama to show what he has to offer. His policy review will not be finished for at least another month.

*[deletia]*

IAEA Director-General Mohamed ElBaradei and many board members will press Iran and Syria to open up voluntarily to U.N. inspectors to defuse mistrust.

Last week, non-proliferation advocates urged the IAEA to impose a rare, legally-binding "special inspection" on Syria to pin down whether it almost built a secret nuclear reactor before it was wrecked in a 2007 Israeli air raid.

The appeal followed a Feb. 19 inspectors' update on Syria that they had found a "significant" amount of uranium traces in soil samples taken at the site last June and they had not come from munitions Israel used to bomb it.

But an IAEA official said a special inspection, which would give agency sleuths sweeping search powers, would be premature and confrontational at this time and was not on the horizon.

*[deletia]*

Statements of the Director General  
2 March 2009 | Vienna, Austria

IAEA Board of Governors

**Introductory Statement to the Board of Governors  
by IAEA Director General Dr. Mohamed ElBaradei**

*[EXCERPT]*

**Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

The Agency has continued its analysis of all information available to it, including from the 23 June 2008 visit to the Dair Alzour site. Further analysis of the environmental samples taken from the Dair Alzour site has been carried out, revealing additional particles of uranium which had been produced as a result of chemical processing. These particles, and those identified as a result of the previous analyses, are of a type not included in Syria's declared inventory of nuclear material. Syria has stated that the origin of the uranium particles was the missiles used to destroy the building. In response to a letter from the Agency, Israel denied that the uranium particles originated in Israel. The Agency's current assessment is that there is a low probability that the uranium was introduced by the use of missiles.

In a letter dated 15 February 2009, Syria reiterated that the destroyed facility, and the current facility, on the Dair Alzour site were military installations and not involved in any nuclear activities. The letter did not address many of the questions raised by the Agency. Syria's responses to some of the Agency's questions were only partial and included information already provided to the Agency.

The Agency expects Syria to provide additional information and supporting documentation about the past use and nature of the building at the Dair Alzour site, and information about procurement activities. Providing additional access to other locations alleged to be related to Dair Alzour would be a welcome sign of Syria's transparency. Such access, together with the sampling of destroyed and salvaged equipment and debris, is essential for the Agency to complete its assessment. I urge Syria to take these measures at the earliest possible date. I also urge Israel and other States that may possess relevant information - including satellite imagery - to make it available to the Agency and to agree to the Agency's sharing of such information with Syria.

## US vows strong diplomacy to back IAEA atom probes

2 March 2009

(Reuters)

*[EXCERPTS]*

VIENNA - The United States on Monday promised strong diplomacy with Iran, Syria and North Korea to help the UN nuclear watchdog tackle suspected proliferation challenges posed by the three nations.

The pledge, made at the first International Atomic Energy Agency meeting since US President Barack Obama took office in January, reflected his commitment to engage US adversaries after years of unfruitful isolation policy by George W. Bush.

Obama's challenges include suspected nuclear weapons work in Iran and Syria and their failure to open up to IAEA inspectors, and stalled talks to end North Korea's atom bomb programme.

He has yet to undertake concrete steps, pending the outcome of a sweeping foreign policy review due in a few weeks.

But Washington's IAEA ambassador sketched the principles of the new US approach, citing 'a moment of unparalleled opportunity with a renewed American commitment to the United Nations and multilateral diplomacy'.

Addressing the IAEA's 35-nation board of governors, Gregory Schulte said the United States believed robust diplomacy would strengthen the IAEA's ability to detect nuclear proliferators and encourage cooperation with its investigators.

'We believe that preserving the agency's credibility in implementing NPT (Non-Proliferation Treaty) safeguards depends on our success in dealing with the immediate challenges, specifically those posed by North Korea, Iran and Syria.'

'The new administration intends to strengthen diplomatic efforts to address each of these challenges,' Schulte said.

'Hence the administration's readiness for direct engagement with Teheran ... Hence the administration using dialogue with Syria to encourage it to cooperate with the IAEA. Hence (our) commitment to the six-party process to pursue the denuclearisation of North Korea.'

This was all part of a heightened US priority to ensure the IAEA 'gets the authority, information, people and technology it needs to do its job', Schulte told the closed-door meeting.

*[deletia]*

On Syria, IAEA inspectors say enough traces of uranium were found in soil samples taken in a trip to the bombed site granted by Syria last June to constitute a 'significant' find, and satellite pictures revealed a building resembling a reactor.

ElBaradei said Syria repeated in a Feb. 15 letter to the IAEA that the wrecked facility, and another built on top of it, were military installations not involved in nuclear activities.

The letter did not address many of the IAEA's queries, he said, again pressing Syria to back up its denials.

Diplomats close to the IAEA say satellite imagery shows Syria removed such materials and landscaped sites in question to alter their appearance after inspectors asked to see them.

UNITED STATES MISSION TO  
**INTERNATIONAL ORGANIZATIONS  
IN VIENNA**

**U.S. Statement on the Nuclear Safety Review for the Year 2008**

IAEA Board of Governors Meeting

March 2-6, 2009

Agenda Item 2

Measures to strengthen international cooperation in nuclear, radiation and transport safety and waste management:

Nuclear Safety Review for the Year 2008

EXTRACT FROM U.S. STATEMENT

Gregory L Schulte

Permanent U.S. Representative to the IAEA

Madam Chairwoman,

This is the first meeting of the IAEA Board since the inauguration of President Obama. This is a moment of complex challenge for the IAEA, but also a moment of unparalleled opportunity with a renewed American commitment to the United Nations and multilateral diplomacy. My delegation notes with appreciation the positive interest of Member States in the U.S. Presidential election and in the ongoing adjustment and review of U.S. policies, including many that affect the work of the Agency. I hope, Madame Chairwoman, you will permit me to start my intervention with five points on behalf of the new U.S. Administration.

First, President Obama and his new Administration strongly support the International Atomic Energy Agency in all aspects of its mission. We seek to strengthen the IAEA and to ensure that the Agency gets the authority, information, people, and technology it needs to do its job. Our top priority is the verification role of the Agency, which is essential to creating the confidence that enables countries worldwide to benefit from peaceful use of nuclear technology. This essential verification role will grow as more and more countries invest in nuclear power to provide clean energy for growth and development. Instruments like the Additional Protocol will become increasingly important not just for verification but to build confidence among nations.

Second, we support the important role the IAEA plays in global efforts to help countries adopt the highest standards for nuclear security and protection of nuclear materials. President Obama has identified preventing terrorists from acquiring nuclear and radiological weapons as his number one security priority. The National Nuclear Security Administration of the U.S. Department of Energy is already pursuing a major Global Threat Reduction Initiative to reduce and protect vulnerable nuclear and radiological material located at civilian sites worldwide. We will continue to look to the IAEA for

support in global efforts to secure nuclear materials; to phase out the use of highly enriched uranium in the civil nuclear sector; to strengthen international intelligence and police cooperation to prevent WMD terrorism; and to help build the capacity of governments around the world to prevent the theft or diversion of nuclear materials.

Third, President Obama has expressed strong support for the creation of an IAEA-administered nuclear fuel bank. While in the U.S. Senate, both he and Secretary Clinton supported legislation providing \$50 million to the IAEA in response to the challenge grant from the Nuclear Threat Initiative. The Administration wants to work with the IAEA and Member States to put into place a fuel bank that would allow countries to benefit from the peaceful uses of nuclear energy without increasing the risks of nuclear proliferation. We welcome the initiatives by the Russian Federation and the Nuclear Threat Initiative, as well as by many others.

Fourth, we believe that preserving the Agency's credibility in implementing NPT safeguards depends on our success in dealing with the immediate challenges – specifically those posed by North Korea, Iran, and Syria. The new Administration intends to strengthen diplomatic efforts to address each of these challenges. We must strengthen and revalidate this important Agency rather than allowing those who violate their obligations to discredit it.

Fifth, the new Administration recognizes that the IAEA's essential role in nonproliferation is part of a broader international effort that includes diplomacy and disarmament. While the IAEA must pursue its essential verification role, there is also a role for diplomacy in ensuring the viability of the NPT. Hence, the Administration's readiness for direct engagement with Tehran as part of the international effort to convince Iran's leadership to meet its responsibilities. Hence, the Administration using dialogue with Syria to encourage its leaders to cooperate with the IAEA. Hence, the Administration's commitment to the Six-Party process to pursue the denuclearization of the North Korea.

The new Administration also recognizes that NPT obligations encompass disarmament as well as nonproliferation. President Obama supports the goal of working toward a world without nuclear weapons. His Administration intends to renew America's commitment to disarmament, including dramatic reductions in U.S. and Russian stockpiles of nuclear weapons and material and a verifiable global ban on the production of new nuclear weapons material.

President Obama believes that the best way to reduce global threats and seize global opportunities is to design and implement global solutions. The new administration looks forward to a close working relationship with the IAEA, its Secretariat, and its Member States to advance our common objective of promoting the safe, secure, and peaceful use of nuclear technology.

(Statement continues...)

Gordon Duguid  
Acting Deputy Department Spokesman  
Daily Press Briefing  
March 3, 2009 11:11 a.m. EST

*[EXCERPT]*

MR. DUGUID: Good morning, everyone. I'd like to again lead off today with a brief rundown of Secretary Clinton's meetings on her visit to Israel, and then I'll go to your questions after that.

*[deletia]*

I also know that many of you have followed her statements earlier today that the State Department will be sending a representative to Damascus as part of her visit to the region, in an effort to look at the comprehensive peace process that we are trying to build there. Senator Mitchell is with the Secretary today and will be with her tomorrow in the West Bank.

With that, I'm ready to go to your questions.

QUESTION: When are – when are they – as part of this trip, they're going to be going to Damascus?

MR. DUGUID: As part of – as a separate trip during this current visit by the Secretary to the region, yes, there will be a two-person team that goes to Damascus. We are finalizing the details today. And as soon as we have more of those, we'll be happy to get that to you.

QUESTION: So in other words, between now and Saturday?

MR. DUGUID: Yes, indeed.

Okay, yes.

QUESTION: Do you expect for Shapiro and Feltman to go with her to Europe?

MR. DUGUID: I do expect that Acting Assistant --

QUESTION: Or will they stay behind?

MR. DUGUID: -- Secretary Feltman and Dan Shapiro will visit Damascus and will be able to calculate their other travel, depending on how the meetings go and how the schedule develops.

QUESTION: Yeah, I know. But I mean, are they going to go with her to Brussels and Geneva?

MR. DUGUID: We don't have the final details yet on --

QUESTION: Right.

MR. DUGUID: -- when they will break off. But as soon as we have those details, we will get them to you.

QUESTION: And Mitchell's not going?

MR. DUGUID: No, sir.

QUESTION: So the Syrian ambassador was right last week when he said the talks here would lead to another round of talks, when the State Department -- when Robert Wood himself -- said there would be no guarantee of further talks.

MR. DUGUID: Well, they're not --

QUESTION: This is very clear.

MR. DUGUID: They're not there yet. We're working on the details to get them there. And this is one effort, on our part, to engage with the Syrians on what productive roles they could play, not only for Middle East peace, but also on Iraq.

Do we want to engage with the Syrians? Yes, we do. Yes, indeed we do. Is this meeting a meeting that will help us see if that process can continue? Yes, it will. But I don't want to predict for you that there will be a series of meetings or that this will become a regular feature. We'll see what this meeting -- next meeting produces, and then we'll go from there.

QUESTION: Are they going to discuss the possibility of restoring a U.S. ambassador to Syria?

MR. DUGUID: Since no decision on that has been made, I can't predict what will come up in the discussions. We'll be talking about a range of bilateral and multilateral issues. But as these discussions go, it's very hard to predict what will and won't come up.

QUESTION: How does it advance U.S. interest not to have an ambassador there?

MR. DUGUID: How does it advance the U.S. interest to put an ambassador in place before we've come to an understanding on what it is we want to work with the Syrians on? The talks have never stopped with Syria. We have had a chargé in place. We have also had discussions here. It's -- it would in a normal relationship be unusual to have -- not have an ambassador in place. We've not had a normal relationship for some time. We're working with the other foreign policy agencies in the U.S. Government to develop a better relationship, or the means for a better relationship with Syria. But this can't be unreciprocated. We have to have some form of moving forward positively before we're going to consider how we're going to staff the embassy there.

QUESTION: So you need something from them before you're going to send an ambassador?

MR. DUGUID: I'm just saying we are looking at our Syria policy right now. We are discussing our relationship with the Syrians. I don't have to go down for you the list of things that we are -- you know, differences that we have with them at the moment. We'll see where these meetings go before we go to a next step.

## **Evidence mounts of Syrian nuclear cover-up: U.S.**

By Mark Heinrich

Wed Mar 4, 2009 11:54am EST

*[EXCERPTS]*

VIENNA (Reuters) - The United States said on Wednesday that U.N. inspectors had found growing evidence of covert nuclear activity in Syria, and European allies said a lack of Syrian transparency demanded utmost scrutiny.

The U.N. nuclear watchdog, the International Atomic Energy Agency, is looking into U.S. intelligence reports that Syria had almost built a North Korean-designed, nuclear reactor meant to yield bomb-grade plutonium before Israel bombed it in 2007.

Last month, the IAEA said inspectors had found enough traces of uranium in soil samples taken in a trip to the bombed site granted by Syria last June to constitute a "significant" find, and satellite pictures taken before the Israeli bombing revealed a building resembling a reactor.

But the IAEA report said Syria, citing national security reasons, had ignored many agency requests for further on-the-ground access and documentation to back up its assertion that Israel's target was a purely conventional military building.

"This report contributes to the growing evidence of clandestine nuclear activities in Syria," Gregory Schulte, U.S. ambassador to the IAEA, said during a debate by its 35-nation Board of Governors in Vienna.

"We must understand why such (uranium) material -- material not previously declared to the IAEA -- existed in Syria and this can only happen if Syria provides the cooperation requested."

He said it was also essential that Syria allow inspectors to examine debris removed from the bombed facility to an unknown location immediately after Israel's strike.

This applied as well, Schulte said, to three other military sites which satellite pictures showed Syria "sanitized" -- landscaping them and whisking away equipment -- shortly after the IAEA asked to check them out.

*[deletia]*

In a statement to the closed-door IAEA gathering, the 27-member European Union voiced concern at the "possibility that Syria has not declared all its nuclear installations."

"Any obstacles, unnecessary delays or a lack of cooperation ... undermine the credibility of the agency's verification capabilities. Such cases, therefore, deserve our utmost attention," it said.

Vienna diplomats said Syria had told the IAEA it had built a missile facility on the desert tract hit by Israel, a disclosure apparently meant to reinforce the Syrian refusal to grant more IAEA access on national security grounds.

## **Syrian source: Uranium found in bombed facility – Israeli**

Published: 03.05.09, 11:53 / Israel News

A diplomatic source in Syria said the facility that was bombed about a year-and-a-half ago "was and will return to be a military facility".

The sources said this in an interview to al-Sharq al-Awsat newspaper, and ruled out claims that the facility was a nuclear reactor. "We have nothing to hide. The International Atomic Energy Agency should ask Tel Aviv about the uranium samples that were found, and not Syria – since they came from the Israeli bombings," the source said. (Roe Nahmias)

## **IAEA Must Probe Israel, Not Syria, on Uranium Traces - Syrian Source**

**06/03/2009**

Vienna, Asharq Al-Awsat - Syria has called on the International Atomic Energy Agency [IAEA] to investigate Israel further regarding the traces of uranium which international inspectors found in the Syrian Dayr al-Zur installation that Israel had destroyed on the pretext that it was a nuclear reactor which Syria was about to complete building.

A Syrian diplomatic source told Asharq Al-Awsat in Vienna yesterday that its country had officially requested the IAEA at the meeting of its board of trustees to ask Tel Aviv and not Damascus about the sources of the uranium traces which Syria asserts were the result of Israeli shells. It added that its country refuted to the conferees the allegations that Dayr al-Zur was a nuclear reactor and reiterated that it was and would remain a military site which Syria is now restoring to its military nature. It pointed out that Syria is demanding the closure of the so-called "Syria's nuclear dossier."

In reply to Asharq Al-Awsat question whether Syria realizes where the denial might lead it to despite the evidence of secret military activity, the source said "Syria is always ready to shoulder the consequences of its actions" and denied again that it has any nuclear activity outside IAEA's control. The official underlined his country's continued cooperation with the IAEA in accordance with the agreements between them and stressed that Syria considers these agreements binding on it. Asked whether Syria can cooperate fully with the IAEA's investigations and therefore win the international community's trust, approval, and assistance as was the case with Libya when it abandoned its undeclared nuclear activity, the Syrian official said his country has nothing to declare and rejects the accusations of secret nuclear activity in whole and parcel and reiterated that Dayr al-Zur was and will return to be a military installation.

## **U.S. takes tentative steps back into Syria**

By Andrea Mitchell, NBC News

Posted: Saturday, **March 07, 2009** 11:33 AM

The United States is engaging Syria again — if tentatively.

A senior American diplomat, briefing reporters by phone from Damascus today, said that his talks with Syrian officials were constructive, comprehensive and lengthy — but that this is only the beginning of engagement. As for specific achievements, the U.S. official — Jeffrey Feltman, acting assistant secretary of state — said, "Let's keep our expectations in check here." He said that no subjects were taboo, but that this was just the start of a process.

Feltman and Dan Shapiro of the National Security Council held talks with Syria's foreign minister and two other officials — but did not see Syria's President Bashar Assad and did not say what the next steps would be.

Today's meetings were the first high-level diplomatic contacts between the U.S. and Syria since the Bush administration cut off relations four years ago in response to the assassination of Lebanon's former Prime Minister Rafik Hariri.

Feltman said they discussed a broad range of issues — regional and international — as well as bilateral issues and how to move forward. "It is our view that Syria can play an important, constructive role in the region," he said.

Asked about any concrete achievement — and whether the U.S. government is any closer to returning a U.S. ambassador to Damascus or more interested now in supporting the indirect Israeli-Syrian peace talks that the previous administration opposed — Feltman said only that President Barack Obama and Secretary of State Hillary Rodham Clinton talked about engagement as a way to achieve goals — but "this is part of a process. We'll see how this develops ... the Syrians have concerns about us as well — I'm sure the Syrians will be looking at decisions we make just as we will be looking at decisions they make."

In another departure from Bush policy, he indicated support for eventual resumption of Israeli-Syrian talks: "We want a comprehensive Israeli-Arab peace. We do want to see forward momentum on the Israeli-Syrian tract when the two parties are ready for this." Those talks were being brokered through Turkey (where Hillary Clinton is today) but broke off during the resumption of hostilities between Hamas and Israel over Gaza.

Asked about Syria's role in the future of Iraq, Feltman said: "There are areas like this — a stable, unified Iraq — where our interests coincide. This is the kind of subject we can explore. Let's see where our interests intersect."

He also indicated that the U.S. side brought up the subject of North Korea's export of nuclear technology to Syria (a suspected nuclear facility in Syria was leveled in a secret Israeli airstrike two years ago). Specifically, when asked if nonproliferation and nuclear issues involving North Korea were discussed with the Syrians, he said: "We're not going to get into a lot of detail. We're looking to the IAEA for their examination, but our talks were comprehensive."

When asked if they had any plans to meet with Assad — and whether the Syrians want to have a U.S. ambassador back in Damascus before that takes place — Feltman said: "We asked for meetings with the Syrian officials ... We stated we want to come to Damascus. We didn't try to dictate to Damascus who our interlocutors would be."

Asked if there would be any change in the U.S. inclusion of Syria on its list of terrorism-supporting states — and any change in Syria's support for Hezbollah — he said: "Let's keep our expectations in check here. We had a good meeting today — but the differences between our two countries will require more work through conversations. We found a lot of common ground today, there were no subjects that were taboo, but it is unrealistic to expect particular results out of this meeting."

In terms of Hezbollah, Syria has backed the U.N. Security Council resolution that ended the hostilities in the July-August 2006 war, Feltman said that can be the basis of further discussions.

The call was cut off by State Department officials in Washington before he could be asked about Syria's support for Hamas leaders in Gaza — or today's announcement of the planned resignation of a top Palestinian Authority leader, Prime Minister Salam Fayyad, whom the U.S. has long hoped would eventually lead a Palestinian unity government.

## Syria leader: nuke site hit by Israel built over

The Associated Press

Monday, March 9, 2009

DAMASCUS, Syria: The Syrian president denounced U.S. claims that a Syrian site bombed by Israel two years ago was a nearly finished nuclear reactor, and said in comments published Monday that the location has been built over.

President Bashar Assad's remarks in the Emirates' Al-Khaleej daily confirmed statements made last month by two Western diplomats with the Vienna-based U.N. nuclear watchdog. The diplomats quoted Syrian nuclear chief Ibrahim Othman as telling the International Atomic Energy Agency that Syria built a new missile facility on the bombed site in a remote desert area.

However, Assad didn't elaborate what the new construction was at Al Kibar.

The autocratic Syrian leader's comments appeared to be an effort to close the chapter on the issue of the bombed site amid a recent drive by Damascus for better relations with Washington and the new Obama administration.

The diplomats in Vienna had said the new structure appeared to be a missile control center or an actual launching pad. Syria had previously said only that the site was military in nature and that it was being rebuilt.

Damascus has denied secret nuclear activities but has blocked IAEA inspectors from visits beyond an initial inspection of Al Kibar.

Israeli warplanes destroyed the site in the Syrian desert in Sept. 2007. Israel has not commented on the strike, but months later Washington presented intelligence purporting to show the target was a reactor under construction, built with North Korean help that would have been able to produce plutonium once completed.

In the Monday interview, Assad said that "America justified the bombing eight months later" and questioned why Washington waited so long to announce the alleged evidence.

Syria, Assad said, allowed the IAEA to visit the site shortly after its request last May and the team from the U.N. watchdog arrived in June.

"Have we had any nuclear activities we wouldn't have allowed them to come," Assad was quoted as saying.

Environmental samples from IAEA's trip revealed traces of man-made uranium and graphite but U.N. officials say it's too early to say whether the graphite is a common element in North Korean prototype reactors or had any nuclear applications.

Assad also disputed the uranium find.

"Where did the uranium come from," he asked in the interview. "Under construction means that it was not built yet," he said, implying that there wouldn't have been any uranium traces unless the site was completed.

*Prepared for Members and Committees of Congress*

[EXCERPT]

## **Clandestine Nuclear Program and the IAEA investigation**

On September 6, 2007, an Israeli air strike inside Syrian territory destroyed what is now referred to as Al Kibar, a remote desert facility which may have housed a nuclear reactor. On April 24, 2008, U.S. intelligence officials briefed some Members of Congress and provided a background news briefing to the media on the nature of the facility. According to reports in the Washington Post, Syria and North Korea were suspected of collaborating on a secret nuclear program since 1997.<sup>14</sup> Since then, senior North Korean officials and scientists from North Korea's Yongbyon nuclear complex reportedly visited Syria several times before construction began in Syria at Al Kibar, between 2001 and 2003. In the spring of 2007, Israel reportedly provided the Administration with photographs of the interior of the alleged facility still under construction. According to the Washington Post, the "pictures depicted a site similar to the one at Yongbyon, which produces plutonium for nuclear weapons."

In order to stress the imminent danger posed by Syria's actions, senior U.S. intelligence officials repeatedly stressed that Al Kibar was nearly operational at the time of the Israeli strike. U.S. officials were quoted saying that, before the Israeli bombing, Al Kibar was within weeks or months of becoming operational.<sup>15</sup> Others noted that the reactor there would have ultimately produced enough plutonium for one or two bombs within a year of becoming operational.<sup>16</sup> Several days after the intelligence briefings, Japanese public broadcaster NHK, citing South Korean intelligence officials, reported that 10 North Koreans working at Al Kibar had died in the September 2007 air raid and that the dead included officials of the North Korea's communist party unit that exports weapons and military technology and members of the North Korean military unit which made nuclear facilities in the country.<sup>17</sup>

For many experts, the Israeli attack has implications that go far beyond Syrian-Israeli relations. Although the veil of secrecy surrounding the attack may reflect U.S. efforts not to derail ongoing Middle East peace negotiations, the attack has been largely seen through the prism of restoring Israeli deterrence at a time when some analysts expect Israel to take action against Iran's uranium enrichment facilities. Though a strike against Iran would be far more difficult than the September 6 bombing or even Israel's strike against the Osirak nuclear facility in Iraq in 1981, Israel's bombing may be intended to send a signal to its opponents in the region that it has the will to act, if necessary unilaterally, to stop Iran and others from developing an advanced nuclear weapons program.

In June 2008, U.N. inspectors visited some areas surrounding Al Kibar. In late 2008, the U.N. International Atomic Energy Agency (IAEA) concluded that the facility had similarities to a nuclear reactor and chemically processed uranium particles were found at the site, but that a final determination could be made until Syria provides "the necessary transparency."<sup>18</sup> In a follow-up report in early 2009, the IAEA said that enough uranium particles had turned up in soil samples to constitute a "significant" find. In response, Syria claims that the uranium particles came from depleted uranium used in Israeli munitions. Syria also claims that the site was a conventional military base, but then disclosed in February 2009 that a new missile facility had been constructed at Al Kibar.<sup>19</sup> According to Gregory Schulte, U.S. ambassador to the IAEA, the IAEA's report "contributes to the growing evidence of clandestine nuclear activities in Syria.... We must understand why such (uranium) material -- material not previously declared to the IAEA -- existed in Syria and this can only happen if Syria provides the cooperation requested."<sup>20</sup>

## **Syria welcomes Obama's overtures**

BY ATSUO HIRATA, THE ASAHI SHIMBUN

2009/3/12

DAMASCUS--Syrian President Bashar Assad said Tuesday that U.S. President Barack Obama's government has taken a positive step toward achieving a Middle East breakthrough.

In an exclusive interview with The Asahi Shimbun, Assad said he welcomed Obama's overtures for dialogue with the Muslim world as a sharp break from his predecessor.

Assad said the United States, with its large influence over Israel, has an important role in the region.

"When you have the direct negotiations that should lead to the signing of the (Syria-Israel peace) treaty, this is where you need the arbiter," Assad said in his first interview with a Japanese media organization since Obama took office in January.

Assad also said Obama's announcement that combat duty for U.S. troops in Iraq will end by August 2010 was "essential to have a stable Iraq."

He criticized the George W. Bush administration's attempts to isolate and contain Syria. Assad said fighting by U.S. troops in Iraq and Afghanistan led to confusion in the Middle East because "the previous administration only talked with countries in the region, including Syria, about their interests, regardless of our interests."

Assad said visits to Syria by top U.S. government officials, including Senator John Kerry, the chairman of the Senate Foreign Relations Committee, were encouraging.

"You start the dialogue and then through the dialogue you see if you have to change or the other one has to change. ... We can continue the dialogue in order to maybe someday have common ground," Assad said.

Syria remains on the U.S. list of states sponsoring terrorism, in part because of support provided by Damascus to the radical Islamic groups Hamas and Hezbollah. Syria is also an ally of Iran.

Assad said Syria would try to persuade Hamas and Hezbollah to enter discussions for a comprehensive peace.

He said to achieve peace, one needs "to have relations with every influential party in every conflict if you want to solve it."

As an example of Syria's influence over Hamas, Assad said Damascus urged Hamas to work with Fatah to form a unified Palestinian government that could then enter peace negotiations with Israel.

Assad defended Iran's right to develop nuclear reactors.

"As a signatory to the Nuclear Nonproliferation Treaty, (Iran) has the right to have peaceful reactors," Assad said.

When asked whether Syria might serve as a go-between for the United States and Iran, Assad said, "We won't say no, providing that we have a clear framework and realistic objectives to work through in order to succeed."

Assad criticized as a "ploy" the U.S. accusation that a facility in eastern Syria was a nuclear plant developed with the support of North Korea. The accusation was made after Israel bombed the facility in September 2007.

"Why did (the United States) say they have evidence eight months after the date of the bombing?" Assad asked. He added that if the site had been a nuclear reactor, there would have been "radiation and casualties. We didn't have that."

Asked about Japan's role in the Middle East, Assad said, "Japan has a very vital role in development in Syria. But we would like to see more of a Japanese role in the peace issue."

Assad assumed the Syrian presidency in 2000 following the death of his father, Hafez Assad.  
(IHT/Asahi: March 12,2009)

## 'Iran defector tipped off U.S. on Syrian nuclear ambitions'

By The Associated Press

Last update - 20:21 19/03/2009

A top-ranked Iranian defector told the United States that Iran was financing North Korean moves to make Syria into a nuclear weapons power, leading to the Israeli air strike that allegedly destroyed a secret reactor, a report said Thursday.

The article in the Swiss daily Neue Zuercher Zeitung goes into detail about an Iranian connection and fills in gaps about Israel's September 6, 2007, raid that knocked out Syria's nearly completed al-Kabir reactor in the country's eastern desert.

Ali Reza Asghari, a retired general in Iran's elite Revolutionary Guards and a former deputy defense minister, changed sides in February 2007 and provided considerable information to the West on Iran's own nuclear program, said the article, written by Hans Ruehle, former chief of the planning staff of the German Defense Ministry.

The biggest surprise, however, was his assertion that Iran was financing a secret nuclear project of Syria and North Korea, he said. No one in the American intelligence scene had heard anything of it. And the Israelis who were immediately informed also were completely unaware.

Ruehle, who did not identify the sources of his information, publishes and comments on security and nuclear proliferation in different European newspapers and broadcasts and has held prominent roles in German and NATO institutions.

U.S. intelligence had detected North Korean ship deliveries of construction supplies to Syria that started in 2002, and American satellites spotted the construction as early as 2003, but regarded the work as nothing unusual, in part because the Syrians had banned radio and telephones from the site and handled communications solely by messengers - medieval but effective, Ruehle said.

Intensive investigation followed by U.S. and Israeli intelligence services until Israel sent a 12-man commando unit in two helicopters to the site in August 2007 to take photographs and soil samples, he said.

"The analysis was conclusive that it was a North Korean-type reactor, a gas graphite model," Ruehle said.

Other sources have suggested that the reactor might have been large enough to make about one nuclear weapon's worth of plutonium a year.

Just before the Israeli commando raid, a North Korean ship was intercepted en route to Syria with nuclear fuel rods, underscoring the need for fast action, he said.

On the morning of September 6, 2007, seven Israeli F-15 fighter bombers took off to the north. They flew along the Mediterranean coast, brushed past Turkey and pressed on into Syria. Fifty kilometers (30 miles) from their target they fired 22 rockets at the three identified objects inside the Kibar complex.

"The Syrians were completely surprised. By the time their air defense systems were ready, the Israeli planes were well out of range. The mission was successful, the reactor destroyed," Ruehle said.

"Israel estimates that Iran had paid North Korea between \$1 billion and \$2 billion for the project," Ruehle said.

Israel has refused from the beginning to comment on, confirm or deny the strike, but after a delay of several months Washington presented intelligence purporting to show the target was a reactor being built with North Korean help.

Iranian officials were not available for comment because of a national holiday. In general, Iran has been silent about the Syrian facility bombed by Israel. Syrian officials could not be reached for comment. But Syria has denied the facility was a nuclear plant, saying it was an unused military building. It has also denied any nuclear cooperation with North Korea or Iran.

The International Atomic Energy Agency earlier this year said United Nations inspectors had found processed uranium traces in samples taken from the site.

Syria has suggested the traces came from Israeli ordnance used to hit the site, but the IAEA said the composition of the uranium made that unlikely. Israel has denied it was the source of the uranium.

Syria has told diplomats that it built a missile facility over the ruins of the site.

## **Wie Iran Syriens Nuklearbewaffnung vorangetrieben hat**

Hintergründe der israelischen Aktion gegen den Reaktor von al-Kibar

19. März 2009, Neue Zürcher Zeitung

Von Hans Rühle\*

**Lange waren die Hintergründe des israelischen Luftangriffs auf den im Bau befindlichen Reaktor von al-Kibar in Syrien im September 2007 unklar. Seit dem Überlaufen eines prominenten iranischen Militärs ist gewiss, dass Teheran im Verbund mit Nordkorea hinter den Bestrebungen Syriens gesteckt hat, in den Besitz von Atomwaffen zu gelangen.**

Im Februar 2007 gelang der CIA ein spektakulärer Coup. Der Sicherheitsberater des iranischen Ex-Präsidenten Khatami und langjährige stellvertretende Verteidigungsminister General Ali Reza Askari wechselte die Seiten und stellte sich der CIA zur Verfügung. Die Befragung Askaris brachte eine Fülle neuer Informationen – auch und besonders über das iranische Nuklearprogramm. Die grösste Überraschung allerdings war seine Aussage, Iran finanziere ein geheimes Nuklearprojekt von Syrien und Nordkorea. Niemand in der amerikanischen Geheimdienst-Szene hatte davon je gehört. Und auch die umgehend informierten Israeli waren ahnungslos. Letzteres war umso peinlicher, als Israels Regierung immer behauptet hatte, es gebe in Syrien nichts, was sie nicht wisse. Und nun dies – ein fast betriebsbereiter, von Nordkorea erbauter Gas-Grafit-Reaktor, der nur der Produktion von Plutonium zur Herstellung von Waffen dienen konnte.

### **Auch Russland hat die Finger drin**

Sowohl die USA als auch die Israeli waren davon ausgegangen, dass Syrien keinerlei Interesse an Nuklearwaffen habe. Zwar hatte Syrien Anfang der neunziger Jahre von China einen kleinen Forschungsreaktor erworben, doch der Versuch, einen leistungsfähigeren Forschungsreaktor zu beschaffen, scheiterte. Der Druck aus den USA auf die potenziellen Ausrüster – China, Russland und Argentinien – und die enormen Kosten zwangen die Syrer zur Aufgabe ihrer Pläne. Stattdessen konzentrierte sich die Führung unter Präsident Asad darauf, ihr Potenzial an chemischen Kampfstoffen auszubauen.

Angeleitet von General Anatoli Kunzewitsch, dem Berater des früheren Präsidenten Jelzin für chemische Waffen, gelang es Syrien Ende der neunziger Jahre, sein umfangreiches Potenzial an Sarin durch die Produktion von VX-Gas zu einer auch für Israel gefährlichen Option auszubauen. Ein Versuch des damaligen israelischen Regierungschefs Barak, Präsident Putin zum Stopp der Aktivitäten des russischen Ex-Generals zu bewegen, scheiterte. Erst als Kunzewitsch 2002 bei einem bis heute ungeklärten Flugzeugabsturz ums Leben kam, endete diese Episode russisch-syrischer Kooperation. In die entstandene Lücke sprang umgehend Iran, das fortan das chemische Waffenprogramm einschliesslich der Trägermittel betreute. Nicht zuletzt ging es darum, das syrische Potenzial von rund 100 alten sowjetischen Raketen (SS-21, Scud-B, -C, -D) zu modernisieren.

Der Aufbau einer für Israel existenziell bedrohlichen chemischen Option durch Syrien beherrschte die israelischen Bedrohungsanalysen im Bereich der Massenvernichtungswaffen in vollem Umfang. An anderes wurde nicht gedacht – weil es jenseits der Vorstellungen über Syriens Pläne zur Ausrüstung mit Massenvernichtungswaffen lag. Die Amerikaner wiederum verliessen sich bezüglich Syriens ohne Einschränkung auf die israelischen Erkenntnisse.

## **Keine gute Figur der Geheimdienste**

Die Fixierung auf die Bedrohung durch chemische Waffen bestimmte auch die Aktivitäten des Mossad, der auf vielfältige Weise das syrische Programm zu behindern versuchte. Nach jüngst verfügbar gewordenen israelischen Quellen hatte aber schon im Sommer 2000 für Syrien eine neue Zeit begonnen. Bachar Asad, der im Gegensatz zu seinem Vater den Iranern ohne Vorbehalte gegenüberstand, liess sich mit Iran und Nordkorea auf eine Dreierbeziehung zum Zwecke der Ausrüstung Syriens mit Nuklearwaffen ein. Bereits unmittelbar nach dem Tod des alten Asad im Juni 2000 kam es zu einem ersten Treffen zwischen Syrien und einer nordkoreanischen Delegation, die zum Begräbnis angereist war. Man kam gleich zur Sache und diskutierte über die Möglichkeit, Syrien durch den Aufbau eines von Nordkorea gelieferten Reaktors zur Nuklearmacht aufzurüsten. Weitere Details wurden anlässlich einer Konferenz in Damaskus im Juli 2002 geregelt. Der «Deal», wie er sich schliesslich ergab, sah vor, dass Iran das Geld, Syrien das Territorium und Nordkorea die nukleare Hardware zur Verfügung stellen sollte.

Noch im Jahr 2002 erreichten die ersten Lieferungen aus Nordkorea syrische Häfen – spezielles Baumaterial, aber auch einschlägige Wissenschaftler und Techniker. Ein reger Schiffsverkehr zwischen Nordkorea und Syrien entstand. Zwar registrierten die USA und Israel diese Entwicklung, doch sahen sie keinen Anlass zur Sorge. Dabei hätte spätestens im Herbst 2006 klar sein müssen, dass Ungewöhnliches im Gange war. Damals wurde ein unter panamaischer Flagge fahrendes Schiff, das in Nordkorea beladen worden war, auf seiner Route nach Syrien durch zyprische Behörden gestoppt und durchsucht. Die Frachtpapiere lauteten auf «meteorologisches Gerät», tatsächlich waren unter anderem 18 mobile militärische Radarsysteme an Bord. Auch wenn diese Radarsysteme im Prinzip unbedenklich waren, hätte der Täuschungsversuch als solcher Anlass zu intensiveren Nachforschungen sein müssen.

## **Ein «stummes» Projekt**

Diese Sorglosigkeit war nur möglich, weil auch die Satellitenaufklärung der USA keinerlei Warnsignale sendete. Zwar registrierte man schon seit 2003 Bautätigkeiten im Gebiet Dir az-Zur im Osten Syriens, doch es schien nichts Aufregendes zu sein. Dies umso weniger, als es bei der Baustelle keinen Funk- oder Telefonverkehr gab. Das Projekt war stumm. Der Grund hierfür lag in der Anordnung der syrischen Regierung, keinerlei technische Mittel zu verwenden, deren Ortung den Zweck des Projekts hätte enthüllen können. Mit anderen Worten: Das Projekt «Reaktor al-Kibar» wurde ausschliesslich über Boten geleitet – mittelalterlich, aber wirksam.

So war es denn kein Wunder, dass Amerikaner und Israeli durch die Enthüllungen von General Askari vom Februar 2007 überrascht wurden. Doch in die Überraschung mischten sich sehr schnell die Zweifel der Geheimdienste, die diesen beruflichen Super-GAU nicht wahrhaben wollten. Es begann eine streng geheime Aktion der Geheimdienste beider Länder, um der Sache auf den Grund zu gehen. Da man wusste, wonach man suchen musste, ergaben sich schnell neue Erkenntnisse, die Askaris Aussage zu belegen schienen. Doch letzte Gewissheit wollte sich nicht einstellen. Da entschloss sich die israelische Führung zu einer riskanten Operation. Mitte August flogen 12 Mann einer Kommando-Einheit in zwei Helikoptern zum Reaktorgelände al-Kibar, nahmen Bodenproben und fotografierten die Anlage. Die Auswertung ergab eindeutig, dass es sich um einen Reaktor nordkoreanischer Bauart handelte.

Da kurz zuvor ein nordkoreanisches Schiff mit nuklearen Brennelementen auf dem Weg nach Syrien überprüft worden war, schien Eile geboten. Am Morgen des 6. September 2007 starteten sieben israelische F-15-Jagdbomber nach Norden. Sie flogen entlang der Mittelmeerküste, streiften die Türkei und drangen nach Syrien ein. 50 Kilometer vor dem Ziel feuerten sie 22 Raketen auf die drei identifizierten Objekte innerhalb des Kibar-Komplexes ab. Die Syrer waren völlig überrascht. Als ihre Luftabwehrsysteme einsatzbereit waren, befanden sich die israelischen Flugzeuge längst ausserhalb ihrer Reichweite. Die Mission war erfolgreich, der Reaktor zerstört.

### **Samthandschuhe gegenüber Nordkorea**

Es dauerte nur wenige Stunden, dann wurde bekannt, Israel sei in den syrischen Luftraum eingedrungen und habe «etwas abgeworfen». Da der syrische Präsident darüber hinaus nur äusserte, nirgendwo sei nennenswerter Schaden entstanden und die syrische Luftabwehr habe die israelischen Jagdbomber zur Flucht gezwungen, blieb die israelische Aktion rätselhaft. Weder die Israeli noch Vertreter ihrer Schutzmacht USA liessen sich zunächst irgendeine Stellungnahme entlocken. Das entsprach einer Vereinbarung, die die beiden Staaten im Vorfeld der Aktion geschlossen hatten. Als Präsident Bush am 20. September anlässlich einer Pressekonferenz mehrmals gefragt wurde, was es mit dieser Aktion der israelischen Luftwaffe auf sich habe, antwortete er immer wieder stereotyp: «Kein Kommentar.»

Bush war offensichtlich daran gelegen, die laufenden Sechs-Parteien-Gespräche über das nordkoreanische Nuklearprogramm nicht zu gefährden, musste er doch befürchten, dass mit der nachgewiesenen Proliferation durch Nordkorea ein Problem zum Verhandlungsgegenstand werden würde, das mit dem Geist der Sechs-Parteien-Gespräche unvereinbar war. Israel spielte das amerikanische Spiel mit, obwohl es eine Reaktion bevorzugt hätte – ein Signal nach Teheran, dass Israel fähig und willens war, keine weitere Nuklearmacht in der Region zuzulassen.

Doch der Versuch, die öffentliche Meinung über den israelischen Angriff zu steuern, scheiterte. Am 23. Oktober wurden erste Artikel in der amerikanischen Presse publiziert. Obwohl die Indizien eindeutiger geworden waren, hielten die Regierungen in Washington und Tel Aviv an ihrer restriktiven Öffentlichkeitsarbeit fest. Doch es bröckelte an allen Ecken und Enden. Am 24. April 2008 schliesslich trat die amerikanische Regierung die Flucht nach vorne an. Ohne Absprache mit Israels Regierung bestätigten amerikanische Geheimdienstmitarbeiter, dass es sich bei dem von Israel zerstörten Objekt um einen Gas-Grafit-Reaktor nordkoreanischer Bauart gehandelt habe, der im September 2007 betriebsbereit gewesen wäre. Nur Stunden danach waren alle Informationen öffentlich.

Die USA hatten bereits gegen Ende 2007 die Vorgänge in al-Kibar vorsichtig-zurückhaltend in die Sechs-Parteien-Gespräche eingeführt. Doch zunächst zeigten die Nordkoreaner keinerlei Bereitschaft, sich auf dieses Thema einzulassen. Dies wiederum veranlasste Präsident Bush Anfang Dezember 2007, in einem Brief an den nordkoreanischen Machthaber Kim Jong Il Aufklärung zu verlangen. Doch die Antwort blieb aus – bis heute. An der Haltung der nordkoreanischen Führung hat sich freilich nichts geändert. Sie lässt sich auf den einfachen Nenner bringen: Geld – möglichst schnell und möglichst viel. Nach israelischen Schätzungen hat Iran das syrische Nuklearprogramm mit Zahlungen von ein bis zwei Milliarden Dollar an Nordkorea finanziert.

Ob es in naher Zukunft zusätzliche Nachfrager für nukleare Hardware aus Nordkorea geben wird, ist eine offene Frage. Der Abschreckungseffekt der israelischen Aktion vom September 2007 wird vermutlich nicht von Dauer sein. Im Übrigen sollte man sich daran erinnern, dass weltweit kein

Experte den geheimen Aufbau eines Plutonium-Brüters durch Nordkorea in Syrien für möglich gehalten hätte. Vergessen sollte man in diesem Zusammenhang auch nicht die Chuzpe der Nordkoreaner, auf der einen Seite Verhandlungen über eine nukleare Abrüstung zu führen und gleichzeitig Syrien zur Nuklearmacht hochzurüsten. Die Geschichte der Proliferation von nuklearer Waffentechnik ist jedenfalls um ein makabres Kapitel angereichert worden.

### **Iran wird sich kaum abschrecken lassen**

Dass die israelische Aktion irgendeine Wirkung auf Iran gehabt hat, ist fraglich. Allenfalls dergestalt, dass Iran seine Luftverteidigungssysteme russischen Ursprungs beschleunigt ausbaut. Dennoch gibt es einen bemerkenswerten Zusammenhang zwischen dem israelischen Angriff auf al-Kibar und der möglichen Option eines Militärschlages gegen das iranische Nuklearprogramm. Alle Experten, die sich mit diesem Szenario befassen, sind sich in einem Punkt einig: Der Angriff würde einen Aufschrei des Entsetzens und massive Proteste im gesamten arabischen Lager auslösen, verbunden mit Racheakten der iranischen Revolutionsgarden und gesteigerten Aktivitäten des islamistischen Terrors.

So plausibel diese Annahme auch sein mag, das Beispiel Syrien mahnt dennoch zur Zurückhaltung: Die Zerstörung des syrischen Nuklearprogramms durch die israelische Luftwaffe ist von der arabischen Welt weitgehend kommentarlos hingenommen worden. Natürlich ist Syrien nicht Iran. Wer aber in der arabischen Welt will wirklich ein nuklear gerüstetes Iran?

## **US: Iran didn't fund Syrian reactor**

Published: 03.19.09, 23:31 / Israel News

A US Counterproliferation official denied a report saying Iran had funded a Syrian reactor that was bombed by Israel in 2007.

"There is strong reason to believe that only two countries were involved in building the Syrian covert nuclear reactor at Al Kibar - Syria and North Korea," said the official, who spoke on condition of anonymity. (AP)

## **Ripping Off Ronen Bergman**

posted Tuesday **March 24, 2009** under iran, Syria by jeffrey

The blog-o-sphere is all worked up over an op-ed (in German) by Hans Rühle claiming that Iran funded Syria's Al Kibar reactor.

Central to Rühle's stardom is the credence lent to his claims by his former position — he is the “former chief of the planning staff of the German Defense Ministry.” (He is the father of Michael Rühle, a senior NATO official.)

The truth is a little uglier.

First, Rühle left the German Ministry of Defense in 1988. Whatever “inside” information Rühle had dates back more than two decades. His information about Al Kibar, therefore, is second hand. Second, by “second hand,” I mean plagiarized.

Most of Rühle's article comes straight from Ronen Bergman's book *The Secret War with Iran*, mainly the chapter “Ghost Raid.”

Let's take a look.

Here is how Rühle describes the raid against the Al Kibar reactor:

Am Morgen des 6. September 2007 starteten sieben israelische F-15-Jagdbomber nach Norden. Sie flogen entlang der Mittelmeerküste, streiften die Türkei und drangen nach Syrien ein. 50 Kilometer vor dem Ziel feuerten sie 22 Raketen auf die drei identifizierten Objekte innerhalb des Kibar-Komplexes ab. Die Syrer waren völlig überrascht. Als ihre Luftabwehrsysteme einsatzbereit waren, befanden sich die israelischen Flugzeuge längst ausserhalb ihrer Reichweite. Die Mission war erfolgreich, der Reaktor zerstört.

That translates roughly as “On the morning of September 6, 2007 seven Israeli F-15 fighter-bombers started toward the north. They flew along the Mediterranean coast, touched on Turkey and then penetrated Syria. 50 kilometers from the finish, 22 rockets were fired on the three identified objects within the Al Kibar complex. The Syrians were quite surprised. By the time their air defense systems were ready for use, the Israeli aircraft were long beyond their reach. The mission was successful, the reactor was destroyed.”

This is almost word-for-word from Bergman's book:

At 3 a.m. on the morning of Thursday, September 6, seven Israeli air force F-15s took off and headed north over the Mediterranean. ... They flew very low along the Mediterranean coast and then over Turkey, before entering Syrian airspace. At a range of 50 kilometers, they launched twenty-two missiles at the three sites within the nuclear complex.

The Syrians were taken completely by surprise. Their air defense systems only detected the firing of the missiles, leaving no time for the sites to be evacuated.

A few anti-aircraft missiles were dispatched, but only after the planes were long gone. American and Israeli satellites hovering above Syria confirmed that the targets had been destroyed.

There are lots of other examples, like Rühle's description of Ali-Reza Asgari's defection and revelation about the Syrian project mirror's Bergman's, down to certain phrases: "Iran finanziert ein geheimes Nuklearprojekt von Syrien und Nordkorea" (translate) compared with: "Iran was financing a joint nuclear venture launched by North Korea and Syria."

Ruehle also lifted Bergman's description of the commando raid:

Mitte August flogen 12 Mann einer Kommando-Einheit in zwei Helikoptern zum Reaktorgelände al-Kibar, nahmen Bodenproben und fotografierten die Anlage. Die Auswertung ergab eindeutig, dass es sich um einen Reaktor nordkoreanischer Bauart handelte.

Compare that with

As a result, on a cloudy night in mid-August, twelve men from Israel's Sayeret Matkal commando unit were flown into Syria in two helicopters. They did not penetrate the site itself, but took soil samples from beyond the vast concrete apron surrounding it. ... The results provided clear-cut proof of the joint nuclear project.

There are just too many similarities to ignore.

Rühle's apparent plagiarism creates a false "confirmation" of Bergman's account — here is how the Associated Press described the report:

Ruehle, who did not identify the sources of his information, regularly publishes and comments on security and nuclear proliferation in different European newspapers and broadcasts, and he has held prominent roles in German and NATO institutions.

One is naturally encouraged to conclude the Rühle's account is the official Geheimdienst version, filtered through a favorite source.

In the interest of full disclosure, I didn't discover the plagiarism — Bergman is (rightfully) complaining about it to friends and colleagues. Moreover, I can't read German — Josh Pollack, and Google Translate, helped out there.

## **Comment**

*[EXCERPT]*

Dear Jeffrey,

Although I once vowed never to engage in blogging, the allegations made about my father's handling of the sources for his article on the destruction of the Syrian reactor prompt me to respond.

First, some info for doubting Omar: My father, Hans Ruehle, does indeed exist (otherwise, I wouldn't), and he headed the German MoD's Planning Staff from 1982-1988. Volker Ruehe is indeed a former German Defense Minister, and, to make matters even more confusing, Lothar Ruehl used to be Under Secretary of Defense at around the same period in the 1980s.

On my father's article: One point I would like to clarify here is something that seemed to have been "lost in translation". The news story by AP, which serves as the source for most commentators, contains the wording "Ruehle did not identify the sources of his information". However, the German original article reads "... according to Israeli sources that have recently become available ...". This is a small yet significant difference. And the journalists who called my father, from Haaretz to the Wall Street Journal, were told about Bergman's book.

Still, the question remains why my father did not explicitly mention Ronen Bergman's book in his article. My father was fascinated by the chapter "Death Raid" in Bergman's book. He considered the information about the debriefing by General Askari to be among the best-kept secrets of Western intelligence services, including the Mossad. Bergman's publication of this sensitive material raised the question why the Mossad, which must have reviewed and cleared the book before publication, allowed for this chapter to be published. My father, who has a pretty solid experience of handling intelligence matters, drew the conclusion that the Mossad wanted this story to be published. In order to avoid a debate about this point, and after discussions with friends and colleagues, my father finally decided to anonymise the sources – even at the risk of causing misunderstandings.

Since I type my father's handwritten manuscripts, I get to study them quite carefully. In this particular case, the first thought that crossed my mind was not whether Ronen Bergman needed to be explicitly credited (arguably, the reference to "Israeli sources" seemed enough). Rather, I wondered why this story had not received more publicity in the first place. After all, Bergman's book has been out for quite a while. And when John Bolton confirmed some of the information just two days later in the WSJ, in an article that was prompted by the news reports about my father's piece, I realised that my father had struck a chord that Bergman's book, though excellent, didn't.

*[Sourcebook comment: John Bolton's Wall Street Journal op-ed of 2009-03-21 is included in Appendix A of this sourcebook.]*

Michael Ruehle

Micheal,

thanks very much for the clarification. Does this mean that Bergman's book is the only source your father based his article on? Or does he have any corroborating information?

— Tom · Mar 25, 11:59 PM ·

#

We should thank Michael Rühle for his explanations and ACW for being, once again, THE place for debating nonpro/arms control issues.

Michael's post is interesting in the sense that it reveals what many of us know: that in a world where so much information is published, it is easy to miss an important source. Many people had not read the Bergman book. I, for one had read it, but it took me a while to make the connection with Rühle's father's article. The silver lining in this whole story is that it may bring people to revisit the hypothesis of an Iranian involvement in the project. The question is: why is there so much discrepancy between (1) what Bergman's sources told him and (2) what the US intelligence community say ("we're pretty sure that only the DPRK and Syria were involved").

— scud · Mar 26, 01:26 AM ·

#

Re: Michael Rühle

I never doubted the existence of Mr. Rühle who published the article. What felt strange was that there was one Hans Rühle who popped out of nowhere to write an quite detailed article with supposedly insider information on the topic. Adding to this was his connection the the German MoD, which, after this clarification, has nothing to do with the whole story or his article.

Still, Bergman's book and the Ghost Raid part very much depends on unverifiable sources, and there are several very strange episodes in the book.

My favorite is the supposed mid-1990s Hezb operation in South America, which was prevented by American SFs coming and leaving in C5 Galaxy transporters out of nowhere. (And without any public trace.)

— Omar · Mar 26, 04:26 PM ·

#

> The silver lining in this whole story is that it may bring people to revisit the hypothesis of an Iranian involvement in the project.

I very much agree, as long as we keep it firmly in mind that we're talking about a hypothesis, not an assertion. Although I have doubts about some details of the description of the raid Bergman gives, the really big question he raises is that of Iranian involvement in the alleged/presumed SY/NK plutonium production project.

I'm thoroughly agnostic on this hypothesis at the moment. There's no really good evidence (IMO) for it, but the involvement of an inconvenient third party might — just might — explain some of the very peculiar post-strike behaviors of Israel, Syria and the US that have been much noted.

Iran is certainly the leading candidate for a third party, but one can think of other possibilities. Pakistan is probably second in line, and there are others.

— Allen Thomson · Mar 26, 05:05 PM ·

#

Ronen Bergman's book was my father's only source regarding Iran's involvement in the Syrian-North Korean reactor project. By contrast, regarding the importance of Askari's debriefing on al-Kibar, there exists a pretty strong hint from US intelligence sources. The protocol of the "Background briefing with Senior U.S. Officials on Syria's Covert Nuclear Reactor and North Korea's involvement" of 24 April 2008 says: "In the spring of last year, we were able to obtain some additional information that made it conclusive". This reference to spring 2007 seems a thinly veiled reference to Askari's debriefing. ([http://www.dni.gov/interviews/20080424\\_interview.pdf](http://www.dni.gov/interviews/20080424_interview.pdf))

Although my father used Bergman's book as a source for his article, Iran's involvement in al-Kibar has now been confirmed by John Bolton in his Wall Street Journal piece of 21 March. Reading the article, my father and I both came away with the impression that Bolton is relieved that this specific aspect of the Syrian adventure has now become widely known. Bolton seems to have known about Askari's debriefing, yet he was not allowed to talk about it. Despite Bergman's uncovering of a crucial part of Askari's debriefing, U.S. intelligence services and those of key allies seem bent on keeping the whole briefing secret. The reasons for this appear obvious: Askari must have said many more things that touch upon a host of Middle Eastern issues. Hence, intelligence services have no choice but to continue denying everything related to Askari.

Omar rightly points out that Bergman's book is based on "unverifiable sources". In a Haaretz interview in September 2007, Bergman said that "99,9 per cent" of his book consisted of "non-declassified material". Needless to say, this raises the question as to who is the "author" of what? This dilemma was part of my father's reasoning for not mentioning Bergman's name and referring to "Israeli sources" instead. At the same time, even though my father had some doubts about the accuracy of some parts of Bergman's account, it was clear that the story of al-Kibar could only be told exactly as Bergman had told it – including the details about the commando raid in August and the attack in September. There was simply no point (nor space) in nitpicking.

As for my father's doubts about Bergman's account, there are two in particular. For one, Bergman creates the impression that the commando raid in August was necessary in order to get conclusive evidence about the true nature of al-Kibar. By contrast, the US briefing mentioned above indicates that the information gathered in spring 2007 "included photographs of the interior and the exterior of the building ... showing key features of the reactor". Moreover, these photographs appear to have been taken "handheld", i.e. by people who were on the reactor site. Does one really need even more confirmation?

There are also certain doubts about Bergman's account of the attack on al-Kibar. Bergman creates the impression that the missiles that were released 50 kilometres off al-Kibar were self-guided and hit the target bullseye. However, the much more detailed account of the Sunday Times of 16 September 2007 reports that these missiles were guided to their target by ground-based laser-designators, i.e. by people who were close to the target.

These details appear small, yet their implications are significant. If Israel were to attack Iranian nuclear installations, it would require certain key people to be on-site in Iran. A formidable challenge.

— Michael Ruehle · Mar 27, 02:28 PM ·

#

Correction: The Bergman interview which I am alluding to is from 2008, not 2007

(<http://www.haaretz.com/hasen/spages/1019866.html>).

## **The Outsider**

The Johns Hopkins Magazine

APRIL 2009 | VOL 61 NO 2

[Accessed 2009-03-30]

Eliot Cohen went inside the State Department after having publicly criticized the Bush administration for its handling of the Iraq war. Back at work in academia now, he shares his insights.

Interview by Jeffrey Anderson

Photos of Winston Churchill and Abraham Lincoln hang on the wall of Eliot A. Cohen's office at the Nitze School of Advanced International Studies in Washington, D.C. A coffee table holds a dish filled with dozens of coins bearing insignia from U.S. and foreign military units Cohen has visited.

What more appropriate furnishings for one of the world's most prominent scholars of military affairs, a proponent of civilian influence on military strategy and tactics, and counselor of the Department of State under former Secretary of State Condoleezza Rice from April 2007 to January 2009?

[deletia]

Cohen led State's response on the North Korean nuclear reactor incident in Syria, and counseled Rice on Iraq and Afghanistan, and on the Russian invasion of Georgia.

[deletia]

### **What was your role in the North Korean nuclear reactor case?**

I was part of a process designed to give the principals — secretary of state, secretary of defense, vice president, national security adviser, and ultimately the president — real options. It's a mistake to think that your job is to come up with your own preferred policy and sell it to your boss. I often felt that my job was to make it clear to my boss what the choices were, and to offer my best judgment about the plusses and minuses. In this case the options were: Do you let the Israelis deal with this? Do you try to think about dealing with it militarily? Or do you try some diplomatic option? As [British general] James Wolfe once said about war, it's an option of difficulties.

### **How would you characterize the outcome?**

There were upsides and downsides. Once the Israelis took out the reactor, they did not want to go public right away for fear of igniting a larger war. They thought it would put pressure on the Syrians to retaliate. My feeling is, it would've given us an opportunity to put pressure on both Syria and North Korea.

## IAEA split over new chief, Iran, Syria

April 3, 2009 – 2:31am

By GEORGE JAHN

Associated Press Writer

VIENNA (AP) - An ideological split at International Atomic Energy Agency is slowing the search for a new chief at a time the organization tasked with keeping nuclear arms away from rogue states needs a firm hand at the rudder.

The longer the delay, the greater the fear that Iran, and possibly Syria, could forge ahead with allegedly illicit nuclear activities with more impunity.

For months, the IAEA's hands have been tied in its probes of the two nations' nuclear programs as internal bickering and the agency's weak mandate prevent it from taking effective action. The hunt is on for a leader who can help unite the fractious 35-nation board for joint decisions on crucial nonproliferation issues.

But the same North-South divisions that have hobbled the IAEA's investigation of Iran and Syria are encumbering the search for a successor to Mohamed ElBaradei, who steps down as director general in November. The developed world believes tough action is needed to block rogue nations from acquiring nuclear weapons; emerging economies argue that countries like Iran and Syria have a right to develop nuclear programs to help them catch up with the West.

That debate has clouded the process of picking a new leader: Six rounds over two days last week left the ballot split between Japan's Yukiya Amano, a low-key administrator favored by the U.S. and other rich nations, and Abdul Samad Minty, a South African backed by developing countries.

The agency on Monday formally relaunched the leadership race, throwing it open to a new round of nominations from the 35 IAEA board member nations. But any new balloting is at least weeks away, with no guarantee of ending the impasse \_ and ElBaradei will increasingly be viewed as a lame-duck leader as he nears the end of his term.

The impression of a rudderless IAEA could further embolden both Iran and Syria.

Most experts agree that Iran recently amassed enough enriched uranium to build a bomb. That adds urgency to efforts to persuade Tehran to give up enrichment. U.S. President Barack Obama is reaching out to Iran and Syria in an effort to break the nuclear impasse: it's a crucial time calling for strong IAEA leadership to support American diplomatic efforts with Tehran and Damascus.

Even before IAEA leadership became an issue, probes of both countries ground to a standstill. With no enforcing powers, the agency was left to ask for cooperation \_ refused in both cases.

Iran last year declared an investigation of allegations that it tried to make nuclear weapons closed and continues to expand its enrichment activities despite U.N. Security Council sanctions. Syria repeatedly turns down requests for onsite IAEA visits to locations suspected of sheltering undeclared atomic activities \_ including an alleged plutonium producing reactor under construction until it was bombed by Israeli warplanes.

Israeli officials have repeatedly suggested Tehran's nuclear facilities could also be hit if the international community fails to persuade it to stop its nuclear activities.

A weak IAEA could increase support for the strike option, providing grist for hawks in Benjamin Netanyahu's new hard-line government.

"Israel, in bombing the Syrian reactor proved ... that it would never tolerate a nuclear weapon in the hands of a country that calls for Israel's destruction," said Israeli analyst Ronen Bergman, author of "The Secret War with Iran."

The agency is not without clout. Its board referred Iran to the Security Council three years ago for breaching the Nonproliferation Treaty, in a vote supported by more than two-thirds of its members.

But such near unity has been rare since.

Once elected to limited board terms, nonaligned nations led by Cuba, Venezuela and others at odds with the U.S and its allies argue that Iran has a right to uranium enrichment to generate nuclear fuel. They dismiss arguments that Tehran could quickly retool its program to create the fissile core of warheads, depicting them as a cover for attempts to keep nuclear technology in the hands of the rich countries.

Like any country, Iran has a right to enrichment for peaceful nuclear purposes \_ and it insists that is all it wants to do. Besides developing countries it often gets tacit support from Russia and China \_ both permanent Security Council members who nonetheless court Iran and Syria for strategic and economic reasons.

Such fissures not only call into question whether a consensus candidate can be found once ElBaradei steps down in November. They also raise the issue of whether anyone at the IAEA helm can exert meaningful new agency leverage on Tehran and Damascus.

At the minimum, the IAEA can be the impartial "eyes and ears" overseeing any agreement reached between the U.S. and Tehran and Damascus. In the case of Tehran for instance, its inspectors could verify that the Islamic Republic is honoring any agreement not to expand its uranium enrichment activities.

More ideally, some argue, the board could empower the agency by giving it more authority, agreeing to a special inspection in the case of Syria that Damascus would find politically difficult to refuse. But such moves are unlikely, as long as the North-South split persists.

For now, "the agency can ask questions and declare that questions have not been answered and (try to) send inspectors," said Graham Allison, director of Harvard's Belfer Center for Science and International Affairs and assistant secretary of defense under President Bill Clinton. "But if a country wants to stiff the agency, it can."

David Albright, whose Washington-based Institute for Science and International Security tracks suspected secret proliferators, suggested the agency could do nothing more on swaying Iran.

"The IAEA doesn't have a place at the table any more," he said. "It's up to the U.S. now to strengthen its role on Iran."

Still, he said an exceptional candidate with charisma and vision could support Washington in its outreach.

"You'd look to a candidate just like we look to Obama in the United States to get beyond the zero sum game."

<http://totalwonkerr.com/2001/hibbs-on-syria-u-traces>

## Hibbs on Syria U Traces

by Joshua Pollack

Apr 18 [2009]

[EXCERPT]

So it turns out that we're just living in James Acton's shadow over here.

Mark Hibbs has details on the uranium oxide traces that the IAEA found in Syria. It's [\*] in the the April 6 [2009] issue of NuclearFuel [<http://www.platts.com/Nuclear/Newsletters%20%20Reports/Nuclear%20Fuel/>].

First, it appears that James's view [<http://www.armscontrolwonk.com/2106/new-evidence-of-nork-syria-link/>] of the 80+ particles of anthropogenic U found in Syria is shared within the IAEA:

Early this year, a senior UN safeguards official said the IAEA believed that the particles appeared to be NATU that had oxidized (NF, 23 Feb., 5). According to the official, the finding was consistent with the hypothesis the uranium was metallic fuel material for a DPRK-type production reactor.

Second, Hibbs goes on to relate that there's not a great deal of research on the behavior of U particles under various conditions, but it's generally accepted that if they are divided finely enough, they'll oxidize all the way through.

Reading between the lines, it seems that the number of particles found in the swipe samples — now described by Hibbs as numbering close to 100 — is simply too many to be accounted for by cross-contamination. So much for my pet theory. As long as we're not talking about something off-the-wall, like HWR fuel — this was said to be a Magnox reactor, remember? — then in the absence of additional information, it's only reasonable to believe that there was a lot of uranium metal onsite, which was blasted into itty-bitty bits. (That's a technical term.)

Hibbs also offers a great deal of insight into the state of attribution technology for particles of this type. The U.S. has traces of U from North Korea; is it sharing the "fingerprints" with the IAEA for purposes of comparison? We don't know. But that Acton fellow has written [<http://www.armscontrolwonk.com/2163/yes-more-on-nork-heu/>] about the North Korea traces.

Lastly, it seems that the Syrian government has refused requests to return to the scene of the swipes to take more samples. Once stung, twice shy. This once again raises the question of when the IAEA will be willing to use its power of special inspections. Any day now, folks!

[deletia]

[\*] Syrian Uranium Particles Put IAEA on Frontier of Forensic Knowledge

## Where Did The U Metal Come From?

by Joshua Pollack

Apr 24 [2009]

A short while ago, we all learned some new stuff from Mark Hibbs about the uranium oxide particles found in Syria. Long story short, the IAEA has reason to believe they were uranium metal “converted” into oxide by... some event that divided the uranium into fine particles, causing it to scatter and oxidize.

Now let’s go further and assume that this uranium was, prior to its untimely fine division, fuel for a Yongbyon-type Magnox reactor. This raises an obvious question: Where did it come from?

Well, I think we can rule out Lancashire. Instinctively, most of us would say, it came from the Yongbyon fuel fabrication complex in North Korea. It might also have come from a duplicate facility in Syria, although this assumes that quite a lot of stuff could have been built, supplied, and operated undetected.

### Ask Dr. Science

The natural place to start is with SIGINT. In February 2008, according to Dr. Siegfried “Sig” Hecker, North Korea had under a quarter of a load of fuel rods — apparently for the infamous 5 MWe reactor that has produced all or essentially all of North Korea’s plutonium — and a full load of uncladded fuel rods for the unfinished 50 MWe reactor.

Is that everything that was supposed to be there? As it turns out, Hibbs has already looked into this question. He asked Hecker and wrote up his answer in the Dec. 18, 2008 issue of Nucleonics Week.

None of the safeguarded fresh uranium fuel produced by North Korea at its Yongbyon nuclear research center for two of its own reactors was diverted to an alleged clandestine reactor project in Syria, a US expert said December 15.

Siegfried Hecker, a director emeritus of the Los Alamos National Laboratory, said in an interview that the fuel, which had been declared to the IAEA, was still at the center when he visited it in February.

OK. So what about the period after the collapse of the Agreed Framework and before the return of inspectors? Is it possible that the complex was put back into operation, making more fuel?

Let’s go back to Hecker’s Feb. 2008 trip report:

The front end of fuel fabrication (Building 1) had been operating making uranium dioxide (UO<sub>2</sub>) from uranium ore concentrate right up to the time the facility was shut down on July 15, 2007. The back end was operational with seven conversion furnaces, two casting furnaces, and eight machining lathes. However, the middle part, the fluorination facility, had deteriorated so badly during the freeze (1994 to 2003) that the building has been abandoned (as we were shown in August 2007). However, the DPRK had recently completed alternate fluorination equipment (using dry rather than wet

techniques) in one of the ancillary buildings. However, this was a makeshift operation that has limited throughput potential. It was not put into full operation by the time of the shutdown on July 15.

It sounds as if A) the complex had only limited capacity during the dark period between 2002 and 2007, but B) the North Koreans were operating some (perhaps all) of the parts that worked, and C) they made efforts to reconstitute what wasn't working (fluourination) on an ad hoc basis. This element was not "put into full operation," but that doesn't mean that it produced nothing, either.

How much fresh fuel could these arrangements have created? Enough for the "test assembly" that one of Hibbs's sources suggests Syria might have had at the reactor? It's not really clear, but seems possible. Either way, it raises the question of where the Syrians expected to get a full load of fresh fuel in 2007, when Yongbyon was once again under safeguards. And no, I'm not even going to start speculating about reprocessing facilities.

### **Anybody Around Here Read Korean?**

One way to know what happened at Yongbyon during the dark years would be to scrutinize the operating records of the fuel fabrication complex. There are forensic tests to establish the genuineness of such documents. But according to (you guessed it!) Mark Hibbs in the Jan. 12, 2009 issue of NuclearFuel, these records were not among those provided by North Korea to the United States.

All together now: Hmmm.

So, it's an open question. Any enterprising journalists out there want to take a stab at this one?

Just for fun: Hibbs quotes a "senior UN official" in the Feb. 23, 2007 [*sic; probably 2009*] issue of NuclearFuel as saying that the particles "looked like UO<sub>2</sub>," not other oxides. Also, a "Western safeguards official" said that — along with uranium oxide and graphite — there was lots of aluminum and magnesium in the IAEA samples from al-Kibar. That's what Magnox fuel cladding is made of. But it might have come from the soil, too, right?

One thing is clear, at least: the Syrians won't be letting the IAEA back in anytime soon.

## **Weak U.N. nuclear watchdog "eroding non-proliferation"**

By Mark Heinrich

Mon Apr 27, 2009 7:58am EDT

*[EXCERPTS]*

VIENNA (Reuters) - The U.N. nuclear watchdog has failed to use all its powers or to beef them up if inspectors are obstructed, leaving the Non-Proliferation Treaty (NPT) in tatters, a former top agency official says.

The International Atomic Energy Agency seeks to catch covert diversions of nuclear energy into bomb-making and foster peaceful uses of the atom. Exposure of suspect nuclear activity in North Korea, Libya, Iran and Syria over the past decade has shaken the Vienna-based watchdog.

"The (nuclear) non-proliferation regime is increasingly challenged by states that exploit ambiguity in rules and rifts in the international community to pursue nuclear weapons capabilities without fear of reprisal," said Pierre Goldschmidt, who was global head of IAEA inspections in 1999-2005.

"Lax and inconsistent compliance practices threaten non-proliferation efforts by giving some states more leeway for evading rules than should be tolerable in an effective non-proliferation regime," he wrote in a paper for the Carnegie Endowment for International Peace think-tank.[\*]

*[deletia]*

### SPECIAL INSPECTIONS

Goldschmidt said the IAEA should reassert a right to impose mandatory "special inspections" in countries refusing to grant broad access to inspectors to resolve intelligence reports of stealthy work to weaponize nuclear materials.

He cited Syria, where inspectors last June found "significant" uranium traces at a spot alleged by Washington to have been a nascent plutonium-producing reactor before Israel bombed the target to rubble in 2007.

Syria denies the accusations but has also denied IAEA requests for a second visit to the site and to three others, as well as a look at debris from the bombing.

Goldschmidt said the IAEA had not applied a clause in Syria's nuclear safeguards agreement saying the agency could resort to a special inspection, allowing short-notice searches anywhere, if information provided by a country was not deemed "adequate for the agency to fulfill its responsibilities."

He suggested the IAEA looked hapless in repeatedly urging a state to voluntarily open up in response to repeated refusals, as it has been doing with Syria, as well as with Iran.

"If the only consequence is that the (IAEA) director-general reports at each Board meeting that no progress had been made, this will encourage any non-compliant state to adopt similar obstructive tactics," said Goldschmidt.

He urged IAEA governors to temporarily broaden verification powers to get around invocations of "national security" used by Syria and Iran to keep military sites in question off limits.

## **Ranking House Intel Republican Doubts Pelosi Claim She Wasn't Briefed On Harsh Interrogations**

by RTT Staff Writer

4/27/2009 8:13 PM ET

*[EXCERPTS]*

The ranking Republican member of the House Intelligence Committee Monday cast doubt on a top Democrat's claims that the Bush Administration never told them harsh interrogation practices were being used.

*[deletia]*

Hoekstra also rejected Pelosi's claim that she was barred from raising objections to even the possible use of the techniques because of the highly-classified nature of the interrogation program.

"It's a pathetic excuse. She's the ranking member on the intelligence committee," he said. "I'm put into that job because it's my responsibility to protect the equities of the House.

He added, "I'm not just sent in to the room to be a wall flower."

As an example, Hoekstra pointed to a conflict around administration disclosure of what precisely happened surrounding an Israeli air strike on a Syrian site that some believe was being used to develop a nuclear program.

"When we disagreed with the White House's unwillingness to brief people on what happened in Syria when the Israelis took out the alleged nuclear reactor, we got an op-ed piece [\*] published," he said.

"We just said we're protesting that this information's not being released. We didn't disclose what it was ... we had to be very careful."

He added, "But the American public was notified that there was a tension between the White House and Congress about the release of classified information."

*[\*] What Happened in Syria?*

Robert Wood  
Acting Department Spokesman  
Daily Press Briefing  
Washington, DC  
April 30, 2009

*[EXCERPT]*

QUESTION: Is the time right for additional U.S. talks directly in Damascus?

MR. WOOD: Well, you know, we've said that we would be willing to engage Syria in a dialogue and, as I said before, after the previous meetings that were held between Acting Assistant Secretary Feltman and the NSC's Dan Shapiro, that there could very well be additional meetings, you know, future meetings. And so I'm certainly not going to rule that out at this point. I don't have anything more to add in terms of travel, but we'll be happy to let you know should there be a visit coming up in the near future.

But what's important from our standpoint is that Syria play a positive role in this region, and up until now, it hasn't. But this Administration has said it's willing to engage. And if the Syrians are willing to engage as well, hopefully, we'll be able to make some progress. But we'll have to see how things go. But if indeed they are willing to contribute to helping promote a two-state solution, that's something definitely to be welcomed.

Robert Wood  
Acting Department Spokesman  
Daily Press Briefing  
May 4, 2009

*[EXCERPT]*

QUESTION: Robert, do you have anything new regarding Assistant Secretary Feltman's trip to Damascus?

MR. WOOD: No, I don't, Michel. Not at this point.

QUESTION: A follow-up on this. Israeli officials have expressed their concern about the rapprochement between Washington and Damascus, and they consider that there is no justification for this. Do you have any reaction?

MR. WOOD: Well, look, we hope to have a dialogue with Syria about a number of concerns that we have in the region. And we hope that that will result in Syria taking some steps that we want to see. And our interests are the same as Israel's in terms of trying to get Syria to play a much more productive role in the region, to cease from supporting terrorist groups.

So we've got a long way to go before we actually have a good relationship with Syria. As I said, we have a number of outstanding concerns, and hopefully we'll be able to address them as we go along. We think Syria has an opportunity to play a positive role in the region. We encourage it to do so.

**Acting Assistant Secretary for Near Eastern Affairs Jeffrey Feltman Travel**

Robert Wood

Acting Spokesman, Office of the Spokesman

Bureau of Public Affairs

Washington, DC

Acting Assistant Secretary Feltman will travel to Syria today, May 5th, to discuss issues of mutual and regional concern. This trip will further advance the U.S. commitment to direct diplomacy with Syria and continue discussions from his previous trip. Acting Assistant Secretary Feltman will be accompanied by NSC Senior Director Daniel Shapiro

PRN: 2009/419

## **Behind the scenes of the Peres-Obama meeting**

Thu, 05/07/2009 - 11:22am

*[EXCERPT]*

The NSC's Shapiro is currently accompanying Jeffrey Feltman, the State Department's acting (and nominated) assistant secretary of state for Near Eastern affairs, on their second trip to Damascus, Syria. Sources say that Feltman, a former U.S. ambassador to Lebanon, was mystified by the trip to Damascus being scheduled now, before the June 7 Lebanese elections, and wondered how and where the decision was made. Neither Feltman nor Shapiro responded to a query on the Damascus trip. Asked about the trip Wednesday, State Department spokesman Robert Wood said he had no more details. "We will engage in dialogue when and where we feel it's appropriate," Wood said. "But we think it's time for both countries" -- Syria and Iran -- to "become part of the solution."

## **Washington Committed to Seeking Syria - Israel Deal**

**May 7, 2009** Filed at 8:58 a.m. ET

DAMASCUS (Reuters) - The United States told the Syrian government Thursday it was committed to seeking a peace deal between Syria and Israel, a main objective for Damascus in its rapprochement with Washington.

"We conveyed ... President Obama's sincere commitment to pursue Arab-Israeli peace on all tracks, including on the Syrian-Israeli track," senior State Department official Jeffrey Feltman said after meeting Syrian Foreign Minister Walid al-Moualeem in the Syrian capital.

The administration of U.S. President Barack Obama started talks with Syria soon after he was inaugurated in January, ending a boycott of several years under his predecessor George W. Bush. Feltman said the two countries still had differences to settle.

Damascus wants the United States to become involved if talks resume, believing this would guarantee any deal would stick.

Indirect talks mediated by Turkey were suspended after Israel's three-week offensive in the Gaza Strip, which ended in mid-January.

Feltman is accompanied by White House official Daniel Shapiro. The two officials were in Damascus in March.

(Reporting by Khaled Yacoub Oweis; editing by Andrew Dobbie)

**THE WHITE HOUSE**

Office of the Press Secretary

---

For Immediate Release

May 8, 2009

**TO THE CONGRESS OF THE UNITED STATES:**

Section 202(d) of the National Emergencies Act, 50 U.S.C. 1622(d), provides for the automatic termination of a national emergency, unless, prior to the anniversary date of its declaration, the President publishes in the Federal Register and transmits to the Congress a notice stating that the emergency is to continue in effect beyond the anniversary date. In accordance with this provision, I have sent to the Federal Register for publication the enclosed notice stating that the national emergency with respect to the actions of the Government of Syria declared in Executive Order 13338 of May 11, 2004, and relied upon for additional steps taken in Executive Order 13399 of April 25, 2006, and Executive Order 13460 of February 13, 2008, is to continue in effect beyond May 11, 2009.

The actions of the Government of Syria in supporting terrorism, pursuing weapons of mass destruction and missile programs, and undermining U.S. and international efforts with respect to the stabilization and reconstruction of Iraq pose a continuing unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For these reasons, I have determined that it is necessary to continue in effect the national emergency declared with respect to this threat and to maintain in force the sanctions to address this national emergency.

BARACK OBAMA

THE WHITE HOUSE,  
May 7, 2009.

*[Sourcebook note: See Certifying Syria's Nuclear Program by Gordon Prather in Appendix A of this sourcebook]*

Robert Wood  
Acting Department Spokesman  
Daily Press Briefing  
Washington, DC  
May 8, 2009

[EXCERPT]

QUESTION: If we can go to Syria, President Obama, I believe yesterday [2009-05-07], signed an executive order renewing sanctions that were imposed on Syria, I believe in 2004. Obviously, he does this just as Ambassador Feltman is in – has been in Syria. What does the – and I realize it's a White House decision to renew the sanctions, but I remember when they were first imposed it was briefed out here. What does the renewal of the sanctions mean for your effort to improve and – improve your relationship with Syria and engage with them more?

MR. WOOD: Well, look, the President felt it was necessary to take these measures. These are not new sanctions, and there is still – I think this shows you that we still have some very serious concerns about Syrian behavior and activity in the world. We've said to you before our concerns about what Syria is doing in Iraq, its support for terrorist groups.

We have encouraged the Syrians to play a positive role in the Middle East. We're willing to engage them in a dialogue to try to address not only our concerns, but concerns that they may have. But there's – it's – there's no secret we have some very serious problems with the government in Syria. And we hope to be able to try to work out those differences, but a lot of it is going to be up to Syria. It has – this is another country that has an opportunity to have a different relationship with the international community.

And part of Acting Assistant Secretary's Feltman's trip to the region is trying to get the Syrians to take some steps that will move us toward a better relationship and – but there's a lot that Syria needs to do. But we're willing to engage them and see if they are serious about addressing some of these concerns, so --

QUESTION: But what is the point of, like, this engagement for Syria? I mean, do you think that like, renewing the sanctions at this point – I mean, even as Secretary Feltman was there – is an incentive for Syria to take steps? I mean, don't you think something like, kind of, you know, waiting – waiting to impose an executive order, at least to see if Syria is going to take some steps to renew the executive order?

MR. WOOD: Well, as you know, the President's required by Congress to report on an annual basis on the sanctions. This is something that the President felt we needed to do, and we're certainly well aware --

QUESTION: What kind of a message do you think, though, that that sends to Syria?

MR. WOOD: Well, I think it sends the message that we have some very serious concerns. We still have them about their activity and behavior. And what Jeff Feltman is, you know, in Damascus to talk about is how we can

get Syria to change its behavior and see if it's willing to really engage seriously in a dialogue, be a positive role in the Middle East. Up until now, Syria hasn't played that positive role. So that's --

QUESTION: But you're talking to them specifically this week about trying to play a positive role.

MR. WOOD: Right.

QUESTION: So on one hand, you're asking them to play a positive role. But for them, what they see you doing is imposing what -- is continuing sanctions on them. I mean, what --

MR. WOOD: Well, the sanctions are the law, and the President is required to report on them (inaudible) basis to Congress.

QUESTION: Well, I know but --

MR. WOOD: So that --

QUESTION: Well, it might -- perhaps it might be helpful if you explain that these -- that the executive order was going to expire on Sunday and perhaps you could also talk about --

QUESTION: I know it was going to expire on Sunday.

QUESTION: -- talk about the -- about whether Assistant Secretary Feltman went now, this week, instead of waiting until after he was confirmed in order to explain to the Syrians exactly what was going on with this renewal.

MR. WOOD: Well, Matt, I think you're reading a little bit too much into this. Look, I've already talked about the sanctions and I even added some points on the sanctions. We have very serious concerns about Syrian behavior. I think you all understand that very clearly, and those haven't gone away.

But what we're saying is instead of isolating Syria, we're willing to engage them.

QUESTION: But what is the benefit of the engagement if you're going to continue to -- these sanctions on them?

QUESTION: Can I go actually -- Matt, I'm sorry. Did he explain -- do you know if he explained to them, look, the renewal's coming up, we're going to have to do this?

MR. WOOD: I haven't talked to Jeff, but I'm sure the Syrians are certainly well aware of the executive order and what the President's required to do. And that's the law and the President has to, you know, take the necessary steps. And because we have that law -- the reason for that law is because of activities that the Syrians have engaged in, in the past. We want to try to move forward. And that's why Jeff is out in the region to talk to Syria about -- to find out whether they are really serious about improving relations with the United States and taking some of these steps to address concerns that we have about their behavior in the international realm.

QUESTION: Have they taken any such steps yet?

MR. WOOD: With regard to?

QUESTION: Well, steps in the direction that you want them to take?

MR. WOOD: Well, we need to see. I mean, the Syrians have said a lot of very positive things, but we need to see actions. And as far as I'm aware, they haven't taken any steps that -- at this point that would lead us to

change – to move in another direction right now. We need to see concrete steps from the Syrian Government for us to move in another direction.

QUESTION: Robert --

MR. WOOD: Yes, James.

QUESTION: -- yet, there must have been some steps taken that would have justified a second visit by Feltman and Shapiro.

MR. WOOD: The second visit is to follow up on the good discussions that Jeff Feltman and Dan Shapiro had on that first trip. But that doesn't mean that Syria has addressed all of our concerns. They haven't addressed our concerns. And so, we want to follow up with them to see if they are serious, to go and take additional steps to improve the nature of the relationship and address some of the issues that we have raised.

QUESTION: So, if you say, "take additional steps," that implies some steps have been taken.

MR. WOOD: Well, they have taken some steps previously in terms of being more cooperative with regard to Iraq, but still there is a lot that they can do to better improve the relationship. But our concerns are still there. And that's – but we are interested in having a dialogue with them, as opposed to just isolating them.

QUESTION: How far back in time are you taking us when you refer to steps that they took in Iraq that were positive?

MR. WOOD: I don't have a timeline for you, James. I mean, you can go back and look at the record in terms of --

QUESTION: I'm just asking are we talking in the past month, two months, ten – five years? What did you have in mind?

MR. WOOD: Certainly within the last couple of years, but I don't have a timeline for you.

QUESTION: You're not talking about recent stuff, anyway.

MR. WOOD: I'm not talking about in the last week or – so no.

QUESTION: Right.

MR. WOOD: On Syria?

QUESTION: Yes.

MR. WOOD: Yes.

QUESTION: Ambassador Feltman, in his statement on Syria, said that he will be continuing this dialogue with the Syrians in Washington and in Syria. Is it expected that the Syrian delegation to come here or just the ambassador?

MR. WOOD: I don't know. I – at this point, I don't know. I mean, I think Jeff was just expressing how he sees these visits going on, but I have no idea about a Syrian delegation or its membership. I just – I think it's a little premature to talk about that.

Yes.

## **Has the Obama-Israel Joint Policy on Iran's Nukes Ruptured?**

David Horovitz

Jerusalem Post editor

May 11th 2009

*[EXCERPTS]*

In his recent book *The Inheritance*, *The New York Times'* chief Washington correspondent David E. Sanger...

... , detailing the global challenges the Bush administration bequeathed to Obama, includes a remarkable passage on Mossad chief Meir Dagan's quiet visit to Washington two years ago, when Israel presented the US intelligence community with incontrovertible evidence that North Korean engineers had almost finished the construction of a nuclear reactor in Syria.

That the US was blithely unaware of this - and had gone to war against a country that turned out not to have nukes, while entirely missing the construction of the nuclear facility next door - was an almighty intelligence failure. While Israel would have been proud of its clear-eyed scoop, it would have been deeply disquieted by America's blindness.

Disquiet turned to dumbfoundedness when the US elected not to act. "The Pentagon developed a plan for a lightning strike," Sanger writes. And he says two senior US officials told him Bush seriously considered it. But ultimately, the US both chose diplomacy itself and urged diplomacy on Israel - "despite the fact that the Syrian reactor project was far more sophisticated than anything Saddam had under way in 2003." It was, as Sanger quotes a senior Israeli official as saying, "laughable logic."

And so Israel, defying the US, took its defense into its own hands, smashed the al-Kibar reactor to smithereens, and - as with Osirak in 1981 - braced for repercussions that didn't come. Presumably, there have been similar quiet visits by the likes of Dagan to Washington where Iran, not Syria, was on the agenda - where Israel was bringing fresh intelligence that underlined the progress and the shortage of time.

But as Sanger quotes a senior American official telling him in the wake of Israel's strike on Syria, the US "had post-Iraq syndrome, and the Israelis had preemption syndrome."

Two traumatized leaderships, taking flawed decisions in the uncertain aftermath of past failures? The depiction is not entirely accurate.

## **Biological Weapons, Instead Of Nuclear Reactor, Keep Syria Within Axis Of Evil**

By David Bedein, Middle East Correspondent

The Philadelphia Bulletin

Tuesday, May 12, 2009

Jerusalem — Syria has reportedly rebuilt the structure that housed the reactor bombed by Israel last year and has turned the site into a facility for manufacturing chemical and biological weapons.

Official sources stated Syria had significantly expanded its biological and chemical weapons program by doing so.

According to a CBS News report, the discovery of the Syrian program was one of the reasons President Barack Obama decided to renew the sanctions against Syria. An American source said [the U.S.] had received information that had altered the situation in U.S.-Syrian relations. After Sunday night's report on CBS, it was clear what this information was.

A senior American intelligence source in Washington told the Israeli media Syria had denied having rebuilt the structure and also denied it was part of its biological and chemical weapons program. American satellite imagery, however, showed unequivocally that Syria was lying.

The discovery of the renewed Syrian biological and chemical weapons program adds to a series of differences of opinion that has left the Syrians and Americans in a deadlock.

Syria's relationship with Iran, arming of Hezbollah and hosting of Hamas and other terror groups greatly troubles the Obama administration.

As a result, Mr. Obama announced a change in his Syria policy after his two envoys returned to Washington on Sunday.

The envoys went to Syria with the new intelligence showing the site that formerly housed the nuclear reactor had been restored and had become a structure housing an expanded chemical and biological weapons program.

Syria, however, denied the existence of the new program at the facility despite being shown the satellite footage, which was the straw that broke the camel's back.

After Mr. Obama consulted with his advisers, he reached the conclusion that Syria had not done anything to justify removing the sanctions.

"The concerns we had about Syria's actions have not changed, so renewing the sanctions was the right thing to do," a senior White House source told the Voice of Israel Radio.

*[Sourcebook notes: As of the date of this sourcebook, the CBS News report mentioned above has not been located. A visit by "two envoys", Jeffrey Feltman and Daniel Shapiro, took place Wednesday, 2009-05-06 through Thursday, 2009-05-07, the same day President Obama signed the sanctions extension order.]*

**UNCLASSIFIED**

**Unclassified Report to Congress  
on the Acquisition of Technology  
Relating to Weapons of Mass Destruction  
and Advanced Conventional Munitions,  
Covering 1 January to 31 December 2008**

*[EXCERPTS]*

The Deputy Director of National Intelligence for Analysis hereby submits this report in response to a congressionally directed action in Section 721 of the FY 1997 Intelligence Authorization Act,

CIA's Weapons Intelligence, Nonproliferation, and Arms Control Center (WINPAC) drafted this report. The National Intelligence Council reviewed and coordinated it within the Intelligence Community (IC).

**Syria**

**Nuclear**

Syria—despite being a Nuclear Non-Proliferation Treaty Party with full-scope IAEA safeguards—was engaged for more than a decade in a covert nuclear program with North Korean assistance. The program involved construction of a nuclear reactor at Al Kibar without informing the IAEA and while taking measures to preserve the site's secrecy. We assess the reactor would have been capable of producing plutonium for nuclear weapons. The reactor was destroyed in September 2007, before it became operational, and Syria went to great lengths to try to eradicate evidence of its existence. The covert nature of the program, the characteristics of the reactor, and Syria's extreme efforts to deny and destroy evidence of the reactor after its destruction are inconsistent with peaceful nuclear applications.

IAEA inspectors visited Syria between 22 and 24 June 2008 and took environmental samples at the Al Kibar site. The IAEA reported to the November 2008 Board of Governors that analysis of the Al Kibar environmental samples revealed a significant number of chemically processed natural uranium particles. The report also noted the Agency's assessment that the features of the Al Kibar building were similar to what may be found in connection with a reactor site, but stated that the IAEA could not exclude the possibility that the building was intended for non-nuclear use. The IAEA is continuing its investigation of Syria's nuclear file.

## **North Korea**

North Korea's relationships with Iran and Syria remain strong. North Korea provided assistance to Syria's covert nuclear effort starting in the late 1990s and retains the potential for exporting nuclear materials or technology.

SPIEGEL INTERVIEW WITH MOHAMED ELBARADEI

## 'It Was Others Who Failed'

05/18/2009 06:37 PM

Mohamed ElBaradei, 66, director general of the International Atomic Energy Agency (IAEA), discusses the record of his term in office, his bitter struggle with the Bush administration and the dangers that new nuclear powers pose.

[EXCERPT]

[deletia]

SPIEGEL: The Israelis accuse you of partisanship because you have sharply criticized the government in Jerusalem for the bombing attack on a Syrian military facility in September 2007.

ElBaradei: What the Israelis did was a violation of international law. If the Israelis and the Americans had information about an illegal nuclear facility, they should have notified us immediately. The fact is that I only learned about it long after the strike was completed. And when everything was over, we were supposed to head out and search for evidence in the rubble -- a virtually impossible task.

SPIEGEL: But your inspectors did travel to Syria, and they did find suspicious evidence.

ElBaradei: Yes, traces of uranium. Where they came from is unclear. There are still questions. Syria is not giving us the transparency we require.

SPIEGEL: Isn't it an eternal cat-and-mouse game, like the one we are seeing once again in North Korea, which expelled your inspectors in April?

ElBaradei: North Korea is obsessed by the fear that the Americans want to topple their regime militarily. As far back as 1992, the foreign minister in Pyongyang gave me a two-hour lecture on how much the Americans had it in for North Korea. Their obsession was only reinforced when George W. Bush placed North Korea on his "Axis of Evil" in 2002. Pyongyang decided then to embark on the road to the bomb.

[deletia]

## **U.S. Tries to Line Up U.N. Rebuke**

By JAY SOLOMON, PETER SPIEGEL and JOE LAURIA

**MAY 27, 2009**

*[EXCERPTS]*

WASHINGTON -- The Obama administration Tuesday sought to gain Russian and Chinese support for a strong United Nations rebuke of North Korea and potential new economic sanctions over its Monday test of a nuclear device.

U.N. diplomats said measures could include new asset freezes on North Korean companies believed to be involved in the country's nuclear program. Renewed efforts to inspect cargo going into North Korea could also form part of a U.N. resolution.

*[deletia]*

A widening sanctions regime, U.S. officials said, would also likely target North Korean firms directly involved in Pyongyang's nuclear program, including Nomchongang Trading Co. U.S. officials believe Nomchongang cooperated with Syria in starting construction on a nuclear reactor that Israel destroyed in a 2007 bombing raid. U.S. officials also said there were indications that Nomchongang had sought to sell nuclear technologies to Myanmar.

*[deletia]*

## Tests Point to Spread of Weapons Trade

By JAY SOLOMON

MAY 29, 2009

[EXCERPTS]

WASHINGTON -- Signs of growth in North Korea's nuclear program and the country's increasing isolation are renewing fears about Pyongyang's ability and need to smuggle weapons of mass destruction around the world, said U.S. and United Nations officials.

North Korea's arms trade has focused on Iran and Syria, countries Washington views as state sponsors of terrorism, as well as Libya. Officials say North Korean arms have also been sold to nations allied with the U.S., such as Egypt and Pakistan, and to the military regime in Myanmar.

[deletia]

U.S. and Asian counterproliferation officials say Pyongyang has developed sophisticated smuggling networks in the Middle East and Asia in recent years. North Korea has worked with Asian criminal gangs to move narcotics and counterfeit currency globally, it ships contraband using Cypriot and Cambodian flagged carriers, and falsifies export documents, the officials say.

In August, the U.S. worked with India to block a North Korean Air Koryo jet from flying to Iran from Myanmar on the belief it was carrying missile components; the intercepted jet flew back to Pyongyang. A diplomat at Myanmar's U.N. mission declined to comment Wednesday. Iran has in the past declined to discuss any allegations of arms deals with North Korea. The U.S. also blocked a Syrian cargo plane from landing in Pyongyang in 2007, due to similar concerns.

[deletia]

In 2007, Israeli jets bombed a Syrian industrial facility on the Euphrates River that U.S. intelligence officials subsequently described as a nascent nuclear reactor being built by North Koreans. The U.N.'s atomic watchdog, the International Atomic Energy Agency, has reported that soil samples taken at the site showed large traces of processed uranium. Syria denied it is developing a nuclear program.

A North Korean state-owned company, Nomchongang Trading Co., was the principal facilitator for the Syrian project, according to former U.S. officials. The company's chief, Yun Ho Jin, worked during the 1990s as a senior diplomat at North Korea's mission at the IAEA, where he developed an understanding of the global procurement system, according to U.S. and U.N. officials. Mr. Yun and Nomchongang couldn't be reached to comment.

Nomchongang had offices in Syria, according to the former U.S. officials. "Nomchongang was the operating interest in the Syrian sale," said Dennis Wilder, who served as President George W. Bush's top Asia adviser until January. "It was the arm of the North Korean government dealing with nuclear issues."

U.S. and Asian officials said Nomchongang was also detected selling equipment to Myanmar that could be used for a nuclear program. Exchanges between senior North Korean and Myanmar military officers have increased, these officials say. Myanmar may be seeking to replicate North Korea's weapons development as a deterrent to Western pressure, the officials say.

## **Israeli Reaction To North Korea: 'We Told You So'**

By David Bedein, Middle East Correspondent

Monday, June 01, 2009

*[EXCERPT]*

Jerusalem — From Israel's perspective, North Korea's nuclear test, conducted Monday, was almost old news. Although the world was shocked when the news broke, Israeli security and Foreign Ministry officials could have said: "We told you so."

Sources in the Israeli security establishment say they have been reporting on the connections between North Korea and Iran since the mid-1990s, when they started warning that North Korean technology was behind Iran's Shahab missile. North Korean military, missile and nuclear experts have roamed the planet, mainly in the Middle East, seeking to sell their technologies to the highest bidder.

"And two years ago we reported — and backed it up with documentation — that North Korea was building Syria a nuclear reactor, and after we told them, we also attacked and destroyed it, to make sure that the threat was removed," the sources said.

From Israel's perspective, this is an existential issue: If the Americans blink, that will be sensed very clearly, and it will tell North Korea that it can continue to go about its nuclear weapons business. The North Korean developments likely will lead to Syria gaining improved missile technology and Iran accelerating its nuclear program.

Another senior Israeli official angrily chastised the United States for its lack of action after it learned North Korea was helping Syria build a nuclear reactor.

"What did the Americans do with all that? Not much," the official said. "The Syrian reactor ought to have taught them that North Korea had lied throughout the entire affair, but Washington nevertheless preferred to persevere with its critical dialogue.

"The result of that is that the missiles were fired, the tests continued. Yesterday was a resounding slap on the cheek, which ostensibly is supposed to indicate to all of us that the time has come for the administration either to sober up, or for us to despair of it."

## Board of Governors

**GOV/2009/36**

Date: 5 June 2009

**Restricted Distribution**

Original: English

### **For official use only**

Item 6(f) of the provisional agenda  
(GOV/2009/33)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. On 19 February 2009, the Director General reported to the Board of Governors on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic (Syria) (GOV/2009/9). The Board requested the Director General to keep it informed of developments, as appropriate. This report covers relevant developments since that date.

## **A. Chronology of Events**

2. On 2 June 2008, the Director General informed the Board of Governors that the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria destroyed by Israel in September 2007 had been a nuclear reactor.

3. As indicated in the Director General's previous report, analysis of the environmental samples taken from the Dair Alzour site during the visit of Agency inspectors revealed a significant number of anthropogenic natural uranium particles (i.e. produced as a result of chemical processing) which indicated that the uranium was of a type not included in Syria's declared inventory of nuclear material. Syria has stated that the origin of the uranium particles was the missiles used to destroy the building (GOV/2008/60, para. 8; GOV/2009/9, para. 2).

4. As part of its efforts to confirm Syria's assertions about the possible source of uranium particles found at Dair Alzour, the Agency, in a letter dated 13 March 2009, provided Syria with the results of additional analyses of the environmental samples. The Agency also reiterated its request that Syria provide further access to the Dair Alzour site (including the water treatment plant at the site), and any other locations where the debris from the building and equipment, and any salvaged equipment removed from Dair Alzour, had been and/or was currently located, so that the Agency could take samples of, and environmental samples from, these items and materials. The Agency also reiterated its earlier request that Syria share the results of any assessments that it may have performed regarding the materials used during, or resulting from, the bombing.

5. In a letter dated 21 April 2009, the Agency provided comments to Syria on the statements made by Syria in its letter of 15 February 2009 regarding alleged efforts by Syrian entities to procure materials and equipment which could support the construction of a nuclear reactor. While expressing appreciation for Syria's efforts to answer some of the issues raised in earlier correspondence, the Agency informed Syria that its responses were only partial and did not address most of the questions.

The Agency requested further clarification and supporting documentation in relation to the functions of the destroyed and currently existing installations at the Dair Alzour site, as well as the other locations alleged to be related to Dair Alzour, and in relation to procurement activities. The Agency reiterated its 13 March 2009 request for information related to Syria's assertion about the origin of the uranium particles found at Dair Alzour.

6. In a letter dated 18 May 2009, the Agency informed Syria that anthropogenic natural uranium particles had been found in environmental samples taken in 2008 from the hot cells of the Miniature Neutron Source Reactor (MNSR) facility in Damascus. In a letter dated 1 June 2009, Syria responded to the Agency's request for an explanation concerning the presence and origin of the anthropogenic natural uranium particles found at the MNSR. In a letter to Syria dated 5 June 2009, the Agency followed up on Syria's explanation.

7. In a letter to Israel dated 20 May 2009, following up on Israel's letter of 24 December 2008, the Agency requested that Israel provide specific information concerning its statements about whether the munitions used in the destruction of the building at Dair Alzour could have been the source of the uranium particles found on the site.

8. In letters to the Agency, one dated 12 May 2009 and one dated 17 April 2009, received on 19 and 20 May 2009, respectively, Syria, inter alia, questioned the correctness of certain statements contained in reports, technical briefings and communications of the Agency.

9. In a letter dated 24 May 2009, Syria responded to the Agency's letter of 21 April 2009. Syria, inter alia, reiterated its earlier statements concerning the nature of the Dair Alzour installations, the water pumping infrastructure and procurement activities, and its statements regarding cooperation with entities from the Democratic People's Republic of Korea (DPRK). The letter did not include any of the supporting documentation requested by the Agency.

10. In a letter dated 4 June 2009, the Agency responded to the concerns expressed by Syria in the three letters received by the Agency in May 2009. The Agency also reaffirmed the correctness of its statements and communications and provided comments on the points raised by Syria. The Agency reiterated its request that Syria provide, as a matter of transparency, information and supporting documentation about the past use and nature of the building at the Dair Alzour site, and information about the procurement activities, as well as access to other locations alleged to be related to Dair Alzour.

## **B. Agency Verification**

11. The Agency has continued to investigate the allegations concerning the destroyed building on the Dair Alzour site. The information provided by Syria to date does not enable the Agency to determine the nature of the facility.

12. Since May 2008, the Agency has requested to have substantive discussions with Syria on this matter and has offered to share all of its satellite imagery, and imagery provided by other Member States. Syria has thus far declined to accept this offer.

13. As indicated in the Director General's last report (GOV/2009/9, para. 7), the Agency has assessed that there is a low probability that the uranium particles found at the Dair Alzour site were introduced by use of the

missiles used to destroy the building on that site. Since that report, no progress has been made in substantiating Syria's explanation. The Agency is continuing with its assessment of the origin of the uranium.

14. In a letter dated 15 February 2009 responding to the Agency's letter of 3 July 2008, Syria provided information regarding the procurement of certain equipment and materials, specifically the water pumping equipment observed at the Dair Alzour site, a large quantity of graphite and large quantities of barium sulphate (GOV/2009/9, para. 4). Syria indicated that the procurement efforts were civilian and non-nuclear in nature and related, respectively, to civil water purification, the domestic Syrian steel industry and shielding material for radiation therapy centres. Syria provided further clarifications in its letter dated 24 May 2009. Based on the information currently available to the Agency, it is not in a position to confirm these explanations and, in its letter of 4 June 2009, requested further clarification from Syria.

15. In its letters dated 3 July 2008 and 21 April 2009, the Agency had requested information and clarification regarding allegations of activities of an import/export company from the DPRK with an office in Syria, and regarding cooperation between nuclear scientists from Syria and the DPRK. Syria provided explanations in its letters of 15 February 2009 and 24 May 2009 and denied the allegations. The Agency is assessing Syria's response.

16. The Agency has reiterated its request for information concerning three other locations allegedly functionally related to the Dair Alzour site (GOV/2008/60, para. 7). Syria has not yet responded to the Agency's requests for access to these sites as a transparency measure.

17. In May 2009, the Agency received the results of the analysis of routine environmental samples taken in August 2008 at the MNSR in Damascus. The results showed the presence of particles of anthropogenic natural uranium, of a type not declared at the facility, inside the hot cells and from associated equipment. On 1 June 2009, Syria provided a response to the Agency's request for an explanation concerning the presence and origin of these particles. In its response, Syria provided information about the use of the hot cells and the presence of natural uranium, but did not address the presence and origin of the anthropogenic uranium. In its letter of 5 June 2009, the Agency wrote to Syria following up on its response. The existence of a possible connection between these particles and those found at the Dair Alzour site requires further analysis by the Agency.

### **C. Summary**

18. The presence of the uranium particles at the Dair Alzour site, the imagery of the site available to the Agency and certain procurement activities remain to be clarified. The information provided by Syria to date does not adequately support its assertions about the nature of the site. In order for the Agency to complete its assessment, Syria needs to be more cooperative and transparent.

19. The anthropogenic natural uranium particles found at the MNSR facility are of a type not included in Syria's declared inventory of nuclear material. The presence and origin of such particles, as well as those found at the Dair Alzour site, needs to be understood by the Agency.

20. The Director General urges Syria to provide at an early date additional information and supporting documentation, access to other locations alleged to be related to the Dair Alzour site and access to relevant locations for the sampling of destroyed and salvaged equipment and debris. As has previously been indicated to Syria, the Agency expresses its readiness to work out with Syria modalities for managed access that would enable Syria to protect sensitive and confidential information that is not relevant to the Agency's mandate, while enabling the Agency to perform its verification mission. It is clearly in Syria's interest to render to the Agency the necessary cooperation and transparency if it wishes the Agency to be able to corroborate its assertion about the nature of the Dair Alzour site. The Director General equally calls on Israel to cooperate with the Agency in its investigation. The Director General also calls on other States that may possess relevant information to make such information available to the Agency and to agree to the Agency's sharing of such information with Syria.

These measures would assist the Agency in establishing the facts and making progress in its verification mandate.

21. The Director General will continue to report as appropriate.

## **No progress on Iran, Syria nuclear dossiers: top UN official**

By Simon Morgan

2 days ago [Accessed 2009-06-08T14:55Z]

*[EXCERPTS]*

VIENNA (AFP) — The UN atomic watchdog has not made any progress in its probe into the alleged illicit nuclear activities in Iran and Syria, a senior official close to the agency said Friday.

"On Iran, there has been very little progress," the official said, speaking on condition of anonymity. "And for Syria, it's the same thing."

*[deletia]*

In a separate report on Syria, the IAEA said its inspectors found uranium particles at a research reactor near Damascus that would not normally be expected there and had asked Syria to explain how they got there.

Inspectors had found "anthropogenic natural uranium particles in environmental samples taken in 2008 from the hot cells of the Miniature Neutron Source Reactor (MNSR) facility in Damascus," the report said.

It was not the type of uranium that would normally be expected to be found at this kind of reactor, a senior official close to the IAEA said on condition of anonymity.

The IAEA has been investigating allegations of illicit nuclear work by Syria since last year.

The United States alleges that a remote desert site -- known alternatively as Dair Alzour or Al-Kibar -- was an undeclared nuclear reactor until it was bombed by Israeli planes in September 2007.

The IAEA has said that the building bore some of the characteristics of a nuclear facility and UN inspectors had also detected "significant" traces of man-made uranium at that site, too, as yet unexplained by Damascus.

But it was too early to say whether the uranium particles at Dair Alzour were connected in any way to those found at the research reactor, the official said.

Syria has claimed the uranium at Dair Alzour came from the Israeli bombs, but the watchdog has more or less ruled out that interpretation.

## Israel's reaction to IAEA reports about Iran and Syria

7 Jun 2009

Israel calls for firmer measures by the IAEA and the international community

(Communicated by the MFA Spokesperson)

Over the weekend, the Director General of the International Atomic Energy Agency (IAEA) published the Agency's latest reports on its investigations in Iran and Syria.

The report on Iran again contains serious findings of increased uranium enrichment in Iran, in violation of Security Council resolutions, as well as other activities that could be connected to a military nuclear program. The report also emphasizes the IAEA's inability to carry out full and effective monitoring in Iran due to that country's continued lack of cooperation. These findings demonstrate that the international community, no more than Israel, cannot place its trust in IAEA monitoring in Iran. Accordingly, what is needed from the international community is immediate and determined action to ensure that Iran will not be able to produce nuclear weapons. The weakness currently displayed by the international community allows a country like North Korea to pursue a policy of defiance, and Iran is an attentive student of this policy.

Regarding Syria, the report details many suspicious findings as well as Syria's unresponsiveness to the Agency's demand to visit the various sites and to provide answers to disturbing issues. This situation reinforces suspicions that Syria is trying to blur evidence of secret nuclear activity that took place at Dir a-Zur in eastern Syria. The Agency should condemn Syria for hiding the facts pertaining to this activity.

The IAEA Director General has so far refrained from using all the means at his disposal to investigate Syria. Israel calls upon him to conduct an investigation free from political considerations and bias, and also to demand that North Korea, which is mentioned in the report, cooperate in the investigation.

## **IAEA: Der Standard Interview with Mohamed ElBaradei**

with Gudrun Harrer

*[EXCERPTS]*

Mohamed ElBaradei, Director General of the International Atomic Energy Agency since 1997, will leave his job in autumn. In an interview with Gudrun Harrer, the Egyptian lawyer speaks about the challenges for the Agency and the hopes for change in the Middle East inspired by US President Barack Obama.

*[deletia]*

STANDARD: Obama has announced that the US will contribute more to the IAEA budget. What can he do to strengthen the Agency's role as the institution responsible for non-proliferation and safeguards? It sometimes seems under threat, there is a lack of trust. For example, Israel took the issue of a suspected Syrian reactor in its own hands and bombed it.

ELBARADEI: As I said, there has been a lot of cynicism. Part of that is the erosion of international law. When Israel bombed the Syrian facility - whatever it was - very few people spoke against it or expressed their concern about a clear violation of international law. I was one of them, Switzerland was another. But not a single EU country spoke against it. I told them: "You cannot apply international law selectively. If you want to have credibility, if you want to talk about Iran, about North Korea, rules of international law and non-proliferation, you cannot pick and choose. You have to have the same standard applied to every situation whether it is your foe or your friend". That is part of the kind of erosion of our system of governance at a global level, which was always supported at least to a certain extent by certain rules of international law, and that also is eroding. If you see anyone referring to international law it is becoming like a luxury. Now all the talk is about the immediate interest.

STANDARD: However, your report on Syria from last week confirmed that there are open questions which Syria has to clarify. For some this would support Israel's decision.

ELBARADEI: If there was really a concern for proliferation, Israel and the Americans at that time - they had the information for one year and they kept the information for 6 months after they bombed. We only got it 6 months after the bombing. If they really were concerned they should have come to us. We would have established in a clear-cut manner whether this was a reactor or not a reactor by going there. Right now we are assigned an impossible task: to try to verify what was there. This is not the way. If you have an institution, make use of it. They have not made use of it. They are sitting outside the regime altogether but they are trying to make full use of it. And they don't understand that by having the nuclear programme... they think it does not threaten... well if you go to any part of the Arab or the Moslem world they look at it in a different light. They see it is a programme that is threatening them.

**Introductory Statement to the Board of Governors  
by IAEA Director General Dr. Mohamed ElBaradei,  
15 June 2009**

*[EXCERPT]*

Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

The Agency has continued to investigate allegations concerning the destroyed building on the Dair Alzour site in Syria. Regrettably, the limited information and access provided by Syria to date have not enabled the Agency to determine the nature of the destroyed facility, nor made it possible for us to corroborate Syria's assertions in that regard. In addition to the particles of anthropogenic natural uranium (i.e. produced as a result of chemical processing) found in environmental samples taken from the Dair Alzour site, anthropogenic natural uranium particles were also found in samples taken in 2008 from the hot cells of the Miniature Neutron Source Reactor facility in Damascus. The Agency needs to understand the presence and origin of the uranium particles found at both sites, which are of a type not included in Syria's declared inventory of nuclear material.

I again urge Syria to be fully cooperative and transparent, to provide the additional information and documentation requested by the Agency and to grant access to other locations, including those relevant for the sampling of destroyed and salvaged equipment and debris from the Dair Alzour site. In the absence of an additional protocol with Syria, the Agency's right of routine access to information and locations is circumscribed. However, I believe it would be clearly in Syria's interests, if it wishes the Agency to corroborate its assertions, to provide the full transparency required to enable us to clarify all allegations and come to an early conclusion. We are ready to discuss with Syria any modalities for access to relevant sites that would ensure that confidential information is protected while enabling the Agency to perform its verification work.

I also call upon Israel to share with the Agency all the information which led it to use force against the Syrian facility without giving the Agency the opportunity to verify the nature of the facility before it was destroyed. I make a similar request to all other States which may have relevant information that could help the Agency to complete its assessment.

## **U.S. to Confront, Not Board, North Korean Ships**

By DAVID E. SANGER

Published: June 16, 2009

*[EXCERPTS]*

WASHINGTON — The Obama administration will order the Navy to hail and request permission to inspect North Korean ships at sea suspected of carrying arms or nuclear technology, but will not board them by force, senior administration officials said Monday.

*[deletia]*

American officials believe that previous North Korean shipments of nuclear technology and missiles have gone undetected. The North Koreans were deeply involved in the construction of a reactor in Syria until September 2007, when the reactor was destroyed in an Israeli air raid. But no ships or aircraft carrying parts for that reactor were ever found.

## **Will Offshore Searches Slow North Korean Nukes?**

By Mark Thompson / Washington

Wednesday, Jun. 17, 2009

*[EXCERPT]*

But Pentagon officials also acknowledge their track record on monitoring North Korea shipping leaves something to be desired. Pyongyang played a major role in the development of a nuclear reactor that Syria was building until the Israeli air force bombed it into rubble in 2007. U.S. intelligence never has been able to identify what North Korean ships, if any, were involved in its construction. Which raises a troubling notion: North Korea's nuclear know-how may be able to elude even the tightest naval noose.

## Statements of the Director General

17 June 2009 | Vienna, Austria

IAEA Board of Governors

Intervention on Non-Proliferation Issues at IAEA Board of Governors  
by IAEA Director General Dr. Mohamed ElBaradei

*[EXCERPT]*

Here I would like to talk about Syria. If Syria wants to prove that the allegations are not accurate, the best thing it can do is to be fully transparent. We are ready to work with any modality to protect Syria's confidential military and non-military information, as we are ready to do with every country. But it is in every country's interest, if it is clean, to work with us through transparency measures, if needed. I deplored Israel for not giving us a chance to verify this facility before it was destroyed. Not many of you did. I did, and I continue to do so because we lost a very important opportunity. However, Syria also has an obligation now to allow us to verify that this was not a reactor. This is our obligation. I hope that Syria will not continue to stick to strict legalities because that means the issues will remain on our agenda.

## Israel accuses IAEA chief of bias on Syria

By GEORGE JAHN

3 hours ago [Accessed 2009-06-18T14:33Z]

VIENNA (AP) — Israel bluntly accused the head of the U.N. atomic agency of political bias Thursday in his probe of Syria's nuclear program, in an unusual direct attack on the agency chief.

The comments by Israel Michael, Israel's chief delegate to the International Atomic Energy Agency, briefly lifted the diplomatic curtain shrouding the agency and revealed the tensions surrounding Middle East issues that often pit Israel — and the U.S., its chief Western backer — against Islamic IAEA member nations.

While diplomats from nations allied with Israel occasionally suggest there is IAEA bias in favor of Iran and Syria — the two Mideast nations being probed by the agency — they do so only on condition of anonymity, in keeping with diplomatic convention that dictates that U.N agencies and its heads are above the political fray.

Syria became the subject of an IAEA probe after Israel jets destroyed what the U.S. says was a nearly finished nuclear reactor built with North Korean help that was configured to produce plutonium — one of the substances used in nuclear warheads.

Syria denies hiding nuclear activities but has blocked the IAEA's probe into the allegations, refusing to allow U.N. nuclear inspectors follow-up visits beyond one last year and declining to provide satisfactory explanations for unusual finds of traces of uranium.

Damascus alleges that Israel used bombs or missiles containing depleted uranium — which hardens metal and allows it to penetrate deeper — in attacking the site. That, says Syria, accounts for one instance of the uranium traces.

But IAEA Director General Mohamed ElBaradei has said that is unlikely, and Israel has repeatedly told the IAEA it did not use such ordnance — something Michaeli repeated in his comments Thursday to the IAEA's 35-nation board.

"Israel has responded ... in good faith" to the allegations, he said, in comments to the closed meeting made available to The Associated Press. "Therefore, the repeated call by the director general on Israel to cooperate with this investigation is redundant.

"Had the director general wished for further information from Israel, he would have not refused to meet with Israeli officials and refrained from publicly lashing (out) at Israel.

"Israel calls on the director general to avoid political bias in dealing with the Syrian file."

ElBaradei has repeatedly criticized the Israeli attack, saying it complicated the chances of success of his agency's probe.

Diplomats first told the AP that ElBaradei was boycotting requests for meetings with Israel officials earlier this year. The agency back then refused to comment.

## **IAEA chief, Israel lock horns over Syria**

18/06/2009 11:12 VIENNA, June 18

(AFP)

UN watchdog chief Mohamed ElBaradei sparred with an Israeli envoy Thursday after being accused of bias in the handling of an investigation into Syria's nuclear activities, diplomats said.

The United States meanwhile accused Syria of obstructing the International Atomic Energy Agency (IAEA) probe into allegations that it was building a secret nuclear reactor at a site that was bombed by Israeli jets in September 2007.

Israeli ambassador Israel Michaeli accused ElBaradei during a debate on Syria at a meeting of the IAEA's 35-member board.

Michaeli urged ElBaradei, an Egyptian, "to avoid political bias in dealing with Syria's nuclear file."

ElBaradei has frequently hit out at Israel for not informing the IAEA of its concerns about the suspect site in Syria before bombing it.

"Israel has responded timely and in good faith to the question addressed to it regarding the possible origin on the uranium particles, traced in the site of the nuclear reactor in Dair Alzour," Michaeli said in remarks, a copy of which was obtained by AFP.

Traces of uranium were found at the site -- known alternatively as Dair Alzour or Al-Kibar -- which Damascus claims came from the Israeli bombs that razed the building.

"Therefore the repeated calls by the director general on Israel to cooperate with this investigation is redundant," the envoy added, accusing ElBaradei of "publicly bashing at Israel."

The IAEA chief was angered by Michaeli's remarks, according to the diplomat and retorted that Israel's position was "totally distorted".

"We're not behaving selectively but across the board. We're implementing the international law. When Israel bombed what was claimed to be a nuclear facility, it was not only hampering our work, but it was a clear violation of international law," ElBaradei said.

"You, sir, your action is deplored (sic) by not allowing us to do what we're supposed to do under international law," the IAEA chief said.

"You're not even a member of the regime to tell us what to do," ElBaradei said, referring to Israel's refusal to sign the Nuclear Non-Proliferation Treaty (NPT).

"We would appreciate it if you stopped preaching to us."

Syria was the main focus of debate on the fourth day of the IAEA meeting.

The United States accused Syria of obstructing the IAEA's probe.

"Over one year has passed since the IAEA began investigating Syria's clandestine nuclear activities related to the destroyed reactor at Dair Alzour," said US deputy chief of mission, Geoffrey Pyatt.

"Regrettably, Syria has not used this time to resolve the lingering questions about the reactor and the associated facilities... Instead, the agency's list of questions is growing," Pyatt said.

Syria had "chosen to hinder the agency's efforts, he said.

Damascus denies the allegations and claims the site was a disused military facility.

It has only allowed IAEA inspectors to visit the site once, and has since turned down requests for follow-up inspections and access to other sites.

The IAEA has said the building bore some characteristics of a nuclear facility and that UN inspectors had detected "significant" traces of man-made uranium at that site, as yet unexplained by Damascus.

In its latest report, the IAEA revealed that inspectors had now found uranium particles at a second site -- a research reactor near Damascus -- that would not normally be expected there.

It was too early to say whether the uranium particles at the two sites were in any connected, according to the IAEA.

The agency has more or less ruled out Syria's claim that the uranium at Dair Alzour came from the Israeli bombs.

"We must understand why the material -- material that was not previously declared to the IAEA -- was detected at two facilities in Syria, one of which was being constructed clandestinely." US diplomat Pyatt said.

## **Siria recibe las críticas de UE y EEUU por su falta de cooperación con el OIEA**

Por Agencia EFE

18/06/2009

Viena, 18 jun (EFE).- Siria recibió hoy en el seno de la Junta de Gobernadores del Organismo Internacional de Energía Atómica (OIEA) duras críticas de la Unión Europea (UE) y de Estados Unidos por su falta de cooperación en la investigación de sus presuntas actividades nucleares.

La UE expresó su "profunda preocupación" de que la información entregada hasta ahora por Damasco al OIEA no ha esclarecido el origen de la instalación de Al Kibar, bombardeada por Israel en septiembre de 2007.

Estados Unidos asegura que Siria estaba construyendo en ese lugar un reactor nuclear con asistencia de técnicos norcoreanos.

Los inspectores del OIEA visitaron Al Kibar en junio del año pasado y encontraron huellas de uranio producido artificialmente y no declarado previamente por el país árabe.

El OIEA considera que es "poco probable" que ese material proceda de las bombas usadas por la aviación israelí, como asegura Siria.

Además, la UE destacó ante la Junta que los inspectores del organismo detectaron en una visita de rutina a un laboratorio en Damasco otras huellas de uranio, similares a las de Al Kibar, aunque no se sabe si estos dos hallazgos están relacionados.

Por eso, la UE sigue "seriamente preocupada sobre la posibilidad de que Siria no haya declarado todas sus instalaciones nucleares, de acuerdo a sus obligaciones bajo el acuerdo de salvaguardas (controles) con el OIEA".

Siria asegura que la instalación bombardeada por Israel era sólo un complejo militar convencional y se niega a otorgar acceso a los inspectores a otros lugares posiblemente relacionados.

La delegación de EEUU se unió a las críticas lanzadas por los europeos y manifestó que Siria "ha decidido entorpecer los esfuerzos del OIEA al negarse a permitir el acceso que el organismo considera necesario para seguir adelante con su verificación".

Asimismo, EEUU dijo que la "lista de preguntas del OIEA está creciendo", por lo que instó a Siria "a cooperar con el organismo plenamente y sin retraso".

Israel se expresó en contra la gestión del director general del OIEA, Mohamed El Baradei, al que acusó de no ser parcial en su investigación el caso sirio.

Ante el pleno de la Junta, el delegado israelí, Israel Michaeli, acusó al responsable máximo del OIEA de haberse negado hasta ahora a reunirse con funcionarios hebreos, lo que demostraría que no tiene interés en conseguir más información sobre Al Kibar

En su más reciente informe sobre Siria, El Baradei critica la falta de transparencia del país árabe al tiempo que insta a Israel y a Estados Unidos a ofrecer más información sobre porqué creen que en Al Kibar se estaba construyendo un reactor nuclear no declarado.

## **EIBaradei, Israel clash over Syria atom probe "bias"**

By Mark Heinrich

Jun 18 2009 11:24AM EDT

VIENNA (Reuters) - Israel accused the U.N. nuclear watchdog chief on Thursday of political bias in his probe into allegations of a secret Syrian atomic site, and he shot back that Israel's position was "totally distorted."

The International Atomic Energy Agency has sought to clarify U.S. intelligence reports saying Syria almost completed a reactor of North Korean design that could have yielded plutonium for atom bombs, before Israel bombed it to pieces in 2007.

IAEA head Mohamed EIBaradei has rebuked Syria for withholding documentation and access needed for inspectors to draw conclusions. But he has also criticized Israel for not alerting the IAEA before destroying the site, which he said has made it almost impossible to establish the truth.

Those tensions boiled over into rare fireworks on the floor of an IAEA board of governors meeting when Israel's envoy accused EIBaradei of making "redundant" demands and showing bias by making repeated calls on Israel to produce more evidence.

He said Israel had answered the only relevant IAEA question put to it by stating that uranium traces found at the bombed site did not come from Israeli munitions that hit it.

"Therefore the repeated call by the director general on Israel to cooperate with this investigation is redundant," Ambassador Israel Michaeli told the 35-nation governing board.

"Had (EIBaradei) wished for further information from Israel, he would have not refused to meet with Israeli officials, and (would have) refrained from publicly lashing at Israel.

"Israel calls on (EIBaradei) to avoid political bias in dealing with the Syrian file," said Michaeli.

Moreover, he said, EIBaradei had not used all "measures in his capacity" to make Syria open up to the investigation.

He was alluding to "special inspections," a rarely used, coercive tool that IAEA officials have told Reuters would be premature and counterproductive in Syria's case.

"DISTORTED"

EIBaradei, departing from normal diplomatic reserve in public, called Michaeli's stance "totally distorted" and Israel's failure to elaborate on what it knew about Syria was "almost an insult to our investigative process."

Looking straight at Michaeli, EIBaradei told him Israel's air strike had prevented the IAEA from carrying out its mandate to verify suspicions of nuclear proliferation in member states.

"You, sir, mentioned that Syria should be deplored and condemned (by us). But Israel, with its action, is (to be) deplored by not allowing us to do what we are supposed to do under international law," he said.

"You say we refrain from using tools. Israel is not even a member of the (non-proliferation) regime to tell us what to do. We would appreciate you stop preaching to us how we can do our jobs. We are using all tools available to us."

Israel is one of only three countries outside the Non-Proliferation Treaty and is believed to have an undeclared nuclear arsenal, the only one in the Middle East.

"You (Israel) cannot sit on the fence, making use of the system without being accountable ... I will continue to ask your government ... what information led you to circumvent the IAEA process," ElBaradei said.

"To say I am biased -- I won't dignify that with a response."

The IAEA agrees the uranium traces' origin was not Israeli and not part of Syria's declared inventory. Neither, it says, were similar uranium particles found later at a Damascus research reactor known to the IAEA and inspected once a year.

Syrian envoy Ibrahim Othman dismissed the second find on Thursday, telling IAEA governors it was a vestige of innocuous neutron experiments by physics students. A senior U.N. official told Reuters that Syria's explanations remained unsatisfactory.

ElBaradei, an Egyptian, will retire later this year after 12 years in office during which critics in Israel and the United States suggested he was "soft" on alleged nuclear proliferators.

ElBaradei denied that and suggested Israel's atomic might has added to Middle East instability by spurring others, like Iran, Israel's arch-enemy, to seek nuclear weapons capability.

(Additional reporting by Sylvia Westall; Editing by Charles Dick)

## **Syria: Damascus vows to work with nuclear watchdog**

*[EXCERPT]*

Vienna, 19 June [2009] (AKI) - A Syrian government representative on Friday [2009-06-19] reiterated that the site bombed by Israel in 2007 is not a nuclear facility and said Damascus would cooperate with the UN nuclear watchdog, the International Atomic Energy Agency.

"Al-Kiber military facility that was attacked by Israel back in 2007 is by no means used in nuclear activities," said Syria's representative at the IAEA, Ibrahim Othman during a media conference.

Othman, however, said that Israel should undergo an IAEA investigation to ensure the region was free of nuclear weapons.

Israel neither acknowledges nor denies having nuclear weapons. However it is believed that Israel's nuclear arsenal contains between 80 and 200 weapons.

According to Othman, the Syrian Research Centre's nuclear plant is not capable of enriching uranium as it only has a capability of 30 kilowatts.

In line with Syria's 2006 agreement with the IAEA, the plant was being supervised by the agency, Othman added.

He also said the plant is used for neutron activation and other research that are not related to nuclear energy.

## **Syria to cooperate with IAEA**

19th Jun 2009, 05:07 am.

Damascus (UNN) Syrian will cooperate with the International Atomic Energy Agency (IAEA) team scheduled to arrive in Syria soon, Syrian representative at IAEA Ibrahim Othman said on Friday.

"Al-Kiber military facility that was attacked by Israel back in 2007 is in no means used in nuclear activities," Othman said, commenting on IAEA Watchdog Chief Mohamed El-Baradei' remarks.

In a press statement, he said that Israel should undergo an IAEA investigation as well, to ensure that the region was nuclear-free.

Israel should have filed a complaint with the IAEA to see if Syria is actually enriching uranium instead of throwing accusations at Damascus, he said.

The nuclear power plant of the Syrian Research Center is not capable of enriching uranium as it is with a capability of 30 kilowatt, he said, adding that in line with Syria's 2006 agreement with the IAEA, the plant was being supervised by the agency.

The plant is used for neutron activation and other researches that are not related to nuclear energy./UNN

Ian Kelly  
Department Spokesman  
Daily Press Briefing  
Washington, DC  
June 24, 2009

[EXCERPTS]

QUESTION: Can you confirm that you decided to send an ambassador again in Syria and Venezuela?

MR. KELLY: I do have something for you on that. As you know, we're prepared to move forward with Syria to advance our interests through direct and continuing dialogue. Of course, you know that we continue to have concerns about Syria's role in this region. And we think one way to address those concerns is to have an ambassador in Damascus. So yesterday, we informed the Syrian charge d'affaires in Washington, and our charge d'affaires in Damascus informed the ministry of foreign affairs in Damascus of the Administration's decision to return an ambassador to Syria.

And this decision reflects the Administration's recognition of the important role Syria plays in the region. And of course, we hope that they will continue to play such a constructive role to promote peace and stability in the region.

You know, of course, that Acting Assistant Secretary Feltman and his NSC colleague Shapiro made several trips to Damascus, as did Senator Mitchell. And this is part of a natural evolution of our reengagement with Syria.

QUESTION: You said several trips. There were only two; correct?

MR. KELLY: Two, yeah. I meant two.

[deletia]

QUESTION: And is any thought being given to delisting Syria from the State Department's list of nations that sponsor terrorism?

MR. KELLY: No, not that I'm aware of.

[deletia]

QUESTION: If I can go back to Syria. Is the – did the situation in Iran help to take the decision to send somebody back to Damascus (inaudible)?

MR. KELLY: As I said before, I think this is just the natural culmination of an evolution of our reengagement with Syria.

QUESTION: There is no link whatsoever?

MR. KELLY: I'm not aware that there was any influence of the very dramatic situation going on in Iran.

*[deletia]*

QUESTION: On Syria, I just wanted to – Syria, just to finish up. If I'm not mistaken, you said that you hope that Syria will continue to play a constructive role?

MR. KELLY: Yeah.

QUESTION: Has it been playing a constructive role so far?

MR. KELLY: Well, without going into too much detail, I think you've seen some comments from people like General Odierno. I know that they have played a positive role in addressing some of our very real concerns about foreign fighters crossing from Syria. We've had some good discussions with them in those four different visits that we had to Damascus – the two visits, the Feltman/Shapiro delegation, the Mitchell visit, and then you had a CENTCOM visit as well. So yeah, I think that's a fair assessment.

QUESTION: Was there also a visit by another assistant secretary of state in connection with scouting locations for a new embassy in Damascus?

MR. KELLY: I'm not sure about that.

QUESTION: Could you take that as a question, please?

MR. KELLY: Yeah, sure.

QUESTION: Didn't Eric Boswell travel there about – a couple of months ago to check out the security situation in --

MR. KELLY: Yeah. It's ringing bells, but let me get back to you. I mean, we're scouting locations for a lot of different embassies.

## **State Designation of North Korean Nuclear Entity**

Bureau of Public Affairs  
Office of the Spokesman  
Washington, DC

**June 30, 2009**

The U.S. Department of State today targeted North Korea's nuclear proliferation network by designating Namchongang Trading Corporation (NCG) under Executive Order 13382. E.O. 13382 is an authority aimed at freezing the assets of proliferators of weapons of mass destruction and their supporters, and at isolating them from the U.S. financial and commercial systems. Entities designated under E.O. 13382 are prohibited from engaging in all transactions with any U.S. person and are subject to a U.S. asset freeze.

NCG is a North Korean nuclear-related company in Pyongyang. It has been involved in the purchase of aluminum tubes and other equipment specifically suitable for a uranium enrichment program since the late 1990s.

The Department of the Treasury also today designated Hong Kong Electronics, located in Kish Island, Iran, for providing support to North Korea's Tanchon Commercial Bank (Tanchon) and Korea Mining Development Trading Corporation (KOMID). Tanchon and KOMID were designated by the United States under E.O. 13382 on June 28, 2005 and the UN Security Council under Resolution 1718 on April 24, 2009.

North Korea's April 5, 2009 launch of a Taepo Dong-2 (TD-2) missile and May 25, 2009 nuclear test demonstrate a need for continued vigilance with respect to North Korea's activities of proliferation concern. The designations add to continuing U.S. efforts to prevent North Korean entities of proliferation concern from accessing financial and commercial markets that could aid the regime's efforts to develop nuclear weapons and the missiles capable of delivering them.

For additional information on the Department of the Treasury's designation of Hong Kong Electronics, please see: [www.treasury.gov/press](http://www.treasury.gov/press).

PRN: 2009/664

*[See sourcebook entry for 2008-05-11 for association of Namchongang Trading Corporation with Syrian nuclear work.]*

<http://www.iiss.org/recent-key-addresses/gary-samore-address/>

On Thursday, 9th July 2009, Gary Samore, Special Assistant to the President and White House Coordinator for Arms Control and Weapons of Mass Destruction, Proliferation, and Terrorism spoke on “The Obama Administration’s arms control and non-proliferation strategy”.

In February, Dr Gary Samore took up his duties to coordinate US government-wide efforts to combat weapons of mass destruction proliferation. As “Nonproliferation Czar,” Samore is a member of the National Security Council staff and his portfolio includes everything from nuclear and conventional arms control to threat reduction to nuclear terrorism.

<http://www.armscontrolverification.org/>

## **Gary Samore at IISS**

**Thursday, 9 July 2009**

Gary Samore today visited the IISS where he gave a spirited and forceful talk on the Obama Administration's priorities over the coming year. I'll try to type up my notes in a way that doesn't completely distort everything he said.

A began by stating an underlying assumption that is today guiding White House policy on non-proliferation and disarmament. Namely that proper containment of states wanting to cheat on their obligations under the 1968 Nuclear Non-Proliferation Treaty cannot be attained unless the regime is strengthened. The belief of the Administration is also that once the regime is shored up, it will be easier to deter or contain future cheaters.

*[deletia]*

He also encouraged the IAEA to use more of the authority that they already have, by for instance pushing for special inspections in Syria.

*[Sourcebook note and transcript: The remark concerning IAEA inspection of Syria comes at minute 30:40 – 31:00 in a video of the Q&A session following Dr. Samore's talk ( <http://www.iiss.org/recent-key-addresses/gary-samore-address/watch-the-qa-session/> ):*

*“The one other thing I would say on, you know, the IAEA, they already have a lot of inspection authority which sometimes isn't always used. In the case of Syria, for example, it seems to me there's a very strong grounds [sic] on which to seek a special inspection to investigate the extremely credible reports that Syria was pursuing a secret nuclear reactor project. And, you know, I hope that the IAEA decides to use the full extent of its authority.”]*

## **U.N. Sanctions Key Players in North Korea Weapons Program**

By JOE LAURIA and JAY SOLOMON

**JULY 17, 2009**

*[EXCERPT]*

A United Nations Security Council committee sanctioned five companies and five individuals from North Korea for taking part in nuclear and missile programs and the international spread of nuclear technology.

U.S. officials said the companies are key nodes in North Korea's weapons business and overall financial system.

The U.S. expressed confidence that Thursday's measures would help slow North Korea's progress in its nuclear-weapons and ballistic-missile programs as well as its proliferation efforts.

"We are pleased with the new international sanctions agreed upon today in response to North Korea's nuclear tests and recent missile activity," said Susan Rice, the U.S. ambassador to the U.N. "These new designations ... will serve to constrain North Korea from engaging in transactions or activities that could fund its WMD [weapons of mass destruction] or proliferation activities."

The five companies named will have their assets frozen and will be blocked from doing any foreign business. The individuals named also will have their assets frozen and won't be allowed to enter nations that comply with the sanctions.

Officials said they hope that by blacklisting a few key North Korean firms, Pyongyang's ability to conduct financial transactions internationally could be severely restricted.

The U.S. had initially proposed 15 companies to be sanctioned, but after negotiations, primarily with China, the list was reduced to five. A U.S. official said Washington was satisfied with the reduced number. U.S. and U.K. officials said they had no evidence that China was a trading partner with any of the 10 companies it ruled out.

North Korea carried out its second nuclear-weapons test on May 25 and fired seven ballistic missiles over the Independence Day weekend. A Security Council resolution passed last month gave authority to countries to monitor and inspect suspect cargo ships. It also gave the Security Council committee the authority to name individuals and companies, as it did Thursday.

U.S. officials say one of the blacklisted companies, Namchongang Trading Corp., a subsidiary of North Korea's General Bureau of Atomic Energy, played a central role in Syria's alleged efforts to build a nuclear reactor along the Euphrates River. Syria denied it had a nuclear program. Israeli warplanes destroyed the site in late 2007.

"Namchongang's proliferation activities are of grave concern given the DPRK's past proliferation activities," the committee said, referring to North Korea by its formal name, the Democratic People's Republic of Korea.

The company's director, Yun Ho Jin, was among the individuals sanctioned. Mr. Yun served as a senior North Korean diplomat at the International Atomic Energy Agency during the 1990s, according to U.S. officials. It wasn't possible to reach him for comment.

## Security Council

### SC/9708

---

16 July 2009

#### **SECURITY COUNCIL COMMITTEE DETERMINES ENTITIES, GOODS, INDIVIDUALS SUBJECT TO MEASURES**

#### **IMPOSED ON DEMOCRATIC PEOPLE'S REPUBLIC OF KOREA BY RESOLUTIONS 1718 (2006)**

On 16 July 2009, pursuant to paragraph 24 of resolution 1874 (2009), the Security Council Committee established pursuant to resolution 1718 (2006) designated entities; determined goods; and designated individuals to be subject to the measures imposed in paragraph 8 of resolution 1718 (2006) as follows:

A) **Entities** designated to be subject to the measures imposed in paragraph 8(d) of resolution 1718 (2006):

#### **1. NAMCHONGANG TRADING CORPORATION**

· **Description:** Namchongang is a Democratic People's Republic of Korea trading company subordinate to the General Bureau of Atomic Energy (GBAE). Namchongang has been involved in the procurement of Japanese-origin vacuum pumps that were identified at a Democratic People's Republic of Korea nuclear facility, as well as nuclear-related procurement associated with a German individual. It has further been involved in the purchase of aluminium tubes and other equipment specifically suitable for a uranium enrichment programme from the late 1990s. Its representative is a former diplomat who served as Democratic People's Republic of Korea's representative for the International Atomic Energy Agency (IAEA) inspection of the Yongbyon nuclear facilities in 2007. Namchongang's proliferation activities are of grave concern given the Democratic People's Republic of Korea's past proliferation activities.

· **Location:** Pyongyang, Democratic People's Republic of Korea.

· **A.K.A.:** NCG; NAMCHONGANG TRADING; NAM CHON GANG CORPORATION; NOMCHONGANG TRADING CO.; NAM CHONG GAN TRADING CORPORATION

#### **2. HONG KONG ELECTRONICS**

· **Description:** owned or controlled by, or acts or purports to act for or on behalf of Tanchon Commercial Bank and KOMID. Hong Kong Electronics has transferred millions of dollars of proliferation-related funds on behalf of Tanchon Commercial Bank and KOMID (both designated by the Committee in April 2009) since 2007. Hong Kong Electronics has facilitated the movement of money from Iran to the Democratic People's Republic of Korea on behalf of KOMID.

· **Location:** Sanaee St., Kish Island, Iran.

· **A.K.A.:** HONG KONG ELECTRONICS KISH CO.

### 3. KOREA HYOKSIN TRADING CORPORATION

- **Description:** a Democratic People's Republic of Korea company based in Pyongyang that is subordinate to Korea Ryonbong General Corporation (designated by the Committee in April 2009) and is involved in the development of weapons of mass destruction.
- **Location:** Rakwon-dong, Pothonggang District, Pyongyang, Democratic People's Republic of Korea.
- **A.K.A.:** KOREA HYOKSIN EXPORT AND IMPORT CORPORATION

### 4. General Bureau of Atomic Energy (GBAE)

- **Description:** The GBAE is responsible for the Democratic People's Republic of Korea's nuclear programme, which includes the Yongbyon Nuclear Research Centre and its 5 MWe (25 MWt) plutonium production research reactor, as well as its fuel fabrication and reprocessing facilities. The GBAE has held nuclear-related meetings and discussions with the International Atomic Energy Agency. GBAE is the primary Democratic People's Republic of Korea Government agency that oversees nuclear programmes, including the operation of the Yongbyon Nuclear Research Centre.
- **Location:** Haeudong, Pyongchen District, Pyongyang, Democratic People's Republic of Korea.
- **A.K.A.:** General Department of Atomic Energy (GDAE)

### 5. Korean Tangun Trading Corporation

- **Description:** Korea Tangun Trading Corporation is subordinate to Democratic People's Republic of Korea's Second Academy of Natural Sciences and is primarily responsible for the procurement of commodities and technologies to support Democratic People's Republic of Korea's defence research and development programmes, including, but not limited to, weapons of mass destruction and delivery system programmes and procurement, including materials that are controlled or prohibited under relevant multilateral control regimes.
- **Location:** Pyongyang, Democratic People's Republic of Korea.

B) **Goods** determined to be subject to the measures imposed in paragraph 8(a)(ii) of resolution 1718 (2006):

- 1) "Graphite designed or specified for use in Electrical Discharge Machining (EDM) machines"
- 2) "Para-aramid fiber (Kevlar and other Kevlar-like), filament and tape"

C) **Individuals** designated to be subject to the measures imposed in paragraphs 8 (d) and (e) of resolution 1718 (2006):

**1. Yun Ho-jin:** Director of Namchongang Trading Corporation; oversees the import of items needed for the uranium enrichment programme. (Additional information: born 13 October 1944; also known as Yun Ho-chin)

**2. Ri Je-son:** Director of the General Bureau of Atomic Energy (GBAE), chief agency directing Democratic People's Republic of Korea's nuclear programme; facilitates several nuclear endeavours including GBAA's management of Yongbyon Nuclear Research Centre and Namchongang Trading Corporation. (Additional information: born 1938; also known as Ri Che-son)

**3. Hwang Sok-hwa:** Director in the General Bureau of Atomic Energy (GBAE); involved in Democratic People's Republic of Korea's nuclear programme; as Chief of the Scientific Guidance Bureau in the GBAA, served on the Science Committee inside the Joint Institute for Nuclear Research.

**4. Ri Hong-sop:** Former director, Yongbyon Nuclear Research Centre, oversaw three core facilities that assist in the production of weapons-grade plutonium: the Fuel Fabrication Facility, the Nuclear Reactor, and the Reprocessing Plant. (Additional information: born 1940)

**5. Han Yu-ro:** Director of Korea Ryongaksan General Trading Corporation; involved in Democratic People's Republic of Korea's ballistic missile programme.

The lists of entities, goods and individuals are available on the Committee's website <http://www.un.org/sc/committees/1718/index.shtml>.

## **US military team in Syria for security talks**

by Staff Writers  
Damascus (AFP)  
Aug 12, 2009

A senior American military delegation arrived in Syria on Wednesday for talks on regional security, the second such visit in nearly two months, a US diplomatic source said.

Major General Michael Moeller of the US Central Command (CENTCOM) is heading the delegation which also includes Frederic Hof, the deputy to US Middle East special envoy George Mitchell who was in Damascus on July 26.

"The focus is on continuing dialogue concerning opportunities for cooperation on regional security matters," the US source said, without elaborating.

A US military delegation held talks with Syrian officials in Damascus in June -- the first visit of its kind since 2004 -- pro-government media and the American embassy said at the time.

Al-Watan newspaper said the June 13 visit came "at the request of the Americans" and focused on "ways to begin cooperation on security matters between the two parties in Iraq." However, the US embassy did not mention Iraq.

"Several similar requests in previous years were rejected by Syria because of the absence of the necessary political will for such cooperation," Al-Watan said.

Since coming to office in January, US President Barack Obama has moved cautiously to improve relations with Syria, mindful of its influential role in the region.

Mitchell has been on two trips to Damascus in recent weeks to meet President Bashar al-Assad, most recently on July 26 when their talks focused on efforts to relaunch the Arab-Israeli peace process.

Mitchell is the highest-ranking US official to visit Syria since Obama took office, and his trip was preceded by several delegations, including lawmakers.

US-Syrian relations were strained under the administration of former US president George W. Bush, amid charges by Washington that Syria was interfering in Lebanon and allowing fighters to infiltrate into Iraq.

On June 24 Washington announced its decision to send an ambassador back to Damascus to replace the envoy who was recalled in 2005 after the assassination in Beirut of Lebanon's former prime minister Rafiq Hariri.

The killing was widely blamed on Syria although Damascus has steadfastly denied any involvement.

## **Strengthening the Nuclear Nonproliferation Regime: A Blueprint for Progress**

Susan F. Burk

Special Representative of the President for Nuclear Nonproliferation

Geneva Center for Security Policy

Geneva, Switzerland

August 12, 2009

(As prepared remarks)

*[EXCERPT]*

### **Introduction**

Thank you very much for inviting me to speak to you this evening on the subject of strengthening the international nuclear nonproliferation regime. This is an objective that the Obama Administration has embraced as one of its highest priorities, and we are engaged in an ambitious effort to address proliferation challenges and opportunities to strengthen the global regime. Being ambitious means the way ahead will be difficult, but there is little of value that comes easily, and we have opportunities now to make real progress if all states work together to take advantage of them.

Let me start with a review of the challenges we are facing today within the nonproliferation regime. Then, to address the way forward, I will use the three pillars of the Nuclear Nonproliferation Treaty, or NPT, as the structure for describing various measures the United States believes the international community has available to buttress the NPT and the broader regime.

### **Challenges**

For years, membership in the NPT grew steadily, and with it a certain complacency about the strength of the Treaty, except – for some – regarding the pace of nuclear disarmament by the nuclear weapon state parties – the United States, United Kingdom, France, Russia and China. In part, this was because to the best of anyone’s knowledge, the non-nuclear weapon states party to the NPT were meeting their obligations; there was nothing to talk about.

But this complacency was shattered with the 1991 discovery of Iraq’s clandestine nuclear activities during the first Gulf War, in violation of the NPT. This, coupled with the declaration by the IAEA in 1993 that they were unable to verify the exclusively peaceful use of nuclear material in the Democratic People’s Republic of Korea (DPRK), leading it to announce its plans to withdraw from the Treaty, further signaled the need for States Parties to pay attention to issues of compliance.

More recent developments underline the gravity of the nonproliferation challenge today. We have witnessed growing commercial availability of sensitive nuclear technology, as demonstrated by the activities earlier this decade of the global criminal network led by A.Q. Khan; North Korea’s announced withdrawal from the NPT, even as it pursued a nuclear weapons program; the difficulties in bringing either North Korea or Iran into compliance with the NPT, even after their violations had been discovered and formally reported by the International Atomic Energy Agency (IAEA); and the limitations of international safeguards exposed, for example, by the construction of a covert nuclear reactor in Syria.

All of which leads to a final challenge which is the perception on the part of some that the NPT is approaching collapse and that further proliferation is inevitable; we must simply learn to live with it. This is a view that is wrong and must be refuted.

*[deletia]*

Public Discussion on

**"Strengthening the Nuclear Non-Proliferation Regime:  
A Blueprint for Progress"**

Ambassador Susan F. Burk

Special Representative of the US President for Nuclear Nonproliferation

Chair

Ambassador Jürg Streuli

Permanent Representative of Switzerland to the Conference on Disarmament and  
Member of the Foundation Council of the GCSP

President Obama has been advocating for nuclear disarmament since his speech in Prague last April. He laid out an extensive arms control plan whereby the US would ratify the Comprehensive Nuclear Test Ban Treaty, and promote an early negotiation of a verifiable Fissile Material Cut-off Treaty (FMCT). He and his Russian counterpart, Dmitry Medvedev, have also undertaken to look into further reductions of their nations' nuclear arsenals. Thus, the United States has placed a high priority on strengthening the Treaty on the Non-Proliferation of Nuclear Weapons (NPT) in cooperation with the other State Parties through a treaty review that is balanced between its three pillars. Ambassador Burk, as the Permanent Representative of the President for Nuclear Nonproliferation, has a leading role in preparing the May 2010 NPT Review Conference. This is her first visit to Geneva since assuming her new position and it will offer an interesting opportunity for an engaging discussion.

Wednesday 12 August 2009  
18:30 - 20:00

*A light cocktail will be served at 18:00 in the GCSP reception area*

Registration Closed

**Sergio Vieira de Mello Auditorium**  
Geneva Centre for Security Policy  
2nd floor, WMO/OMM Building  
Avenue de la Paix 7bis  
(Identity document required to enter the venue)

## Board of Governors

**GOV/2009/56**  
Date: 28 August 2009

Item 6(e) of the provisional agenda  
(GOV/2009/58)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. On 5 June 2009, the Director General reported to the Board of Governors on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic (Syria) (GOV/2009/36). The Board requested the Director General to keep it informed of developments, as appropriate. This report covers relevant developments since that date.
2. As the Board will recall, on 2 June 2008, the Director General informed the Board of Governors that, in May of that year, the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria destroyed by Israel in September 2007 had been a nuclear reactor. That information further alleged that the reactor was under construction but not operational at the time of its destruction, and that it had been built with the assistance of the Democratic People's Republic of Korea (DPRK).
3. The Agency visited the site on 23 June 2008, during which time, inter alia, environmental samples were taken. Analysis of the samples indicated the presence of particles of anthropogenic<sup>1</sup> natural uranium of a type not included in Syria's declared inventory of nuclear material. Syria has maintained that the building was destroyed by Israel and had been a military non-nuclear installation, and that Syria has not had nuclear cooperation with the DPRK (GOV/2009/36, para. 15). Syria has also stated that the origin of the anthropogenic natural uranium particles was the munitions used to destroy the building. In this context, Israel has not responded to the Agency's 20 May 2009 request for specific information needed to confirm whether the munitions used in the destruction of the building could have been the source of the anthropogenic natural uranium particles (GOV/2009/36, para. 7).
4. The Agency has repeatedly requested to have substantive discussions with Syria on the nature of the destroyed building, and to share with Syria satellite imagery and other information available to the Agency. Syria has thus far declined to have such discussions. While the Agency has continued its verification activities, its ability to confirm Syria's explanation regarding the past nature of the destroyed building at the site (GOV/2008/60, para. 1) is severely impeded because Syria has not provided sufficient access to information, locations, equipment or materials.

<sup>1</sup> "Anthropogenic" refers to material that has been produced as a result of chemical processing.

5. As reported in the previous report to the Board of Governors, in a letter dated 4 June 2009, the Agency requested further clarification from Syria regarding the purpose of water pumping equipment seen at the Dair Alzour site, and the procurement of large quantities of graphite and barium sulphate, which Syria has stated were acquired for civilian and non-nuclear related uses (GOV/2009/36, para. 14). The Agency reiterated its request in a letter dated 23 July 2009. In a letter dated 13 August 2009, Syria responded to the Agency's letter of 4 June 2009, inter alia, reaffirming its earlier statements concerning the destroyed building and the Dair Alzour site infrastructure. Syria added that the October 2007 cancellation of the remaining supply of barium sulphate was unrelated to the destruction of the building at the Dair Alzour site. With the limited information provided by Syria, the Agency is not in a position to confirm Syria's statements regarding the purpose of the procurement of this equipment and material.

6. As indicated in the Director General's February 2009 report (GOV/2009/9, para. 7), the Agency has assessed that there is a low probability that the anthropogenic natural uranium particles found in samples taken from the Dair Alzour site were introduced by use of the missiles used to destroy the building on that site as asserted by Syria. In its 4 June 2009 letter, and again in its 23 July 2009 letter, the Agency requested access to the locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment may have been and/or are located, for the purpose of taking samples and assessing the nature of the building (GOV/2009/36, para. 4).

7. In the letters dated 4 June 2009 and 23 July 2009, the Agency also reminded Syria of its earlier request for access to three other locations allegedly functionally related to the Dair Alzour site, suggesting that modalities be agreed in advance with Syria for the protection of any sensitive information related to the Dair Alzour site and the three other locations.

8. In its letter dated 13 August 2009, Syria also stated that the destroyed building had been under construction at the time of the bombing and, hence, could not have been the source of the anthropogenic natural uranium particles collected in the environmental samples. Syria also added that due to the disposal of the debris from the site, it was impossible to meet the Agency's request for access to the debris as the Agency's request had been made more than a year after the destruction of the building by Israel.

9. In that same letter, Syria stated that it had provided all the information it had regarding the questions raised by the Agency concerning the Dair Alzour site and that it did not accept that the anthropogenic natural uranium particles found in the environmental samples could be considered undeclared nuclear material. Syria also reiterated that, due to the military and non-nuclear nature of the Dair Alzour site and the three other locations, it had no obligation to provide more information under its Safeguards Agreement with the Agency. Syria emphasised its resolve to continue its cooperation with the Agency in accordance with its Safeguards Agreement and the Agency's Statute, provided that "this cooperation never infringes on the confidentiality of its defence capabilities, its sovereignty and its national security". The Agency is continuing its assessment of the information provided by Syria.

10. In relation to the presence of anthropogenic natural uranium particles at the Miniature Neutron Source Reactor (MNSR) in Damascus (GOV/2009/36, para. 17), Syria provided additional explanations about the possible origin of the particles in a letter dated 8 June 2009. In that letter, Syria stated its view that the natural uranium particles had resulted from the accumulation of sample and reference materials used in neutron activation analysis. In support of its statement, Syria provided a list of standard reference materials used in those activities and some information on a related shielded transport container.

11. On 8 July 2009, the Agency performed a physical inventory verification (PIV) at the MNSR during which environmental samples were taken, as well as samples from the materials which Syria stated were the source of the anthropogenic natural uranium particles. The Agency is awaiting the results of the analyses of the samples.

## Summary

12. Syria has cooperated with the Agency in its verification activities at the MNSR. The Agency is currently analysing samples taken at the MNSR.

13. Syria has not yet provided the necessary cooperation to permit the Agency to determine the origin of the anthropogenic natural uranium particles found in samples taken at the Dair Alzour site. Syria also did not cooperate with the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building on the Dair Alzour site and to determine what, if any, functional relationship existed between the Dair Alzour site and three other locations or to substantiate Syria's claims regarding certain procurement efforts and its alleged foreign nuclear cooperation.

14. Syria has asserted that, in accordance with its Safeguards Agreement, it is under no obligation to provide further information concerning the Dair Alzour site or the other locations because of their military nature not related to any nuclear activities. However, as the Agency has previously explained to Syria, there is no limitation in comprehensive Safeguards Agreements on Agency access to information, activities or locations simply because they may be military related. The fact that the Agency has found particles of nuclear material of a type which is not in the declared inventory of Syria underscores the need to pursue this matter.

15. The Director General urges Syria to cooperate with the Agency in its verification activities so that, in accordance with its mandate under Syria's Safeguards Agreement, the Agency is able to ensure that safeguards are applied to all source and special fissionable material in all peaceful nuclear activities. Recognizing Syria's concerns about the sensitivity of certain information and locations, the Director General urges Syria to engage with the Agency to establish the necessary modalities for managed access to such information and locations to enable the Agency to establish the facts and make progress in its verification, while protecting Syria's sensitive military and other information at relevant locations. The Director General also calls on other States, including Israel, which may possess information relevant to the Agency's verification, including information which may have led them to conclude that the installation in question at the Dair Alzour site had been a nuclear reactor, to make such information available to the Agency.

16. The Director General will continue to report as appropriate.

## **Little progress in Syrian nuclear probe: UN official**

(AFP)

19 hours ago [Retrieved 20090829T15:30Z]

*[EXCERPT]*

VIENNA, Austria — The UN atomic watchdog has been unable to make much progress in its investigation into alleged illicit nuclear activities in Syria, a senior UN official said Friday.

"There's not much progress, if anything," the official said in response to a new report by the International Atomic Energy Agency on its probe into allegations that Damascus had been building a covert nuclear reactor at a remote desert site until it was bombed by Israeli planes in September 2007.

*[deletia]*

## **Statements of the Director General**

7 September 2009 | Vienna, Austria  
IAEA Board of Governors

### **Introductory Statement to the Board of Governors by IAEA Director General Dr. Mohamed ElBaradei**

*[EXCERPT]*

#### **Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

The Agency has continued to investigate allegations concerning the destroyed building on the Dair Alzour site in Syria.

Syria has cooperated with the Agency in its verification activities at the Miniature Neutron Source Reactor in Damascus. However, Syria has not yet provided the necessary cooperation to permit the Agency to determine the origin of the anthropogenic natural uranium particles found in samples taken at the Dair Alzour site. Syria has not cooperated with the Agency to enable the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building on the Dair Alzour site, nor has it provided the required access to information, locations, equipment or materials.

I urge Syria to cooperate with the Agency in its verification activities related to the nature of the Dair Alzour site. It is in Syria's interest to enable the Agency to corroborate its statements. I also call on other States which may possess information relevant to the Agency's verification to make such information available to the Agency.

## Israeli official doubts Syria's clout on Hezbollah

Tue Sep 8, 2009 4:37pm EDT

*[EXCERPTS]*

JERUSALEM, Sept 8 (Reuters) - Syria may not be able to curb Lebanon's Hezbollah guerrillas, a senior Israeli official said on Tuesday, casting doubt on the feasibility of a long-standing Israeli condition for a peace deal with Damascus.

Syria, which pursued indirect negotiations with Israel last year, rejected the demand that it distance itself from Hezbollah and Iran. Syria, for its part, wants an Israeli undertaking to return the occupied Golan Heights. Israel has balked at this.

Amos Gilad, a top adviser to Israeli Defence Minister Ehud Barak, told an international security conference at the Herzliya Interdisciplinary Centre that Iran's influence over Shi'ite Hezbollah appeared to be far greater than that of neighbouring Syria.

*[deletia]*

The prospect of renewed cross-border rocket salvos by Hezbollah could impact on any plan by Israel to attack Iran pre-emptively. Iran, which denies seeking the bomb, has vowed widespread retaliation should its nuclear facilities be struck. Assumed to have the Middle East's only atomic arsenal, Israel bombed a Syrian site in 2007 which the CIA described as a secret nuclear reactor. Damascus denied having such a facility.

"There is no nuclear threat to Israel right now because Libya gave up its nuclear programme (in 2003)," Gilad said. Syria, we can say, also has given up its (nuclear) option, involuntarily. Iran does not have it yet."

(Writing by Dan Williams, Editing by Myra MacDonald)

**Statement by EU Presidency to IAEA Board of Governors - Syria (09/09/2009)**

Swedish Presidency of the EU

**LOCATION** Vienna

**SPEAKER** EU Presidency

**EVENT** IAEA Board of Governors

**DATE** 09/09/2009

The EU Presidency issued a statement on Syria during the IAEA Board of Governors meeting in Vienna.

Implementation of the NPT-safeguards agreement in the Syrian Arab Republic

Madam Chair,

1. I have the honour to speak on behalf of the European Union. [The candidate countries Turkey, Croatia, the former Yugoslav Republic of Macedonia,[1] the Countries of the Stabilization and Association process and potential candidates Albania, Bosnia and Herzegovina, Montenegro and Serbia, the EFTA countries Iceland, Liechtenstein and Norway, members of the European Economic Area, as well as Ukraine, the Republic of Moldova, Armenia, Azerbaijan and Georgia associate themselves with this statement].

2. The European Union thanks the Director General for his report on the Implementation of NPT-safeguards in Syria (document GOV/2009/56).

3. The EU notes that Syria has cooperated with the IAEA in its verification activities at the Miniature Neutron Source Reactor in Damascus and awaits with interest the IAEA's assessment of the results of the samples taken there in July.

4. However, the EU remains concerned about the fact that Syria has still not provided the IAEA with all the additional information and supporting documentation about the origin of the anthropogenic natural uranium particles found at the Dair Alzour site, nor allowed access to all the locations requested by the Agency. Syria has also failed to engage in substantive discussions with the IAEA concerning the structure of the destroyed building and certain apparently nuclear related procurement activities.

The EU shares the Director General's position that, in this situation, the declared military nature of the Dair Alzour site does not preclude further investigations by the Agency.

5. The EU agrees with the Agency about the necessity to establish the origin of the particles of nuclear material of a type which is not in Syria's declared inventory. In the absence of the necessary co-operation with the IAEA the completeness and correctness of Syria's declarations under its Comprehensive Safeguards Agreement would clearly remain in doubt.

6. The EU therefore calls upon Syria to cooperate with the Agency to establish modalities which will allow IAEA access to relevant information and locations while protecting sensitive military information.

7. Safeguards Agreements should be implemented in full. It is the obligation of each state with a Comprehensive Safeguards Agreement in force to declare all its nuclear installations and material and to report on any new nuclear facility to the Agency once the decision on its construction is taken.

8. The EU calls upon Syria to provide the IAEA with all the information and documentation requested by the Agency. The EU also calls upon Syria to sign and ratify the Additional Protocol as soon as possible as a means to strengthen the confidence of the international community about the peaceful nature of Syria's nuclear activities.

9. Finally, Madam Chair, the EU joins the Director General in calling upon other states, which may possess information relevant to the verification of Syria's Safeguards Agreement, to provide the Agency with all such information.

Thank you, Madam Chair

[1] Croatia and the Former Yugoslav Republic of Macedonia continue to be part of the Stabilisation and Association Process

## **Schulte: Syria may have more nuke sites**

By JPOST.COM STAFF

Sep 10, 2009 15:25 | Updated Sep 11, 2009 7:54

*[EXCERPT]*

Syria may be operating more nuclear sites, apart from the reactor at Deir Azour which was bombed by Israel on September 6, 2007 in what came to be known as Operation Orchard, former US envoy to the International Atomic Energy Agency (IAEA), Gregory Schulte told Channel 10 Thursday evening *[2009-09-10]*.

"I think there were other activities that gave us concern, that gave the IAEA concern... IAEA inspectors actually asked to go to a number of other sites, and the Syrians wouldn't let them go there; they claimed they were military sites. They claimed the uranium particles that the inspectors found at the destroyed reactor came from Israeli bombs," Schulte said.

In the past, the Syrian accusation was brushed aside both by the IAEA and Israel, as the uranium used to strengthen the metal of shells is of a different type than the uranium used in producing nuclear energy.

Schulte went on to criticize the conduct of Mohammed ElBaradei, the Egyptian-born outgoing IAEA chief who has been accused by Israel many times of being biased.

"I tell you Mohammed ElBaradei was not happy ... he was mad at Israel, he was mad at the United States; he didn't express any discontent about Syria," he said.

Schulte added that ElBaradei issued a statement following Operation Orchard, "where he sort of deplored Israel's unilateral action, he deplored the late provision of intelligence which was a direct slap at the United States."

*[deletia]*

## 'Nuclear-free zone impossible in anti-Israel Mideast'

By Yossi Melman and Zvi Bar'el, Haaretz Correspondents and Haaretz Service

Last update - 20:27 15/09/2009

The chairman of Israel's Atomic Energy Commission on Tuesday told the international community that a nuclear-free Middle East requires a change in regional attitude toward Israel.

In an address to the International Atomic Energy Association in Vienna, Shaul Chorev emphasized Israel's stance that it was prepared in principle to commit to a Middle East free of nuclear weapon.

Chorev also reiterated that Israel has repeatedly asserted it would not be the first to introduce nuclear weapons into the region.

"It is our vision and policy to establish the Middle East as a mutually verifiable zone free of weapons of mass destruction and their delivery," Chorev told delegates.

While Israel firmly supports control of nuclear arms, said Chorev, such a move cannot be imposed on the Middle East from the outside.

"It is the firm view and the policy of Israel, that the right to use nuclear energy for peaceful purposes is based on the absolute duty of each state not to abuse this right," said Chorev.

"As the international community has accepted and recognized in other regions, the establishment of such a zone can only emanate from within the region," he said.

Chorev stressed that in order for the Middle East to function as a nuclear-free zone, the Arab states in the region needed to alter that approach to Israel.

"Progress toward realizing this vision cannot be made without a fundamental change in regional circumstances, including a significant transformation in the attitude of states in the region toward Israel," he said.

"The constant efforts by member states in the region to single out the State of Israel in blatantly anti-Israel resolutions in this General Conference is a clear reflection of such hostile attitude.

He also emphasized that many states that are party to the international non-proliferation treaty have violated their commitments. "The most widely recognized cases of non-compliance with legally binding non-proliferation obligations have occurred in the Middle East, by states that are parties to the NPT.

"Grave and overt violations by Iran and Syria had been detected and then formally reported by the IAEA," he added. "The Agency's investigations in these two countries have been hampered by a continued lack of cooperation, denial of access and efforts to conceal and mislead the inspectors."

Chorev promised that Israel was following these developments with "profound concern" and would "assist the international community in its efforts to prevent dangerous proliferation of nuclear weapons, and the abuse of the right to peaceful nuclear energy."

"The activities of these countries that breach their international commitments and obligations must be met with concrete and immediate international measures," he said. "Violations cannot go unpunished."

During Chorev's address, representatives every Arab state save Jordan and Egypt walked out of the auditorium.

Swedish Presidency of the European Union

## EU Statement at the IAEA 53rd General Conference

Published  
17 September  
10:35

*[EXCERPTS]*

Statement by Sweden on behalf of the European Union by State Secretary Åsa-Britt Karlsson. International Atomic Energy Agency 2009 General Conference 53rd Session, Vienna

Madam President,

1. I have the honour to speak on behalf of the European Union. The candidate countries Croatia, the former Yugoslav Republic of Macedonia, the countries of the Stabilization and Association process and potential candidates Albania, Bosnia and Herzegovina and Montenegro, the EFTA countries Iceland and Norway, members of the European Economic Area, as well as Ukraine and the Republic of Moldova associate themselves with this statement.

*[deletia]*

Syria

15. The EU continues to be concerned about the possibility that Syria has not declared all its nuclear material and installations, which calls into question the completeness and correctness of Syria's declarations under its Comprehensive Safeguards Agreement. The EU calls upon Syria to provide IAEA with all the information and supporting documentation, as well as with access to all relevant sites, as requested by the Agency. The EU also calls upon Syria to sign and ratify the Additional Protocol as soon as possible as a means to strengthen the confidence of the international community about the peaceful nature of Syria's nuclear activities.

*[deletia]*

## **Iran President: We have no need for nuclear weapons**

By Reuters and AP

Last update - 11:50 18/09/2009

*[EXCERPT]*

Meanwhile Thursday, IAEA member states agreed to call for a Middle East free of nuclear arms, with more countries supporting the resolution than last year.

At the IAEA's annual general conference, 103 countries voted in favor, none against. Only four abstained - including the United States and Israel. Last year, 13 countries abstained on a similar resolution.

Consensus on the resolution was reached only after an indirect reference to Iran and Syria was included in Egypt's draft text.

A deal was reached in discussions in the last days involving Egypt, Israel, Sweden - holding the current European Union presidency - and the United States, according to diplomats.

Alluding to Iran and Syria, the final text of the adopted resolution called on all states in the Middle East to "to cooperate fully with the IAEA within the framework of their respective obligations."

The IAEA said in a recent report that it has made no headway in confirming whether Iran conducted research related to nuclear weapons in the past.

The Vienna-based nuclear agency has also been trying in vain to get more access to Syria, in order to verify whether a site bombed by Israel in 2007 was indeed a secret nuclear reactor under construction.

"We are very pleased with the agreed approach reflected here today in the discussions that we've had on this issue this week," U.S. ambassador Glyn Davies said.

US Ambassador to IAEA dissatisfied with level of cooperation with Iran (INTERVIEW)

28.09.2009 09:00

## **US Ambassador to IAEA dissatisfied with level of cooperation with Iran (INTERVIEW)**

Azerbaijan, Baku, Sept. 26

Trend News, E.Ostapenko, T.Konyayeva/

The United States Permanent Representative to the International Atomic Energy Agency (IAEA), Glyn Davies spoke with Trend News Persian Desk in an exclusive interview.

*[EXCERPT]*

Q: Before this, Egypt and Syria gave the information on the traces of enriched uranium to the IAEA. Are the discussions and investigations of this matter still kept going?

A: The IAEA has issued four reports relating to Syria's nuclear activities since the Al-Kibar reactor was destroyed in September 2007.

While we cannot discuss the report in detail, the IAEA Director General makes clear that Syria has unfortunately chosen to continue to deny the Agency the access and cooperation necessary to address its outstanding questions about Syria's nuclear activities.

It has been over a year since Syria allowed a one-time visit of IAEA inspectors to the al Kibar site and has yet to provide any access to additional suspected sites. Syria has also not yet allowed Agency inspectors access to the debris and equipment removed from al Kibar.

For the Agency to answer the multiple outstanding questions related to scope of Syria's clandestine nuclear activities, it is essential that Syria fully cooperate with the IAEA, including by granting inspectors access to the Al-Kibar facility and other suspected sites.

This access is important regardless of the results of the follow-up inspection at the separate declared facility.

As for Egypt, we expect and have every confidence that any questions that may have arisen will be addressed as appropriate by the IAEA and Egypt.

## **Mikdad continues his meetings with US officials on aspects of bolstering Syria-US dialogue**

**Sep 30, 2009**

Washington DC, (SANA) – Deputy Foreign Minister Dr. Fayssal Mikdad continued on Wednesday [2009-09-30] his meetings in Washington as he held talks at the White House with Deputy National Security Advisor to the US President Thomas Donilon on aspects of bolstering the current dialogue between Syria and the US aiming at developing bilateral relations between the two countries, in addition to several regional issues.

Dr. Mikdad also completed his talks at the US State Department where he met Assistant Secretary of State for Near East Affairs Geoffrey Feltman where they discussed issues of mutual interest.

Earlier, the Deputy Foreign Minister met at the Congress headquarters United States House Permanent Select Committee on Intelligence Vice Chairman Alcee Hastings and Deputy National Security Advisor to the Vice President Brian McKeon.

The meetings were attended by Syria's Ambassador in Washington Dr. Imad Mustafa.

Dr. Mikdad began on Tuesday an official visit to the US capital Washington DC upon the invitation of the US Department of State. He discussed with Deputy Secretary of State for Management and Resources Jacob J. Lew the bilateral relations and means for developing them, in addition to discussing regional issues of mutual interest.

The meeting was attended by Acting Assistant Secretary for Near Eastern Affairs Jeffrey D. Feltman. A plenary meeting followed, attended by representatives of various US departments and agencies. The meeting dealt with bilateral relations between the two countries and how to address them.

Dr. Mikdad also met with a group of US Congress figures that included Chairman of the House Committee on Foreign Affairs Howard Berman, member of the Senate Committee on Foreign Relations Ted Kaufman, and Congressman Nick Rahall.

## Remarks at the United States Institute of Peace

Hillary Rodham Clinton  
Secretary of State  
Renaissance Mayflower Hotel  
Washington, DC  
October 21, 2009

[EXCERPT]

[deletia]

The International Atomic Energy Agency doesn't have the tools or authority to carry out its mission effectively. We saw this in the institution's failure to detect Iran's covert enrichment plant and Syria's reactor project. Illicit state and non-state proliferation networks are engaging in sensitive nuclear trade and circumventing laws designed to protect us against the export and import of nuclear materials.

[deletia]

Enhancing the IAEA's capabilities to verify whether states are engaging in illicit nuclear activity is essential to strengthening the nonproliferation regime. The IAEA's additional protocol, which allows for more aggressive, short-notice inspections should be made universal, through concerted efforts to persuade key holdout states to join.

Our experience with Iraq's nuclear program before the 1991 Gulf War showed that the IAEA's rights and resources needed upgrading. The additional protocol is the embodiment of those lessons. A failure to make this protocol the global standard means the world will have failed to heed the lessons of history at our collective peril. The IAEA should make full use of existing verification authorities, including special inspections. But it should also be given new authorities, including the ability to investigate suspected nuclear weapons-related activities even when no nuclear materials are present. And if we expect the IAEA to be a bulwark of the nonproliferation regime, we must give it the resources necessary to do the job.

Improving the IAEA's ability to detect safeguard violations is not enough. Potential violators must know that if they are caught, they will pay a high price. That is certainly not the case today. Despite American efforts, the international community's record of enforcing compliance in recent years is unacceptable. Compliance mechanisms and procedures must be improved. We should consider adopting automatic penalties for violation of safeguards agreements; for example, suspending all international nuclear cooperation, or IAEA technical cooperation projects until compliance has been restored.

October 21, 2009

Press Release

### **On responding to Secretary Clinton's remarks at the USIP**

In response to Secretary Clinton's remarks today at the United States Institute of Peace, we would like to stress that first, Syria is a signatory to the NPT and has abided by all its obligations under this treaty, regardless of the false accusations leveled by some circles. Second, while we verifiably have no nuclear weapons, Israel boasts the largest nuclear weapons arsenal per capita in the world and obstinately refuses to sign the NPT while the US turns a blind eye.

Still, we commend Secretary Clinton's, and indeed the Obama administration's, commitment to bolstering the NPT and working on achieving a world free of nuclear weapons. In this spirit, and in accordance with the administration's vision, we call on the US to adopt the tabled UN resolution introduced by Syria in 2003 that declares the Middle East, in its entirety, a region free of weapons of mass destruction. As a region mired by tension, this step would set a great example for the world and would act as a building block for the administration's broader vision of a world free of WMDs. We also call on the administration to follow its own commitment and vision by exerting pressure on its ally Israel to join the ranks of the world and sign the NPT. Pushing to bolster the NPT while allowing a major ally to avoid it, is a double standard that will undermine the US's nonproliferation efforts in our region in particular, and the world as a whole.

Embassy of the Syrian Arab Republic, Washington D.C.

## Clinton cites nuke worry; panel fears bio attack

By ROBERT BURNS - AP National Security Writer

Wednesday, Oct. 21, 2009

[EXCERPTS]

WASHINGTON -- Secretary of State Hillary Rodham Clinton on Wednesday warned of dire consequences from the spread of nuclear weapons, while a special U.S. panel asserted that the more worrisome and urgent threat is terrorists attacking the United States or its allies with biological weapons.

In a speech outlining the Obama administration's nuclear arms agenda, Clinton cited a range of troubling trends abroad, including a failure to stop North Korea from developing a nuclear bomb and weakness in the United Nations agency that is responsible for monitoring nuclear programs worldwide.

[deletia]

Clinton also lamented the failure of the IAEA to detect what Washington insists was a nuclear reactor in Syria, which was destroyed in a 2007 Israeli airstrike, as well as a recently revealed uranium-enrichment facility that Iran had kept secret for some years.

"The IAEA should make full use of existing verification authorities, including special inspections," she said. "But it should also be given new authorities, including the ability to investigate suspected nuclear weapons-related activities even when no nuclear materials are present. And if we expect the IAEA to be a bulwark of the nonproliferation regime, we must also give it the resources necessary to do its job."

The Syrian Embassy in Washington issued a statement in response to Clinton's speech, asserting that it has abided by all its obligations under the Nuclear Non-Proliferation Treaty, "regardless of the false accusations leveled by some circles."

The Syrians also commended Clinton's push for bolstering the non-proliferation treaty and for declaring a goal of a world free of nuclear weapons. But it said the U.S. efforts are undermined by its unwillingness to push Israel to sign the treaty, even though Israel allegedly has a substantial nuclear arsenal.

## **The Next Steps on Nonproliferation**

BY HILLARY RODHAM CLINTON

OCTOBER 28, 2009

*[EXCERPTS]*

In an age of pressing global challenges, none threatens our nation or our world as urgently as the possible spread of nuclear weapons. The United States has a special responsibility to meet this challenge, and under President Obama, we seek to lead the international community in minimizing these dangers and reinvigorating the nuclear nonproliferation regime.

Recent developments underscore the threat. The international community failed to prevent North Korea from developing nuclear weapons. Iran continues to ignore resolutions from the U.N. Security Council demanding that it suspend its enrichment activities and live up to its international obligations. Too much of the world's nuclear material remains vulnerable to theft or diversion, even as illicit state and nonstate networks engage in sensitive nuclear trade. **And as we saw with the failure to detect Iran's covert enrichment plant and Syria's reactor project, the International Atomic Energy Agency (IAEA) doesn't have the tools to carry out its verification mission effectively.**

*[deletia]*

To be effective, the international nonproliferation regime must have teeth. **The United States supports enhancing the IAEA's verification authorities and resources so it can perform its mission effectively.** And we should consider automatic penalties for violations of safeguards agreements, such as suspending all IAEA technical cooperation until compliance has been restored. Potential violators must know full well that they will be caught and that they will pay a high price for failing to live up to their obligations.

## Board of Governors

**GOV/2009/75**

**Restricted Distribution**

Original: English

### For official use only

Item 4(d) of the provisional agenda  
(GOV/2009/73, Add.1 and Add.2)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. On 28 August 2009, the Director General reported to the Board of Governors on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic (Syria) (GOV/2009/56). This report covers relevant developments since that date.
2. On 2 June 2008, the Director General informed the Board of Governors that in May of that year the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria, destroyed by Israel in September 2007, had been a nuclear reactor (GOV/2009/56, para. 2). Syria has maintained that the building was a military non-nuclear installation.
3. The Agency has repeatedly requested to have substantive discussions with Syria on the nature of the destroyed building, and to discuss with Syria relevant satellite imagery and other information available to the Agency. Syria has declined to have such discussions. In a letter dated 23 October 2009, the Agency repeated its requests for information concerning the Dair Alzour site, the infrastructure observed at the site, and certain procurement efforts which Syria has stated were related to civilian activities (GOV/2009/36, para. 14). The Agency also reiterated its request for access to technical documentation and any other information related to the construction of the destroyed building. The Agency also requested access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are located. In that letter, the Agency also offered to engage with Syria to establish the necessary modalities for managed access to sensitive information and locations, including the Dair Alzour site and three other locations allegedly functionally-related to the Dair Alzour site, to enable the Agency to establish the facts and make progress in its verification, while protecting military and other information which Syria considers to be sensitive.

4. Analysis of the samples taken in June 2008 at the Dair Alzour site indicated the presence of particles of anthropogenic<sup>1</sup> natural uranium of a type not included in Syria's declared inventory of nuclear material. Syria has stated that the origin of the anthropogenic natural uranium particles was the missiles used to destroy the building. The Agency has assessed, based on the isotopic and chemical composition and the morphology of the particles, that there is a low probability that the source of the anthropogenic natural uranium particles was the use of missiles (GOV/2009/9, para. 7). In its 23 October 2009 letter, the Agency once more reiterated its request that Syria share any information it may have to support its statement. To date, Syria has not provided any information to this effect. In this context, Israel has not responded to the Agency's request of 20 May 2009 for specific information on the contents of the munitions used to destroy the building (GOV/2009/36, para. 7).

5. In its 23 October 2009 letter, the Agency also responded to Syria's assertions<sup>2</sup> that, due to the military and non-nuclear nature of the Dair Alzour site and the other three locations, it had no obligation to provide more information under its Safeguards Agreement, and that the anthropogenic natural uranium particles found at the Dair Alzour site do not constitute undeclared nuclear material. The Agency indicated that the Safeguards Agreement between Syria and the Agency places no limitation on Agency access to information, activities or locations simply because they may be military related. The Agency also indicated that the presence at the Dair Alzour site of particles of anthropogenic natural uranium of a type not included in Syria's declared inventory gives rise to questions about the correctness and completeness of Syria's declaration, which the Agency is obliged to pursue.

6. In relation to the presence of anthropogenic natural uranium particles at the Miniature Neutron Source Reactor (MNSR) in samples taken there in August 2008 (GOV/2009/36, para. 17), Syria has stated that the presence of natural uranium particles resulted from the accumulation of samples and reference materials used in neutron activation analysis (GOV/2009/56, para. 10). In a letter dated 13 October 2009, the Agency provided Syria with the results from additional samples it had taken during the July 2009 physical inventory verification at the MNSR. The results also showed the presence of anthropogenic natural uranium particles at a number of locations and on certain equipment. However, the results did not indicate the presence of anthropogenic natural uranium particles in either the standard reference materials or on the shielded transport container which Syria had indicated as possible sources of the uranium particles. In light of these results, the Agency requested to meet with Syria to discuss the matter further.

7. In a meeting held on 2 November 2009 in Vienna, Syria was provided with further detailed information concerning the results of the analysis of the environmental samples from the MNSR. At that meeting, Syria identified other possible sources of the anthropogenic natural uranium particles, including domestically produced yellowcake and small quantities of imported, but previously undeclared, commercial uranyl nitrate. Syria also provided a document to support its explanation for the presence of the uranyl nitrate at the MNSR.

8. In a letter to Syria dated 5 November 2009, the Agency announced its intention to carry out an inspection at the MNSR on 17 November 2009 for the purposes of taking samples of the yellowcake and the uranyl nitrate and taking environmental samples at the locations where the materials are stored and where they were used. The Agency also requested that Syria provide information concerning the yellowcake, the uranyl nitrate and any other uranium-containing materials which may have been the source of the anthropogenic natural uranium particles.

## Summary

9. Essentially, no progress has been made since the last report to clarify any of the outstanding issues relevant to the implementation of safeguards.

10. Syria has not yet provided the cooperation necessary to permit the Agency to determine the origin of the anthropogenic natural uranium particles found in samples taken at the Dair Alzour site. Syria has also not

provided information or access that would allow the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building on the Dair Alzour site, or to determine if, as alleged, any functional relationship existed between that site and three other locations. Nor has Syria substantiated its claims regarding certain procurement efforts that, in the Agency's view, could support the construction of a reactor. The Agency will continue its verification activities to confirm Syria's statements within the authority available to it and subject to the cooperation provided by Syria.

11. The results of the environmental sampling at the MNSR confirm the presence of particles of anthropogenic natural uranium of a type not in Syria's declared inventory. The results do not support Syria's earlier explanation for the origin and presence of the particles. The Agency is investigating Syria's explanation discussed at the 2 November 2009 meeting for the presence of the particles and has announced its intention to carry out an inspection at the MNSR on 17 November 2009.

12. The Director General urges Syria to cooperate with the Agency in its verification activities so that, in accordance with its mandate under Syria's Safeguards Agreement, the Agency is able to ensure that safeguards are applied to all source and special fissionable material subject to that Agreement. Recognizing Syria's concerns about the sensitivity of certain information and locations, the Director General also urges Syria to engage with the Agency to establish the necessary modalities for managed access to such information and locations that will enable the Agency to establish the facts and make progress in its verification, while protecting military and other information considered by Syria as sensitive. The Director General also calls on other States, including Israel, which may possess information relevant to the Agency's verification, including information which may have led them to conclude that the installation in question at the Dair Alzour site had been a nuclear reactor, to make such information available to the Agency.

13. The Director General will continue to report as appropriate.

<sup>1</sup> "Anthropogenic" refers to material that has been produced as a result of chemical processing.

<sup>2</sup> Communicated in Syria's letter to the Agency dated 13 August 2009, see GOV/2009/56, paras 8, 9.

## **IAEA wants to inspect three secret Syrian nuclear sites**

DEBKAFfile Special Report

November 16, 2009, 10:53 PM (GMT+02:00)

The new IAEA report on Iran's formerly secret uranium enrichment site at Fordo near Qom also includes a section on Syria and a demand to inspect suspicious sites there too. The inspectors clearly suspect Both Tehran and Damascus of concealing from the UN nuclear watchdog secret facilities related to nuclear weapons production. Monday, Nov. 16, the seven-page IAEA inspectors' report on their October visit to Fordo stated clearly that Tehran's belated declaration of its uranium enrichment site suggested that more secret sites remained to be discovered in Iran.

With regard to Syria, IAEA inspectors are to visit Damascus on Tuesday, Nov. 17, for clarifications of the conflicting explanations Syria has offered for uranium traces. They will also insist on making return visits to three military sites which Damascus has so far refused, following information received by the agency of clandestine "nuclear activity" there. DEBKAFfile's intelligence sources reveal that Israel hit one of three at the same time as its air force bombed the unfinished plutonium plant at Dair Alzour in 2007, although this was never admitted by Israel or Syria.

The nuclear watchdog wants a close survey of this site because it is certain the ground would yield up important clues to Syria covert nuclear weapons program. Permission has been denied for a visit there as well as a request to visit to the Euphrates River's west bank opposite the bombed plant.

The Assad regime has claimed the uranium particles discovered near Damascus could have come from domestically produced "yellow cake" or imports of commercial uranyl nitrate undeclared to the IAEA. The Syrians also said they could have come from reference materials or from a transport container.

The report pointed out that the uranium traces found did not fit these explanations; nor could they be traced to Syria's declared inventory.

Ian Kelly  
Department Spokesman  
Daily Press Briefing  
Washington, DC  
November 17, 2009

[EXCERPT]

MR. KELLY:

Yeah, Andy.

QUESTION: I have a sort of ancillary question back on the IAEA report. We've had your reaction to the Iran section of that report. I'm wondering if you have any reaction to the Syria section of that report, where they talk about --

MR. KELLY: Yeah.

QUESTION: -- deep suspicions about Syria's activities.

MR. KELLY: Right. Right. If you just give me a second here, I do. Yeah, this is the fifth report by the IAEA relating to Syria's nuclear activities since the Al Kibar reactor was destroyed in 2007. In the report, the IAEA makes clear that Syria unfortunately has not made any credible explanations that clarify the true nature and scope of its clandestine nuclear activities. The IAEA has again had to report that Syria is refusing to cooperate fully with the IAEA and has failed to account for the undeclared manmade uranium found at two sites. We believe that Syria must uphold its international obligations, including providing access to any site or information requested. And we again reiterate our full support for the IAEA's investigation.

QUESTION: What does the U.S. think should be the next step if Syria doesn't uphold its international obligations?

MR. KELLY: Well, I think it will depend on what their response is to it. We'll continue to consult with our partners in the IAEA about next steps in light of their -- in light of the serious nature of the findings in this report and in the previous reports. But I think whatever we do, will have to be in consultation with our partners and allies.

QUESTION: Well, what would be an adequate response, in your view, from the Syrians? I mean, are you looking for them to say, yes, you've caught us, we were working with the North Koreans and the Iranians secretly to build a reactor? Is that what you want them to say?

MR. KELLY: No, we want them to open up what the IAEA is asking them to open up in terms of access to sites and access to information. I'm not asking for any --

QUESTION: But haven't --

MR. KELLY: -- declaration necessarily.

QUESTION: Well, you said that they have not made any credible explanation yet of this.

MR. KELLY: Yeah, that's what we want – a credible explanation.

QUESTION: Well, is a credible explanation “Yes, we were colluding with the North Koreans and the Iranians to do this secretly?”

MR. KELLY: Well, I – (laughter) – a credible explanation will be allowing full access to what they're doing.

QUESTION: Have they not allowed access?

MR. KELLY: No, not to everything that the IAEA has asked for.

## **IAEA revisits Syria reactor in uranium traces probe**

**Wed Nov 18, 2009 3:45am IST**

VIENNA (Reuters) - U.N. inspectors revisited a Damascus nuclear research reactor on Tuesday [2009-11-17] to take more swipe samples after judging Syria's initial explanation for uranium traces found there to be doubtful.

An International Atomic Energy Agency official confirmed inspectors were at the site a day after an IAEA report said tests of samples taken in August 2008 showed the traces did not come from Syria's declared nuclear inventory, as it maintained.

The report also said Syria was still blocking follow-up IAEA access to a desert site of what U.S. intelligence reports said was a nascent, North Korean-designed nuclear reactor geared to yield atomic bomb fuel, before Israel bombed it in 2007.

The Vienna-based IAEA has been checking whether there could be a link between the Damascus and Dair Alzour sites since discovering mysterious particles of processed uranium at both.

Some analysts have said the findings raised the question of whether Syria used some natural uranium intended for the alleged reactor at Dair Alzour in tests applicable to learning how to separate out bomb-grade plutonium from spent nuclear fuel.

Syria, an ally of Iran which is under IAEA investigation over nuclear proliferation suspicions, has denied ever having an atom bomb programme and has said the intelligence is fabricated.

Syria told the IAEA earlier this month that the traces at the Damascus site could have come from domestically-produced uranium concentrate known as "yellow cake", or from imports of commercial uranyl nitrate which it had not declared to the IAEA.

Tuesday's inspector trip aimed to verify that assertion.

Syria at first told the IAEA that the traces found last year came with contaminated equipment used at the site, but IAEA test results did not stand up this explanation, and the particles could not be traced to Syria's declared inventory.

"They have (now) acknowledged doing experiments with natural uranium compounds, some originating from yellow cake which they have got from their own facility or laboratory," a senior official close to the IAEA said.

IAEA inspectors examined the desert Dair Alzour site in June 2008 but Syria has barred renewed access and also not let them visit three military sites, whose appearance was altered by landscaping after the IAEA first asked to check them.

"No progress has been made since the last report to clarify any of the outstanding issues," Monday's agency report said.

[EXCERPT]

Q. If the focus turns to missiles, wouldn't that shift the agenda to containment or deterrence, rather than prevention?

A. Not at all. It's just another option to consider in a layered approach to this international problem. Since it is the policy of the United States to prevent a nuclear-capable Iran, why should Israel have a separate policy? On this, we and many other countries in the region and beyond see eye to eye. Now is the time for tests to see if negotiations will bear fruit.

If not, you can't try indefinitely to rely only on the political approach. Our first choice is to see the U.S. president succeed in his efforts. But at some point, you have to say we tried. If diplomacy fails, we'll have to move on to Plan B.

Q. Are you referring to military strikes akin to the 1981 operation in Iraq and the 2007 action in Syria?

A. There's a difference between those two operations and what we're facing in Iran. The reactor in Iraq didn't concern the world as such, nor do I think the attack on the Syrians was a world problem. These were local problems. I think Israel must be very careful not to monopolize a global problem and make it our own. The options that exist globally are wider and more varied than the options that are under proposal in Israel.

## **Syrian Atomic Energy Agency chief: "our country fully cooperated with IAEA"**

By Abdelwaheb El Gueyed (with photos)

Date : 11/25/2009

VIENNA, Nov 24 (KUNA) -- Chief of the Syrian Atomic Energy Agency Dr. Ibrahim Othman asserted Tuesday [2009-11-24] that his country is fully cooperating with the International Atomic Energy Agency (IAEA) by the virtue of the Non-Proliferation Treaty (NPT) and the safeguards system applied by IAEA to member states.

Othman said in an interview with Kuwaiti News Agency (KUNA) on the sidelines of the IAEA's Technical Cooperation committee meeting of the IAEA, that his country will continue with its approach of cooperation.

However, he stressed that this will not by any means be at the expense of disclosing "our military positions or threatening our national security," adding that the IAEA's general director Dr. Mohammad El-Baradei has said that he realized the Syrian concerns regarding the sensitivity of some information and sites inside the county.

Othman that his country has offered to the IAEA all what can be offered of documents and assistance, adding that the last visit paid the IAEA inspectors was paid through an agreement between the UN nuclear watchdog and Damascus.

They inspected the "Mensr" reactor near the capital, Damascus, and carried out the necessary studies, he said, expressing his belief that this was quite different from what is circulated by media and what is also mentioned by the Vienna-based IAEA's report.

Responding to a question on his evaluation to what is mentioned in the report, Othman said Syria voiced reservations because the information in the report was not verified by Syria.

He added that the agency did not allow Syria to discuss and verify contents of the report, deeming that the IAEA report highlighted a one side of the issue and not the whole truth.

Othman went on to say that his country has repeatedly declared that the Syrian site bombed by Israel in Dir Al-Zour in 2007 was and still a military one, and consequently it is meaningless for the inspectors to ask to visit it again.

In this regard, the Syrian nuclear watchdog agency has reviewed the facilities offered by his country to the IAEA inspectors according to its signed agreement with the IAEA, said Othman.

He added that Damascus has granted the them enough time and full freedom to inspect and take samples, besides making interviews with the people they want without any restrictions. (end) amg.af KUNA 242115 Nov 09NNNN

## **Statements of the Director General**

**26 November 2009** | Vienna, Austria

IAEA Board of Governors

Introductory Statement to the Board of Governors  
by IAEA Director General Dr. Mohamed ElBaradei

*[EXCERPT]*

### **Nuclear Verification**

*[deletia]*

### **Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

Essentially no progress has been made since my last report in clarifying the outstanding issues relevant to the implementation of safeguards in the Syrian Arab Republic.

Syria has not provided the cooperation necessary to permit the Agency to determine the origin of the anthropogenic natural uranium particles found in samples taken at the Dair Alzour site. Nor has Syria provided information or access that would allow the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building on that site.

The Agency is investigating whether particles of anthropogenic natural uranium of a type not in Syria's declared inventory, detected at the Miniature Neutron Source Reactor (MNSR) in Damascus in July, may be due to experiments Syria says it carried out at the MNSR with materials containing uranium. The materials and certain experiments should have been reported earlier to the Agency. The Agency took additional samples at the reactor on 17 November, the results of which we await.

The Agency will continue its efforts to verify Syria's statements within the authority available to it. Without Syria's cooperation, or access to information that may be available to other States, including Israel, the Agency will not be able to progress much further in its verification efforts.

## **Ehud Olmert still dreams of peace**

Greg Sheridan, Foreign editor

From: The Australian

November 28, 2009 12:00A [Accessed 2009-11-27T19:00Z]

*[EXCERPTS]*

*[deletia]*

In Sydney this week, I conducted, perhaps, the longest interview and discussion Olmert has undertaken with any media since leaving office in March after more than three years as prime minister.

*[deletia]*

For 90 minutes in the boardroom of Sydney's Park Hyatt, and then over a relaxed lunch with his wife, Aliza, at Circular Quay, Olmert talked with remarkable frankness about the military campaigns in Gaza and Lebanon, the historic peace deal he offered the Palestinians, President Barack Obama's Middle East policy and the options for action against Iran.

*[deletia]*

Olmert believes that the Syria track is perhaps the only peace process open to Israel in the immediate future, and that the time has come for direct Israel-Syria negotiations.

But if Syria is willing to make peace, I ask Olmert, how come it was building, with North Korean help, a nuclear reactor which Israel, under Olmert, bombed to obliteration? "I am saying nothing about that."

## **Damascus shrugs off nuclear rebuke**

Phil Sands, Foreign Correspondent

Last Updated: November 28. 2009 8:34PM UAE / November 28. 2009 4:34PM GMT

DAMASCUS // If the latest rebuke by the United Nations nuclear watchdog against Syria caused any alarm in Damascus, the authorities here are certainly not showing it.

On Thursday Mohamed ElBaradei, the head of the International Atomic Energy Agency (IAEA), said Syria was not fully co-operating with his investigation into uranium particles, found in the eastern desert at a site that Israel and the US claim was a secret nuclear reactor.

Syria insists that the facility, which was destroyed in an Israeli air strike more than two years ago, was a conventional military base and that any uranium found there must have come from Israel's bombs.

In his statement to the IAEA's board of directors in Vienna, Mr ElBaradei said Damascus had "not provided the co-operation necessary" to support its claim, either through documents or by granting access for follow-up inspections.

In addition to the bombed site, the UN team say they found particles of uranium at Syria's small nuclear research lab that are not in its declared inventory. The neutron reactor has been authorised by the UN, but under the terms of its operation, Damascus should inform the IAEA of any new experiments undertaken, something that had not been done.

These new and unexpected uranium traces are currently being tested, Mr ElBaradei said.

Nonetheless Syria, which has consistently claimed its innocence, clearly feels it has little to fear from the IAEA.

"The UN cannot just say 'we will visit this site, or we will go to that place', they do not have the power under international law," said an official from the ruling Baath party, on condition of anonymity. Smartly dressed in a well-cut suit and red tie, he appeared unperturbed by the ongoing nuclear controversy.

IAEA inspectors would certainly not be given permission to carry out new searches for evidence on Syrian military bases, he said. They had been allowed one set of inspections and, as far as Syria was concerned, that meant it had fully met its obligation to co-operate.

"These are issues of sovereignty and self-determination," the Baathist insisted. "It's a question of dignity."

Syria has not forgotten how supposedly independent UN weapons inspectors in Iraq during the 1990s were, in fact, reporting back to western intelligence agencies, something Damascus – still at war with Israel – does not want to let happen in its case.

The well-dressed Baathist said Syria was wary of any Iraq-style conspiracy designed to justify military action by its enemies. "We all know what happened in Saddam Hussein's case," he said. "There were fabricated claims he had weapons of mass destruction when he had nothing. But by the time the truth was known, the Americans had already invaded."

In his comments, Mr ElBaradei was also critical of Israel and the US, both of which have claimed to have evidence of a covert Syrian nuclear programme. That evidence, if it exists, has not been shared with the United Nations, Mr ElBaradei said.

“When there is talk about transparency, let it come from all sides,” said the Baathist. “Let us be honest, this is not some impartial or apolitical situation, there are double standards here and bad intentions aimed towards us.

“If we are talking about illegal nuclear weapons programmes, why aren’t IAEA inspectors going into Israel to check? They have 200 nuclear warheads and no one says anything about that. Where are the inspectors?”

“Here is Syria’s position: We support the idea of a nuclear weapons free Middle East. Let that be the goal of the international community.”

Mr ElBaradei long ago made clear his frustrations that, in launching a unilateral attack on the Syrian site rather than going through formal – and peaceful – inspection channels, Israel had effectively made it impossible to ever know the truth about the alleged nuclear programme.

The bombs demolished most of whatever was there and Syria, insisting that it will not compromise national security by allowing inspectors to go wherever they please, has made sure that the remains cannot be more thoroughly examined.

As a result, claims of a Syrian nuclear programme are unlikely to be either proven or disproved.

Given that the US and Europe are already re-engaging with Damascus after years of diplomatic isolation, and given that the West is far more concerned about Iran’s nuclear ambitions, Syria’s sense is that its own nuclear controversy is already fading away.

It is a conclusion that was essentially confirmed by Mr ElBaradei, who appeared to signal that his investigation had run its course and was now almost certainly futile.

“The agency will continue its efforts to verify Syria’s statements within the authority available to it,” he said.

“Without Syria’s co-operation, or access to information that may be available to other States, including Israel, the agency will not be able to progress much further in its verification efforts.”

So, if the Baath party member in Damascus was not acting alarmed, it is because he saw no cause to be. Syria is apparently sure, not without reason, that this matter is now all but finished with.

## **Report: IAEA experts visited Syria nuclear site**

Roe Nahmias

Published: 11.30.09, 14:41 / Israel News

*[Sourcebook comment: This report may be a conflation of the IAEA visits to the research reactor near Damascus on 2009-11-17 and to the al-Kibar site on 2008-06-23.]*

A delegation of International Atomic Energy Agency experts traveled to Syria and visited the al-Kibar nuclear site that was bombed by Israel in 2007, Qatari newspaper al-Watan reported on Monday.

According to the report, the delegation's members took soil samples from the site to try and locate the origin on the uranium found there. Damascus told the experts that the traces of uranium found at the site were remnants from the Israeli strike in the area.

In mid-November, the IAEA inspectors visited a nuclear site in Damascus to examine uranium residue found in the state, and the explanation provided for the residue was unsatisfactory.

A UN spokesperson said that the inspectors visited the facility following suspicious findings uncovered during the composition of a secret report.

Some analysts have said the findings raise the question of whether Syria used some natural uranium intended for the alleged reactor at Dir a-Zur for tests applicable to learning how to separate out bomb-grade plutonium from spent nuclear fuel. Syria in the past has denied such allegations.

Last February, it was reported that UN inspectors discovered traces of uranium and graphite in samples taken from the site Washington says was a secret graphite nuclear reactor.

Furthermore the IAEA said that the uranium found at the site is unlikely to have come from Israeli missiles that bombed it.

The IAEA wrote in a report that its "current assessment is that there is a low probability that the uranium was introduced by the use of missiles."

It was the first disclosure that graphite particles had turned up and a senior UN official said the discovery of additional uranium traces was a "significant" find, while stressing an IAEA investigation of Syria remained inconclusive.

## US embassy cables: Iran hid full reactor plans from nuclear inspectors

Sunday 28 November 2010 18.14 GMT

Wednesday, 02 December 2009, 17:17

SECRET SECTION 01 OF 05 UNVIE VIENNA 000540

MULTILATERAL VIENNA'S FRUSTRATING NAM DYNAMIC

REF: EMBASSY VIENNA 1450

Classified By: Mark Scheland, Counselor for Nuclear Policy; reasons 1.4 (b) and (d)

[EXCERPTS]

1. (S) Summary: HFAC staffers Richard Kessler and David Fite received from IAEA Secretariat November 10 information on the Iran case that tracked with the tone of the subsequent Director General's reporting on Iran to the Board of Governors. The STAFFDEL heard that contact with Iran over "possible military dimensions" of the nuclear program was at an "absolute stalemate." According to Safeguards regional division director Herman Nackaerts, IAEA inspectors' first visit to the enrichment facility under construction near Qom had run predictably but without extraordinary responsiveness on Iran's part; the Secretariat was still trying to understand the motivation to build the plant as now designed. Nackaerts described the frustrating limitations of Iran's cooperation with the Agency, and the STAFFDEL deduced that Iranian officials held back because they were uncertain about what lines of inquiry the IAEA was best equipped to exploit. Questioning then-DG ElBaradei's remark to media that the Agency had found "nothing to worry about" in Qom, STAFFDEL asked if the Secretariat would report on how it judged the plant did or did not fit into Iran's publicly explained nuclear program. Nackaerts expressed appreciation for the precision and usefulness of U.S.-supplied information in the Qom case and generally.

2. (C) Summary contd.: On Syria, Nackaerts said the Secretariat had told Damascus its first explanation for the presence of anthropogenic uranium at the Miniature Neutron Source Reactor was not credible. Further, the Secretariat still could not yet present the case for how what was being built at Dair Alzour fit in as "part of a Syrian program or part of someone else's program." On DPRK, IAEA/EXPO's Tariq Rauf said the IAEA, when it could, would ultimately have to "go back to the early 1990s" to reconstruct accountancy of plutonium and could not accept a "political" compromise setting material "off to the side." To get to a finding of "no diversion" would take several years and extensive resources and forensics.

[deletia]

Syria Stalemate

-----

9. (SBU) The Syria case, Nackaerts said, was starting to look like Iran in that the government provided "good cooperation" on some areas but presented a "stalemate" on others. The Secretariat challenged Syria's proposed explanation for the presence of uranium at Dair Alzour/Al Kibar (i.e., that Israeli depleted uranium munitions

could be the source), but the inquiry was at a roadblock. Syrian officials had been told their first explanation for anthropogenic uranium at the Miniature Neutron Source Reactor (MNSR) was not credible, and the Agency had inquired what nuclear material Syria could have had that was not previously declared. Overall, the IAEA still "did not understand" (meaning, it could not yet present the solid case for) how Dair Alzour fit in as part of a Syrian nuclear program "or part of someone else's program."

*[deletia]*

20. (U) STAFFDEL did not review this report.

DAVIES

## US to focus on uranium findings in Syria - evidence of Iranian proliferation

DEBKAFfile Exclusive Report

December 6, 2009, 9:00 AM (GMT+02:00)

A senior official in the Obama administration described the UN nuclear watchdog inspectors' discovery of traces of highly processed plutonium [*sic*] at the bombed Syrian-North Korean facility at Dir a-Zur as a "smoking gun" - evidence of Iran's covert nuclear activities and proliferation, DEBKAFfile's Washington sources report.

It was confirmed by International Atomic Energy Agency inspectors in their Nov. 30 visit to the site which was demolished by Israel in September 2007.

Obama administration sources are confident that with this information of Iranian violations of the Non-Proliferation Treaty, even Russia and China will have to endorse stiff new sanctions against the Islamic Republic.

The soil samples the inspectors collected at their last visit to Dir a-Zur confirmed an earlier discovery of uranium used in separating out bomb-grade plutonium from spent nuclear fuel which the US believes was supplied by Iran. Those experiments were clearly further along than previously assessed.

The same traces were found at the Syrian nuclear research reactor near Damascus.

Washington intends to present these findings as solid evidence of the tie-in between the Syrian and Iranian military nuclear programs, together with proofs of Tehran's direct involvement in the planning and construction of the demolished Syria reactor.

Iran will also be shown to have supplied Syria with the nuclear materials and technology for its operation as part of its own program to attain a nuclear weapons capability.

The US will use this body of evidence to demonstrate Iran has been in grave breach of its NPT obligations since 2007. This week, officials in Tehran said their government has no plans to abdicate from the treaty.

According to DEBKAFfile's Washington sources, the Obama administration may decide to plant the information in the US and world media before making a formal presentation.

Last Thursday, Dec. 3, Iran's national security council director Saeed Jalili visited Damascus for urgent consultations with Syrian leaders on fending off the coming American assault on its nuclear program based on the evidence of Syria covert nuclear activities. His party included members of Iran's nuclear energy commission who helped build the Syria's North Korean reactor.

Jalili and Syrian president Bashar Assad spent several hours discussing how to respond to the forthcoming American revelations.

Their talks were violently interrupted by the bomb blast on an Iranian pilgrim bus in central Damascus. Official figures have not been released but the number of dead is believed to be fifteen Iranians with many more injured. Assad ordered Syrian officials on the spot to claim the blast was an accident and not an act of terror. Both sides assumed that the hand behind the attack had advance knowledge of the Iranian-Syrian conference and was bent on sabotaging it.

## **U.S. Girds for Talks in North Korea**

By JAY SOLOMON

DECEMBER 7, 2009

*[EXCERPTS]*

WASHINGTON -- President Barack Obama's special representative to North Korea is set to hold his first bilateral meetings with Pyongyang this week, in the administration's highest-level dialogue with the country to date.

But signs that the communist state may be prepared to return to international disarmament negotiations were overshadowed by U.S. concerns that it could seek new conditions to the talks.

Stephen Bosworth, a career diplomat and negotiator, was expected to arrive in Pyongyang on Tuesday for two days of meetings, with the goal of persuading North Korea to rejoin talks aimed at getting it to give up its nuclear-weapons program.

*[deletia]*

U.S. officials said they didn't know who Mr. Bosworth would meet during his trip. Kim Jong Il hasn't directly engaged Washington on the nuclear issue, though he did discuss it with former President Bill Clinton in August.

The Obama administration is interested in learning about North Korea's economy in light of Pyongyang's decision to revalue its currency last week. U.S. officials also said they'll continue to push for information on North Korea's alleged support for the nuclear programs of Syria and Myanmar.

## **Hirano urges Syria to allay suspicions over nuke development**

**Dec 8 09:48 AM US/Eastern**

TOKYO, Dec. 8 (AP) - (Kyodo)—Japan's Chief Cabinet Secretary Hirofumi Hirano urged Syria on Tuesday [2009-12-08] to make efforts to dispel international suspicion over the country's nuclear development program in cooperation with the International Atomic Energy Agency, according to the Japanese Foreign Ministry.

The government's top spokesman made the request during a meeting with Abdullah al-Dardari, Syria's deputy prime minister for economic affairs, at the prime minister's office in Tokyo, according to the ministry.

In their half-hour meeting, al-Dardari responded that Syria fully supports the Nuclear Nonproliferation Treaty, the ministry said.

The Syrian minister traveled to Japan to attend a ministerial session of the first Japan-Arab Economic Forum in Tokyo on Monday.

Posted : Wed, 09 Dec 2009 16:22:04 GMT

Damascus - Iranian Defence Minister Ahmad Vahidi, speaking in Damascus, on Wednesday hailed Syrian-Iranian defence ties as a "deterrent" against Israeli "threats," Iranian media reported. "Promotion of defence ties (between) Iran and Syria is a deterrent factor against the Zionist regime's threats which target nations of the region," Iran's official ISNA news agency quoted Vahidi as saying after his meeting with Syrian President Bashar al-Assad.

The meeting, which a statement from the Syrian presidency said also included Syria's top military commanders, came three days after Syria hosted Iran's top nuclear negotiator, Saeed Jalili.

"The enemy's aim is to threaten the region's security and plunder its reserves, but the two countries have always prevented accomplishment of (this) evil aim," Vahidi reportedly said Wednesday.

The minister also held meetings with representatives of the Lebanese Shiite group Hezbollah and with representatives of Palestinian groups living in exile in Damascus, the Syrian presidency's statement noted.

<http://world.brunei.fm/2009/12/13/iran-needs-more-nuclear-stations-says-mottaki/>

## **IRAN NEEDS MORE NUCLEAR STATIONS – SAYS MOTTAKI**

MANAMA,

Dec 13 [2009]

(NNN-KUNA) –Iranian foreign minister Manouchehr Mottaki said Saturday Tehran needed to move ahead with its nuclear program, noting the Islamic Republic’s need to build 10-15 nuclear reactor for the generation of power.

“Iran needs between 10 and 15 nuclear stations to generate electricity ... and We are now building one station in collaboration with Syria,” Mottaki said in a speech before the 6th Manama Dialogue.

Meanwhile, Mottaki said anew Iran was ready to establish security cooperation with the Arab Gulf countries, while rejecting the foreign military presence in the area.

“Iran, as the common neighbor for all countries in the region, has announced readiness to strengthen collective and comprehensive cooperation with the regional countries particularly in the security field,” he said.

Mottaki said the Manama Dialogue was a good opportunity to redefine regional security.

## **Report: N. Korea resumes military aid to Syria**

Yitzhak Benhorin

Published: 02.02.10, 18:44 / Israel News

*[EXCERPT]*

WASHINGTON – The Pyongyang-Damascus axis is back in order. For the first time since the Syrian reactor was bombed in September 2007, North Korea has renewed its supply of sensitive military technology to Damascus, according to a report Tuesday in Japanese business newspaper, Nikkei.

Western intelligence sources told the newspaper that North Korea is aiding Syria in the production of maraging steel, which is extremely durable at high heats and pressure. It is typically used in missile skins, ballistic warheads, and gas centrifuges critical in the uranium enrichment process. Its durability and malleability makes it ideal to for creating thin missile skins capable of carrying heavier payloads.

The West and Japan restrict the export of maraging steel.

According to the report, a production line for the material was built at the military factory in the city of Homs, in northern Syria.

North Korea, in defiance of the West, does not restrict its export of the special nickel-alloy steel, and has supplied Syria with a melting furnace and molding tools necessary for making the steels at their Homs plant.

The report reveals that North Korean experts are training Syrian engineers how to produce the specialized steel. Sources told the newspaper that the production line will be complete if equipment for handling waste and for chemical tests and other analyses are supplied.

*[deletia]*

## **N Korea, Syria Resume Military Cooperation: Sources**

By KEN MORIYASU

Wednesday, February 3, 2010

(The Nikkei Feb. 1 morning edition)

**TOKYO (Nikkei)--After a hiatus of several years, North Korea is once again providing sensitive military technology to Syria, Western intelligence sources say.**

According to the sources, North Korea is helping Syria build a production line for a superalloy that can be used in missile skins, chemical warheads and gas centrifuges, a vital component in the uranium enrichment process.

**The production line for maraging steel, a nickel-iron alloy of extremely high strength and malleability, is apparently being added to Syria's existing military factory in the western city of Homs.**

Japan and many Western nations restrict the export of maraging steel. But North Korea has already provided melting furnaces and molding tools needed to make the steel to the Homs plant, where North Korean experts are training local engineers on its production, the sources said.

If equipment for handling waste, and for chemical analysis and other tests are delivered, the production line will be complete, they added.

Maraging steel is commonly used for aircraft engines. The material's strength and malleability also allow it to be formed into thinner rocket and missile skins that can carry heavier payloads.

Military assistance has long been North Korea's primary source of foreign currency. The country is believed to have been helping Syria build a nuclear reactor in 2007, until the facility was bombed by Israel.

In the wake of the Israeli air strike, it was thought that North Korea and Syria were no longer working together. But with the apparent maraging steel project, it seems that bilateral military cooperation is back.

**Annual Threat Assessment of the  
US Intelligence Community  
for the Senate Select Committee on Intelligence**

**Dennis C. Blair**  
**Director of National Intelligence**  
**February 2, 2010**

**Senate Select Committee on Intelligence**

US INTELLIGENCE COMMUNITY  
ANNUAL THREAT ASSESSMENT

**STATEMENT FOR THE RECORD**

*[EXERPTS]*

Chairman Feinstein, Vice Chairman Bond, Members of the Committee, thank you for the invitation to offer the Intelligence Community's assessment of threats to US national security. I am pleased to be accompanied today by the Directors of the Central Intelligence Agency, Defense Intelligence Agency, Federal Bureau of Investigation, and the Acting Assistant Secretary of State for Intelligence and Research.

*[deletia]*

**North Korean WMD and Missile Programs**

Pyongyang's nuclear weapons and missile programs pose a serious threat to the security environment in East Asia. North Korea's export of ballistic missiles and associated materials to several countries including Iran and Pakistan, and its assistance to Syria in the construction of a nuclear reactor, exposed in 2007, illustrate the reach of the North's proliferation activities.

Despite the Six-Party October 3, 2007 Second Phase Actions agreement in which North Korea reaffirmed its commitment not to transfer nuclear materials, technology, or know-how we remain alert to the possibility North Korea could again export nuclear technology.

*[deletia]*

## Syria

*[deletia]*

- Damascus remains generally uncooperative with the IAEA investigation of its covert nuclear efforts following the destruction of its secret nuclear reactor in September 2007. Syria also maintains a chemical weapons programs and an active missile program, with some missiles that can reach 700 kilometers.

*[deletia]*

## **Remarks on Middle East Peace Following Meeting With Syrian President Dr. Bashar al-Assad**

**William J. Burns**

Under Secretary for Political Affairs

**Damascus, Syria**

**February 17, 2010**

**UNDER SECRETARY BURNS:** I'm here to convey President Obama's continuing interest in building better relations with Syria based upon mutual interest and mutual respect. Syria plays an important role in the Middle East and this is a moment in which both Syria and the United States, despite our differences, have a stake in exploring ways in which we might cooperate. I had quite productive and extensive discussions with President Assad. We talked candidly about areas in which we disagree, but also identified areas of common ground on which we can build. The White House announced yesterday that Robert Ford will be the next American ambassador to Syria if he is confirmed by the U.S. Senate. That is a clear sign, after five years without an American ambassador in Damascus, of America's readiness to improve relations, and to cooperate in the pursuit of a just, lasting and comprehensive peace between Arabs and Israelis with progress on all tracks of the peace process and in the pursuit of regional peace and stability. To deepen our dialogue as we move forward, Ambassador Dan Benjamin, the State Department's coordinator for counter-terrorism, will remain here for another day of meetings. I have no illusions about the challenges on the road ahead, but my meeting with President Assad leaves me hopeful that we can make progress together in the interests of both of our countries. Thank you very much.

## Board of Governors

Item 6(d) of the provisional agenda  
(GOV/2010/1)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

## A. Introduction

1. On 2 June 2008, the Director General informed the Board of Governors that in April of that year the Agency had been provided with information alleging that an installation at the Dair Alzour site in the Syrian Arab Republic (Syria), destroyed by Israel in September 2007, had been a nuclear reactor. Satellite imagery available to the Agency showed that, by the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building.<sup>1</sup>

2. The Agency was provided with access to the site on 23 June 2008, at which time it was permitted to take environmental samples.<sup>2</sup> While it cannot be excluded that the destroyed building was intended for non-nuclear use, the Agency has assessed that the features of the building and the connectivity of the site to adequate pumping capacity of cooling water are similar to what may be found at nuclear reactor sites.<sup>3</sup> The Agency has also assessed that the water pumping equipment seen by it at the Dair Alzour site, and the procurement by Syria of large quantities of graphite and barium sulphate, all of which Syria has stated were acquired for civilian and non-nuclear related uses, could support the construction of a reactor (GOV/2009/36, para. 14).

3. Syria has maintained that the destroyed building was a military non-nuclear installation. The information and access provided by Syria to date has not allowed the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building or to substantiate Syria's claims regarding the procurement efforts for civilian, non-nuclear uses.

4. Analysis of the samples taken in June 2008 at the Dair Alzour site indicated the presence of particles of anthropogenic<sup>4</sup> natural uranium of a type not included in Syria's declared inventory of nuclear material. Syria has stated that the origin of these particles was the missiles used to destroy the building. The Agency has assessed that there is a low probability that the source of these particles was the use of missiles.<sup>5</sup> The presence of such

particles points to the possibility of nuclear related activities at the site and adds to questions concerning the nature of the destroyed building. Syria has yet to provide a satisfactory explanation for the origin and presence of these particles. In this context, information yet to be provided by Israel might be helpful in clarifying the matter.<sup>6</sup>

5. The Agency has repeatedly requested Syria to have substantive discussions with it on the nature of the destroyed building, and to discuss relevant satellite imagery and other information available to the Agency. In a letter dated 7 January 2010, the Agency reminded Syria of its repeated requests for:

- information concerning the Dair Alzour site, the infrastructure observed at the site and certain procurement efforts which Syria has stated were related to civilian non-nuclear activities;
- access to technical documentation and any other information related to the construction of the destroyed building;
- access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or is now situated; and
- further access to the Dair Alzour site itself and access to three other locations allegedly functionally related to the Dair Alzour site.

6. The Agency has, on several occasions, offered to engage with Syria to establish the necessary modalities for managed access to sensitive information and locations, including the Dair Alzour site and the three other locations. Such access would enable the Agency to establish the facts and make progress in its verification, while protecting military and other information which Syria considers to be sensitive.

7. Since the time of the Agency's visit to the Dair Alzour site in June 2008, Syria has declined to have substantive discussions with the Agency, has not provided any detailed information in response to the Agency's requests and has not agreed to the Agency's requests for further access to the Dair Alzour site and access to the three other locations of interest to the Agency in connection with its investigation.

8. Syria has also maintained its position that, due to the disposal of the debris from the Dair Alzour site, it was impossible to grant the Agency's request for access to it as the Agency's request had been made more than a year after the destruction of the building. Based on the discussions held in June 2008 in Damascus and other information available to the Agency, the Agency has continued to request access to the debris from the destroyed building and any salvaged equipment from the Dair Alzour site.

9. In relation to the anthropogenic natural uranium particles found at the Miniature Neutron Source Reactor (MNSR) (GOV/2009/36, para. 17), Syria's initial explanations for the presence of the particles were that they had originated either from standard reference materials used in neutron activation analysis or from a shielded transport container. These explanations were not supported by the results of subsequent sampling carried out by the Agency at the MNSR (GOV/2009/75, para. 6). In a meeting held on 2 November 2009 in Vienna, Syria suggested that the particles may have originated from other materials present at the MNSR, specifically quantities of yellowcake produced at a pilot phosphoric acid purification plant at Homs<sup>7</sup>, previously undeclared uranyl nitrate compounds derived from the yellowcake and/or small quantities of previously undeclared imported uranyl nitrate materials (GOV/2009/75, para. 7).

10. The possibility of a link between the particles found at the MNSR and those found at the Dair Alzour site requires further sampling and analysis by the Agency. The Agency also needs to determine whether the use of the natural uranium compounds at the MNSR may be relevant to allegations concerning one of the three other locations and whether experiments may have been performed with the larger quantities of yellowcake produced at the Homs plant.<sup>8</sup>

## **B. Verification Activities**

11. On 17 November 2009, during an inspection at the MNSR, the Agency provided Syria with a letter, dated 13 November 2009, in which it listed experimental activities carried out with nuclear material which, according to open sources, had been performed in Syria and which could be of relevance in determining the origin of the particles found at the MNSR. In the letter, the Agency requested access to the persons involved in those activities and to detailed information regarding the nuclear material and equipment used in the experiments. Syria made one of the requested persons available during the inspection and discussions were held on the experimental activities. Following up on Syria's statements concerning nuclear material at the MNSR (para. 9), samples were taken from yellowcake and uranyl nitrate compounds present at the MNSR. Environmental samples were also taken from equipment and locations at the MNSR associated with experimentation involving uranium-containing materials. In a letter to the Agency dated 6 December 2009, Syria provided limited information about some of the nuclear material observed at the MNSR. However, Syria did not address the Agency's concerns regarding the origin and presence of the anthropogenic natural uranium particles found there.

12. In a letter dated 7 January 2010, the Agency requested confirmation of the quantities of nuclear material observed at the MNSR, the complete reporting of all nuclear material, detailed information regarding the use of uranium-containing nuclear material and updates to the design information.

13. In a letter dated 21 January 2010, the Agency provided Syria with the results of the samples taken during the 17 November 2009 inspection. While the results confirmed the characteristics of the material as declared by Syria, the Agency informed Syria that further clarification regarding the presence and use of anthropogenic natural uranium at the MNSR was necessary, and proposed that a meeting be held in Damascus on 8 and 9 February 2010 to discuss these issues.

14. In a letter dated 10 February 2010, Syria declined the Agency's request for the meeting, indicating that, in the light of the information provided in the same letter, it could be planned for a later stage. The information Syria provided does not clarify the presence and use of anthropogenic natural uranium at the MNSR. The Agency is planning an inspection at the MNSR to be performed on 23 February 2010 to verify nuclear material at the MNSR and examine relevant source documents related to the experiments indicated above.

## **C. Assessment and Next Steps**

15. Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites since the previous report to the Board of Governors.

16. Syria has provided some additional information concerning the presence and use of the anthropogenic natural uranium at the MNSR. However, Syria has not yet provided a full explanation of the activities and experiments involving nuclear material conducted at the MNSR that may have been the source of the particles found there. Therefore, further clarification from Syria is necessary in order to resolve this issue and to help exclude any possible link between the particles found at the MNSR and those found at the Dair Alzour site. Additionally, Syria is required to provide complete reporting of all nuclear material in Syria and to provide the Agency with access to all relevant documentation. The Agency has requested Syria's cooperation in these respects.

17. Since the November 2009 inspection, Syria has not fully cooperated with the Agency to facilitate the resolution of the issues concerning the MNSR. Syria has also not provided design information concerning the irradiation of uranium at the MNSR or met its nuclear material reporting obligations under the Safeguards Agreement (INFCIRC/407).

18. At both the Dair Alzour and MNSR sites, the Agency has found particles of anthropogenic natural uranium. Given that Syria has no reported inventory of natural uranium, this calls into question the completeness and correctness of Syria's declarations concerning nuclear material and facilities.

19. The Director General urges Syria to engage with the Agency on the above issues so that, in accordance with its mandate under Syria's Safeguards Agreement, the Agency is able to confirm that all nuclear material in Syria is in peaceful activities. For both the Dair Alzour and the MNSR sites, given the passage of time and the possible degradation of information, the Agency requests Syria to provide prompt access to all relevant information for the verification of Syria's declarations. The Director General is ready to agree with Syria on the necessary modalities for managed access to information and locations that will enable the Agency to establish the facts and make progress in its verification, while protecting military and other information considered by Syria as sensitive.

20. The Director General also urges Syria to bring into force an Additional Protocol to its Safeguards Agreement which will facilitate the Agency's work in verifying the correctness and completeness of Syria's declarations.

21. The Director General will continue to report as appropriate.

<sup>1</sup> GOV/OR.1206, para. 26 and GOV/2008/60, para. 16.

<sup>2</sup> GOV/2008/60, para. 4.

<sup>3</sup> GOV/2008/60, paras 10 and 11.

<sup>4</sup> "Anthropogenic" refers to material that has been produced as a result of chemical processing.

<sup>5</sup> GOV/2009/9, para. 7.

<sup>6</sup> GOV/2009/36, para. 7.

<sup>7</sup> A pilot plant for the purification of phosphoric acid was constructed and commissioned in 1997 at Homs, Syria, with the support of the United Nations Development Programme and the IAEA. Yellowcake was produced as a by-product of the purification process.

<sup>8</sup> During a July 2004 visit to the Homs phosphoric acid purification pilot plant, Agency inspectors observed some hundreds of kilograms of yellowcake.

## IAEA suspects Syrian nuclear activity at bombed site

Mark Heinrich

VIENNA

Thu Feb 18, 2010 4:47pm EST

VIENNA (Reuters) - Uranium particles found at a Syrian desert complex bombed to ruin by Israel in 2007 point to possible covert nuclear activity at the site, the U.N. atomic watchdog said Thursday.

It was the first time the International Atomic Energy Agency lent public support to Western suspicions that Israel's target was a nascent nuclear reactor that Washington said was North Korean in design and geared to making weapons-grade plutonium.

Previous IAEA reports on its two-year investigation into the affair, impeded by a lack of Syrian cooperation, said only that the uranium particles raised concern because they did not come from Syria's declared inventory.

"The presence of such particles points to the possibility of nuclear-related activities at the site and adds to questions concerning the nature of the destroyed building," said the confidential report by new IAEA Director-General Yukiya Amano, obtained by Reuters.

"Syria has yet to provide a satisfactory explanation for the origin and presence of these particles," he wrote, dismissing Damascus's contention that the traces came with munitions used by Israel to wreck the complex.

In what analysts called another departure from predecessor Mohamed ElBaradei, Amano prodded Syria to adopt the IAEA's Additional Protocol, which permits unfettered inspections beyond declared nuclear site to ferret out any covert atomic activity.

### SYRIAN STONEWALL

U.N. inspectors examined the site at Dair Alzour in June 2008 but Syria has barred renewed access and also not let them visit three military sites, whose appearance was altered by landscaping after the IAEA first asked to check them.

The Vienna-based IAEA has also been checking whether there could be a link between the particles uncovered at Dair Alzour and similar unexplained traces detected in swipe samples taken at a Damascus nuclear research reactor later in 2008.

The report said Syria had refused a meeting in Damascus last month to address the issue. But inspectors now planned to visit the research reactor on February 23 to take more test samples and examine "relevant source documents related to the experiments."

Some analysts say the Damascus findings raised the question whether Syria used some natural uranium intended for the alleged reactor at Dair Alzour in tests applicable to learning how to separate out bomb-grade plutonium from spent nuclear fuel.

Syria, an ally of Iran which is under IAEA investigation over nuclear proliferation suspicions, has denied ever having an atom bomb program and has said the intelligence is fabricated.

"Syria has not cooperated with the agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it," said the U.N. watchdog report.

"As a consequence, the Agency has not been able to make progress toward resolving the outstanding issues."

The issue, along with the IAEA's hardening concern about a possible covert Iranian nuclear weapons program, will be on the agenda of the first of four quarterly meetings by the IAEA's 35-nation board of governors starting on March 1.

(Editing by Jon Hemming)

Philip J. Crowley  
Assistant Secretary  
Daily Press Briefing  
Washington, DC  
February 19, 2010

[EXCERPT]

QUESTION: The IAEA also made a report on Syria, which you guys have noted. It says that Syria isn't giving any cooperation to IAEA either. So – and yet, in the case of Syria, they're – they're getting an ambassador, they just had a visit by Mr. Burns. Why this holding out of hands to Syria which is equally in contravention of the IAEA, and getting more tough on Iran?

MR. CROWLEY: Well, we – I mean, we remain concerned about Syria's nuclear activity. They have not explained what was happening at the Al-Kibar reactor. It's refused to cooperate with the IAEA or account for chemically processed uranium found at two sites. We're not putting an ambassador into Damascus as a favor to Syria; we're putting an ambassador in Damascus so we can have the kind of direct conversation and engagement that we think is necessary in the region in the 21st century. We are going to have an ambassador there who will engage Syria on the full range of issues, those areas where we think there's opportunity for cooperation and those areas where we have concerns about Syria's ongoing activity, whether it's unexplained nuclear activity, whether it's support of terrorism, whether it's the presence of extremist groups in Damascus, whether it's unhelpful activity that Syria is engaged in with respect to Iraq.

On the – at the same time, we will have conversations with Syria about its own intentions as part of the peace process and whether it's willing to engage Israel constructively and move – make progress on that track of the peace process towards the comprehensive peace that we seek in the Middle East.

So we're not – we're not engage – returning an ambassador there as a favor; we're returning an ambassador because we think it's in the United States interest to have an ambassador in place who can have an ongoing daily conversation with Syrian officials and help them understand what we think about what is happening in the region and the bilateral relationships and multilateral relationships that we think are vitally important and serve our interest in the region.

QUESTION: But if Syria continues to stonewall the IAEA, would the U.S. then support continuing down the pressure track on the Syrian case and talk about new sanctions on Syria?

MR. CROWLEY: A lot of "ifs" in that question.

## Syria dismisses IAEA call for more inspectors access

By Khaled Yacoub Oweis

Saturday, February 20, 2010; 10:48 AM

DAMASCUS (Reuters) - Syria dismissed on Saturday an International Atomic Energy Agency recommendation to allow its inspectors unrestrained access, days after the agency said a bombed Syrian complex could have been a nuclear site.

An IAEA report said on Thursday [2010-02-19] that Uranium particles found at a Syrian complex destroyed by an Israeli air raid in 2007 suggest the possibility of covert nuclear activity at the site.

The report, by new IAEA Director-General Yukiya Amano, prodded Syria to adopt the IAEA's Additional Protocol, which permits unfettered inspections beyond a declared nuclear site to check out any covert atomic activity.

"We are committed to the non-proliferation agreement between the agency and Syria and we (only) allow inspectors to come according to this agreement," Syrian Foreign Minister Walid al-Moualem said.

"We will not allow anything beyond the agreement because Syria does not have a military nuclear program. Syria is not obliged to open its other sites to inspectors," Moualem said after meeting his Austrian counterpart Michael Spindelegger.

Moualem did not address the findings of the latest IAEA report on Syria and repeated Syria's position that its nuclear activities are peaceful and related mostly to medicine.

### SUSPICIONS

The United States said the site bombed by Israeli warplanes three years ago at al Kubar, around 60 km (37 miles) west of the city of Deir al-Zor, was a North Korean designed nuclear reactor geared to making weapons-grade plutonium.

The IAEA report lent public support for the first time to the U.S. assessment.

"Unlike Israel, our program is peaceful," Moualem said, referring to the Arab view that Israel has a massive nuclear arsenal that contributes to Middle East instability.

Previous IAEA reports on its investigation into Kubar said lack of Syrian cooperation impeded the investigation.

U.N. inspectors examined the site in June 2008 but Syrian authorities has barred them access since and did not let them visit three military sites.

The IAEA has also been checking whether there could be a link between the particles uncovered at Kubar and similar traces detected in swipe samples taken at a Damascus nuclear research reactor later in 2008.

The report said Syria had refused a meeting in Damascus last month to address the issue. But inspectors now planned to visit the research reactor on February 23.

Syria, is an ally of Iran, which is under IAEA investigation over its nuclear facilities. Moualem said Western proposals for fresh U.N. sanctions on Iran were counterproductive.

"We do not think sanctions will solve the issue," he said. "They will complicated the chances for a constructive dialogue between Iran and the West."

French Prime Minister Francois Fillon said on during a visit to Syria on Saturday that world powers would have to take new action against Iran if Tehran made no further gestures.

(Editing by Jon Hemming)

Local News /

Feb 22, 2010 - 09:25 AM

Damascus, (SANA)- The meeting of President Bashar al-Assad with Austrian Foreign Minister Michael Spindelegger on Saturday [2010-02-20] dealt with bilateral relations between the two friendly countries and the development they are witnessing following reciprocal visits by a number of officials from both countries, particularly the recent visit to Syria by Austrian Chancellor Werner Fyammann.

[deletia]

Answering a question on whether Syria has a nuclear program, [Syrian Foreign Minister] al-Moallem said "Syria doesn't have a military nuclear program, but it uses the nuclear energy for peaceful purposes, particularly in the field of nuclear medicine and this activity is done under the supervision of the International Atomic Energy Agency (IAEA)."

He added "We are committed to the Nuclear Non-Proliferation Treaty and the Safeguards Agreement signed between Syria and the IAEA... We allow the inspectors according to this agreement to come and watch the activities done in this regard."

He went on to say "As for the IAEA other demands that don't come in the framework of the Safeguards Agreement, we don't allow going beyond the Safeguards Agreement, consequently we are not obliged to open our other sites to inspectors... Our activity is peaceful contrary to what Israel possess, and our activity is supervised by the IAEA."

[deletia]

## **Defence minister cautiously optimistic about Lebanon mission**

22. 02. 10. - 12:00

Social Democratic (SPÖ) Defence Minister Norbert Darabos is cautiously optimistic about Austrian participation in the UN mission in Lebanon (UNIFIL).

Darabos said on Saturday: "I have nothing against participation in the UN Interim Force in Lebanon", but cautioned that "I will not allow myself to be pressured since a positive decision will entail large expenses."

People's Party (ÖVP) Foreign Minister Michael Spindelegger had said on Saturday following his return from a week-long visit to the Middle East that he was "quite positive" about participation in UNIFIL and a decision would be made in the very near future.

*[deletia]*

Spindelegger, who concluded his Middle East tour Saturday in Damascus, Syria, called on the Syrian government to cooperate fully with the International Atomic Energy Agency (IAEA), based in Vienna.

The minister said uranium found in the ruins of the Syrian facility in Dair Alzour after its bombing by Israel in 2007 might have meant Syria had been engaging in secret nuclear activity.

Spindelegger told Syrian President Bashar al-Assad during their meeting that Iran needed to realise the international community's patience with regard to its nuclear programme was coming to an end.

*[deletia]*

SUBJECT: UK RESPONSE: SYRIA AT MARCH IAEA MEETING  
REF: SECSTATE 16530

Classified By: Political Counselor Robin Quinville for reasons 1.4 (b) and (d).

1.(C/NF) Poloffs delivered reftel demarche to Duncan Johnson, Regional Issues Desk Officer in the Counter-Proliferation Department (CPD) of the Foreign and Commonwealth Office (FCO), and Victoria Dunne, Syria and Lebanon Desk Officer in the Middle East and North Africa Department of the FCO, on February 25. Johnson and Dunne said that the UK shared U.S. concerns about Syria's lack of cooperation with the IAEA and about the message that Syria's defiance sent to other potential proliferators, including Iran.

2.(C/NF) Johnson noted that though this was the IAEA's sixth report on Syria, no real progress had yet been made on convincing Syria to cooperate with the IAEA. Johnson said that from a counter-proliferation perspective, it was worrying that a country could defy the IAEA in this way, and Dunne questioned what precedent Syria's example set for dealing with Iran. Johnson said that DG Amano's recent meetings with Foreign Secretary Miliband and Foreign Policy Adviser to No. 10 Simon McDonald indicated that while Amano realizes Syria is a concern, Amano's top priority is Iran; Dunne said that the UK was concerned that Amano's focus on Iran could lead to neglect of the Syria issue.

3. (C/NF) Johnson said that the UK was responding to the situation in three ways. First, together with EU Partners it is issuing a "fairly strong" statement at the Board of Governors meeting that calls for Syria to comply with IAEA requests and "does not lift the pressure" on Syria. (Note: The FCO passed Poloffs a confidential copy of the statement that we will email to NEA and ISN. End Note.) Second, it is raising the issue *bilaterally* when UK ministers meet with their Syrian counterparts (and Dunne noted that the UK welcomed recent U.S. rapprochement with Syria as well). Third, it is seeking intermediary countries to pass messages to the Syrians; an example is Turkey, who the UK last year successfully lobbied to intervene with Syria.

4. (C/NF) Johnson said that the UK's "higher objective" was to push the Syrians away from Iran, and noted that there was, at times, conflict between that goal and the goal of Syrian cooperation with the IAEA. On the issue of special inspections, Johnson said that the UK was "not at the moment" pushing this idea.

Middle East Nuclear-Free Zone -----

5. (C/NF) Johnson said that FCO Director-General of Defence and Intelligence Mariot Leslie recently spoke with Under Secretary Tauscher about a Russian proposal for a conference on a Middle East Nuclear-Free Zone. Johnson said that the UK viewed the Russian proposal as a possible way forward on the Syria issue, among others, and asked for U.S. views on this proposal. ## Syria turns down U.N. nuclear watchdog inspection

Thu Feb 25, 2010 3:12am IST

VIENNA, Feb 24 (Reuters) - Syria has turned down a planned visit to a research reactor in Damascus by U.N. nuclear inspectors trying to shed light on possible covert atomic activity in the country, diplomats said on Wednesday.

Syria told the International Atomic Energy Agency (IAEA) in a letter that the visit could not take place due to preparations for the IAEA's 35-nation Board of Governors meeting, which starts on Monday.

The letter was dated Feb. 18, the same day as the IAEA issued its latest report on Syria, but reached the agency on Tuesday, a diplomat close to the IAEA said. This did not give the agency enough warning as it had planned the inspection also for Tuesday.

Syria, an ally of Iran which is under IAEA investigation over nuclear proliferation suspicions, has denied ever having an atom bomb programme.

*[deletia]*

The agency is investigating whether there could be a link between the *[al Kibar]* bombed site and the reactor in Damascus. It had wanted to examine "relevant source documents related to the experiments" at the reactor on its visit this week.

IAEA officials told diplomats from member states on Wednesday that countries could suggest alternative dates for inspection visits if there were scheduling problems and that they were working with Syria to find a solution, diplomats said.

## **Taken Question: Meeting Between Assistant Secretary for Near Eastern Affairs Feltman and Ambassador Moustapha**

Office of the Spokesman  
Washington, DC

Question Taken at the February 26, 2010 Daily Press Briefing  
February 26, 2010

**Question:** Was Syrian Ambassador Moustapha summoned to the State Department today? What was discussed and what was the outcome of the meeting?

**Answer:** Assistant Secretary for Near Eastern Affairs Jeffrey Feltman asked Ambassador Moustapha to come to a meeting today at the State Department. This was their first opportunity to discuss next steps after Under Secretary Burns' visit to Damascus on February 17. The meeting was part of our ongoing efforts to engage with the Syrian government in a candid, direct manner on issues of mutual concern.

## **N. Korea provided raw uranium to Syria in 2007: sources**

(Mainichi Japan) February 28, 2010

TOKYO (Kyodo) -- North Korea provided about 45 tons of "yellowcake" uranium to Syria in September 2007 for production of fuel for an undeclared nuclear reactor, diplomatic and military sources knowledgeable on North Korean issues said Saturday [2010-02-27].

But the shipment was followed shortly by an Israeli air strike targeting the reactor and the uranium involved is believed to have been transferred to Iran around last summer, according to a Western diplomatic source.

The move highlights North Korea's nuclear proliferation activities, leaving open the possibility that Iran would use the yellowcake for covert uranium enrichment. But a Middle East military source has said that Syria may have returned the yellowcake to North Korea in the wake of the air strike.

U.N. Security Council resolutions ban North Korea from exporting nuclear-related materials and prohibit all member countries from procuring such items from the reclusive communist country.

David Albright, president of the U.S.-based Institute for Science and International Security, said 89 to 130 kilograms of weapons-grade uranium could be produced if 45 tons of yellowcake is further processed into uranium hexafluoride and is enriched.

"In any case, 45 tons of yellowcake is enough for several nuclear bombs," Albright said in a written response to Kyodo News.

Such an amount of yellowcake is equivalent to making 5,500 nuclear fuel rods for the type of 5,000-kilowatt graphite-moderated experimental reactor in North Korea's Yongbyon nuclear complex, on which Syria is believed to be modeling its own reactor. Plutonium, another material used for nuclear weapons, can be extracted from spent fuel rods.

U.S. officials have said the Syrian reactor had been close to becoming operational when it was destroyed by the Israeli strike.

It remains unclear whether there was a facility designed to create nuclear fuel rods or a reprocessing plant in Syria. But U.S. government officials say the head of North Korea's nuclear reactor fuel manufacturing plant in Yongbyon had visited Syria.

The diplomatic source said that the cargo of the yellowcake left North Korea's Nampo and passed through China's Dalian and Shanghai before reaching the port of Tartus in Syria on Sept. 2, 2007.

Israel noticed the move beforehand -- a factor that led the country to launch the air strike on Syria on Sept. 6.

The diplomatic source said Iran provided financial support for the construction of the Syrian nuclear reactor. Iran asked Syria to hand over the yellowcake after the strike, and the source said it is highly likely that the material was transferred to Iran via Turkey.

Iran is believed to be close to exhausting its yellowcake stockpiles reserved for its nuclear program and is seeking supplies from abroad.

North Korea, meanwhile, has abundant natural uranium resources which can be processed into nuclear fuel rods. It is also believed to be capable of making uranium hexafluoride for enrichment.

The United States and a number of European countries are wary that the North's resources and technologies may be used for secret nuclear development programs in Iran and other countries for the purpose of earning foreign currency.

In September last year, it was revealed that Iran was secretly constructing a second uranium enrichment plant.

"Iran might want a secret source of uranium or uranium hexafluoride for a parallel enrichment program, since the uranium hexafluoride produced at Esfahan is safeguarded by the International Atomic Energy Agency," Albright said, referring to a uranium conversion facility in the central city.

Some experts think that North Korea may refrain from exporting nuclear-related materials as it is seeking dialogue with the United States, which aims to prevent North Korea from engaging in nuclear-proliferation activities.

However, Pyongyang was once supporting Syria in its nuclear reactor construction program when the six-party talks aimed at denuclearizing the North were being held. Given such a track record, a high-level South Korean official said, "There are no taboos for the North."

## **IAEA Director General Addresses Board**

**1 March 2010**

IAEA Director General Yukiya Amano opened a busy Board of Governors meeting in Vienna, Austria with an introductory statement.

His statement dealt with nuclear energy, nuclear safety and security, cancer control, nuclear verification and safeguards, as well as management and budget issues.

*[[EXCERPTS]*

### **Nuclear Verification and Safeguards**

*[deletia]*

**Syria:** "As my report on the Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic shows, Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and other locations. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites since the previous report to the Board of Governors. It would be helpful if Israel shared with the Agency any relevant information which it may possess. Full cooperation is also needed from Syria to facilitate the resolution of issues concerning the Miniature Neutron Source Reactor."

During the approximately three days of meetings, the Board of Governors will consider measures to strengthen international cooperation in nuclear, radiation, transport and waste safety, and strengthening the Agency's activities related to nuclear science, technology and applications.

Reports by the Director General on the Implementation of the NPT Safeguards Agreement and Relevant Provisions of Security Council Resolutions 1737 (2006), 1747 (2007), 1803 (2008) and 1835 (2008) in the Islamic Republic of Iran, and on the Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, will also be discussed.

At the end of the opening morning session of the Board of Governors, the Director General briefed the press on issues relating to nuclear verification and safeguards as well as cancer control.

See Story Resources for more information.

By Sasha Henriques, IAEA Division of Public Information

Philip J. Crowley  
Assistant Secretary  
Daily Press Briefing  
Washington, DC  
March 1, 2010

[EXCERPT]

QUESTION: How do you assess the meeting that Assistant Secretary Feltman has had on Friday with the Syrian ambassador, and what about the timing of this meeting that came one day after the Syrian-Iranian summit in Damascus?

MR. CROWLEY: Well, I would point it in a slightly different direction. It came several days after an important visit to Damascus by Under Secretary Bill Burns. It was the first opportunity for Assistant Secretary Jeff Feltman to follow up on the particulars that were discussed as part of that visit. And Syria's relations with Iran is one of those items that is a part of our ongoing discussion with Syria. We want to see Syria play a more constructive role in the region. We also want – to the extent that it has the ability to talk to Iran directly, we want to make sure that Syria's communicating to Iran its concerns about its role in the region and the direction, the nature of its nuclear ambitions. So – but the primary purpose for having the Syrian ambassador in was to just kind of follow up on that meeting in Damascus and chart the way forward.

QUESTION: Have they discussed the statements made by President Assad?

MR. CROWLEY: It wouldn't surprise me.

QUESTION: Was Ambassador Ford in the meeting?

MR. CROWLEY: I don't know. It's a good question. I --

QUESTION: Can you get back to us on that?

MR. CROWLEY: Has he been confirmed? I don't think he's been confirmed --

QUESTION: Well, he wasn't in the meeting?

MR. CROWLEY: If he's not confirmed, he wouldn't be in the meeting. That would be a – no, I – I know from – until you're confirmed, you're not in business meetings.

## US, EU, urge Syria to drop nuclear secrecy

By GEORGE JAHN , 03.04.10, 09:10 AM EST

VIENNA -- Fiercely backed by allied Iran, Syria on Thursday [2010-03-04] denied hiding nuclear activities from the world and said Israel was the source of suspicious uranium particles found at a Syrian desert complex bombed two years ago by the Jewish state.

The Syrian and Iranian comments to the International Atomic Energy Agency's board of governors came in response to Western demands that Damascus stop stonewalling IAEA attempts to investigate suspicions that it ran covert nuclear programs - some with possible weapons applications.

While Iran remains the main focus of the board, Syria's refusal to allow IAEA inspectors into the country for follow-up visit to sites possibly linked to secret nuclear work was the principal theme of Thursday's closed board meeting.

A recent IAEA report prepared for the board said for the first time that uranium particles found at the desert facility destroyed by Israeli warplanes in September 2007 indicate possible covert nuclear activities at the site. The finding lent backing to Western allegations that the bombed target was a nearly completed nuclear reactor that Washington says was of North Korean design and meant to making weapons-grade plutonium.

Syria has put forward several explanations for the source of the uranium at the bomb site and of uranium traces found at its Damascus research reactor that IAEA inspectors say would not normally be found at such a facility. One Syrian suggestion - that Israeli munitions used to bomb the desert location contained depleted uranium - has been all but ruled out by the agency.

Delegates inside the meeting told The Associated Press that Bassam Al-Sabbag, Syria's chief IAEA delegate offered a new theory Thursday, suggesting that Israel had dropped uranium particles from the air after the bombing to implicate his country.

Separately, Iranian chief delegate Ali Asghar Soltanieh said Israel - not Syria - should be criticized at the meeting, describing the bombing of the Dair Alzour desert site as "an aggressive act, committed by the Zionist Regime." He accused the US and its allies of making an issue of "a few uranium particles."

But the U.S and the European Union said the onus was on Syria to disprove suspicions by cooperating with the agency.

*[deletia]*

"Over the past two years, we have noticed a troubling pattern in Syria's behavior," Chief U.S. delegate Glyn Davies told the meeting. "The more evidence the agency uncovers that Syria was engaged in serious safeguards violations, the more Syria has tried to actively hinder the agency's investigation."

On behalf of the EU, Spanish chief delegate Jose Luis Rosello expressed deep regret that Syria "has not been cooperative and transparent with the agency."

Associated Press writers Noura Maan and Alexander Mueller contributed to this report.

## Syria hints Israel planted nuclear traces on its territory

Last update - 18:57 04/03/2010

By News Agencies

[EXCERPTS]

Syria suggested on Thursday that Israel dropped uranium particles onto Syrian soil from the air to make it look as if a covert nuclear weapons plant was being built there, diplomats at a United Nations nuclear watchdog meeting said.

[deletia]

In a closed-door debate by the IAEA's 35-nation board of governors, Syria reiterated its assertion that the uranium traces came with munitions Israel used to destroy the complex.

IAEA head inspector Olli Heinonen replied that the chemical composition, size, shape and distribution of the traces made it extremely unlikely they were a type of uranium sometimes used in munitions as a hardening agent, diplomats present said.

Rather, he said, they were traces of processed uranium - which after further treatment could be used for nuclear fuel.

In response, Syrian Ambassador Bassam al-Sabbagh suggested Israel might have contaminated the site with uranium particles dropped by air during or right after the air strike, participants in the meeting told Reuters.

"The IAEA should verify the nature of the material dropped by Israel ... There were planes that overflowed the site and we don't know what it was they dropped. I'm not just talking about munitions," Sabbagh was quoted by diplomats as saying.

Western diplomats dismissed his remarks as another twist in Syrian efforts to deflect the IAEA probe without addressing the substance of UN and Western concerns.

"It's part of a pretty weak defense by Syria," said a European Union diplomat, who like others spoke on condition of anonymity.

"I don't think (most delegations) took this seriously," said another diplomat.

Asked about that, a senior UN official familiar with Syria's dossier said: "The best solution would be to let the IAEA take samples from the debris to establish the facts, as the IAEA reports on this have indicated."

[deletia]

The UN watchdog's governors took no action on Syria pending further efforts by inspectors to gain access.

U.S., European and other Western delegates urged Syria to cooperate fully with the IAEA inquiry, while Iran said it was Israel, not Syria, that should be in the agency's dock.

"The core of the problem is an aggressive act committed by the Zionist regime," Iranian Ambassador Ali Asghar Soltanieh said. He blamed Western powers for the IAEA focusing "on the minor issue of a few uranium particles".

## **Iran wants IAEA to switch concern to Israel**

Fri, 05 Mar 2010 18:36:50 GMT

Iran's envoy to the International Atomic Energy Agency (IAEA) has urged the top nuclear body to switch its focus from Syria's atomic work to Israel's nuclear arsenal as the main cause for concern.

Ali Asghar Soltanieh read out a statement in the Thursday meeting of the IAEA Board of Governors on the implementation of the Safeguards Agreements in Syria.

In the statement, Soltanieh said that Iran was "deeply concerned" about the IAEA's verification measures which, he said have shifted focus from Israel's nuclear work as the main source of problem to "secondary technical" issues.

"The core problem is, in fact, the Zionist regime of Israel's offensive against Syria which is a blatant violation of the UN Charter and the international law including the Statute of the International Atomic Energy Agency," Fars News Agency quoted Soltanieh as saying on Thursday.

In September 2007, Israeli warplanes destroyed Syria's al-Kibar military site blaming the country for harboring a nuclear reactor there, a claim rejected by Syria.

Soltanieh then accused Israel and its allies of having engaged the IAEA in a made-up scenario by raising "false claims" against Syria.

"Meanwhile, those member states who cry foul over Syria [s nuclear work] have turned a blind eye to the Israeli regime's nuclear arsenal, which poses a serious threat to both regional and global peace and security," he said.

An IAEA report by Director General Yukiya Amano said in February that uranium particles found at the Syrian complex suggest the possibility of covert nuclear activity at the site.

In response to the report, Syria said that unlike Israel, it was "committed to the non-proliferation agreement," reiterating that its nuclear work is totally peaceful.

Israel, the world's sixth largest nuclear weapons power, maintains a policy known as "nuclear ambiguity" and continues to remain outside the Nuclear Non-Proliferation Treaty.

**STATEMENT OF ROBERT FORD  
AMBASSADOR-DESIGNATE TO THE SYRIAN ARAB REPUBLIC  
BEFORE THE SENATE COMMITTEE ON FOREIGN RELATIONS  
MARCH 16, 2010**

*[EXCERPTS]*

Especially at a time when the Middle East confronts increasing regional tensions, we must be talking every day and every week with top-level officials who have influence and decision-making authority. They need to hear directly from us, not from the media or third-party intermediaries, what are our bottom lines and the potential costs to them – and to the region – of their miscalculations. If confirmed, unfiltered straight talk with the Syrian government will be my mission priority.

And I am under no illusions as to the nature of the challenge I will face if confirmed;

*[deletia]*

And while we urge countries in the region to comply with their obligations under the Nuclear Nonproliferation Treaty and their obligations to the International Atomic Energy Agency in Vienna, the Syrians have so far refused to provide the IAEA access and information necessary to resolve the concerns about Syria's nuclear activities.

*[deletia]*

PolicyWatch #1649: Special Forum Report

## **Too Little, Too Late? Nuclear Security and the Middle East**

Featuring Gregory Schulte, George Perkovich, and Simon Henderson

April 6, 2010

On April 5, 2010, Gregory Schulte, George Perkovich, and Simon Henderson addressed a special Policy Forum luncheon at The Washington Institute to discuss the implications of regional nuclear proliferation in the context of the April 12-13 Nuclear Security Summit in Washington. Ambassador Schulte, who served as U.S. representative at the International Atomic Energy Agency in Vienna from 2005 to 2009, is a senior visiting fellow at the National Defense University's Center for the Study of Weapons of Mass Destruction. Dr. Perkovich is vice president for studies and director of the Nuclear Policy Program at the Carnegie Endowment for International Peace. Mr. Henderson is the Baker fellow and director of the Gulf and Energy Policy Program at The Washington Institute. The following is a rapporteur's summary of their remarks.

**Note: The opinions expressed in Ambassador Schulte's presentation are his own and not necessarily those of the National Defense University or the U.S. government.**

*[Sourcebook note and transcript: at 9 minutes 25 seconds into Amb. Schulte's audio presentation he provides an example of the surprises that can occur: "Remember how, more recently, Syria built a nuclear reactor in the desert -- with no one noticing for at least five years."]*

## **IAEA inspects Syria reactor in uranium traces probe**

Tuesday, April 6, 2010; 1:08 PM [*Accessed 2010-04-06T18:50Z*]

VIENNA (Reuters) - U.N. inspectors have been able to revisit a Damascus nuclear research reactor as part of a probe into possible covert atomic activity in Syria, diplomats said on Tuesday.

But Syria continues to deny inspectors follow-up access to a desert site where Israel bombed a building in 2007 which U.S. intelligence reports said was a nascent, North Korean-designed nuclear reactor geared to yield atomic bomb fuel.

The Vienna-based International Atomic Energy Agency has been checking whether there could be a link between the Damascus reactor and the bombed Dair Alzour site after discovering unexplained particles of processed uranium at both.

Syria turned down a planned IAEA inspection of the Damascus reactor in February, saying it was too busy with preparations for an IAEA Board of Governors meeting. But inspectors have now been allowed to examine the site.

"They visited Damascus only," a diplomat close to the IAEA said. The nuclear watchdog's next report on Syria is due toward the end of May.

Syria, an ally of Iran which is under investigation over nuclear proliferation suspicions, has denied ever having an atom bomb programme.

But in his February report on Syria, new IAEA chief Yukiya Amano gave independent support to Western suspicions for the first time by saying the uranium traces found in a 2008 visit by inspectors pointed to nuclear-related activity on the ground.

Syria's envoy to the IAEA has suggested Israel dropped uranium particles on to its soil to make it look as if a covert nuclear weapons plant was being built, an explanation which has been treated with skepticism by Western diplomats.

The IAEA wants to re-examine the desert site so it can take samples from rubble removed immediately after the air strike.

The agency has also been seeking access to three other Syrian sites under military control whose look was altered by landscaping after inspectors asked for access.

Israel is widely believed to be the only Middle East state to possess nuclear weapons, although it maintains public ambiguity about its capability.

## **Some Still Doubt Nuclear Terror Threat, Former U.S. Envoy Says**

By Lee Michael Katz

Special to Global Security Newswire

Friday, April 9, 2010

*[EXCERPTS]*

WASHINGTON -- Even as the United States and other nations have pressed the issue in recent years, there have been doubts within the international community about the immediacy of the threat posed by nuclear terrorism, according to a former U.S. envoy to the United Nations' nuclear watchdog (see GSN, April 8).

Gregory Schulte for years worked alongside diplomats at the International Atomic Energy Agency who "weren't convinced nuclear terrorism was real, that terrorists could actually get their hands on a nuclear weapon or even a dirty bomb. So, they tended to dismiss the threat," he said in an exclusive interview with Global Security Newswire.

*[deletia]*

### **Q: Do you think IAEA technical assessments on Iran were politicized?**

**Schulte:** It became a political football.

I recently read the two reports by the new director general, on Iran and Syria. And I have been reading IAEA reports now for five years. These were refreshingly forthright and honest. It was clear to me they hadn't gone through the painful political editing process that previous reports went through. There was often an effort to remove words or adjectives that would be seen as critical towards Iran. There was often an attempt to suppress concerns that were put forward by the IAEA inspectors.

Mohamed ElBaradei, the previous director general, added to the politics of this. The reports became politicized because the director general didn't want to be too confrontational with Iran. I think that undercut both the credibility and the effectiveness of the organization.

I'm very pleased to see Yukiya Amano, the new director general, is bringing the IAEA back to its core technical mission.

*[deletia]*

### **Q: What are the other challenges faced by the IAEA and the NPT regime?**

**Schulte:** For us to strengthen the IAEA and the NPT regime, we really need to focus in three areas. First, we have to improve the capability of the IAEA and the international community to detect violations, to detect clandestine nuclear activities. We're not real good at it.

Take the example of the covert reactor that Syria was building with North Korean help. You know, the United States didn't detect this facility, which was cleverly disguised. We didn't detect it for years. The IAEA never detected it. That's not the fault of the IAEA's inspectors. It's just that Syria wasn't living up to its obligations to report it. Look at the clandestine weaponization efforts the Iranians had under way and perhaps still do. The IAEA didn't detect those until they were provided information on them. So detecting clandestine programs is a real challenge.

And if we're going to dissuade other countries from pursuing nuclear weapons, at a minimum they have to understand they could be caught. And this means national intelligence communities have to work to do better. We need to look at how can we strengthen the IAEA inspectors. The Department of Energy has an initiative under way to try to get them better technology to help in characterizing and tracking down nuclear material. That's very important.

*[deletia]*

**Q: The reported Syrian nuclear reactor, which Syria denies, was bombed by Israel in 2007. Is Syria telling the truth? (see GSN, April 7) Is it cooperating with IAEA inspectors?**

**Schulte:** Syria would like to bury the IAEA investigation the same way that Syrian bulldozers buried the remains of the reactor after Israel bombed it. They started with a cover-up and the denial. Then they proceeded to complete noncooperation.

After the site was bombed, they carted away the wreckage and built a new building on top. Only then did they allow IAEA inspectors to come, hoping that inspectors would find nothing. Well, IAEA inspectors found something. They found a bunch of chemically processed uranium particles that couldn't be explained. The latest report by the IAEA director general makes it clear the inspectors assumed it was a reactor. It says it has all the characteristics of a nuclear reactor site -- and it doesn't accept any of Syria's explanations.

Syria has stopped all of its cooperation, and it's hoping that the investigation will go away. But I don't think it will.

**Q: What is North Korea's involvement in Syria, if any? And with proliferation elsewhere?**

**Schulte:** The Syrian case is really more about North Korea than it is about Syria. We talk about the IAEA investigation of Syria because the covert reactor was being built in Syria, but who provided the designs? Who provided the expertise? Who perhaps even provided resources and financing for it? The North Koreans.

When the possibility of this reactor first emerged, the IAEA inspectors were somewhat dismissive because they said, 'well, you know, Syria doesn't have the expertise or the resources to build a nuclear reactor.' But it quickly became apparent they got that expertise and resources from North Korea. So, North Korean involvement in designing a reactor very much like their reactor at Yongbyon, which as we know, produced plutonium for their nuclear weapons, is quite troubling indeed.

It illustrates that North Korea is prepared not only to engage and trade in missile systems and other conventional armaments as we've seen, but they're also ready to sell nuclear technology. That has to worry us, because if North Korea's going to sell nuclear technology to Syria, where else might they do it? Are they going to sell it to Burma? To Venezuela? Are they going to sell it to anyone who's ready to purchase this?

*[deletia]*

## **Statement to 2010 Review Conference of Parties to the Treaty on the Non-Proliferation of Nuclear Weapons (NPT)**

by IAEA Director General Yukiya Amano

3 May 2010 | New York, USA

*[EXCERPTS]*

*[deletia]*

At present, the Agency is working to resolve important safeguards implementation issues in three States.

*[deletia]*

As far as Syria is concerned, the Agency has not been able to make progress towards resolving questions related to the nature of the Dair Alzour site destroyed by Israel and other locations. Syria has not cooperated with the Agency since June 2008 in this regard. I continue to request Syria to engage with the Agency on all outstanding issues.

*[deletia]*

CONTINUATION OF THE NATIONAL EMERGENCY  
WITH RESPECT TO SYRIA

---

MESSAGE

FROM

**THE PRESIDENT OF THE UNITED STATES**

TRANSMITTING

NOTIFICATION THAT THE NATIONAL EMERGENCY WITH RESPECT TO SYRIA, ORIGINALLY DECLARED ON MAY 11, 2004, BY EXECUTIVE ORDER 13338, IS TO CONTINUE IN EFFECT BEYOND MAY 11, 2010, PURSUANT TO 50 U.S.C. 1622(d)

MAY 5, 2010.—Message and accompanying papers referred to the Committee on Foreign Affairs and ordered to be printed

---

U.S. GOVERNMENT PRINTING OFFICE

*To the Congress of the United States:*

Section 202(d) of the National Emergencies Act, 50 U.S.C. 1622(d), provides for the automatic termination of a national emergency, unless, prior to the anniversary date of its declaration, the President publishes in the Federal Register and transmits to the Congress a notice stating that the emergency is to continue in effect beyond the anniversary date. In accordance with this provision, I have sent to the Federal Register for publication the enclosed notice stating that the national emergency with respect to the actions of the Government of Syria declared in Executive Order 13338 of May 11, 2004, and relied upon for additional steps taken in Executive Order 13399 of April 25, 2006, and Executive Order 13460 of February 13, 2008, is to continue in effect beyond May 11, 2010.

While the Syrian government has made some progress in suppressing foreign fighter networks infiltrating suicide bombers into Iraq, its actions and policies, including continuing support for terrorist organizations and pursuit of weapons of mass destruction and missile programs, pose a continuing unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For these reasons, I have determined that it is necessary to continue in effect the national emergency declared with respect to this threat and to maintain in force the sanctions to address this national emergency. As we have communicated to the Syrian government directly, Syrian actions will determine whether this national emergency is renewed or terminated in the future.

BARACK OBAMA.

THE WHITE HOUSE, May 3, 2010.

NOTICE  
CONTINUATION OF THE NATIONAL EMERGENCY WITH RESPECT TO  
THE ACTIONS OF THE GOVERNMENT OF SYRIA

On May 11, 2004, pursuant to his authority under the International Emergency Economic Powers Act, 50 U.S.C. 1701–1706, and the Syria Accountability and Lebanese Sovereignty Restoration Act of 2003, Public Law 108–175, the President issued Executive Order 13338, in which he declared a national emergency with respect to the actions of the Government of Syria. To deal with this national emergency, Executive Order 13338 authorized the blocking of property of certain persons and prohibited the exportation or re-exportation of certain goods to Syria. On April 25, 2006, and February 13, 2008, the President issued Executive Order 13399 and Executive Order 13460, respectively, to take additional steps with respect to this national emergency.

The President took these actions to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by the actions of the Government of Syria in supporting terrorism, maintaining its then existing occupation of Lebanon, pursuing weapons of mass destruction and missile programs, and undermining U.S. and international efforts with respect to the stabilization and reconstruction of Iraq.

While the Syrian government has made some progress in suppressing networks of foreign fighters bound for Iraq, its actions and policies, including continuing support for terrorist organizations and pursuit of weapons of mass destruction and missile programs, continue to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. As a result, the national emergency declared on May 11, 2004, and the measures adopted on that date, on April 25, 2006, in Executive Order 13399, and on February 13, 2008, in Executive Order 13460, to deal with that emergency must continue in effect beyond May 11, 2010. Therefore, in accordance with section 202(d) of the National Emergencies Act, 50 U.S.C. 1622(d), I am continuing for 1 year the national emergency declared with respect to certain actions of the Government of Syria. The United States will consider changes in the policies and actions of the Government of Syria in determining whether to continue or terminate this national emergency in the future and would welcome progress by the Government of Syria on these matters.

This notice shall be published in the Federal Register and transmitted to the Congress.

BARACK OBAMA.

THE WHITE HOUSE, May 3, 2010.

## UN experts say NKorea is exporting nuke technology

By EDITH M. LEDERER (AP)

14 hours ago [Accessed 2010-05-28T21:00Z]

UNITED NATIONS — North Korea is exporting nuclear and ballistic missile technology and using multiple intermediaries, shell companies and overseas criminal networks to circumvent U.N. sanctions, U.N. experts said in a report obtained by The Associated Press.

The seven-member panel monitoring the implementation of sanctions against North Korea said its research indicates that Pyongyang is involved in banned nuclear and ballistic activities in Iran, Syria and Myanmar. It called for further study of these suspected activities and urged all countries to try to prevent them.

The 47-page report, obtained late Thursday by AP, and a lengthy annex document sanctions violations reported by U.N. member states, including four cases involving arms exports and two seizures of luxury goods by Italy — two yachts and high-end recording and video equipment. The report also details the broad range of techniques that North Korea is using to try to evade sanctions imposed by the U.N. Security Council after its two nuclear tests in 2006 and 2009.

Council diplomats discussed the report by the experts from Britain, Japan, the United States, France, South Korea, Russia and China at a closed-door meeting on Thursday.

Its release happened to coincide with heightened tensions between North Korea and South Korea over the March sinking of a South Korean navy ship which killed 46 sailors. The council is waiting for South Korea to decide what action it wants the U.N.'s most powerful body to take in response to the sinking, which a multinational investigation determined was caused by a North Korean torpedo.

The panel of experts said there is general agreement that the U.N. embargoes on nuclear and ballistic missile related items and technology, on arms exports and imports except light weapons, and on luxury goods, are having an impact.

But it said the list of eight entities and five individuals currently subject to an asset freeze and travel ban seriously understates those known to be engaged in banned activities and called for additional names to be added. It noted that North Korea moved quickly to have other companies take over activities of the eight banned entities.

The experts said an analysis of the four North Korean attempts to illegally export arms revealed that Pyongyang used "a number of masking techniques" to avoid sanctions. They include providing false descriptions and mislabeling of the contents of shipping containers, falsifying the manifest and information about the origin and destination of the goods, "and use of multiple layers of intermediaries, shell companies, and financial institutions," the panel said.

It noted that a chartered jet intercepted in Thailand in December carrying 35 tons of conventional weapons including surface-to-air missiles from North Korea was owned by a company in the United Arab Emirates, registered in Georgia, leased to a shell company registered in New Zealand and then chartered to another shell company registered in Hong Kong — which may have been an attempt to mask its destination.

North Korea is also concealing arms exports by shipping components in kits for assembly overseas, the experts said.

As one example, the panel said it learned after North Korean military equipment was seized at Durban harbor in South Africa that scores of technicians from the North had gone to the Republic of Congo, where the equipment was to have been assembled.

The experts called for "extra vigilance" at the first overseas port handling North Korean cargo and close monitoring of airplanes flying from the North, saying Pyongyang is believed to use air cargo "to handle high valued and sensitive arms exports."

While North Korea maintains a wide network of trade offices which do legitimate business as well as most of the country's illicit trade and covert acquisitions, the panel said Pyongyang "has also established links with overseas criminal networks to carry out these activities, including the transportation and distribution of illicit and smuggled cargoes."

This may also include goods related to weapons of mass destruction and arms, it added.

Under council resolutions, all countries are required to submit reports on what they are doing to implement sanctions but as of April 30 the panel said it had still not heard from 112 of the 192 U.N. member states — including 51 in Africa, 28 in Asia, and 25 in Latin America and the Caribbean.

While no country reported on nuclear or ballistic missile-related imports or exports from North Korea since the second sanctions resolution was adopted last June, the panel said it reviewed several U.S. and French government assessments, reports from the International Atomic Energy Agency, research papers and media reports indicating Pyongyang's continuing involvement in such activities.

These reports indicate North Korea "has continued to provide missiles, components, and technology to certain countries including Iran and Syria ... (and) has provided assistance for a nuclear program in Syria, including the design and construction of a thermal reactor at Dair Alzour," the panel said.

Syria denied the allegations in a letter to the IAEA, but the U.N. nuclear agency is still trying to obtain reports on the site and its activities, the panel said.

The experts said they are also looking into "suspicious activity in Myanmar," including activities of Namchongang Trading, one of the companies subject to U.N. sanctions, and reports that Japan in June 2009 arrested three individuals for attempting to illegally export a magnetometer — which measures magnetic fields — to Myanmar via Malaysia allegedly under the direction of a company known to be associated with illicit procurement for North Korea's nuclear and military programs. The company was not identified.

Item 7(f) of the provisional agenda  
(GOV/2010/22)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

## *Report by the Director General*

1. On 18 February 2010, the Director General reported to the Board of Governors on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic (Syria) (GOV/2010/11). This report covers developments since that date.

### **A. The Dair Alzour Site**

2. On 2 June 2008, the Director General informed the Board of Governors that the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria, destroyed by Israel in September 2007, had been a nuclear reactor. The information further alleged that the reactor was under construction but not operational at the time of its destruction, and that it had been built with the assistance of the Democratic People's Republic of Korea (DPRK). By the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building.<sup>1</sup> Syria has maintained that the destroyed building was a nonnuclear military installation and that it had had no nuclear related cooperation with the DPRK.<sup>2</sup> While it cannot be excluded that the destroyed building was intended for non-nuclear use, the Agency has assessed that the features of the building and its connectivity to adequate cooling are similar to what may be found at nuclear reactor sites.<sup>3</sup> While Syria has indicated that its efforts to procure pumping equipment and large quantities of barite and graphite were civilian and non-nuclear in nature, the Agency has assessed that these items could also support the construction of a nuclear reactor.<sup>4</sup>

3. The Agency was provided with access to the site on 23 June 2008, at which time it was permitted to take environmental samples but was not provided with the requested access to documentation relevant to the destroyed building and other buildings, or to debris and equipment from the destroyed building.<sup>5</sup> Analysis of the samples indicated the presence of particles of anthropogenic<sup>6</sup> natural uranium of a type not included in Syria's declared inventory of nuclear material. The Agency has assessed that there is a low probability that the particles originated from the missiles used to destroy the building, as was claimed by Syria.<sup>7</sup> The presence of such uranium particles points to the possibility of nuclear related activities at the site and adds to questions concerning

the nature of the destroyed building. Syria has yet to provide a satisfactory explanation for the origin and presence of these particles. In this context, information yet to be provided by Israel might be helpful in clarifying the matter.<sup>8</sup>

4. As indicated in previous reports, Syria made a number of statements concerning the Dair Alzour site, the three other locations allegedly functionally related to it, the procurement activities referred to above and the alleged foreign assistance. The statements are limited in detail and no documentation has been provided to support them. Syria has also maintained its position that, due to the disposal of the debris from the Dair Alzour site, it is impossible to grant the Agency's request for access to the debris. The information and access provided by Syria to date have not allowed the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building, or to substantiate Syria's claims regarding its procurement efforts.

5. The Agency has repeatedly requested that Syria have substantive discussions with it on the nature of the destroyed building, and discuss relevant satellite imagery and other information available to the Agency. Since the Agency's visit to the Dair Alzour site in June 2008, Syria has declined to engage substantively with the Agency in this regard. Furthermore, Syria has maintained that, due to the military and non-nuclear nature of the Dair Alzour site and the three other locations, it had no obligation to provide more information under its Safeguards Agreement with the Agency.<sup>9</sup> In this regard, the Agency has previously explained to Syria that there is no limitation in comprehensive safeguards agreements on Agency access to information, activities or locations simply because they may be military related. In a letter dated 17 March 2010, the Agency reminded Syria of its repeated requests for:

- information concerning the Dair Alzour site, the infrastructure observed at the site and certain procurement efforts which Syria has stated were related to civilian non-nuclear activities;
- access to technical documentation and any other information related to the construction of the destroyed building;
- access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are now situated; and
- further access to the Dair Alzour site and access to three other locations allegedly functionally related to the Dair Alzour site.

6. The Agency has, on several occasions, offered to engage with Syria to establish the necessary modalities for managed access to sensitive information and locations, including the Dair Alzour site and the three other locations. Such access is essential to enable the Agency to establish the facts and make progress in its verification, while protecting military and other information which Syria considers to be sensitive. Given the passage of time and the possible degradation of information, the Agency requests Syria to provide prompt access to all relevant information. The Agency remains ready to discuss with Syria the necessary modalities for managed access.

## **B. Activities at the MNSR Site**

7. Particles of anthropogenic uranium of a type not included in Syria's reported inventory were found at the Miniature Neutron Source Reactor (MNSR) in 2008 and in 2009. Syria's initial explanations in June 2009 that the particles had originated either from standard reference materials used in neutron activation analysis or from a shielded transport container were not supported by the results of sampling carried out by the Agency.<sup>10</sup>

8. In the course of the Agency's investigation into the origin and presence of the uranium particles at the MNSR, Syria suggested in November 2009 that they may have originated from yellowcake produced domestically at the Homs phosphoric acid purification plant, and from a small quantity of imported depleted uranyl nitrate.<sup>11</sup>

9. A physical inventory verification (PIV) was undertaken at the MNSR on 31 March 2010. During the PIV, Syria provided the Agency with information concerning previously unreported activities involving the conversion of yellowcake to uranyl nitrate. Syria stated that the conversion activities involved tens of grams of nuclear material and had taken place in 2004 at the MNSR. Syria explained that the conversion activities had been performed in order to produce natural uranyl nitrate for comparison with depleted uranyl nitrate in irradiation experiments at the MNSR.

10. During the PIV, Syria presented approximately 1 kg of yellowcake which it stated had been produced at Homs, and small quantities of uranyl nitrate powders and solutions. Syria provided the Agency with access to samples which it stated had been irradiated during experiments at the MNSR. Syria also provided the Agency with copies of documentation said to be related to the conversion activities. Syria submitted to the Agency updated design information for the MNSR in a letter dated 11 April 2009 and draft inventory change reports concerning the newly declared material. In a letter to Syria dated 23 April 2010, the Agency requested further information concerning documentation and information provided during the PIV. In a letter dated 10 May 2010, Syria provided additional information. The Agency is awaiting the results of the analysis of samples taken during the PIV.

11. Further assessment of Syria's declarations concerning the conversion activities, the related experiments and the origin of the anthropogenic natural uranium particles is ongoing.

### C. Summary

12. Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites. Furthermore, with time, some of the necessary information may deteriorate or be lost entirely. The Director General urges Syria to cooperate with the Agency on these issues in a timely manner.

13. Syria has provided information on previously unreported uranium conversion and irradiation activities at the MNSR and additional explanations concerning the presence of the anthropogenic natural uranium particles at the MNSR. Subsequently, Syria submitted draft inventory change reports concerning the newly declared nuclear material. The information provided by Syria is still being assessed.

14. The Director General also urges Syria to bring into force an Additional Protocol to its Safeguards Agreement, which will further facilitate the Agency's work in verifying the correctness and completeness of Syria's declarations.

15. The Director General will continue to report as appropriate.

7 June 2010 | Vienna, Austria  
IAEA Board of Governors

## **Introductory Statement to Board of Governors**

by IAEA Director General Yukiya Amano

*[EXCERPT]*

### **Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

As my report on Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic shows, Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and some other locations. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites. It would also be helpful if Israel shared with the Agency any relevant information which it may possess in this regard.

Since my last report, the Agency has performed a physical inventory verification at the Miniature Neutron Source Reactor (MNSR) with Syria's cooperation. Syria has provided information on previously unreported laboratory-scale uranium conversion and irradiation activities at the MNSR and additional explanations concerning the presence of anthropogenic natural uranium particles. Syria subsequently submitted inventory change reports concerning the newly declared nuclear material. The information provided by Syria is still being assessed.

I urge Syria to cooperate with the Agency on all issues in a timely manner and to bring into force an Additional Protocol to its Safeguards Agreement to enable the Agency to verify the correctness and completeness of Syria's declarations.

## Reflections on Service

### A Conversation with Former CIA Director Michael Hayden

Mark Mansfield

Studies in Intelligence

Volume 54, Number 2 (June 2010)

*[EXCERPTS]*

Former CIA Director Michael Hayden—known for making good, efficient use of his time—has kept a brisk schedule since leaving office in February 2009 after a nearly three-year tenure at the CIA. In addition to being a principal at the Chertoff Group, a security consulting firm founded by former Secretary of Homeland Security Michael Chertoff, he serves as distinguished visiting professor at George Mason University’s School of Public Policy, writes and speaks publicly about intelligence and national security, travels frequently, and still finds the time—and marshals the energy—to train for 10K runs with his wife Jeanine.

Now that he has been out of government for well over a year, I wanted to ask him to reflect on his years at CIA—the accomplishments, the challenges he faced, and the positions he took on some controversial issues, including the detention and interrogation program.

On a lovely morning this spring, I had an opportunity to get together for breakfast with Hayden at the Fontainebleau Hotel in Miami Beach, where he had just arrived to address a large group of corporate executives about leadership. (I am currently serving as the CIA’s officer-in-residence at the nearby University of Miami.)

Hayden spent the better part of an hour discussing his years at CIA. Following are excerpts from our discussion.—MM

*[deletia]*

*[Mansfield:]* You strongly advocated publicly disclosing the role intelligence played in detecting the nuclear reactor in Syria. Why did you advocate this?

*[Hayden:]* It was a very complex political problem. First of all, when we became aware of it, it became very important to keep it secret. Arguably secret, because it had to be dealt with in a way that didn’t create a war in the Middle East. And the more public it became, the more difficult it would be for the Syrians to act responsibly. So no question that it needed to be kept secret.

But after a time, after the facility had been destroyed, there were two lines working—because you had two bad actors here, the Syrians and the North Koreans. With the Syrians, you needed to keep it secret, otherwise they

might do something stupid if they were publicly embarrassed. With the North Koreans on the other hand, we were moving in the direction of a new arrangement with regard to things “nuclear,” including proliferation. And so, the fact that we knew the North Koreans had done this very egregious thing, I felt would undercut the confidence in the treaty when, sooner or later, it became more visible, more known, more public. So we had this line with the Syrians where you’ve got to keep it secret, but that was fading over time. Conversely, with the North Koreans, the imperative to make it public was growing over time, as we were getting to a firm agreement. I think the lines crossed about the first of the year—remember it was discovered largely in April [2007] and destroyed in September [2007]. By about December or January [2008], I think that’s when it’s crossed. So we at the Agency became very strong advocates for making it public. But in an intelligence process way, we knew that we had only told a few members of Congress, and the legitimacy for keeping it closely held was eroding as we got further away from the destruction of the facility, and therefore from any likely Syrian reaction. We had an additional impulse to tell Congress.

Report to the [UN] Security Council from the  
Panel of Experts established  
Pursuant to Resolution 1874 (2009)<sup>1</sup>  
Final Version

[EXCERPTS]

## I. Executive Summary

1. On 12 June 2009, the Security Council unanimously adopted resolution 1874 (2009) in which it requested the Secretary-General to establish a Panel of Experts mandated to: gather, examine and analyze information regarding the implementation of the measures imposed by the Council in resolutions 1718 (2006) and 1874 (2009), in particular incidents of non-compliance; make recommendations on actions the Council, the Committee or Member States may consider to improve implementation of those measures; and, assist the 1718 Committee in carrying out its functions.

[deletia]

59. Nevertheless, the Panel of Experts has reviewed several government assessments,<sup>24</sup> IAEA reports<sup>25</sup>, research papers and media reports indicating continuing DPRK involvement in nuclear and ballistic missile related activities in certain other countries including Iran, Syria and Myanmar. A number of government and private experts with whom members of the Panel of Experts have spoken also expressed concern that the DPRK has the capability as well as the propensity to provide nuclear and ballistic missiles-related equipment, facilities, technical advice to and through clients overseas.

60. Evidence provided in these reports indicates that the DPRK has continued to provide missiles, components, and technology to certain countries including Iran and Syria since the imposition of these measures. The Panel of Experts has also reviewed government issued reports indicating that the DPRK has provided assistance for a nuclear programme in Syria, including the design and construction of a thermal reactor at Dair Alzour. The IAEA is still attempting to obtain updated reports concerning the current status of this site and the activities involved.<sup>26</sup>

61. The Panel of Experts is also looking into suspicious activity in Myanmar including activities there of Namchongang Trading (NCG), a 1718 Committee designated entity, and reports that Japan, in June 2009, arrested three individuals for attempting to illegally export a magnetometer to Myanmar via Malaysia, allegedly under the direction of a company known to be associated with illicit procurement for DPRK nuclear and military programmes.

62. The Panel of Experts believes that the information referred to paragraphs 59 to 61 merits the close attention of Member States with regard to the implementation and enforcement of the Security Council measures. Further study with regard to these suspected activities will be conducted by the Panel in order to develop a more thorough understanding of the facts. The Panel will seek the cooperation of relevant organizations, including the IAEA, in this regard.

<sup>1</sup> The views expressed in this report are exclusively those of Panel of Experts and do not represent those of any others unless otherwise indicated.

<sup>24</sup> Reference is made to the Press Briefing by Dr. Mathew J. Burrows, US National Intelligence Council (NIC) Counselor and Director of the Analysis and Production Staff, 24 March 2010,

<[www.dni.gov/interviews/20100324\\_interview.pdf](http://www.dni.gov/interviews/20100324_interview.pdf)>, as well as the Background Briefing with Senior U.S. Officials on Syria's Covert Nuclear Reactor and North Korea's Involvement, 24 April 2008,

<[www.dni.gov/interviews/20080424\\_interview.pdf](http://www.dni.gov/interviews/20080424_interview.pdf)>. Reference is also made to concerns expressed in the French White Paper on Defence and National Security, June 2008, regarding continuing military cooperation between DPRK and other countries in the ballistic missile field, <[www.livreblancdefenseetsecurite.gouv.fr/IMG/pdf/livre\\_blanc\\_tome1\\_partie1.pdf](http://www.livreblancdefenseetsecurite.gouv.fr/IMG/pdf/livre_blanc_tome1_partie1.pdf)>.

<sup>25</sup> Implementation of the NPT Safeguards Agreement on the Syrian Arab Republic, GOV/2010/11, 18 February 2010.

<sup>26</sup> In a letter to the IAEA dated 24 May 2009, Syria denied these allegations but provided no supporting documentation concerning the facilities in question. In its last report on Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, the IAEA underlines that Syria has not cooperated with the Agency since June 2008 regarding the unresolved issues related to the Dair Alzour site. (See paragraph 15 of Gov/2010/11 of 18 February 2010). See also Statement to 2010 Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons (NPT) made by IAEA Director General, Yukiya Amano, 3 May 2010.

[deletia]

72. The Government of the Republic of Korea informed the 1718 Committee on 13 October 2009 that the relevant authorities of the Republic of Korea inspected at the port of Busan a container ship flying the Panama flag with the name of MSC Rachele, owned by Mediterranean Shipping Company, a Swiss firm, and found that four containers were filled with working protective garments which were deemed to have military utility for chemical protection. The Republic of Korea authorities further indicated that their investigation had revealed that the shipment of the four containers in question had originated in the port of Nampo, DPRK, and were shipped on or about 11 September 2009 to Dalian, China. In Dalian the containers were placed on board the MSC Rachele. The intended recipient of the goods was declared as the Environmental Study Center in Syria. The Government of Syria disavowed the shipment. In December 2009, the Panel was given an information briefing from ROK officials and experts on the case and the nature of the goods. The Panel was also able to physically examine the goods in the port of Busan. Based on the information provided and expertise of the Panel, it concluded that these goods would primarily have military application in the protection against certain chemical agents.<sup>31</sup>

<sup>31</sup> It was noted by some experts that these goods could also be used for civil purposes.

[deletia]

109. The DPRK relies heavily on overseas branches of its banks and on their correspondent accounts to handle surreptitious transactions. This scenario is exemplified by the activities of Korea Kwangson Banking Corporation (KKBC), which continues to maintain overseas branches. KKBC has repeatedly been involved in transactions for and on behalf of the entities designated by 1718 Committee including Tanchon Commercial Bank<sup>55</sup>, the Korea Mining Development Trading Corporation (KOMID), Korea Hyoksin Trading Corporation and Korea Ryonbong General Corporation. According to information provided to the Panel of Experts, KKBC has handled several transactions involving millions of dollars directly related to transactions conducted between the Korea Mining Development Trading Corporation (KOMID) and Myanmar.<sup>56</sup>

<sup>56</sup> See U.S. Treasury Department Designation Statement contained in Document TG 260 dated 11 August 2009.

[deletia]

## **XII. Recommendations**

*[deletia]*

### **Interdiction**

9) The Panel of Experts has expressed concern that certain countries such as Syria, Iran, Myanmar, continue to be associated with the DPRK in regard to proscribed activities and believes that special attention should be taken by all Member States to inhibit such activities. Further study should be conducted by the Panel of Experts, and by the Committee, for a more thorough understanding of such activities. Cooperation with other relevant international organization including the IAEA should be sought in this regard.

## US Ambassador to IAEA Glyn Davies on Iran's Nuclear Program, Sanctions

Telephone interview with US Ambassador to the IAEA Glyn Davies, by Manal Lutfi; in Vienna; date not given: "US Ambassador to IAEA: Iran Wants Negotiations Over 'Shape of Table' - We Want Negotiations Over Issues; IAEA Ambassador to Al-Sharq al-Awsat: Syria's Cooperation With IAEA Insufficient, We Are Convinced Syria Working Illegally With North Korea"

Al-Sharq al-Awsat Online

Tuesday, July 13, 2010 T12:11:18Z

Journal Code: 1431 Language: ENGLISH Record Type: FULLTEXT

Document Type: OSC Translated Text

Word Count: 4,024

[EXCERPT]

(Lutfi) Regarding Syria, how do you assess the current Syrian cooperation with the IAEA?

(Davies) The Syrian cooperation with the IAEA is insufficient. The problem is that they allowed the IAEA to inspect the Dayr al-Zawr reactor one time a while ago and the IAEA came up with more questions than answers about what is going on there. Syria says there was no nuclear reactor there and the agency said: we have found evidence of activities that you said had not taken place. Our position vis-a-vis Syria was: if you were not violating the nuclear non-proliferation treaty, then why do you not allow IAEA inspectors into the Dayr al-Zawr location? Let the inspectors do their work at that location and talk to engineers and scientists at the location. This is when Syria started going around in circles and denying any secret activities. However, America will not let the matter go. America insists that Syria fulfill its international nuclear non-proliferation duties and it must respond to the IAEA questions.

(Lutfi) Do you suspect a link between the Dayr al-Zawr reactor and Syrian-Iranian cooperation?

(Davies) I do not think this is where the problem lies. We have no information in this regard. However, the problem here is North Korea's role in building the Dayr al-Zawr reactor. We are convinced that Syria is working illegally with North Korea to circumvent the nuclear non-proliferation system. There are some very important questions, especially for the region if a country suddenly and secretly starts to cooperate with a rogue state, that is North Korea, which has withdrawn from the nuclear weapons non-proliferation treaty in a secret effort to acquire nuclear capabilities. This will lead to a series of questions toward Syria over the reason why they are doing it secretly.

[EXCERPT]

**SYRIA**

**FINDING**

Syria failed to declare and provide design information to the IAEA for the construction of the reactor at Al Kibar. Therefore, it failed to meet its obligations pursuant to modified Code 3.1 of the Subsidiary Arrangements to its Safeguards Agreement. Moreover, the reactor's apparent purpose was the clandestine production of plutonium for non-peaceful activities.

**BACKGROUND**

Until September 2007, Syria was building a covert nuclear reactor at Al Kibar in Syria's eastern desert that would have been capable of producing plutonium. The reactor was destroyed on September 6, 2007, before it became operational. The reactor's intended purpose was apparently the production of plutonium, because the reactor was not configured for power production, was isolated from any civilian population, and was ill-suited for research.

Syria is an NPT Party that has implemented a Comprehensive Safeguards Agreement with the IAEA. However, Syria failed to declare and provide design information to the IAEA for the construction of the reactor at Al Kibar. Following the reactor's destruction, Syria went to great lengths to clean up the site and to destroy evidence of what had existed at the site. On October 10, 2007, Syria conducted a controlled demolition of the reactor debris and promptly began removing equipment and debris from the site. By December 2007, Syria had constructed a large building over the location where the reactor once stood. Despite repeated requests by the IAEA, Syria did not allow inspectors to visit the site until June 2008. As of the release of this Report, Syria continued to reject IAEA requests for follow-up visits to the site and other suspected facilities.

The IAEA has continued to investigate concerns regarding the nature of the former facility at Al Kibar. The IAEA Director General's introductory statements to the September and November 2008 IAEA Board of Governors meetings noted that environmental samples were taken from the site during a June 2008 IAEA visit, and that the samples "revealed a significant number of natural uranium particles, which had been produced as a result of chemical processing."<sup>23</sup> The Director General's November 2008 statement also noted that the features of the building in question, along with the availability of adequate pumping capacity of cooling water, were similar to what may be found in connection with a reactor site. In these 2008 statements, the Director General urged Syria to show maximum cooperation and transparency and to provide all the information needed by the IAEA to complete its assessment.<sup>24</sup>

## Compliance Discussions

In April 2008, the United States provided information to the IAEA indicating that the installation destroyed in September 2007 at Al Kibar was a nuclear reactor being constructed with North Korean assistance. Nuclear verification in Syria has remained an unresolved IAEA issue, with many countries expressing concerns about Syria's nuclear related activities. The United States and several other countries have urged the Syrian Government to demonstrate transparency and cooperate fully with the IAEA to address all outstanding questions about Syria's clandestine nuclear activities.

Syria has continued to reject concerns regarding its past activities at Al Kibar. It has stated that the Al Kibar site was a military site and was not involved in any nuclear activities. It has further stated that its cooperation with the IAEA would not be at the expense of military or national security.

## COMPLIANCE ANALYSIS

That Syria clandestinely built a nuclear reactor, apparently intended for plutonium production, without providing any information to the IAEA indicates that Syria was likely pursuing a non-peaceful nuclear program. Furthermore, Syria's actions in razing the site of the destroyed reactor to remove all evidence of its existence, its denial of the construction of the reactor, and its continuing failure to demonstrate transparency and cooperation with the IAEA's investigation of this and related sites lend further credence to this conclusion regarding the intended purpose of the reactor. Finally, that Syria failed to report early design information on the reactor means it failed to meet its obligations pursuant to Code 3.1 of the Subsidiary Arrangements under its Safeguards Agreement.

<sup>23</sup> The IAEA Director General's introductory statement to the Board of Governors meeting in June 2009 noted that similar particles of chemically processed natural uranium were detected in environmental samples taken from the Al Kibar site (during the June 2008 visit) and from the hot cells of the Miniature Neutron Source Reactor facility in Damascus in 2008. The IAEA sought to understand the presence and origin of the uranium particles found at both sites, which are of a type not included in Syria's declared inventory of nuclear material.

<sup>24</sup> In an introductory statement to the March 2009 IAEA Board of Governors meeting, the IAEA Director General indicated that additional access to other locations alleged to be related to the Al Kibar site, together with the sampling of destroyed and salvaged equipment and debris, was essential for the IAEA to complete its assessment. In an introductory statement to

the June 2009 IAEA Board of Governors meeting, the Director General noted that “[r]egrettably, the limited information and access provided by Syria to date have not enabled the Agency to determine the nature of the destroyed facility, nor made it possible for us to corroborate Syria’s assertions in that regard.”

## **US official: Nuclear inspection in Syria possible**

By DAVID STRINGER (AP)

1 hour ago [Accessed 2010-08-03T16:00Z]

[EXCERPT]

LONDON — The U.N.'s International Atomic Energy Agency will likely consider a special inspection of Syria to answer nagging questions over its nuclear activities, the U.S. ambassador to the organization said Tuesday [2010-08-03].

Glyn Davies said a number of countries on the IAEA's board of governors support plans to invoke the rarely used sanction.

Like Iran, Syria is suspected of hiding weapons-related nuclear activities and has blocked access to a suspected nuclear site destroyed by Israeli warplanes in September 2007.

"We need to keep the focus very much on Iran — but stay tuned on Syria, because Syria I think would love to just stave off any serious action to get to the bottom of what they were doing," Davies told reporters in London.

A recent IAEA report said that uranium particles found at the Dair Alzour desert facility indicate possible covert nuclear activities. The finding supported Western allegations that the bombed target was a nearly completed nuclear reactor which the U.S. alleges was of North Korean design and intended to produce weapons-grade plutonium.

Agency experts inspected Dair Alzour in June 2008, but have since been barred from revisiting.

"Because Syria has stonewalled for years ... the number of questions have continued to accumulate about what it is Syria was up to," Davies said.

He said there was a growing consensus among nations on the IAEA board that the issue must be addressed.

"A number of countries are beginning to ask questions about whether it might not be time to use that instrument of a special inspection, so that the agency can go in — or at least go to Damascus," Davies said.

Davies acknowledged that a special inspection — a sanction under which the IAEA's requests for access are made legally binding — had not been authorized for many years.

The Carnegie Endowment For International Peace claims records show the provision has been used only twice — in 1992 to inspect Romania's suspected nuclear weapons program and in 1993, when North Korea refused inspectors access to facilities.

Syria denies allegations it has been helped by Iran and North Korea in developing a covert nuclear weapons program. However, a recent IAEA report said Syria had acknowledged it carried out some small-scale nuclear experiments it had previously not owned up to.

Davies said that upcoming meetings are likely to be dominated by work to encourage Iran to return to negotiations over its alleged nuclear weapons program, but added that Syria would probably be discussed before the year's end.

"We are not going to postpone this indefinitely, we can't. The agency needs to do its duty, and needs to get answers to these questions and certainly a special inspection is one of the tools that's available — so that's something that needs to be considered and looked at," he said.

## U.S. Considers Push for U.N. Action in Syria

By JAY SOLOMON

AUGUST 6, 2010

[EXCERPTS]

WASHINGTON—The Obama administration is considering pressing the United Nations to pursue a "special inspection" of alleged Syrian nuclear sites, a senior U.S. official said Thursday [2010-08-05], a move that could leave Damascus facing a Security Council reprimand if it doesn't comply.

The International Atomic Energy Agency, the U.N. nuclear watchdog, has repeatedly rebuked Syrian President Bashar al-Assad's government in recent months for denying IAEA inspectors unhindered access to as many as five sites potentially tied to a covert nuclear-weapons program.

Syria's alleged nuclear work has complicated an outreach campaign by President Barack Obama's administration, which seeks to build stronger relations with Mr. Assad's government in an effort to counter Iranian influence in the region.

U.S. officials said Syria's lack of cooperation with the IAEA poses a major threat to the global campaign to contain nuclear weapons. But Washington wants to make sure a special inspection is the best tool to gain Damascus's cooperation and to maintain international unity, they say.

The IAEA's director general, under U.N. guidelines, has the authority to call for a special inspection of suspect facilities in any member country feared to be violating its commitment not to pursue atomic weapons. If the country rejects the IAEA's request, the agency can refer the case to the U.N. Security Council as an act of noncompliance, potentially triggering sanctions.

"At some point, you do need to make a decision and find a way forward. That point is coming with Syria," said Glyn Davies, the U.S. ambassador to the IAEA.

Mr. Davies said the U.S. didn't expect an imminent IAEA push for a special inspection. But he said a number of IAEA member states are likely to examine the issue in the fall when the agency convenes its annual general conference and its quarterly Board of Governors meetings.

U.S. officials say a request could lead to a drawn-out diplomatic process that could split the IAEA's 35-member board. Officials fear that if Syria rejects a special inspection, the international community might not have the unity to push through substantial penalties in response, as has often been the case with Iran.

[deletia]

U.N. officials have said they would like to visit at least three other sites that may have been connected to a broader nuclear-weapons program.

"It's been years since the IAEA had its one crack at this. And it came away with more questions than answers," said Mr. Davies.

[deletia]

## Adib al-Alam Gathered Info on Alleged Syrian Nuclear Reactor Site, Report

Beirut, 31 Aug 10, 08:05

Lebanese Mossad agent Adib al-Alam has gathered information on an alleged Syrian nuclear reactor site in Deir al-Zour that Israel bombed in September 2007, a security source told al-Liwaa newspaper.

The daily quoted sources as saying that former security services officer Brig. Gen. al-Alam transferred the info to Israel without specifying the nature of the data.

The International Atomic Energy Agency said in May that Syria "provided the Agency with information concerning previously unreported uranium conversion and irradiation activities" at a small research reactor in Damascus.

However, Damascus is still refusing to cooperate over allegations that it was building a secret nuclear reactor with North Korea's help in Deir al-Zour, the IAEA said in a four-page report.

The IAEA has been investigating the allegations since 2008 and has already said that the building bore some of the characteristics of a nuclear facility.

Item 7(e) of the provisional agenda  
(GOV/2010/38)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. This is the report of the Director General to the Board of Governors on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic<sup>1</sup> (Syria); it includes developments since the last report was issued in May 2010.<sup>2</sup>

## A. The Dair Alzour Site

2. On 2 June 2008, the Director General informed the Board of Governors that the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria, destroyed by Israel in September 2007, had been a nuclear reactor. The information further alleged that the reactor was under construction but not operational at the time of its destruction, and that it had been built with the assistance of the Democratic People's Republic of Korea (DPRK). By the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building.<sup>3</sup>

3. Syria has maintained, since May 2008, that the destroyed building was a non-nuclear military installation and that it had had no nuclear related cooperation with the DPRK.<sup>4</sup> While it cannot be excluded that the destroyed building was intended for non-nuclear use, the Agency has assessed that the features of the building and its connectivity to adequate pumping capacity of cooling water are similar to what may be found at nuclear reactor sites.<sup>5</sup> While Syria has indicated that its efforts to procure pumping equipment and large quantities of graphite were civilian and non-nuclear in nature, the Agency has assessed that these items could also support the construction of a nuclear reactor.<sup>6</sup>

4. As described in the Director General's report GOV/2009/36, Syria has made a number of statements regarding the purpose of the procurement of large quantities of barite.<sup>7</sup> These statements are not supported by the information available to the Agency, in particular with respect to the stated end use for the barite. In letters dated 4 June 2009 and 23 October 2009, the Agency requested that Syria provide access to project documentation and plans related to relevant activities to allow the Agency to confirm Syria's statements. Syria has not yet responded to these requests.

5. As indicated in previous reports, the Agency was provided with access to the Dair Alzour site on 23 June 2008, at which time it was permitted to take environmental samples but was not provided with the requested access to documentation relevant to the destroyed building and other buildings, or to debris and equipment from the destroyed building.<sup>8</sup> Analysis of the samples indicated the presence of particles of anthropogenic<sup>9</sup> natural uranium of a type not included in Syria's declared inventory of nuclear material. The Agency has assessed that the probability the particles originated from the missiles used to destroy the building is low.<sup>10</sup> According to the Agency's current assessment, there is also a low probability that the particles were introduced by aerial dispersion from aircraft involved in the destruction of the building due to, inter alia, the particles' pattern of distribution among the sampling locations. The presence of such uranium particles points to the possibility of nuclear related activities at the site and adds to questions concerning the nature of the destroyed building. Syria has yet to provide a satisfactory explanation for the origin and presence of these particles. In this context, information yet to be provided by Israel might be helpful in clarifying the matter.<sup>11</sup>

6. Syria has previously made a number of statements concerning the destruction of the building<sup>12</sup>, the Dair Alzour site, the three other locations<sup>13</sup> allegedly functionally related to it, the procurement activities referred to above and the alleged foreign assistance. The statements are limited in detail and no documentation has been provided by Syria to support them. Syria has also maintained its position that, due to the disposal of the debris from the Dair Alzour site, it is impossible to grant the Agency's request for access to the debris. The information and access provided by Syria to date have not allowed the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building, or to substantiate Syria's claims regarding its procurement efforts.

7. The Agency has repeatedly requested that Syria have substantive discussions with it on the nature of the destroyed building, and discuss relevant satellite imagery and other information available to the Agency. Since the Agency's visit to the Dair Alzour site in June 2008, Syria has declined to engage substantively with the Agency in this regard. Furthermore, Syria has maintained that, due to the military and non-nuclear nature of the Dair Alzour site and the three other locations, it had no obligation to provide more information under its Safeguards Agreement with the Agency.<sup>14</sup> In this regard, the Agency has previously explained to Syria that there is no limitation in comprehensive safeguards agreements on Agency access to information, activities or locations simply because they may be military related. The Agency has made repeated requests to Syria for:<sup>15</sup>

- information concerning the Dair Alzour site, the infrastructure observed at the site and certain procurement efforts which Syria has stated were related to civilian non-nuclear activities;
- access to technical documentation and any other information related to the construction of the destroyed building;
- access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are now situated; and
- further access to the Dair Alzour site and access to three other locations allegedly functionally related to the Dair Alzour site.

8. The Agency has repeatedly proposed to Syria the establishment of the necessary modalities for managed access to sensitive information and locations, including the Dair Alzour site and the three other locations. Such access is essential to enable the Agency to establish the facts and make progress in its verification, while protecting military and other information which Syria considers to be sensitive. In view of Syria's reluctance to engage with the Agency on this matter and the continuing degradation of information with the passage of time, the Agency requests that Syria increase its cooperation and provide prompt access to all relevant information and locations as requested by the Agency.

## **B. Activities at the MNSR Site**

9. As previously reported, particles of anthropogenic uranium of a type not included in Syria's reported inventory were found at the Miniature Neutron Source Reactor (MNSR) in 2008 and in 2009. Syria's initial explanations in June 2009 that the particles had originated either from standard reference materials used in neutron activation analysis or from a shielded transport container were not supported by the results of sampling carried out by the Agency.<sup>16</sup>

10. Syria has since then explained that the anthropogenic particles originated from previously unreported activities related to the production of uranyl nitrate performed at the MNSR, using yellowcake material produced at Homs<sup>17</sup>. Syria further explained that the purified uranyl nitrate was then used along with imported depleted uranyl nitrate in irradiation experiments at the MNSR. During the March 2010 physical inventory verification (PIV) at the MNSR, the Agency was provided with access to the location and material which Syria stated had been used in the production of uranyl nitrate and irradiation activities at the MNSR, where the Agency took a number of samples. The Agency was also provided with access to some supporting documentation.<sup>18</sup> In a letter dated 30 June 2010, Syria submitted inventory change reports for the newly declared material shown to the Agency during the PIV. In a letter dated 16 August 2010, the Agency provided Syria with the results of the analysis of samples taken during the March 2010 PIV and requested discussions with Syria concerning inconsistencies and questions raised by those results.

11. Information in publicly available scientific publications indicates the past use of nuclear material in experiments and the possible presence of additional unreported nuclear material in Syria. The experiments described in the publications are not included in the activities which Syria has declared as having occurred at the MNSR.

12. In a letter to Syria dated 20 August 2010, the Agency requested access to the Homs phosphoric acid purification plant and its associated buildings for the purpose of determining the extent of any uranium processing activities and nuclear material at the plant.

13. During a meeting in Vienna on 3 September 2010, the Agency provided Syria with additional information concerning the results of the samples taken during the March 2010 PIV, discussions were held regarding the above issues and agreement was reached on a plan of action for resolving the Agency's questions and for addressing the Agency's request for access to the plant at Homs.

14. The Agency remains engaged with Syria to clarify the origin of the anthropogenic natural uranium particles. Conclusions will only be possible once the Agency has exhausted its investigations on the material and activities at the MNSR site and related locations.

## **C. Summary**

15. Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.

16. With the passage of time, some of the necessary information concerning the Dair Alzour site is further deteriorating or has been lost entirely. After two years of investigations constrained by Syria's lack of cooperation, it is critical that Syria positively engage with the Agency on these issues without further delay.

17. Syria has provided information on previously unreported uranyl nitrate production and irradiation activities at the MNSR and additional explanations concerning the presence of the anthropogenic natural uranium particles at the MNSR. More recently, it has submitted inventory change reports concerning the newly declared nuclear

material. The Agency has provided Syria with the results of the PIV sampling and met with Syria to discuss the outstanding issues concerning the MNSR, the other uranium experiments and the possible presence of additional unreported nuclear material in Syria. Agreement was reached on a plan of action for addressing these issues.

18. The Director General urges Syria to bring into force an Additional Protocol to its Safeguards Agreement, which would further facilitate the Agency's work in verifying the correctness and completeness of Syria's declarations.

19. The Director General will continue to report as appropriate.

## **France calls on Syria to show more “transparency” over its nuclear activities**

iloubnan.info

September 08, 2010

BEIRUT – In a report issued this week, the IAEA pointed out to Syria and its refusal to allow the agency’s inspectors to enter a site liable to shelter the country’s nuclear activities. Asked about France’s stance in this regard during a press conference, the French Foreign Affairs and European minister spokesperson said, “The report of the Agency’s general Manager will be studied during the next Council of Governors set to start on September 13. It tackles the recent IAEA-Syria developments according to the general warrantee agreement concluded by Syria. However, there still some pending issues, namely regarding the nature of Dair Alzour site”.

"France backs all Agency's check-up activities", the spokesperson recalled, "and calls on Syria to show necessary concrete cooperation and transparency in order to shed the light on its past and current nuclear activities".

## France calls on Syria to cooperate with IAEA inspectors

By JPOST.COM STAFF

09/08/2010 22:18

France on Wednesday [2010-09-08] called on Syria to show more transparency in its dealings with the International Atomic Energy Agency concerning its the site of a suspected nuclear reactor it was allegedly building before it was destroyed in an Israeli air strike. The IAEA issued a report earlier this week claiming that Syria had refused to allow agency inspectors to visit the site.

"[The IAEA report] tackles the recent IAEA-Syria developments according to the general warranty agreement concluded by Syria. However, there are still some pending issues, namely regarding the nature of the Dair Alzour site," said a French foreign ministry spokesperson. "France backs all IAEA check-up activities and calls on Syria to show the concrete cooperation and transparency needed to shed light on its past and current nuclear activities."

On Tuesday [2010-09-07], the US representative to the IAEA said that the organization may consider a special inspection of Syria to answer nagging questions over its nuclear activities.

Glyn Davies said a number of countries on the UN's International Atomic Energy Agency's board of governors support plans to invoke the rarely used sanction.

Like Iran, Syria is suspected of hiding weapons-related nuclear activities and has blocked access to a suspected nuclear site destroyed by Israeli warplanes in September 2007.

"We need to keep the focus very much on Iran — but stay tuned on Syria, because Syria I think would love to just stave off any serious action to get to the bottom of what they were doing," Davies told reporters in London.

A recent IAEA report said that uranium particles found at the Dair Alzour desert facility indicate possible covert nuclear activities. The finding supported Western allegations that the bombed target was a nearly completed nuclear reactor which the US alleges was of North Korean design and intended to produce weapons-grade plutonium.

## **IAEA technical justification session on Iran, Syria convened**

IRNA

08 September 2010

*[EXCERPTS]*

Vienna - Technical Justification session of IAEA on agency chief's reports on Iran and Syria was convened Wednesday [2010-09-08] evening at agency's headquarters here. Iran's ambassador to the agency, Ali-Asghar Soltaniyeh said in an exclusive interview with IRNA after the end of the session, "At this justification session that is normally convened before the IAEA Board of Governors Session the Deputy Secretary General of the agency presents explanations based on the Secretary General's reports and then he replies to the questions that are raised respectively."

*[deletia]*

Referring to the agency's report on Syria's nuclear program at the justification session, he said, "We also pointed out that the agency's demands of Syria regarding various issues, including information on purchases, or entry into military zones, are quite contradictory with the articles of the NPT, and should not have been posed."

The Iranian envoy reiterated, "In case of Syria issue, the main source of concern is the Zionist regime's attack against a country, and keeping in mind the IAEA report, regarding the observed technical information and the seen pollutions, definitely the source of them is the missiles shot by the Zionists against the Syrian site, which calls for sample taking from the missile launcher in Israel."

Soltaniyeh pointed out that that the agency has not in case of Syria performed its major and technical responsibilities, adding, "The agency should sport the source of the pollutions and instead of inserting pressure against Damascus regarding presentation of information that is quite unnecessary, it should heed its real and technical responsibilities."

He reiterated, "At the justification session we also declared that the member countries at the agency are not responsible for presenting information about their purchases at all and the agency, too, is not allowed to deal with the military zones the same way that it treats the non-military regions."

Soltaniyeh reiterated, "Countries' legal responsibilities and commitments should be surveyed restrictedly within the framework of the agency's documents and regulations."

## Nuclear Scrutiny to Turn to Israel

By JAY SOLOMON

SEPTEMBER 11, 2010

[EXCERPTS]

WASHINGTON—*Arab states are preparing to press for far greater United Nations controls over Israel's nuclear program, in a move that could complicate the Obama administration's broader nonproliferation campaign and Middle East peace drive.*

Beginning Monday, the U.N.'s nuclear watchdog, the International Atomic Energy Agency, will hold two sets of meetings in Vienna aimed at strengthening international efforts to stanch the spread of atomic weapons.

Arab diplomats say they are preparing to use the conferences—for the second consecutive year—to pass a resolution through the IAEA's member states aimed at bringing Israel's nuclear program under tighter international controls.

The resolution seeks to pressure Israel into signing the U.N.'s principal counterproliferation document, the Nuclear Nonproliferation Treaty, and to place Israel's nuclear assets under IAEA safeguards. A similar resolution passed last year.

Israel is believed to be the only Middle East country to possess atomic weapons. Its government neither confirms nor denies their existence.

The U.S. has already begun trying to head off the Arab initiative, according to American and Arab diplomats, due to concerns it will distract from the conferences' focus on the proliferation cases of Iran and Syria.

[deletia]

U.S. officials also said the Arab-led resolution could also cause Israel to reject any participation in a planned 2012 conference aimed at establishing a Middle East free of weapons of mass destruction.

"Another resolution singling out Israel and ignoring proliferation issues like Iran and Syria would seriously diminish the chances for convening a 2012 meeting," said Glyn Davies, the U.S. ambassador to the IAEA, in an interview.

[deletia]

U.S. and European officials said they plan on using the IAEA meetings to intensify pressure on Iran and Syria.

The IAEA issued new reports this week that reprimanded both Tehran and Damascus for continuing to deny U.N. inspectors access to sites alleged to be involved in covert nuclear work. The IAEA particularly criticized Iran's decision to deny two U.N. staff any future entrance to the country. Washington fears Tehran is increasingly shutting down monitoring of its nuclear sites, as its ramps up the production of nuclear fuel.

Mr. Davies has said the U.S. and its allies might push in coming months for the IAEA to conduct a "special inspection" of Syria's alleged nuclear infrastructure. Such a measure would compel Damascus to comply with Mr. Amano's requests or risk facing a U.N. Security Council censure, if not sanctions. Iran was hit with its fourth round of sanctions in June for its defiance of the U.N.

Israeli warplanes in 2007 destroyed a facility near the eastern Syrian town of Dair Alzour that the U.S. believes was a nearly operational nuclear reactor built in cooperation with North Korea. A subsequent IAEA visit to the site found significant traces of natural uranium. And in its most recent report, the agency detailed what it said were unreported experiments conducted by Syria that could be utilized to produce nuclear fuel.

This month, Syria and the IAEA agreed to an action plan that would allow U.N. monitors greater access to Damascus's research reactor, where the experiments were held. But Syria has continued to deny the IAEA any new visits to the site destroyed by the Israelis two years ago, or to make available officials and documents related to the facility.

"It's important for the agency ... to resolve all questions about the scope of Syria's undeclared nuclear activities," said Mr. Davies. "Ultimately the issue is gaining unfettered IAEA access to the Dair Alzour site, which we are confident was a secret nuclear reactor."

Syria denies it was developing a nuclear reactor. And Syrian officials said the IAEA won't be allowed to visit sites that have military purposes.

## **Statements of the Director General**

13 September 2010 | Vienna, Austria

IAEA Board of Governors

Introductory Statement to Board of Governors  
by IAEA Director General Yukiya Amano

*[EXCERPT]*

### **Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

As my report on Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic shows, Syria has declined to engage substantively with the Agency in connection with the unresolved issues related to the Dair Alzour site and some other locations. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.

It is critical that Syria positively engage with the Agency on all of these issues without further delay.

During a meeting between Syria and the Agency on 3 September 2010, agreement was reached on a plan of action for resolving the Agency's questions concerning the results of samples taken at the Miniature Neutron Source Reactor (MNSR) in Damascus. The Agency remains engaged with Syria to clarify the origin of anthropogenic natural uranium particles found at the MNSR.

## **US: time may come for special nuke probe of Syria**

By GEORGE JAHN (AP)

2 hours ago [Accessed 2010-09-16T15:15Z]

VIENNA — A U.S. envoy on Thursday suggested time was running out for Syria to cooperate with a U.N. atomic agency probe of alleged secret nuclear activities before the agency invokes its seldom-used authority to call for a special inspection — a possible prelude to U.N. Security Council involvement.

Rising to Syria's defense, a senior Iranian diplomat accused the organization — the International Atomic Energy Agency — of harassing Syria by leveling false allegations in collusion with Israel and its allies.

The two officials spoke as the 35-nation atomic agency board meeting turned its attention from the agency's probe of Iran's nuclear activities to suspicions that Syria has a hidden nuclear program.

Israeli warplanes bombed what the U.S. says was a nearly finished nuclear reactor three years ago, launching an agency investigation. After an initial visit to the site, agency inspectors have not been allowed to return — or visit other suspect sites — and the agency's chief, Yukiya Amano, says Syria's lack of cooperation could mean that information sought by the agency could be lost with the passage of time.

Iranian envoy Ali Asghar Soltanieh told the board that Israel's attack is the real issue and Syria has become targeted by a "vicious circle of endless questions and allegations."

Syria denies hiding nuclear activities.

But Glyn Davies, the chief U.S. delegate to the agency, told the meeting that, unless Syria ends its stonewalling, the IAEA must increasingly "consider all available measures and authorities to pursue the verification assurances the international community seeks" — diplomatic language for a special inspection.

Only twice has the atomic agency ever called for or carried out a special inspection, which gives it authority for countrywide inspections of known or suspect nuclear activities.

Romania asked to be inspected in 1992 to show that the post-communist government had no nuclear-weapons aspirations. A year later, the agency asked for a special inspection in North Korea — a request turned down by the country, which continued with its secret development of nuclear weapons.

Refusal by Syria to allow a special inspection would allow the board to refer the issue to the U.N. Security Council, which then could issue a reprimand, pass a resolution demanding compliance and ultimately pass the kind of sanctions Iran is now under for refusing to heed demands to curb nuclear activities that could be used both to generate energy or make weapons.

## Statements of the Director General

20 September 2010 | Vienna, Austria

### Statement to Fifty-Fourth Regular Session of IAEA General Conference 2010 by IAEA Director General Yukiya Amano

[EXCERPT]

#### Nuclear Verification

Turning now to nuclear verification, at the start of my term, I expressed the hope that the milestone of 100 additional protocols in force would soon be achieved. The number now stands at 102. This is an encouraging development. The additional protocol is an essential tool for the Agency to be able to provide credible assurance not only that declared nuclear material is not being diverted from peaceful uses, but also that there are no undeclared nuclear material and activities in States with comprehensive safeguards agreements. I strongly hope that all remaining States will conclude additional protocols as soon as possible.

I also ask the 18 States without NPT safeguards agreements in force to bring such agreements into force without delay, and call on States with small quantities protocols that have not yet done so to amend or rescind their protocols.

We have realigned the management of the Agency's laboratories, creating a new Office of Safeguards Analytical Services within the Department of Safeguards. Construction of the Clean Laboratory extension at Seibersdorf started in June. The ultra sensitive mass spectrometer has been procured and the first factory tests were successfully completed. Agency staff are now undergoing training at the factory. The new Clean Laboratory is expected to be fully operational in the first half of 2011.

As far as the new Nuclear Material Laboratory is concerned, we hope to award a construction contract in December so that work can start in July 2011. Despite extra budgetary contributions by several Member States, for which I am deeply grateful, we still need additional funding to complete this project.

To help better understand future verification challenges, the Agency will in November host its traditional international safeguards symposium. The event will bring together technical experts from the IAEA, Member States, the nuclear industry and other bodies to share information and exchange views on the best technical responses to the changes taking place in the field of nuclear verification.

I have continued to report regularly to the Board of Governors on implementation of Agency safeguards, including in the Islamic Republic of Iran and the Syrian Arab Republic, which have been on the Board's agenda. My basic approach has been that all safeguards agreements between Member States and the Agency, and other relevant obligations, should be implemented fully.

UNITED STATES MISSION TO  
**INTERNATIONAL ORGANIZATIONS  
IN VIENNA**

## **STATEMENT**

### **National Statement to the IAEA General Conference**

**Dr. Steven Chu**

**United States Secretary of Energy**

**September 20, 2010**

Vienna, Austria

*[EXCERPT]*

#### **Strengthening Nonproliferation and International Safeguards**

The second area I want to discuss is strengthening nonproliferation safeguards to increase the security of nuclear material around the world.

As noted at the 8th NPT Review Conference, the IAEA safeguards system is facing a growing imbalance between workload and resources. New facilities require safeguards and technologies require updating, yet the IAEA safeguards budget has remained relatively static. The United States supports a significant increase in the IAEA's Regular Budget.

At the U.S. Department of Energy we have also undertaken a major effort called the Next Generation Safeguards Initiative to identify technology gaps and solutions, train new experts, and develop new concepts and approaches to improve international safeguards.

Further, the IAEA has stated that it needs the measures of the Additional Protocol to assure compliance with a safeguards agreement. Therefore, I urge all countries that have not yet done so to conclude an Additional Protocol with the Agency without delay.

**For countries that do not adhere to their safeguards commitments there must be real and timely consequences. We support the IAEA in its efforts to resolve outstanding concerns related to the nuclear programs in Iran and Syria and we encourage the Agency to make full use of existing authorities.** North Korea also continues to present a challenge to nonproliferation efforts and needs to comply with international obligations.

The U.S. hopes all states will focus on meeting their essential international nuclear verification obligations, rather than criticize the IAEA's effort to effectively implement its legal mandate under Agency safeguard agreements.

## Iran, the NAM, and Amano

By mark *[Hibbs]*

21 September 2010

*[EXCERPTS]*

Since 1985 I have spent two years and four months of my life in Vienna—not bad if you consider that I never have owned or rented a flat there. I’m right now halfway through another Vienna stay with one week down, and one week to go.

A lot of those two-plus years went by in corridors of the A and B buildings at the Vienna International Center where the IAEA has its headquarters. That was also true last week... and so after five days of IAEA board deliberations beginning 9/13, and one more week to go at this year’s General Conference, here’s the essential thumbnail at half-time:

*[deletia]*

- \* Amano’s deliberate post-election courtship with the NAM doesn’t look like it is paying off.

- \* Bush and ElBaradei are both history, but as of the end of this week, NAM-Western Group atmospherics at the IAEA haven’t improved under Obama.

- \* Amano’s September IAEA report on Iran was much tougher than it looked at first glance and was given credit for, as specific objections raised by Iran and the NAM clearly bore out last week.

- \* The NAM and the Arab group tabled their fateful copycat resolution (from 2009) on Israel’s nuclear capabilities to the IAEA General Conference next week.

- \* Board antics underscored that an IAEA special inspection request to Syria is off the table for Amano.

- \* The US and Western group are between a rock (the Arabs/ NAM) and a hard place (Israel) if they want to prepare an alternative GC resolution this week to the NAM on Israel one drafted in July. The P-5’s commitment to holding a Middle East disarmament conference in 2012 has put them there.

*[deletia]*

### Passion Play

This third of four annual quarterly board meetings last week was a curtain raiser to the GC (one ambassador told me it was a “passion play”) convening in Boardroom A in the M Building inside IAEA HQ on 9/13. Monday and Tuesday were spent on less-controversial items which had to be dealt with to get them onto the agenda of the GC the week thereafter. But Wednesday, Thursday, and Friday were spent on the rest of the agenda—Iran, Syria, Israel, the Middle East—and it didn’t take long for bloodletting to begin.

*[deletia]*

On Thursday and into Friday, the war of words continued on Syria and Middle East issues, with Arab Group and NAM states accusing Amano and the IAEA secretariat of trying to deceive them concerning the latitude which the IAEA’s statute provides Amano in reporting to the board on Israel’s nuclear capabilities.

*[deletia]*

After concluding the war of words on Iran, the board moved to Syria. A few pithy statements were made—in particular one by Belgium—about the lack of Syrian willingness to cooperate with the IAEA to arrive at a

“managed access” solution to permit IAEA inspectors to view sites proposed by the US as possible hosting evidence of clandestine nuclear activity by Syria. The Syrian response was firm: no cooperation on managed access, on account of Syria’s objections that any access would compromise the country’s national security. That, with the exception of an impassioned plea by Sudan, on behalf of the Arab Group, to take Syria at its word, was the end of the discussion about Syria’s nuclear program. As I had suggested on the eve of the board meeting elsewhere a request for a special inspection in Syria, or a resolution to that effect by the board, would be a non-starter, and with Sudan in there slugging it out on Syria’s behalf, it was.

[deletia]

**[COMMENTS]**

[deletia]

**Allen Thomson** | September 22, 2010

Mark, since my particular hobbyhorse is the story of the alleged (and former) plutonium production reactor in Syria, what is your take on the current state of play? It looks to me as if Syria has successfully stonewalled the IAEA and that the matter will eventually be forgotten.

Do you see any further measures the IAEA or others, like the US, could take to bring clarity to the matter?

[deletia]

**mark** | September 22, 2010

Allen, it would appear that Syria is being successful. The statement on their behalf by Sudan threw the gauntlet down to the DG. There are good reasons why the USG people in technical meetings back home and over here have raised the issue of information continuity. There are people here in Vienna who have been here a long time who say that the problem is that the IAEA never institutionalized the special inspection provision over the last five decades. The last one called for was 16 years ago. It is seen as an exceptional event. Had the IAEA called for such inspections in member states with a certain periodicity—so this argument goes—the current IAEA administration would have more confidence. Bottom line is that Amano cannot force Syria to do it and the climate in this place since Sept 2007 when the attack was carried out does not favor doing this. There is an unusual climate of political risk avoidance. Board members know that it is not up to them to call for a special inspection but is up to the DG alone. The board can urge him to do it in a resolution, but given the current state of affairs, and especially the validation of Syrian and Iranian positions in the NAM and the unique receptivity to them by the DGO, it would be folly to bet that the situation in Syria will change without a considerable demonstration of political will in Vienna which frankly I just don’t see.

## **Syria denies stonewalling UN atomic probe**

(AFP) – 2 hours ago [*Accessed 2010-09-22T18:40Z*]

VIENNA — Syria denied Wednesday that it was not cooperating with a UN atomic watchdog probe into alleged illicit nuclear activities, insisting it had answered all the agency's questions.

"I would like to assure you that Syria was and still is committed to cooperation with the agency," Syria's ambassador to the International Atomic Energy Agency, Bassam Sabbagh, told the body's annual general conference being held here this week.

"Syria has supplied the agency with information and with the necessary replies to all their queries and this was sufficient to verify the nature of this site," he said.

Syria is accused of building a covert nuclear reactor at a remote desert site called Dair Alzour with the help of North Korea until it was bombed by Israel in September 2007.

Damascus allowed IAEA inspectors to visit the site once in 2008, but has refused to permit any follow-up visits.

The IAEA has said the building bore some of the characteristics of a nuclear facility and UN inspectors also detected "significant" traces of man-made uranium at that site.

But these have not yet been explained by Damascus.

The IAEA also requested access to three other locations allegedly functionally related to Dair Alzour, also so far to no avail.

In his latest update on the probe, circulated to member states earlier this month, IAEA chief Yukiya Amano complained that time was pressing in the two-year investigation because some of the information concerning Dair Alzour was "further deteriorating or has been lost entirely".

"I would like to point out that Syria has allowed the agency's team to visit the site of the destroyed building in Dair Alzour in 2008. It also allowed this team free mobility and allowed them to obtain samples without any obstruction," Syrian ambassador Sabbagh said Wednesday.

## U.S. Woos Syria in Mideast Peace Push

Foreign Minister Says Direct Talks With Israel Hinge on Border Issue

By JAY SOLOMON

SEPTEMBER 27, 2010

NEW YORK—Secretary of State Hillary Clinton intensified American efforts to woo Syria into backing the U.S.'s Middle East strategy, holding her first direct meeting with her Syrian counterpart in a bid to find common ground on Iran, Lebanon and the Arab-Israeli dispute.

But Damascus's top diplomat, Walid Moallem, in an hourlong interview Monday [2010-09-27], voiced opposition to many of the Obama administration's top regional initiatives, and expressed skepticism about the prospects for renewed Syrian-Israeli peace talks.

Mr. Moallem said Damascus would oppose United Nations efforts to issue indictments to support the U.N. investigation into the 2005 murder of former Lebanese Prime Minister Rafik Hariri, a crime some Lebanese officials have blamed on Syria.

The Syrian diplomat ruled out any further cooperation with a U.N. probe into evidence that Damascus had been covertly developing a nuclear reactor along the Euphrates River before Israeli jets bombed the site in 2007.

Mr. Moallem said the U.N.'s nuclear watchdog, the International Atomic Energy Agency, discredited itself last week by failing to approve an Arab-led initiative that seeks to place Israel's nuclear infrastructure under IAEA safeguards.

"It is discredited, the agency," Mr. Moallem, 69 years old, said in the interview in a mid-Manhattan hotel. "It shows how much politics is inside their work. But more, it shows double-standard policies."

Damascus has for years denied any role in Mr. Hariri's death, as well as accusations that it was seeking to develop nuclear weapons in cooperation with North Korea.

Senior U.S. officials have increasingly sought to engage Syrian President Bashar al-Assad in a bid to gain Damascus's support on a range of Mideast issues, as well as to weaken its strategic alliance with Iran. Syria and Iran partner closely in arming and financing the main Arab groups fighting Israel— Hamas in the Palestinian territories and Hezbollah in Lebanon. Syria also has close ties to many of the political factions currently seeking to form a new Iraqi government.

U.S. officials believe a resumption of direct Israeli-Syria talks over the status of the Golan Heights region—a process that broke down in 2000—could diminish Syrian support for Hamas and underpin the separate Israeli-Palestinian peace track.

State Department spokesman, P.J. Crowley, said later Monday Mrs. Clinton and Mr. Moallem discussed a range of regional issues and that Mrs. Clinton "expressed her commitment to securing a comprehensive peace." Mr. Crowley said Syria's foreign minister voiced his own government's interest in peace talks and that Washington and Damascus "would explore ways to move the process further."

Still, Mr. Moallem said he believed a comprehensive Arab-Israeli peace would be doomed without Israel's commitment to first freezing any new construction in disputed territories. He said any direct talks between Syria and Israel could begin only after Prime Minister Benjamin Netanyahu committed to restoring the Jewish state's borders with Syria to the pre-June 4, 1967, lines. "So the land is ours. And it's not up for negotiation," Mr. Moallem said.

The Syrian foreign minister stressed that following such a commitment on the Golan, Damascus would be prepared to discuss joint security and water arrangements, as well as normalization of diplomatic ties, with Israel.

Mr. Netanyahu's government has said it won't enter into talks with Syria that have preconditions. Israel also says Syria has been transferring increasingly sophisticated long-range missiles to Hezbollah, a charge Mr. Moallem denied.

Lebanon remains an issue of tension between Washington and Damascus. The U.S. has strongly voiced its support for the U.N. completing its investigation into Mr. Hariri's murder, as well as trying those indicted for the crime at a U.N. court in The Hague.

Mr. Moallem alleged Monday that the U.N.'s work in Lebanon has been irredeemably "politicized" and that Damascus has received word that members of Hezbollah were soon to be formally charged with the murder. He said that such developments risked plunging Lebanon into a new round of sectarian strife and that the U.N.'s investigation should be replaced by a purely Lebanese investigation to ensure fair treatment.

"We are convinced that a condemnation of the prosecutor of this court against Hezbollah will be a factor of disturbance in Lebanon," Mr. Moallem said.

The U.S. and Syria also could clash diplomatically this fall over the nuclear-proliferation issue, as the Obama administration has indicated it would press for the IAEA to have the powers to launch a "special investigation" of Syria's alleged nuclear infrastructure.

Such a move, if pursued by the IAEA's director general, could result in Syria facing a U.N. Security Council censure, and possibly sanctions, if it doesn't comply with the agency's requests for documents and visiting rights.

Mr. Moallem said Syria, as a signatory to the U.N.'s Nuclear Non-Proliferation Treaty, would continue to allow the IAEA to visit Damascus's research reactor, which is included in his country's formal cooperation agreement with the U.N. body. But he said the IAEA wouldn't be allowed to return to the Euphrates site.

"They know that this case is baseless," Mr. Moallem said. "Of course, to have a nuclear program, a military one, we need to invest billions of billions of dollars. We are not advocating a race for nuclear weapons in the region, on the contrary."

The Syrian diplomat said Mr. Assad has grown disappointed with the pace and scope of President Barack Obama's administration's effort to rebuild ties with Syria over the past 18 months.

The White House's special envoy to Syria, George Mitchell, has visited Damascus and outlined ways that pervasive American sanctions on the Middle East country could be eased to facilitate high-tech trade and the shipment of spare parts for airplanes, according to U.S. officials. But so far, Mr. Moallem said, these steps have had little impact inside Syria.

"Until today—nothing," he said.

**Current Threat to Global Nuclear Security: Iran**

But the world remains a dangerous place. And a few countries reject our call to move toward a world without nuclear bombs. North Korea, Syria and Iran are the states of greatest concern. And at a time when the overwhelming majority of nations is working together to reduce the threats posed by nuclear weapons and nuclear proliferation, the biggest current threat to global nuclear security is Iran.

## UN nuclear agency mulls more "special inspections"

By Fredrik Dahl

Mon Nov 1, 2010 4:58pm GMT

VIENNA, Nov 1 (Reuters) - The U.N. nuclear watchdog signalled on Monday it wanted to use its "special inspection" powers more often, something the United States has suggested could be invoked in the case of Syria.

The International Atomic Energy Agency last resorted to such a prerogative in 1993 in North Korea, which still withheld access and later developed nuclear bomb capacity in secret.

"It is a normal tool that we should be able to use more frequently," Herman Nackaerts, the IAEA's deputy director general in charge of inspections, told a news conference.

He said the U.N. body wanted to look at ways to "lower the threshold" for deploying such missions but he declined to discuss specific states whose activities it is probing.

Washington's envoy to the IAEA said earlier this year a "number of countries" were beginning to ask whether it was time to invoke the special inspection tool to give the IAEA the authority to look anywhere necessary in Syria at short notice.

It has been over two years since the IAEA was allowed to visit a desert site in Syria where secret nuclear activity may have taken place before it was bombed by Israel in 2007.

U.S. intelligence reports have said it was a nascent North Korean-designed reactor geared to produce bomb fuel. Syria, an ally of Iran, denies ever having an atomic bomb programme.

### PLUTONIUM REACTOR?

But Damascus is unlikely to agree to a special inspection and diplomats and analysts believe the IAEA will refrain from escalating the dispute at a time of rising tension with Iran, which the West suspects of seeking nuclear weapons.

If Syria were to reject a possible request for such an inspection, the IAEA board could vote to refer the issue to the U.N. Security Council, as it did with Iran four years ago.

In September, an IAEA report said Syria's refusal to allow U.N. inspectors access to the site, known as Dair Alzour, was endangering potential evidence in the investigation.

Nackaerts' predecessor, Olli Heinonen, suggested in an interview with an Israeli newspaper published last month he believed a special inspection was merited for Syria.

"If it was a nuclear reactor, it would have been...the first time that an IAEA member state was constructing a plutonium reactor on such a large scale," he told Israel's Haaretz daily.

Nackaerts said the IAEA wanted to see if special inspections could become more of a routine tool.

"This type of inspection has become very difficult to use and so the threshold has become very high," he said.

"I think we should change that so that we don't necessarily have to have a major issue of non-compliance (with IAEA rules) before we can start thinking of using it."

Syria's case has been overshadowed by the more high-profile dispute over Iran's nuclear activity. Tehran rejects Western accusations its programme has military aims.

One important difference between the two, diplomats say, is that Iran's work is still going on while the Syrian site was destroyed.

UNITED STATES MISSION TO  
**INTERNATIONAL ORGANIZATIONS  
IN VIENNA**

## **Verification Challenges for the Future**

Ambassador Glyn T. Davies  
Permanent U.S. representative to the IAEA  
and the United Nations Office in Vienna

November 4, 2010

Vienna International Centre, Vienna, Austria

Thank you all for coming today. And I'd like to thank Laura for her introduction. The last time I saw Laura was also at a table, of a sort . . . she was decked out as a table at a Halloween party, wearing a huge platform around her neck to make the table top. That did not stop her from dancing, I would note. I was dressed as the Mad Hatter, which my wife tells me is befitting of my personality.

I'm grateful to the Institute of Nuclear Materials Management and Marco for inviting me to speak and arranging our luncheon, and I'm happy to have the opportunity to talk with you about challenges that the IAEA faces, particularly verification challenges, and how we think Member States can help the IAEA overcome those challenges.

The United States is committed to ensuring that the International Atomic Energy agency has the necessary resources and support to carry out its mission in all three pillars of its work - safeguards and verification, safety and security, and the promotion of the peaceful uses of nuclear energy. "Resources and support" can mean a lot of things – financial contributions, collaboration and cooperation between technical experts, lobbying for agreement among Member States on initiatives that seek to strengthen the safeguards regime, sharing information with the Agency and other Member States on particular issues of concern, and advocacy for legal authorities to fulfill the Agency's mission.

In order to meet the Agency's needs, the United States dedicates a lot of time and effort to evaluating how well our shared goals for a strong Agency are being met. This should come as no surprise given our long track record of support for the IAEA and given President Obama's Prague agenda. Although it might be easy to interpret U.S. efforts to support strong IAEA verification as relating mainly to the ongoing issues of concern in Iran, Syria, and the DPRK, that same U.S. support for a strong safeguards regime is central to creating the conditions necessary for bringing to fruition a world free from nuclear weapons. Such a world would require the strongest possible international verification assurances.

It is in that context that I'd like to talk with you today about challenges that the U.S. sees for the IAEA. In particular I'd like to talk about safeguards and verification challenges, but I will also touch briefly on nuclear safety and security, and on promoting the peaceful uses of nuclear energy.

### **Safeguards and Verification Challenges**

First, safeguards and verification –

Strengthening the international safeguards system is a key element of the U.S. non-proliferation policy agenda. President Obama called for more resources and authority to strengthen international inspections in his April 2009 Prague speech. While the Agency is working hard to fulfill its mandate to ensure the effective verification of nuclear materials and activities, there are growing challenges, among them: the global expansion of nuclear activities, the growth in the scope of information available, and the lack of cooperation by states that obscure necessary information and refuse to meet their safeguards obligations.

While we support the continued expansion in the use of nuclear technology for peaceful purposes, that expansion is not without cost. The global expansion of nuclear activities challenges the Agency's ability to provide confidence that nuclear material, technologies, and expertise are not being diverted to weapon programs. The expanding use nuclear power means the Agency must monitor more facilities and nuclear material requiring safeguards verification. At the same time that the Agency is contending with increased numbers, it must also develop the means to cope with advancing technologies and next generation nuclear facilities.

And as nuclear activities increase, more and more information becomes available to the IAEA, especially as the IAEA is now called upon to provide assurances about the absence of undeclared nuclear activities in addition to verifying the non-diversion of declared nuclear material. The Agency must be able to obtain and assess information from countries' own declarations, inspection results, open sources including satellite imagery, and other sources. It is a demanding task to keep up with the growing quantity of data available, and the changing technologies for obtaining that data. The Agency must ensure that it can effectively evaluate all the information about a country as a whole to reach timely and credible conclusions about that country's nuclear material and activities. It is in light of this challenge that I understand much discussion is being generated this week at the Safeguards Symposium in support of the Agency's effort to transform the safeguards regime into a system that takes full account of all of information, rather than relying on criteria that stem only from a state's description of its declared stockpile of nuclear material.

It is not just the significant expansion of nuclear programs that challenges the Agency's verification abilities. As we all know, countries of concern - that is, countries for which the IAEA has found credible reason to doubt the correctness and completeness of their declarations - still present serious verification challenges to the Agency. If a Member State does not uphold its commitments to, and cooperate transparently with, the IAEA, Agency verification that its programs are peacefully intended becomes next to impossible, and the only recourse under the safeguards agreement is to report such cases to the UN Security Council. The IAEA began adopting strengthened measures for safeguards implementation in the 1990s based on lessons learned from Iraq, the DPRK, Libya, and Iran, but significant challenges still remain. Nowhere is that more evident than with Iran.

### **Verification Challenge: Iran**

At a time when the overwhelming majority of nations is working together to reduce the threats posed by nuclear weapons and nuclear proliferation, the biggest current threat to global nuclear security is Iran. Why is that so? It is not because the United States is targeting Iran for political purposes, as my esteemed colleague from Iran so often asserts in meetings here in Vienna. No - Iran is a threat because it is not upholding its commitments under the Nuclear Non-Proliferation Treaty and refuses to allow the IAEA to verify that its nuclear program is peaceful. Moreover, Tehran has threatened to wipe out at least one other member of the United Nations.

The lengthening list of Iran's violations of its obligations under its safeguards agreement and UN Security Council resolutions, its heated, rhetoric, and its refusal to address international concerns, undermine Iran's claim that there is nothing to worry about with Iran's nuclear program. We heard during the opening session of the Symposium some arguments why we should not believe Iran's intentions include the manufacture of nuclear weapons. However, as the IAEA -- including former Director General ElBaradei -- has said on many occasions, it is not the IAEA's job to judge intentions, but to verify nuclear programs. Whatever Iran's intentions, its actions vis-à-vis the IAEA appear to be consistent with hiding a nuclear weapons program. In fact, Iran's recent

actions imply it has heightened its long-term campaign to undercut the effectiveness of safeguards implementation. Since 2003, the IAEA has reported 30 times on Iran's failure to comply with its IAEA Safeguards Agreement and, since 2006, it has reported 20 times on Iran's failure to comply with the UN Security Council requirement to suspend its uranium enrichment- and heavy water-related activities.

In blatant violation of its UN and IAEA obligations, Iran is expanding and escalating some of its most proliferation-sensitive nuclear activities, such as the continued production of near twenty percent enriched uranium. The Director General noted in September that Iran still refuses to provide the Agency with the information it needs to fully understand the purpose of the Fordow Fuel Enrichment Plant near Qom and the chronology of its construction. The Director General's most recent report on Iran also expresses the Agency's concern with Iran's latest objection to certain designated IAEA inspectors in Iran, which the Director General reported "hampers the inspection process and thereby detracts from the Agency's capability to implement effective and efficient safeguards in Iran." In addition, Iran remains the only state with significant nuclear activities that refuses to acknowledge its legal obligations under the modified Code 3.1 of its Safeguards Agreement, which requires Iran to declare nuclear facilities to the IAEA as soon as it takes a national decision to build them. This, despite the fact that Iran's leaders have announced publicly that they have decided to build several additional nuclear fuel cycle facilities, including uranium enrichment plants.

### **Verification Challenge: Syria**

While Iran may present the biggest verification challenge for the safeguards regime, it is not the only one. The Agency's efforts to investigate Syria's nuclear program have been hindered for too long by Syria's refusal to allow the Agency to conduct its mandated verification role. The Secretariat's most recent report on Syria - and its previous seven reports - indicate that the IAEA continues to attempt to verify credible information indicating that Syria, with assistance from the DPRK, was developing a clandestine nuclear program with no evident civilian purpose, the centerpiece of which was a reactor suited for plutonium production and little else. Syria, however, refuses to cooperate by allowing the IAEA the access its inspectors say they need.

The international community does not yet know the full scope of Syria's clandestine nuclear activities, and, as the IAEA has reported, any information related to Syria's clandestine nuclear activities is deteriorating or has been lost entirely due to Syria's refusal to cooperate. The unwillingness of Syria to allow the IAEA to conclude its investigation about the existence of clandestine nuclear facilities in Syria is part of a growing threat to the credibility of the safeguards regime.

It is URGENT AND ESSENTIAL that Syria provide access without further delay to all requested sites, information, personnel, and material, so the Agency can make progress in its efforts to verify that all nuclear material and activities in Syria are exclusively for peaceful purposes. Absent clear action by Syria to cooperate fully with the IAEA, we are rapidly approaching a situation where the Board and the Secretariat must consider all available measures and authorities to pursue the verification assurances the international community seeks.

### **Overcoming Safeguards and Verification Challenges**

So, given the host of challenges that the IAEA faces in the realm of safeguards and verification, what can Member States do to make sure that the IAEA can successfully overcome those challenges? How can the Agency contend with ever-increasing nuclear activities and information, and address countries which are less transparent than they should be?

We must enhance the Agency's ability to detect undeclared nuclear activities. The Additional Protocol provides the IAEA the tools it needs to establish confidence about the absence of undeclared nuclear activities by providing additional access to people, information, and locations, and for short-notice inspections. 102 states to date have brought an Additional Protocol into force. That demonstrates significant progress, but more work needs to be done to make the Protocol universal. The Agency must also fully exercise its legal authorities,

including special inspections, so that such inspections are understood to be in order in cases where the IAEA finds routine inspections insufficient.

As to strengthening safeguards methodologies, the United States fully supports the Agency's ongoing efforts, with essential support from Member States, to continue the transition to safeguards implementation that is fully informed by all relevant information available to the Agency. In a similar vein, we fully support measures to strengthen national systems of accounting and control.

The United States is working to achieve these goals in a number of ways. The U.S. Department of Energy's National Nuclear Security Administration launched the Next Generation Safeguards Initiative in 2008 to develop the policies, concepts, technologies, expertise, and international safeguards infrastructure necessary to strengthen and sustain the safeguards system as it evolves to meet new challenges. As the presentation by Assistant Deputy Administrator Mark Whitney this week described, while this program has a domestic focus, it is also a resource for supporting the international safeguards system directly. And through the U.S. Support Program to IAEA Safeguards, we provide assistance through the development of technologies and expertise, including on research and development projects the Agency is not suited to pursue and cannot afford. We are constantly looking to deepen the positive impact of our Support Program for Safeguards and urge other Member States to do the same.

### **Challenges to Safety and Security**

While I have focused today on safeguards and verification challenges, I would be remiss if I did not mention challenges to the other, equally-important pillars: safety and security, and promoting the peaceful uses of nuclear energy.

The expansion of nuclear power poses not only safeguards and verification challenges, but also challenges the implementation of safety and security measures. The Agency plays a crucial role in assisting Member States with their national efforts to establish the necessary physical protection and regulatory structures, and to ensure that adequate safety and security measures are in place. Nuclear power programs demand rigorous nuclear safety, security and regulatory structures for reliable and responsible operation. Existing facilities require continuous evaluation and improvement, and new facilities need the advice and expertise gained from past experience.

In order to continue to lead efforts to advise states and provide the most current expertise to Member States, the Agency is finalizing its Nuclear Security Series, including the recommendations on the physical protection of nuclear material and nuclear facilities contained in Revision 5 of INFCIRC/225. The Nuclear Security Series is an important and valuable set of documents. They create consistent, agreed-upon norms available to all Member States.

In addition to actively supporting the Agency's drafting and review of the Nuclear Security Series, the U.S. supports the Agency as it strives to provide high-quality training, missions, and upgrades to Member States. We continue to promote the entry into force of the 2005 Amendment to the Convention on the Physical Protection of Nuclear Material. We support the establishment of more national Nuclear Security Support Centers. And we continue to coordinate with multilateral and bilateral nuclear security-related initiatives, among them UN Security Council Resolution 1540 and the Global Initiative to Combat Nuclear Terrorism.

### **Challenges to Promoting the Peaceful Uses of Nuclear Energy**

Finally, on promoting the peaceful uses of nuclear energy -

To support the pursuit of nuclear power, the IAEA must provide significant assistance to States to help build the necessary infrastructure, institutional capacities, and human resources to administer reliable nuclear power

programs. Finding the funds to support new nuclear energy programs, particularly in developing countries, is a perennial problem.

The United States has recently made a significant effort to energize the promotion of the peaceful uses of nuclear energy. At the 2010 Nuclear Non-Proliferation Treaty Review Conference, Secretary Clinton announced that the U.S. will make a contribution of \$50 million over the next five years for a new Peaceful Uses Initiative. The U.S. contribution will be applied to IAEA projects supporting nuclear power infrastructure development, food security, water resources management, and human health in a broad selection of countries, including Indonesia, Nigeria, Uzbekistan, Morocco, Thailand, Vietnam, Yemen, Ethiopia, Paraguay, Ghana, and Azerbaijan. In fact, I will be travelling to Indonesia and Vietnam in a few weeks to visit some Technical Cooperation projects there to witness firsthand how Agency peaceful uses activities are making a difference in people's lives.

As we move forward in funding projects through the Peaceful Uses Initiative, we hope that other countries will join us in supporting this effort to expand the IAEA's ability to provide Member States with access to the peaceful applications of nuclear energy. President Obama has challenged nations to raise an additional \$50 million by 2015 for the Peaceful Uses Initiative. In September the Japanese Ambassador announced that Japan has requested \$3.5 million for a contribution to the Peaceful Uses Initiative to be included in the Japanese budget for the next fiscal year.

## **Conclusion**

So, having given you a sketch of some of the challenges we see the IAEA facing, I'd like to circle back for a moment and conclude where I began by telling you why we think it's important for Member States to support the IAEA as it works to overcome those challenges.

President Obama has made a significant commitment to reducing the threats posed by nuclear weapons. In April of 2009, in Prague, he made a strong, straightforward statement of principle: "I state clearly and with conviction America's commitment to seek the peace and security of a world without nuclear weapons."

That commitment has intensified U.S. efforts to counter the spread of nuclear weapons and reduce the threat posed by those weapons that still exist. These efforts include reaffirming the NPT, supporting the creation of an international fuel bank so that countries can access peaceful power, establishing the Peaceful Uses Initiative, trying to engage Iran and address other noncompliance issues, and importantly to our discussion today, ensuring that the International Atomic Energy Agency has the resources, support, and authorities it needs.

We must ensure that the Agency is equipped with the right tools to meet and overcome the ever-increasing challenges it faces. The expansion of nuclear activities, the development of new technologies, and the behavior of noncompliant Member States add to the perpetual problems of too few resources and a growing desire among Member States for increased access to nuclear technologies. In this context the importance of the IAEA as an independent verifier and as a clearinghouse for peaceful nuclear technology has grown substantially. It is in our interest and to our benefit to lend as much support as we can to the Agency as it seeks to surmount the many challenges before it.

Thank you, and I look forward to your questions and comments.

## **Bush: Olmert asked me to bomb suspected Syria nuclear plant**

[Accessed 2010-11-05T19:11Z]

By Reuters

Former United States President George W. Bush wrote in his new memoirs that he considered ordering a U.S. military strike against a suspected Syrian nuclear facility at Israel's request in 2007, but ultimately opted against it, Reuters revealed on Friday.

Israel eventually destroyed the facility, which Syria denied was aimed at developing a nuclear weapons capability.

In his memoir, "Decision Points," to hit bookstores Tuesday, Bush says shortly after he received an intelligence report about a "suspicious, well-hidden facility in the eastern desert of Syria," he spoke by phone with former Prime Minister Ehud Olmert.

"George, I'm asking you to bomb the compound," Olmert told Bush, according to the book, a copy of which was obtained by Reuters.

Bush says he discussed options with his national security team. A bombing mission was considered "but bombing a sovereign country with no warning or announced justification would create severe blowback," he writes.

A covert raid was discussed but it was considered too risky to slip a team in and out of Syria undetected.

Bush received an intelligence assessment from then-CIA Director Mike Hayden, who reported that analysts had high confidence the plant housed a nuclear reactor, but low confidence of a Syrian nuclear weapons program.

Bush says he told Olmert, "I cannot justify an attack on a sovereign nation unless my intelligence agencies stand up and say it's a weapons program."

Bush had ordered the U.S.-led invasion of Iraq in 2003 based on intelligence that said Iraq possessed weapons of mass destruction, which were never found.

Olmert was disappointed at Bush's decision to recommend a strategy of using diplomacy backed up by the threat of force to deal with Syria over the facility.

"Your strategy is very disturbing to me," Olmert told Bush, according to the book.

Bush denies charges that arose at the time that he had given a "green light" for Israel to attack the installation.

"Prime Minister Olmert hadn't asked for a green light, and I hadn't given one. He had done what he believed was necessary to protect Israel," Bush writes.

Bush writes that Olmert's "execution of the strike" against the Syrian compound made up for the confidence he had lost in the Israelis during their 2006 war against Hezbollah in Lebanon, which Bush feels was bungled.

## **The Case for an Immediate IAEA Special Inspection in Syria**

By Olli Heinonen

November 5, 2010

A key option for inspectors of the Vienna-based International Atomic Energy Agency (IAEA), the world body charged with stopping the spread of nuclear weapons, is a "special inspection" an intrusive visit made when the IAEA judges the information provided by a state to be inadequate. But The IAEA is reluctant to use such inspections, even though, in the case of Syria, circumstances cry out for one. This reluctance challenges the authority and credibility of the agency, its board of governors (made up of the representatives of thirty-five of its member states), and the ultimate guardian of the world nuclear order, the United Nations Security Council.

### **Background**

Since 1970, the IAEA has been responsible for inspecting the nuclear facilities of states that have signed the Nuclear Nonproliferation Treaty (NPT) to make sure that nuclear material is not diverted from peaceful activities to nuclear weapons programs. This does not mean, however, that over the course of the last forty years, all issues relating to these so-called "safeguard" missions have been clarified and the necessary policies and practices established.

The IAEA verification system has evolved over time to meet the new challenges posed by the spread of nuclear weapons. The agency's tools are inspections, reports of its findings to its board, and, if it deems necessary, referral of cases of concern to the UN Security Council. Until the early 1990s, the system focused on checking the correctness of a member state's declarations, that is, confirming that declared nuclear material had not been diverted. Since then, the system has also focused on detecting undeclared nuclear material and activities. The combination of these two objectives better serves the intent of Article III.1 of the NPT, which sets the goal of "preventing diversion of nuclear energy . . . to nuclear weapons."

It is important to note that the NPT uses the word "preventing," which means that the verification system must be designed to work so that alarms are triggered before the actual diversion takes place or a mushroom cloud appears.

After the safeguards system was revamped to detect undeclared activities, North Korea, Iran, South Korea, Egypt, Libya, and Syria failed to meet the reporting requirements under their safeguards agreements. The cases of South Korea and Libya were resolved with the cooperation of the states, and the case of Iran is being dealt with by the UN Security Council. The Egyptian case, relating to the presence of highly enriched uranium particles, has yet to be resolved.

### **Use of Special Inspections**

Special inspections have been attempted only twice. The first case was in post-communist Romania in 1992, when the IAEA was asked to verify unreported plutonium separation experiments conducted during the Ceausescu regime. The affair did not make headlines; the request for inspection came in May 1992, the IAEA's director general reported the results in September 1992, and no special reports were issued.

The media focused much greater attention on the case of North Korea, where the IAEA requested a special inspection in 1993 but was refused the necessary access by Pyongyang. Subsequently referred to the UN Security Council, the case is being handled in a lengthy process that is still unfinished. Indeed, North Korea has since carried out two nuclear tests, one in 2006 and one in 2009.

## Defining "Special" to Mean "Rare"

Before the 1992 and 1993 special inspection cases, the IAEA board had been strengthening the safeguards system, whose limitations had become apparent after Saddam Hussein's clandestine nuclear weapons program was discovered in Iraq following the expulsion of his forces from Kuwait. The role of special inspections was discussed, and one of the outcomes was the decision that a special inspection should be carried out "in rare occasions only." This definition has led some to consider special inspections as a good theoretical option, but one that never needs to be used.

This is a fallacy premised on the fact that a great majority of NPT signatory states duly fulfill their reporting obligations, cooperate with the IAEA, and comply with their obligations. Under such circumstances, there is no need for a special inspection, and consequently, such an event is indeed rare. But the decision of the IAEA board should not be taken to mean that such an inspection should be a rare event, but rather, that it should be used when needed.

The IAEA Secretariat should, therefore, use its rights fully to meet the spirit of the NPT by preventing the diversion of nuclear energy technologies and material to nuclear weapons. This is the agency's obligation; its secretariat should use all the tools at its disposal in a timely manner to fulfill its mandate. The special inspection is no exception; it should be used when there is an impasse, and challenges should not be allowed to persist and become increasingly complicated. Special inspections should not be treated lightly, but when they make it possible to clarify the picture or to remove inconsistencies, the world community must not shy away from them.

The IAEA could have invoked the provisions of a special inspection in the cases of South Korea and Libya. But it received the necessary cooperation from the inspected parties, had access to all sites, persons, and information requested, and was therefore able to fulfill its mandate to ensure that all nuclear material in those states was for peaceful use only.

In the case of Syria, however, the IAEA has reached a point where a special inspection is warranted at Deir Al-Zour (destroyed in a reported Israeli air strike in 2007) and other locations that could be functionally related to it or that may have information useful for clarifying what was going on there. The IAEA found uranium particles at the site, and satellite imagery and procurement information point toward possible construction of a nuclear reactor there. If it was a nuclear reactor, this would have been the first time that an IAEA member state and an NPT signatory constructed a plutonium production reactor on such a scale without reporting it to the IAEA. Together with official Syrian reluctance to give the agency access to relevant information, persons, equipment, and sites, the resulting situation calls for the use of full inspection rights to ensure that all nuclear material in Syria is for peaceful purposes.

If the world nuclear order is to be maintained and sanctuary for future nuclear proliferators prevented, the international community should expect nothing less than that the IAEA will use all its inspection rights in Syria, including a special inspection, now.

Olli Heinonen, a senior fellow at the Belfer Center at Harvard University, was formerly deputy director-general and head of the department of safeguards at the International Atomic Energy Agency.

## **A Conversation with Yukiya Amano**

**Speaker: Yukiya Amano, Director General, IAEA**

Presider: Albert Carnesale, Chancellor Emeritus, University of California, Los Angeles (UCLA)

November 9, 2010, New York

Council on Foreign Relations

*[EXCERPTS]*

CARNESALE: And in Iran, of course, we worry not only about the declared facilities and what they might be used for, but what might be covert facilities that we don't know about.

And we're hardly comforted about what happened in Syria. Syria, it appears that the entire system failed. U.S. intelligence didn't seem to know there was a reactor there. The international community didn't seem to know there was a reactor there. Israeli intelligence seemed to figure out that there was a reactor under construction there.

I wonder if you can tell us -- because, again, you had a similar thing to say about Syria, that they too were not cooperating, and you've been unable to make progress on resolving the outstanding issues. What is the status now in Syria? Do we know? Does the IAEA -- has it confirmed that a nuclear reactor was under construction? What is the current situation?

AMANO: Okay. Let me explain just a little bit about the background, and I'll come back to where we stand now and -- where we stand now.

The question that was addressed to me is related to the site in the desert called Deir ez-Zor site. At the beginning it was very unfamiliar, but now I remember this word -- Deir ez-Zor site.

Deir ez-Zor site is a facility, then, in the desert, and it was bombarded and destroyed in 2007. After several months, this issue was brought to our attention, then the allegation that it was in fact a nuclear reactor.

My predecessor, Dr. Mohamed ElBaradei, asked access to the site, and in 2008 inspectors visited there. What we saw is that the facility was destroyed, the ground was cleared, the remaining building was repainted. We could collect the samples, and we brought it back.

Later, after analyzing them, the samples, we found that they are the particles of man-made uranium. But up to today, we cannot identify what is the origin.

Later I succeeded this issue, and I -- I'm keeping on requesting Syria to give us access to the site of Deir ez-Zor and some other site. But as you mentioned, Syria has not given us access, and therefore we cannot make progress.

What is the status? What is our thinking? Judging from the information that we have, we think it is possible or quite possible that it was a reactor. Why we couldn't find it? Why international -- other countries could not discover it? I think that far as we are concerned, the absence of additional protocol was a serious disadvantage. If we had -- if we had additional protocol, we could have asked as a right to visit the site and could have been able to have some information. But that may be after-thinking. Additional protocol should have been quite useful to clarify on that issue.

What I'm doing now is to continue to ask Syria to accept inspectors at the site, to the site of Deir ez-Zor and other sites. For the future option, I'm open.

CARNESALE: Why not -- if it's true if you had the additional protocol, you could have had such an inspection, what about a special inspection now? You have the authority for a special inspection. What about a special inspection in Syria?

AMANO: Special inspection is one of the tools specified in the IAEA comprehensive safeguards. It was used -- it was called for twice, in case of North Korea and Romania. Romania was a special case, but the typical case was North Korea. But North Korea did not accept it, and the matter was reported to the Security Council.

In Syria, special inspection is, of course, one of the options. But for now, I am continuing to request Syria to provide us access -- with access to continue to do that for now. For the future, as I said, I am open.

*[deletia]*

CARNESALE: Other questions? Sir, right there.

QUESTIONER: I'm Michael Adler, from the Wilson Center. Hi, Mr. Amano.

You -- Mr. Amano, you said that you were open towards moving more strongly against Syria. What does that mean? The United States is pressing very strongly for special inspections. Do you expect that this will come up at the November board? And would you advocate special inspections?

And just one question about Iran, if I may. Do you find -- there seems to be an increased atmosphere of confrontation at the IAEA, especially between you and the Iranian ambassador. Do you think that is -- how do you explain that? And do you think that is hindering at all the effectiveness of your ability to work in Iran, especially after what happened with the two inspectors who were asked to leave?

CARNESALE: I should mention that I should have said one question to a person -- but I'm sure you would have been creative enough to make it sound like one question. (Laughter.)

Yes, go ahead.

AMANO: (Laughs.) The first question was on -- I'm not --

CARNESALE: Special inspections.

AMANO: Oh, special inspections. Special inspections. I didn't say that I will take a (stronger position/strong opposition ?) on Syria. What I said is that there has not been progress, but for now I keep on asking Syria to accept our inspectors at the site of Deir ez-Zor and other locations. And when I am asked about special inspections for the future, I am open.

Special inspection is one of the tools, but there are other tools, and we need to think well. Nothing has been decided. Nothing has been decided, except that for now I continue to seek access to that Deir ez-Zor site and other locations. Nothing has been decided and I am open does not mean that I have called for special inspection in December. I don't think so.

*[deletia]*

QUESTIONER: (Off mike.) Mr. Amano, on Syria, could you tell us, under what circumstances could it follow in its ally Iran's footsteps and end up at the Security Council, possibly being sanctioned for not allowing your inspectors into the country?

AMANO: For now, I'm saying that I'm asking Syria to accept inspectors' visits to the Deir site and others. It's some -- not appropriate to discuss about Security Council -- report to the Security Council.

QUESTIONER: But you mentioned other -- (off mike) --

AMANO: Oh. If I misled you, I'm terribly sorry. I did not mean that I reported to the secretary about -- by no means.

QUESTIONER: (Off mike) --

AMANO: The -- for example, we have to -- I did not want to get into too much in details, so I focused on Deir ez-Zor site. But we have another site at -- near Damascus, on research reactor, and we have sent down our teams. We've got some new declarations. And we are discussing with them. So our dialogue, inspection, is the normal way, and I am pursuing this route now.

## Board of Governors

**For official use only**

Item 6(d) of the provisional agenda  
(GOV/2010/57 and Add.1)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. This report of the Director General to the Board of Governors is on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic<sup>1</sup> (Syria); it includes developments since the last report was issued in September 2010.<sup>2</sup>

## **A. The Dair Alzour Site**

2. On 2 June 2008, the Director General informed the Board of Governors that the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria, destroyed by Israel in September 2007, had been a nuclear reactor. The information further alleged that the reactor was under construction but not operational at the time of its destruction, and that it had been built with the assistance of the Democratic People's Republic of Korea (DPRK). By the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building.<sup>3</sup>

3. Syria has maintained, since May 2008, that the destroyed building was a non-nuclear military installation and that Syria had had no nuclear related cooperation with the DPRK.<sup>4</sup> While it cannot be excluded that the destroyed building was intended for non-nuclear use, the Agency has assessed that the features of the building and its connectivity to adequate pumping capacity of cooling water are similar to what may be found at nuclear reactor sites.<sup>5</sup> While Syria has indicated that its efforts to procure pumping equipment and large quantities of graphite and barite were civilian and non-nuclear in nature, the Agency has assessed that these items could also support the construction of a nuclear reactor.<sup>6</sup> Additionally, Syria's statements concerning the end use of the barite, which was purchased by the Syrian Arab Republic Atomic Energy Commission (AECS), are not consistent with other information available to the Agency. Syria has also maintained that the particles of anthropogenic natural uranium found in samples taken during the Agency's June 2008 visit to the Dair Alzour site originated from the missiles used to destroy the building.<sup>7</sup>

4. As indicated in previous reports, the Agency has assessed that the probability that the particles originated from the missiles used to destroy the building is low. The Agency also assessed that there is a low probability that the

particles were introduced by aerial dispersion. The presence of such uranium particles points to the possibility of nuclear related activities at the site and adds to questions concerning the nature of the destroyed building. Syria has yet to provide satisfactory explanations for the origin and presence of these particles.<sup>8</sup> In this context, information yet to be provided by Israel might be helpful in clarifying the matter.<sup>9</sup>

5. Syria's statements concerning the nature of the destroyed building, the Dair Alzour site, the three other locations allegedly functionally related to it, the procurement activities referred to above and the alleged foreign assistance are limited in detail and no supporting documentation has been provided by Syria. The information and access provided by Syria to date have not allowed the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building. Since the Agency's visit to the Dair Alzour site in June 2008, the Agency has made repeated requests to Syria for:

- information concerning the Dair Alzour site, the infrastructure observed at the site and certain procurement efforts which Syria has stated were related to civilian non-nuclear activities;
- access to technical documentation and any other information related to the construction of the destroyed building;
- access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are now situated; and
- further access to the Dair Alzour site and access to three other locations allegedly functionally related to the Dair Alzour site.

6. Syria has maintained that, due to the military and non-nuclear nature of the Dair Alzour site and three other locations allegedly functionally related to Dair Alzour, it had no obligation to provide more information under its Safeguards Agreement with the Agency.<sup>10</sup> The Agency has explained to Syria that there is no limitation in comprehensive safeguards agreements on Agency access to information, activities or locations simply because they may be military related. The Agency has repeatedly offered to establish the necessary modalities for managed access to sensitive information and locations, including the Dair Alzour site and the three other locations.

7. Syria has not engaged substantively with the Agency on the nature of the Dair Alzour site since the Agency's June 2008 visit and, since August 2009, has not responded to the issues noted in paragraph 5. The Agency continues to request Syria to provide access to the information, material, equipment and locations previously indicated by the Agency.

## **B. Activities at Other Locations in Syria**

8. As previously reported, particles of anthropogenic uranium of a type not included in Syria's reported inventory were found at the Miniature Neutron Source Reactor (MNSR) in 2008 and in 2009. Syria's initial explanations in June 2009 that the particles had originated either from standard reference materials used in neutron activation analysis or from a shielded transport container were not supported by the results of sampling carried out by the Agency.<sup>11</sup> During the November 2009 inspection, Syria explained that the anthropogenic particles had originated from previously unreported activities performed at the MNSR related to the preparation of tens of grams of uranyl nitrate using yellowcake produced at Homs.<sup>12</sup> At the March 2010 physical inventory verification (PIV), another small quantity of undeclared uranyl nitrate was found at the MNSR. Syria explained that the unreported activities had taken place in a different location in the MNSR than previously declared to the Agency.<sup>13</sup> As reported earlier, Syria submitted inventory change reports in June 2010 for the newly declared material shown to the Agency during the PIV. However, inconsistencies between Syria's declarations and the Agency's findings remained unresolved.

9. During a meeting on 3 September 2010, agreement was reached with Syria on a plan of action for resolving these inconsistencies. The plan included actions relating to:

- the amount and types of nuclear material used in the preparation of uranyl nitrate, the irradiation activities at the MNSR and the processes used;
- scientific publications by the AECS that indicate uranium conversion experiments different from those declared by Syria to have occurred at the MNSR;
- information indicating the presence of nuclear material under the control of the Waste Management Department of the AECS but not part of Syria's declared inventory; and
- access to Homs for the purpose of determining the extent of any uranium processing activities and nuclear material at that location.

10. In a letter dated 9 September 2010, the Agency provided Syria with a detailed request for clarification concerning inconsistencies regarding the amounts and types of nuclear material involved in the preparation of the uranyl nitrate. In response, Syria sent two letters to the Agency dated 28 October 2010; these did not clarify the issues identified in the Agency's letter and the plan of action. In addition, the letters appear to have added further inconsistencies concerning the preparation of the uranyl nitrate and subsequent irradiation activities.

11. In a letter dated 13 September 2010, the Agency provided Syria with a list of the locations to be accessed and the activities to be performed during the visit to Homs. In its letter of 29 October 2010, the AECS responded that the pilot plant in Homs and the activities being carried out there are not subject to Syria's Safeguards Agreement with the Agency and that further aspects of the Agency's request for access needed to be discussed and clarified with the Agency before the AECS is able to request permission for the visit.

12. In a letter to the Agency, dated 28 October 2010, with respect to the nuclear material inventory under the control of the Waste Management Department of the AECS, Syria acknowledged the presence of some of the nuclear material previously identified by the Agency and conveyed that the material and related documents will be available for Agency verification in March/April 2011. In a letter dated 12 November 2010, the Agency reminded Syria to provide the necessary inventory change report concerning this nuclear material and reiterated its request that Syria provide information on other nuclear material identified by the Agency in earlier letters.<sup>14</sup>

13. In two letters dated 12 November 2010 and during a meeting in Vienna on 15 November 2010, the Agency provided Syria with assessments of the information contained in Syria's October 2010 letters and explained why further clarifications were necessary. During that meeting, Syria reaffirmed its commitment to resolving the MNSR issues within the scope of its Safeguards Agreement, to respond to the Agency's questions concerning inconsistencies, and to discuss with the Agency its earlier requests for access to the pilot plant at Homs. The Agency also reiterated the importance of a prompt and positive reaction from Syria on these issues.

## **C. Summary**

14. Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.

15. With the passage of time, some of the information concerning the Dair Alzour site is further deteriorating or has been lost entirely. It is critical, therefore, that Syria actively cooperate with the Agency on these unresolved safeguards implementation issues without further delay.

16. Concerning the MNSR, Syria's responses to date, under the agreed plan of action, do not resolve the inconsistencies identified by the Agency. Conclusions about the source of the uranium particles at the MNSR will only be possible once Syria has provided clarification regarding outstanding inconsistencies.

17. The Director General urges Syria to bring into force an Additional Protocol to its Safeguards Agreement, which would further facilitate the Agency's work in verifying the correctness and completeness of Syria's declarations.

18. The Director General will continue to report as appropriate.

<sup>1</sup> INFCIRC/407.

<sup>2</sup> GOV/2010/47 (6 September 2010).

<sup>3</sup> GOV/OR.1206, para. 26 and GOV/2008/60, para. 16.

<sup>4</sup> GOV/2008/60, para. 1 and GOV/2009/36, para. 15.

<sup>11</sup> GOV/2009/75, para. 6.

<sup>12</sup> A pilot plant for the purification of phosphoric acid was constructed and commissioned in 1997 at Homs, Syria, with the support of the United Nations Development Programme and the IAEA. Yellowcake was also produced as a result of the acid purification process. During a July 2004 visit to the Homs phosphoric acid purification plant, Agency inspectors observed some hundreds of kilograms of yellowcake.

<sup>13</sup> GOV/2010/47, para. 10.

<sup>14</sup> The Agency previously sent letters to Syria, dated 14 May 2010 and 29 July 2010, regarding the possible presence of undeclared nuclear material at waste management facilities under the control the AECS. Syria responded, in letters dated 23 May 2010 and 15 August 2010, that no such material was present and that its declared inventory was complete.

## **U.N. nuclear agency makes little progress in Syria**

By Julia Damianova, Los Angeles Times

November 26, 2010

*[EXCERPTS]*

The United States is about to push for so-called special inspections in Syria by the U.N. nuclear watchdog, a rarely used tool to seek access in a country that otherwise denies entry to sensitive sites, diplomats familiar with the issue say.

After a report Tuesday from the International Atomic Energy Agency that showed no substantial progress in its investigation of Syria's nuclear activities, Western countries may start to play hardball by implementing the rarely used procedure, the diplomats told The Times this week.

"The United States wants to bring up the subject of special inspections in Syria at the IAEA Board of Governors in December," said a European diplomat who asked to remain unnamed because of the sensitivity of the issue.

Countries that are signatories to the Nuclear Non-Proliferation Treaty may be subject to special inspections if the agency decides that the information obtained in routine visits is not adequate to fulfill its duties, which include watching for signs that a country may be trying to obtain nuclear weapons.

Currently, a reactor in Damascus is the only Syrian nuclear facility under international watch, and the agency needs the country's permission to visit any other location.

*[deletia]*

Western diplomats following the case are frustrated by what they describe as Syria's intransigence.

"The new IAEA report on Syria seems to be similar to the one from September, showing no progress in the agency's investigation," said one diplomat in Vienna who spoke on condition of anonymity.

Another diplomat familiar with the issue said patience with Syria's lack of cooperation is wearing thin and that the country may now be ripe for the special inspections procedure.

Damianova is a special correspondent.

## **Berman Condemns Syria's Obstruction of International Inspections of its Nuclear Activities**

**Monday, November 29, 2010**

Washington, DC – Rep. Howard Berman (D-CA), chairman of the House Committee on Foreign Affairs, today condemned Syria's continued efforts to block the efforts of the International Atomic Energy Agency (IAEA) to investigate its illicit nuclear activities, as recently revealed by the IAEA Secretary General in a report to the organization.

"Syria continues to defy the world and is violating its obligations to prove that all its nuclear-related activities are peaceful. The IAEA Secretary General should immediately demand a special inspection of Syria's activities regarding its illicit and covert construction of a nuclear reactor and other suspicious activities. If Syria refuses, the IAEA Board of Governors should refer Syria's non-compliance with its safeguards obligations to the UN Security Council."

## Syrien unter Atomwaffenverdacht

### Rätselhafte Erdarbeiten

Von Paul-Anton Krüger

02.12.2010, 09:28 2010-12-02 09:28:05

**Die Atomenergiebehörde IAEA hat neue Hinweise auf ein geheimes Nuklearprogramm in Syrien. Das Land will weder dazu Stellung nehmen - noch lässt es Kontrollen zu.**

Gegen Mitternacht vom 5. auf den 6. September 2007 greifen mindestens vier israelische F-15 I Kampfflugzeuge ein mysteriöses, würfelförmiges Gebäude in Syrien an. Es steht am Ufer des Euphrat; die nächste größere Stadt, 30 Kilometer entfernt, ist Dair as-Saur. Ihr Name taucht in Dokumenten der Internationalen Atomenergiebehörde (IAEA) auf, wenn es um den Reaktor geht, den Syrien angeblich mit Hilfe aus Nordkorea in dem Quader gebaut hat, versteckt in einem Tal, das von dem Strom abgeht.

**Verdächtige Anlagen in Syrien. Links: ein Gebäudekomplex nahe Masyaf. Rechts: Der mutmaßliche Reaktor kurz vor dem israelischen Angriff (links und unten), kurz nach dem Angriff (Mitte), und das Gelände, nachdem die Syrer es geplant haben. (© SZ: Hanna Eiden, Fotos: Google Earth, AFP, AP)**

Laut einem Briefing des US-Auslandsgeheimdienstes CIA von Ende April 2008 wäre der auch unter dem Namen der nahen Ortschaft el-Kibar geläufige Reaktor gut geeignet gewesen, Plutonium zu erzeugen - aus dem sich Atomwaffen bauen ließen. Für andere Zwecke dagegen taugt die Technik aus den Fünfzigern kaum. Die CIA führte eine Videopräsentation vor mit unscharfen Satellitenbildern. Per Computeranimation blendete sie

ein, wo welche Komponenten des Reaktors vor der Zerstörung gewesen sein sollen, der eine verkleinerte Kopie des nordkoreanischen Modells aus dem Atomzentrum Yongbyon sei. Zudem legte sie Fotos vor, die das Gebäude aus der Nähe zeigen oder gar den Innenraum. Der Reaktor sei kurz vor der Inbetriebnahme gestanden, hieß es, aber noch nicht mit Brennstäben bestückt gewesen.

Heute, mehr als drei Jahre nach dem Bombardement, ist kaum mehr bekannt als damals, ja die Rätsel wurden mit der Zeit eher größer. Der frühere US-Präsident George W. Bush hat jüngst in seinen Memoiren enthüllt, dass sich die CIA vor dem Angriff zwar recht sicher war, dass Syrien in el-Kibar einen Reaktor baute, aber kaum Anhaltspunkte dafür sah, dass es in dem Land "ein aktives Nuklearwaffenprogramm" gab. Manche Geheimdienstler in Europa sind da lieber noch vorsichtiger und sprechen nur von einem "angeblichen Reaktor", auch wenn sie die CIA-Präsentation für "plausibel" halten. Ihnen fehlen harte Beweise, ebenso wie der IAEA. Gefragt, wie sicher er sei, einen Reaktor vor sich zu haben, antwortete ein hoher UN-Diplomat im Sommer nur lapidar, die IAEA habe "genug Material, um Fragen zu stellen".

Den Schutt des angeblichen "ungenutzten Militärgebäudes" schafften die Syrer zwar eilig beiseite und planierten das Gelände gründlich. Dennoch fand im Juni 2008 ein IAEA-Team unter dem früheren Chefinspektor Olli Heinonen in el-Kibar Spuren von Uran, das von Menschen hergestellt worden war. Zudem erhielt die IAEA über einen Mitgliedstaat Satellitenbilder kommerzieller Anbieter aus der Zeit direkt nach dem Angriff, die aussagekräftiger sein dürften als die von der CIA präsentierten. Allerdings sind diese Aufnahmen auf dem Markt nicht zu bekommen, weil der unbekannte Auftraggeber - vielleicht Israel - sie exklusiv gekauft hat. Die IAEA kann daher ihre Echtheit nicht unabhängig verifizieren.

Syrien hat immer beteuert, nie ein geheimes Atomprogramm betrieben oder einen Reaktor gebaut zu haben. Das Uran stamme von den israelischen Waffen, erklärte Damaskus. Doch das wies die IAEA nach Analyse der Partikel als unwahrscheinlich zurück. Seither weigert sich Damaskus, darüber zu diskutieren - genauso wie über die Satellitenbilder. Zudem verwehrt es den Kontrolleuren eine zweite Inspektion in el-Kibar und den Zugang zu den Trümmern des zerbombten Gebäudes. Aber auch Israel schweigt eisern. "Wir werden das nie kommentieren", bekräftigte jüngst zur Zeit des Angriffs amtierende Premier Ehud Olmert die offizielle Position.

So schleppt sich die Untersuchung des Falls seit Juni 2008 ergebnislos hin und "entwickelt sich zunehmend zu einem ernsthaften Glaubwürdigkeitsproblem für die Behörde", wie ein hoher westlicher Diplomat am Sitz der IAEA in Wien zugesteht - schließlich steht ein schwerer Verstoß gegen den Atomwaffensperrvertrag im Raum, über den die IAEA wacht.

### **Die Nuklear-Inspektoren haben "genug Material, um Fragen zu stellen"**

Als Schlüssel zu Fortschritten bei der Aufklärung sieht die IAEA offenbar drei weitere Einrichtungen, die "in funktioneller Verbindung" mit dem mutmaßlichen Reaktor stehen sollen - und anders als dieser noch existieren. Dabei haben die Inspektoren bislang weder offengelegt, um welche Anlagen es sich handelt, noch welche Funktion sie haben oder was sie verdächtig erscheinen lässt.

Nach Informationen der Süddeutschen Zeitung werden sie bei der IAEA intern als Marj as-Sultan, Masyaf und Iskandariayah bezeichnet, wiederum abgeleitet von nahe gelegenen Städten. Das unabhängige Institute for Science and International Security in Washington (Isis) hat diese Orte identifiziert und auf Satellitenbildern einen Gebäudekomplex bei Masyaf ausfindig gemacht, bei dem es sich höchstwahrscheinlich um eines der verdächtigen Objekte handelt. Es befindet sich möglicherweise in oder unmittelbar neben einem Militärstützpunkt - genau mit dieser Begründung verwehrt Syrien der IAEA den Zugang zu den drei Orten. In Wien heißt es, die Syrer fürchteten eine fishing expedition - dass die IAEA von den USA vorgeschickt werde, um Militäranlagen auszuspähen. Denn die Nukleardetektive waren durch einen Tipp der US-Geheimdienste auf die Einrichtungen aufmerksam geworden.

Die IAEA hat Hinweise, darunter Satellitenfotos, dass zwischen den drei Orten und dem Quader am Euphrat Material hin- und hertransportiert wurde. Ein hoher westlicher Diplomat in Wien sagte, mindestens eine der Anlagen könnte "in Zusammenhang mit der Brennstoffproduktion" stehen. Es gebe aber "keine Hinweise auf sensible Aktivitäten", also Urananreicherung oder Wiederaufarbeitung; Prozesse, die zum Bau von Atomwaffen nötig sind. Der Reaktortyp wird zwar mit Uran betrieben, das nicht angereichert ist. Doch wo das Uran hätte herkommen sollen und wo daraus später das Plutonium für die Bombe abgetrennt werden sollte, zu diesen zentralen Fragen gibt es allenfalls plausible Vermutungen.

Unklar ist auch, ob Trümmer, die wertvolle Spuren bergen könnten, an den drei Orten gelagert wurden. Als wären die Hunderte Lastwagenladungen vom Erdboden verschwunden, will niemand Informationen darüber haben, wo der Schutt geblieben ist. Die nur wenige Kilometer von el-Kibar auf der anderen Seite des Euphrat gelegene Salzmine al-Tibni, die Syrien 1998 auf ihre Eignung als Lager für radioaktiven Müll untersucht hat, gilt der IAEA als unwahrscheinlich. Der frühere IAEA-Inspektor Robert Kelley hatte sie jüngst in einer Analyse von Satellitenbildern für das renommierte Magazin Jane's Intelligence Review mit dem Reaktor in Verbindung gebracht.

Aufnahmen aus dem Orbit zeigen aber, dass Syrien an den drei verdächtigen Orten Erdarbeiten vornahm und große Container entfernte, nachdem die IAEA Zugang verlangt hatte. Das kann Zufall sein, hat aber kaum dazu beigetragen, den Verdacht auszuräumen. Zudem heißt es in Diplomatentreisen, habe die IAEA etliche Monate darauf verwendet, einen Plan für Inspektionen dort zu entwickeln, der es Syrien erlauben sollte, etwaige Militärgeheimnisse zu wahren - allein der Aufwand zeigt, wie groß das Interesse der Inspektoren ist. Indes, Damaskus bündelte auch diesen Vorschlag ab.

*Hatten westliche Diplomaten in Wien noch vor einem Jahr beschwichtigt, der Reaktor sei ja zerstört, daher habe die Sache keine hohe Dringlichkeit, bringt etwa US-Botschafter Glyn Davies seit ein paar Monaten sogenannte Sonder-Inspektionen ins Spiel, eines der schärfsten Mittel, das die Wiener Atombehörde hat, um Kontrollen durchzusetzen. IAEA-Chef Yukiya Amano, der diese Inspektionen vorschlagen müsste, hat zwar schon von "einer Option, für die ich in der Zukunft offen bin" gesprochen, noch aber zögert er. Es liegt ein hohes Risiko in diesem Weg: Zum einen braucht es dafür eine Mehrheit im Gouverneursrat der IAEA, und etliche der dort vertretenen 35 Länder sind alles andere als erpicht auf eine Eskalation. Zum anderen, wie ein Diplomat zu bedenken gibt: "Was ist, wenn sie am Ende gar nichts finden?"*

**For Immediate Release**

**December 2, 2010**

## **Fortenberry Leads Call for Comprehensive Inspections in Syria's Nuclear Program**

Washington, D.C. -- Congressman Fortenberry, along with seven other leading Members of Congress, today called on the President to urge the International Atomic Energy Agency (IAEA), to conduct special comprehensive nuclear inspections in Syria. Concern stems from Syria's clandestine construction of an alleged nuclear reactor intended to produce weapons-usable plutonium near the town of Al-Kibar. According to news reports, this facility, which was likely built with North Korean assistance, was destroyed by an Israeli airstrike in September 2007.

"Syria is obligated by international law to engage in nuclear activities that are completely open and transparent," Fortenberry said. "Given the strong evidence suggesting Syria's covert attempts to build a nuclear reactor that could further a nuclear weapons program, Syria should immediately allow international inspectors unfettered access to its nuclear program, and allay concerns that it may still be engaging in undeclared nuclear activities."

Fortenberry's letter to the President comes as the nations that comprise the IAEA's governing board meet this week in Vienna, Austria. Signatories to the letter include Congressman Edward Markey (D-MA), Senator Jon Kyl (R-AZ), Senator Kirsten Gillibrand (D-NY), Congressman Ed Royce (R-CA), Congressman Brad Sherman (D-CA), Senator John Ensign (R-NV), and Senator Joseph I. Lieberman (ID-CT).

High-ranking IAEA officials share international concerns that Syria may be concealing nuclear materials and equipment that could be used to obtain nuclear weapons capability. Under international treaties and agreements, Syria is required to declare nuclear activities so that the IAEA can ensure that these activities are used for exclusively peaceful purposes.

The Fortenberry letter also urges the President to use existing legal authorities to impose sanctions on Syrian individuals and entities that received illicit North Korean assistance. The letter notes that the President used these same authorities in August 2010 to sanction North Korean individuals and entities that provided illicit assistance to Syria's weapons of mass destruction program.

Fortenberry, who co-chairs the Congressional Nuclear Security Caucus, is a member of the House Foreign Affairs Committee and the Oversight and Government Reform National Security Subcommittee.

## **Director General Addresses December Board of Governors Meeting**

**2 December 2010**

IAEA Board of Governors

*[EXCERPTS]*

IAEA Director General Yukiya Amano opened today's meeting of the Board of Governors with a statement that covered a number of issues including technical cooperation, nuclear energy, nuclear verification and assurance of supply of nuclear fuel.

*[deletia]*

### **Nuclear Verification**

*[deletia]*

### ***Syrian Arab Republic***

"Concerning the Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and some other locations. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.

I wrote a letter to the Minister for Foreign Affairs of the Syrian Arab Republic on 18 November 2010 to request the Government to provide the Agency with prompt access to relevant information and locations related to Dair Alzour. I also requested Syria's cooperation regarding the Agency's verification activities in general."

## Special Reports

### Syria's Assad plays the security card

Published: Dec. 2, 2010 at 3:49 PM

[EXCERPTS]

CAIRO, Dec. 2 (UPI) -- Syrian President Bashar al-Assad has resisted U.S. efforts to pry his regime away from its strategic alliance with Iran, but he seems to be conducting discreet diplomacy with Western Europe and with China.

In recent weeks Assad has dispatched his security chiefs to London, Paris and Rome to share intelligence on terrorist groups, according to Intelligence Online, a Paris-based Web site that covers global security affairs.

[deletia]

But while all this was going on, Assad was also apparently taking care of business with a different set of diplomatic partners to the east -- which may turn out to be more important than his dealings in the West.

He sent Maj. Gen. Bassam Merhej, identified as director of Assad's security and military bureau, to Beijing Nov. 23.

"His real destination was probably Pyongyang, with whom Syria has a nuclear cooperation program," Intelligence Online reported.

That program suffered a major setback Sept. 6, 2007, when the Israeli air force destroyed a nuclear reactor being built by North Korea at al-Kibar in eastern Syria on the Euphrates River.

Merhej is reported to have replaced Maj. Gen. Mohammed Suleiman, who was assassinated Aug. 2, 2008.

Merhej was accompanied by Col. Jihad Shehadeh of the army's Corps of Engineers, who has been seconded to the Center for Scientific Study and Research, which is involved in Syria's nuclear program, Intelligence Online said.

He was also accompanied by an Iranian, identified as Ali Zadeh, officially the cultural attache at the Iranian Embassy in Damascus but "in reality in charge of logistics for the Iranian nuclear program in Syria."

[Sourcebook note. Google News excerpts:

*EUROPE / SYRIA - Bashar al-Assad's shadow diplomacy*

Dec 2, 2010 ... Two Iranians were also with them, the engineer Mohammed Mutawakkili and Ali Zadeh, who is officially the Iranian cultural attaché in Syria but in reality is in charge of logistics for the Iranian nuclear programme in the country.

[www.intelligenceonline.com/.../bashar-al-assad-s-shadow-diplomacy;86463831-ART](http://www.intelligenceonline.com/.../bashar-al-assad-s-shadow-diplomacy;86463831-ART)

## Syria tells U.N. atom body: focus on Israel, not us

By Sylvia Westall and Fredrik Dahl

VIENNA

Fri Dec 3, 2010 12:13pm EST

[EXCERPTS]

VIENNA (Reuters) - Syria dismissed on Friday calls to grant U.N. nuclear inspectors prompt access to the remains of a suspected nuclear site bombed to rubble by Israel, saying they should focus their investigation on the Jewish state instead.

Damascus's envoy to the International Atomic Energy Agency (IAEA) said Washington's suggestion that the IAEA could seek broader inspection powers to enable it to examine sites in Syria was "nonsense" and he did not believe it was likely.

"I think it is an agenda which some countries are pursuing," Bassam Al-Sabbagh told Reuters on the sidelines of a meeting of the IAEA's 35-nation board. "It is the time for dialogue and cooperation which is going on between Syria and the agency."

[deletia]

Washington hinted again on Friday that the IAEA may need to consider invoking its "special inspection" mechanism to give it authority to look anywhere necessary in Syria at short notice if Damascus did not cooperate with the agency's requests.

"Absent that cooperation, the United States believes the (IAEA) board will have little choice but to consider appropriate action," U.S. envoy Glyn Davies said. He said countries needed to take steps in the coming months to "preserve the credibility of the IAEA and the international safeguards regime."

### SPECIAL INSPECTION?

[deletia]

Amano said on Thursday he had urged Syria in a letter to provide his inspectors with prompt access to Dair Alzour, which Damascus says is a non-nuclear military site.

But Al-Sabbagh said the IAEA should turn its attention to Israeli sites. Syria has suggested the uranium traces came with Israeli munitions used in the attack.

The IAEA says it is unlikely that they were of a type of uranium sometimes used in munitions as a hardening agent.

"I think it is time now for the agency to visit the Israeli sites which were used for preparations for the attack ... it is time for the agency to move on the Israeli side," he said, when asked if Syria would grant the IAEA's request for access.

Arab states as well as Iran say Israel poses a threat to regional stability, with its presumed atomic arsenal -- the only Middle East country to have such arms. Israel neither confirms nor denies it has nuclear weapons.

Highlighting growing Western frustration, the European Union told the IAEA meeting it had "deep concern" over Syria's stance.

The IAEA has struggled to get Syria to open up because the country's basic safeguards treaty with the agency covers only its one declared atomic facility, an old research reactor.

Diplomats and analysts believe the IAEA will avoid escalating the dispute at a time of rising tension with Iran, which the West suspects of seeking nuclear weapons.

*[deletia]*

## **Egyptian has 'revealed three Israeli spy cells'**

(AFP)

2 days ago [Accessed 2010-12-26T17:15Z]

CAIRO — The confessions of an Egyptian accused of spying for Israel have led to three espionage cells being dismantled in Lebanon and Syria, where an agent was executed in November, Cairo newspapers said Friday.

Tareq Abdul Razzak, the 37-year-old owner of an import-export business, is accused of having spied for the Jewish state together with two wanted Israelis.

Egypt, which has a 1979 peace treaty with Israel, informed Lebanon and Syria of his activities in recruiting agents after Abdul Razzak's arrest in May, Al-Masri newspaper said, quoting a security source close to the investigation.

The suspect has allegedly confessed that his two Israeli contacts had tasked him with making visits to Damascus with a fake passport and identity under the guise of business trips.

The aim of the missions was to deliver sums of money to a Syrian holding a "sensitive" post with the security services.

Al-Shuruk daily said Abdul Razzak has provided investigators with copies of reports he had passed on to Israeli intelligence from a Syrian chemist working for the security services in connection with a Syrian nuclear programme.

The Syrian expert had been spying for Israel for 13 years, according to the confessions. He was executed in Syria last month, said Al-Shuruk, which did not give sources for its report.

On September 6, 2007, Israel launched an air raid on northern Syria that destroyed an alleged secret nuclear reactor.

The Egyptian trader is to be tried in Egypt's High Security Court on charges of spying for Israel and recruiting agents to report on telecoms secrets in Egypt, Lebanon and Syria, a judicial source said on Monday.

Arrest warrants have been issued for his two Israeli accomplices, the source said, without giving a trial date.

Abdul Razzak is accused of supplying Mossad between 2007 and 2010 with the names of potential recruits employed in the telecommunications sectors in Egypt, Lebanon and Syria.

According to a court statement, Abdul Razzak's first contact with Mossad was in 2007, when he received an email while looking for work in China.

The same year he met the Israeli agents in Thailand, where the Egyptian was asked to set up an import-export business back home as a cover for his real work with Mossad.

Abdul Razzak also set up a website that offered telecommunications jobs in Egypt, Syria and Lebanon, with the aim of looking for more potential recruits, the statement said.

In Lebanon, more than 100 people have been arrested on suspicion of spying for Israel since April 2009, including telecoms employees, members of the security forces and active duty troops.

## **Egyptian spy handed Israel files on Syria's nuclear program**

Ahmed Eleiba

Sunday 26 Dec 2010

Egypt helped Syria uncover a high-level Israeli mole in its security apparatus, as well as a host of other sensitive Syrian intelligence the suspected Egyptian spy is said to have given over to the Israelis

A source in the Syrian foreign ministry told Ahram Online that Egyptian-Syrian security cooperation remains strong despite the uneasy nature of their political ties in the past few years.

The two countries continue to work together on many security files, including the recently revealed network of Israel spies, lead by the Egyptian suspect Tarek Abdel Razeq.

The source added that after the discovery of this "conspiracy", Egypt handed over to Damascus a dossier of sensitive technical information relating to Syria's nuclear program, including the project's maps and strategic positions and means of obtaining nuclear materials.

The file has been a rich source of details for the discovery of an Israel spy network in Syria. The most outstanding piece of information handed over by Egypt to the Syrians concerned an Israeli mole, a high ranking member of Damascus' security apparatus, who had been collaborating with Israel for the past thirteen years.

The source says that the investigation remains open, looking into "other individuals" not yet identified. According to the source, existing information confirms there is a security breach extending to "security personnel in Syria."

The source, who wished to remain anonymous, added that Israel continues to be "an enemy to Arabs" and this, in his words, is one of main conclusions to be drawn from the uncovering of the tripartite networks in Egypt, Syria and Lebanon. In his opinion the peace deal between Israel and Egypt did not prevent from continuing intelligence war to damage inter Arab relations. He referred to the Egyptian prosecutor general's statement on the spy issue, particularly his statement that Israel sought to harm relations between Arab countries.

The source ruled out that it was on the operations agenda of the espionage case to assassinate figures in Syria, such the Hezbollah leaders Emad Mughneyah (who was assassinated in February 2008) or Lieutenant Mohammed Souleyman, an advisor to the Syrian president (assassinated in August 2008). However, he admitted that Israel had been able to penetrate highly sensitive security positions in Syria.

## **Mossad successfully recruited Syrian nuclear official, spy ring member says**

Ahmed Shalaby

Wed, 29/12/2010 - 10:29

An Egyptian recently arrested on charges of spying for Israel, Tarek Abdel Razek Hussein, has revealed to interrogators the name of a Syrian official he recruited to provide information on Syria's nuclear program.

Hussein, in the summarized interrogations exclusively published by Al-Masry Al-Youm, said the nuclear official in Syria's military intelligence, Saleh al-Nejm, worked with him, under Mossad's coordination, to track Syria's uranium enrichment plants, nuclear remnants disposal spots, and other elements related to Syria's nuclear program.

Hussein discovered that al-Nejm had been working with Mossad for years, he added.

The information was later transferred to an Israeli nuclear expert, according to Hussein, who said he believed it was a helpful tool in the Israeli air raid on alleged Syrian nuclear sites in September 2007.

Translated from the Arabic Edition.

## **Report: Accused Egyptian spy says Israel paid Syrian agent for nuclear plan details**

By DPA

Published 13:29 29.12.10

Latest update 13:29 29.12.10

An Egyptian charged with spying for Israel told authorities that his Syrian counterpart was paid 1.5 million dollars to provide Israel with information on Syrian nuclear activities, Egyptian media reported Wednesday.

The Syrian intelligence official, named as Saleh Al-Nijm, provided Israel with information on the whereabouts of an alleged Syrian nuclear reactor which probably led to the bombing of the facility in 2007, according to Egyptian state media reports.

According to the EgyNews website, Tareq Abdelrazeq told authorities that he met with al-Nijm several times in Damascus and that they collaborated on providing information to the Mossad.

For his part, Abdelrazeq allegedly received 37,000 dollars from Israel in payment for his activities, Egyptian officials said.

Syria denies that the bombed structure was a nuclear reactor.

Meanwhile, Israel has not officially said it was behind the 2007 attack, but a U.S. government cable released by WikiLeaks earlier this month named Israel as responsible.

The cable, written in 2008 by then secretary of state Condoleeza Rice, stated that "on September 6, 2007, Israel destroyed the nuclear reactor built by Syria secretly."

Abdelrazeq also allegedly told prosecutors that no other Egyptians had collaborated with him in providing Israel information.

Egyptian authorities announced the arrest of Abdelrazeq earlier this month, accusing him of spying for Israel and attempting to recruit spies in Syria and Lebanon for the Mossad.

Egypt's Emergency State Security court is expected to hear the case on January 15.

The prosecutor's office also accused two Israelis of working alongside Abdelrazeq and forming a spy ring in Egypt. The prosecutor did not name the suspects, only saying they were "fugitives" and had not yet been arrested.

## 'Officer charge of Syrian nuclear program was Mossad spy'

By JPOST.COM STAFF

12/29/2010 17:02

Tarek Abdel-Razek, who was arrested in Syria last week for allegedly gathering intelligence for Mossad, revealed while he was undergoing investigation the identity of another alleged spy in Syria, saying he was a senior officer who was in charge of the regime's nuclear project in Damascus, reported the Egyptian newspaper Al-Masry Al-Youm on Wednesday.

According to the report, Razek told investigators that the Syrian officer's name is Salah a-Najam, a colonel in Syria's military intelligence. He claimed that Najam served as an agent of Mossad for many years and received a million and a half dollars from the Israelis.

Razek also said he met with Najam several times in Damascus and received information from him on the development of Syria's nuclear program, the location of nuclear facilities and sites where radioactive was buried. The information, according to Najam, was transferred to an Israeli nuclear expert and contributed to the attack on the nuclear reactors in the Syrian desert in September 2007.

## **SPIEGEL Interview with IAEA Head Yukiya Amano**

'We Still Know Too Little about Tehran's Nuclear Activities'

01/11/2011 01:14 PM

*[EXCERPTS]*

A possible nuclear program in Iran, atomic weapons in North Korea and instability in Pakistan: It is not an easy time to be head of the International Atomic Energy Agency. SPIEGEL spoke with new IAEA head Yukiya Amano about the challenges he faces and the dangers emanating from Tehran.

*[deletia]*

SPIEGEL: Israel, which feels particularly threatened by Iranian President Mahmoud Ahmadinejad, has demonstrated, most recently in September 2007, that it does not shy away from military strikes. In Syria, an ally of Iran, Israel destroyed a complex of buildings where plutonium was presumably being produced. Do you have any new information about Syrian President Bashar Assad's nuclear plans?

Amano: Syria isn't letting our inspectors into the country to examine this location in detail. In a letter to the Syrian foreign minister in November, I was critical of his country's cooperation. We also need progress in this case. And then we have a second problem with Syria: The research reactor in Damascus is under IAEA supervision, and we conduct routine inspections there. We have now found traces of uranium from a source unknown to us, which is something we also want to know more about. We have been given two explanations to date, but we don't consider them sufficient. Even if it's only a matter of a few grams, we still want to know where they came from and why they are there.

## **Interview With Syrian President Bashar al-Assad**

**JANUARY 31, 2011**

*[EXCERPTS]*

In a rare interview, Mr. Assad told The Wall Street Journal that the protests in Egypt, Tunisia and Yemen are ushering in a "new era" in the Middle East, and that Arab rulers would need to do more to accommodate their people's rising political and economic aspirations.

[deletia]

**WSJ: Can I ask a broader question? I know the big issue in this region from Iran to Syria to Israel is of a region free of WMDs; nuclear free zone. On the one hand, I know Syria and other countries have been very interested in pushing Israelis to sign the NPT under international auspices and that does not happen, but at the same time is in a little bit of a conflict with IAEA over allegations that Syria has this kind of covered pursued nuclear technology. Can you talk about those and how to get to a nuclear free zone and beat your conflict with the IAEA and if there is a way to have a resolution over their accusations?**

**President Assad:** We were a member of the Security Council for two years, 2002 and 2003, and there was a Syrian draft at that time regarding freeing the Middle East from WMDs and of course who opposed that? The Bush administration, because it included Israel, and actually it is still there, and I think they gave it a blue form, I mean it is not activated. This is our point of view: that it has been a region of conflict for centuries not decades. Regarding the IAEA, Israel attacked this site and we said this is a military site. Of course at the beginning they did not say it is a nuclear site. They waited for eight months and after we rebuilt the site, they said it was a nuclear site. They should be punishing the United States and Israel, especially the United States: why did you wait eight months to say it is nuclear, this is the first point. The second point is what happened with IAEA. They asked us to send experts; and because we were very confident we told them you can come, and they came and took samples and went to Vienna I think, and then they said that they discovered some particles of radiations, and you know if you had a nuclear plant, you would not allow anyone in the world to come if you want to keep it secret, this is first. Second, they said Israel attacked a nuclear site under construction and before it started working. If it is under construction, and before it started working, how could you have these particles? Where did they come from? Because you do not bring the materials to the site till it is working, it is ready, is that true? This is second. Third, how can they destroy a site without having causalities, without having any emergency plans, because it is supposed to be nuclear? What about radiations? Everybody could go there now, it is open and you can cross beside it. So, it is clear to everyone that it was not nuclear, but the question is: why they waited for eight months? Because when you wait eight months and we rebuilt the site, it is easy for you to say it was, you understand that?

**WSJ: Yes.**

**President Assad:** Because if they believed it was nuclear, they should have done that without the attacking. If they want to create a problem for Syria, they could tell the IAEA: look we have the satellite images, go to Syria and Syria will be cornered. What to do, we have a site, we are going to allow them and they are going to see the site as it is. So, they destroyed it and they waited for Syria to build it, and then they said it was a nuclear site. Now "was" how can you prove "was". Now, this is the convoluted issue, the complicated issue they created and how to prove it? So, as long as you cannot prove it was, then this means it "was"...

**WSJ: And definitely it was not?**

**President Assad:** Definitely it was not. From the course of events, it was not because if you attack it, how was it, where are the materials? We do not have it; the experts went there and you have normal live there, how could you have radiations after the attack and you do not have any emergency plans? They have the satellite and its pictures every day and they can tell. The only thing that we did is that we took the debris and removed it somewhere else and rebuilt the site. We did not clean and you cannot clean if you want to clean the radiations; they say it stays for one hundred years or forever I do not know. So, this is not realistic, they know this. The other issue of the IAEA is not related to, what we call a small experimental reactor, of course under the supervision of the IAEA and they come from time to time to Syria to check and they checked this time and discovered materials which they say are illegal and we are still discussing this with them and we do not know about it because we have a phosphate factory and we have yellow cakes as a result and some of our expert scientists made some experiments and the funny thing is that those experiments were published in journals; these experiments are not a secret and they said this is a breach. Okay, but this is public and it was published in a journal; it is not a secret. So, there was this kind of conflict and they want to find a link between this first site and the second site, but this one is different from that.

**WSJ: And do you think that this issue with the IAEA can be resolved?**

**President Assad:** Yes, I think now we are discussing with them. Most of the issues are technical and legal actually.

**WSJ: Will you allow whatever inspection that is needed, whatever the IAEA wants to do or are you still negotiating with them?**

**President Assad:** No, actually there is cooperation between Syria and the IAEA regarding the normal things like this reactor and this yellow cake, it does not see it every six months or a year, we have rules, but this time they asked Syria to sign the additional protocol that they can come any time. No, we are not going to sign.

**WSJ: Anytime, anywhere?**

**President Assad:** No, we are not going to sign. We can only follow the NPT that we are signatory to and we do not have any problem. Nobody will accept to sign it; this is something about sovereignty: to come any time to check anything under the title of checking nuclear activities, you can check anything. We have many secret things like any other country and nobody will allow them...

**WSJ: You feel that will be misused?**

**President Assad:** It will definitely be misused...

[deletia]

## **U.N. Warns Syria on Nuclear Inspections**

BY DAVID CRAWFORD

FEBRUARY 1, 2011

The United Nations' nuclear watchdog has toughened its stance toward Syria, warning that lack of cooperation by Damascus won't prevent the publication of a critical report on Syria's nuclear program.

The challenge marks a departure in the International Atomic Energy Agency's nearly three-year effort to gain access to several Syrian sites by shifting the burden of proof to Syria, an ally of Iran, to demonstrate it is fulfilling its international nuclear obligations and isn't pursuing nuclear weapons.

In a November letter to Syrian Foreign Minister Walid al-Moallem, IAEA Director General Yukiya Amano demanded that Syria cooperate with the IAEA's investigation of an alleged former nuclear facility at Dair Alzour, according to three Western diplomats familiar with the letter. Otherwise, he indicated, the agency would draw and report its own conclusions as to whether the country's atomic program is in international compliance with the Nuclear Non-Proliferation Treaty, based on the evidence it has already, without Syrian cooperation, according to these people.

The IAEA could release its findings as early as late February, when an IAEA report on Syria's nuclear activity is expected, roughly two weeks before the agency's board of governors meets on March 7.

An IAEA spokeswoman declined to comment on both the content of the letter and the coming report.

The Syrian government has made it clear that it won't allow the IAEA to revisit the Dair Alzour site, which was bombed by Israel in 2007. Damascus says the venue is off-limits to regular IAEA inspections because it is a military site. Syria doesn't plan to sign an agreement, called the Additional Protocol, that would give the agency unfettered access to inspect suspect Syrian sites.

In an interview Sunday, Syrian President Bashar al-Assad denied that Damascus was covertly developing nuclear technologies and said his government was in discussions with the IAEA to provide cooperation on sites already covered by agreements made with the Vienna-based body. "We are not going to sign" the Additional Protocol, Mr. Assad said. "We can only follow the [Nuclear Non-Proliferation Treaty] that we are signatory to, and we do not have any problem" with this.

Syria's mission to the IAEA didn't return calls and didn't respond to faxed and emailed requests to comment.

Should Syria fail to agree to let inspectors onto the sites, the IAEA's conclusions based on evidence gathered so far are likely to be damning. Two diplomats familiar with the IAEA probe say agency inspectors have concluded that Syria secretly built and later failed to declare a nuclear reactor at the Dair Alzour site. That verdict could lead to referral to the U.N. Security Council, where sanctions could be imposed.

The findings would rely substantially on evidence that construction features at the Dair Alzour building were consistent with features commonly found at nuclear reactors, according to the three diplomats, citing IAEA reports that also were reviewed by The Wall Street Journal. IAEA inspectors concluded that the shielding of the building, the electrical infrastructure and the manner in which Dair Alzour is connected to a large water supply are consistent with features found in nuclear reactors, according to IAEA reports in November 2008 and November 2010.

The IAEA's tougher line follows Syria's refusal for more than two years to allow U.N. nuclear inspectors access to four different sites where the agency has said it suspects nuclear-related activity, including Dair Alzour.

U.S. diplomats—concerned that Syria, like Iran, might delay cooperation with the IAEA indefinitely—have issued requests to several countries represented on the IAEA board of governors to join in a possible board resolution demanding that Syria cooperate with IAEA inspectors, say two of the diplomats, who are from countries on the board. Such a move is often a preliminary step in seeking a broader U.N. resolution.

Lobbying for a board of governors action against Syria began informally during the December board meeting, one of the three diplomats said.

The message U.S. diplomats wanted to convey was that Syria can't "duck and hide from the IAEA in respect to fulfilling obligations" simply by ignoring IAEA requests for cooperation, that person said.

In 2008, the IAEA asked Syria to grant its inspectors access to the four sites, spurred by allegations that Syria had secretly built a nuclear reactor at Dair Alzour before the facility was bombed by the Israeli air force in late 2007.

In 2008, IAEA officials were permitted to briefly visit the Dair Alzour site, but since then, Syria hasn't permitted more in-depth inspections of the site, according to the November 2010 IAEA report.

Syria has denied that the site ever held a nuclear facility.

In his letter, the IAEA's Mr. Amano told the Syrian foreign minister the IAEA would reserve the right to announce its conclusions about Dair Alzour without additional Syrian input. He requested a Syrian reply before the IAEA board of governors meeting in March and stipulated that any last-minute response wouldn't be considered. Syria's only response so far has been to ask for a deadline extension, according to the three diplomats familiar with the letter.

## "We Don't Have a Smoking Gun; We Have Concerns"

IAEA chief Yukiya Amano on nuclear programs in Iran, North Korea, and Syria.

By Lally Weymouth

Posted Sunday, Feb. 13, 2011, at 8:59 PM ET

Yukiya Amano, director general of the International Atomic Energy Agency, says it is unlikely the Stuxnet cyberattack on Iran derailed the Islamic republic's nuclear program. The Washington Post's Lally Weymouth talked to Amano last week in Vienna. Excerpts:

*[deletia]*

### **L.W.: What is the status of the al-Kibar situation [in Syria]?**

Y.A.: The main issue in Syria is the al-Kibar site that was destroyed by Israel in 2007. They have constructed new buildings, and we visited after the destruction in 2008. After that we continued asking Syria to allow us further access, but they did not. As I didn't receive a response, I wrote a letter to the foreign minister in November.

### **L.W.: [Syrian] President Bashar al-Assad recently denied the facility ever existed.**

Y.A.: Yes, he said the facility was not a nuclear reactor. ... The problem is that this facility was destroyed, cleaned up, and a new building was built on that ground. We hope to visit again; we hope to check it again. But the facility which was touted to be a nuclear reactor is gone.

### **L.W.: What is the Syrian explanation for the particles you found?**

Y.A.: We have particles of radium that are man-made, not natural. ... One allegation is that the depleted uranium used by Israel in the bombs may be the origin, but we don't think that is likely. It's not totally impossible, but it is highly unlikely.

### **L.W.: If they are so honest, why won't they let your inspectors in?**

Y.A.: They say it is not a nuclear reactor.

### **L.W.: Was the Syrian [nuclear] program eliminated by the Israeli bombing?**

Y.A.: The nuclear reactor was eliminated.

*[deletia]*

## Syria stonewalls on site IAEA wants to see-sources

Mon Feb 14, 2011 2:48pm GMT

By Fredrik Dahl

VIENNA, Feb 14 (Reuters) - Syria has not granted a U.N. nuclear watchdog request for prompt access to a desert site, effectively rebuffing an appeal for urgent cooperation with a probe into suspected covert atomic activity, diplomatic sources said.

For more than two years Syria has refused to allow U.N. inspectors to revisit the Dair Alzour site, which U.S. intelligence reports said was a nascent North Korean-designed nuclear reactor intended to produce bomb fuel.

"Apparently the Syrians have not offered anything new in terms of access to Dair Alzour," one Western source said, referring to Syria's response to a letter sent by Yukiya Amano, the head of the International Atomic Energy Agency, last year.

It "didn't provide the IAEA with the answers the DG (Director-General Amano) had been seeking," he added. Another diplomatic source painted a similar picture, without giving detail.

It was not clear whether Damascus had made any other concessions in the dispute, which is expected to be high on the agenda of a March 7-11 meeting of the IAEA's 35-nation governing board, in its reply to Amano.

The IAEA had no comment on the issue and officials Syria's mission to the Vienna-based nuclear agency were not immediately reachable.

Syria, an ally of Iran, denies ever harbouring an atom bomb programme and says the IAEA should focus on Israel instead because of its undeclared atomic arsenal and the fact it has never joined the nuclear Non-Proliferation Treaty.

Amano's letter to Syrian Foreign Minister Walid al-Moualem on Nov. 18 was the first time he appealed to Syrian authorities directly, rather than just through his regular reports.

He asked the Syrian government to provide prompt IAEA access to relevant information and locations linked to Dair Alzour.

"HIGHLY UNLIKELY"

The United States has suggested that the IAEA may need to consider invoking its "special inspection" mechanism to give it authority to look anywhere necessary in Syria at short notice.

Amano told Reuters earlier this month that he did not rule out this option, but that no decision had been taken.

Some Vienna-based diplomats have cautioned against using the special inspections tool, as it would escalate the issue at a time of rising tension with Iran, which the West accuses of seeking to develop nuclear arms. Tehran denies the charge.

The agency last resorted to these inspection powers in 1993 in North Korea, which still withheld access and later developed a nuclear bomb capacity in secret.

Last year, the IAEA gave some weight to suspicions of illicit atomic activity at Dair Alzour by pointing to uranium traces found in a 2008 visit by inspectors and saying these traces did not come from Syria's declared nuclear inventory.

The agency wants to re-examine the site and take samples from rubble removed immediately after the air strike to an undetermined location.

Damascus has suggested the uranium traces came with Israeli munitions used in the attack, but the IAEA says this is unlikely, a position underlined by Amano in a Washington Post interview published on Monday.

"One allegation is that the depleted uranium used by Israel in the bombs may be the origin, but we don't think that is likely. It's not totally impossible, but it is highly unlikely," Amano was quoted as saying.

## Verdächtige Gebäude in bester Wohnlage

Von P.-A. Krüger  
23.02.2011, 20:06

Westliche Geheimdienste vermuten, dass Syrien in einem Vorort von Damaskus eine geheime Atomfabrik gebaut haben könnte. Überprüfen lässt sich das nach einem israelischen Bombardement schwer.

Die Wahrheit über el-Kibar liegt unter einer mächtigen Betonplatte begraben. Und damit schienen alle Beteiligten bisher auch gut leben zu können: Syrien, das im Verdacht steht, an diesem Ort am Euphrat einen geheimen Atomreaktor zur Produktion von Plutonium errichtet zu haben; Israel, das den mysteriösen, quaderförmigen Bau im Osten Syriens in der Nacht vom 5. auf den 6. September 2007 bei einem Luftangriff zerbombte; und auch die USA, vorab über die Attacke ins Bild gesetzt, schwiegen monatelang.

In der Zwischenzeit hat Syrien die Reste der Ruine eingerissen, ohne dass jemand hätte prüfen können, was dort vorgegangen war - und ob Syrien den Atomwaffensperrvertrag gebrochen hat. Das erste öffentlich zugängliche Satellitenbild zeigt das Gelände sieben Wochen nach dem Angriff: Es ist planiert, und wenig später begann Syrien damit, ein 60 mal 60 Meter großes Fundament aus Beton zu gießen. Seit Januar 2008 stand darauf eine Halle mit blauem Dach, 13 Meter breiter und länger als der angebliche Reaktor.

Syriens Präsident Baschar al-Assad hat vehement bestritten, das es sich bei dem zerbombten Komplex um eine Atomanlage gehandelt hat: "Definitiv nicht!", sagte er jüngst dem Wall Street Journal. Damaskus beharrt darauf, el-Kibar sei eine normale militärische Einrichtung gewesen. Und Assad kritisierte die USA dafür, acht Monate gewartet zu haben, bis sie Anschuldigungen gegen sein Land erhoben.

Erst im April 2008 hatte die CIA mit einer Video-Präsentation zunächst den US-Kongress und später die Medien darüber informiert, dass es sich bei dem von Israel zerbombten, auch als Dair as-Saur bezeichneten Komplex um einen Reaktor gehandelt habe, mit dem womöglich spaltbares Material für Atomwaffen erbrütet werden sollte. Um ihre Behauptungen zu untermauern, präsentierten die Geheimdienstler grisselige Satellitenbilder und bunte Animationen, die zeigten, wo in dem Quader sich vor der Bombardierung welche Reaktorteile befunden haben sollen. Auch zeigten sie Bilder, die aus dem Inneren des Gebäudes stammen sollen.

## "Keine Priorität"

Doch selbst nachdem Washington sein Schweigen gebrochen hatte, sah sich offenbar niemand zur Eile genötigt, das Geheimnis in der Wüste aufzuklären. Israel schweigt beharrlich zu dem Angriff, auch weil er gegen internationales Recht verstieß. Die USA versuchten vor allem, die Hinweise als Hebel zu nutzen, um die Syrer von ihren Verbündeten in Teheran loszueisen und Iran - seinerseits unter Verdacht, an Atomwaffen zu arbeiten - in der Region zu isolieren. Doch auch nachdem in Barack Obama Anfang 2009 ein Präsident ins Weiße Haus einzog, der sich den Kampf gegen die Verbreitung von Atomwaffen auf die Fahnen geschrieben hat, erklärte der neu entsandte US-Botschafter bei der Internationalen Atomenergiebehörde (IAEA) in Wien noch, die Aufklärung der syrischen Aktivitäten habe "keine Priorität". Die Europäer hofierten Assad ebenfalls - in der Hoffnung, ihn zu einem Seitenwechsel bewegen zu können.

"Sie haben es zerstört und gewartet, bis Syrien es wieder aufgebaut hatte", empört sich Assad über Israels Attacke auf das mysteriöse Gebäude und das Schweigen der Amerikaner. "Dann sagten sie, es sei eine Nuklearanlage gewesen. Nun, ‚gewesen‘, wie können sie beweisen, was gewesen ist?", fragt er. Allerdings: So abwegig, wie es der Präsident darzustellen versucht, ist das Unterfangen nicht. Die IAEA hat kurz nach den US-Enthüllungen mit der Spurensuche begonnen, und derzeit scheitert sie vor allem daran, dass Syrien jeden Zugang nach el-Kibar verweigert - und auch zu drei weiteren Orten, die nach Auffassung der IAEA in "funktioneller Verbindung" mit dem zerbombten Komplex stehen sollen. Intern sind diese Objekte bei der Wiener Behörde unter den Namen der Orte Marj as-Sultan, Masyaf und Iskandariyah geläufig.

Zunächst könnten die Trümmer des zerstörten Komplexes nahe Dair as-Saur wertvolle Spuren bergen. Ein Team um den einstigen Chefinspektor der IAEA, Olli Heinonen, fand im Juni 2008 beim einzigen Besuch der Behörde auf dem Gelände nach der Planieraktion der Syrer immerhin kleine Mengen Uran, das von Menschen hergestellt war. Syrien erklärte, es stamme von den israelischen Bomben - was die Inspektoren als "unwahrscheinlich" zurückweisen. Doch weiß die IAEA offenbar nicht, wo die Trümmer des angeblichen Reaktors geblieben sind. "Wir haben den Schutt genommen und woandershin gebracht", sagt Präsident Assad.

Wie eine Person mit Kenntnis der Satellitenbilder aus der Zeit direkt nach dem israelischen Angriff der Süddeutschen Zeitung erklärte, liegt jedoch zumindest ein guter Teil der Reste des Reaktorbaus unter dem Fundament der neuen blauen Halle. Die Syrer haben dieser Beschreibung zufolge Ausrüstungsgegenstände aus der Ruine entfernt, Computer etwa oder möglicherweise auch eine Maschine, mit der einmal die Brennelemente in den Reaktorkern hätten eingesetzt werden sollen. Manches davon soll nach Iskandariyah gebracht worden sein - ohne dass bekannt ist, wo genau ein mögliches Lager dort liegt. Dann aber sprengte Syrien im Oktober 2007 das teils unterirdisch gelegene Reaktorgefäß und füllte den Schutt des Gebäudes in den entstandenen Krater. Bulldozer, die in späteren Satellitenaufnahmen klar zu erkennen sind, schoben Erdreich aus dem umliegenden Gebiet über die Stelle, an der einst der Quader stand. Und wenig später versiegelte der Beton die möglichen Beweise.

Damaskus ist bislang der Bitte von IAEA-Chef Yukia Amano nicht nachgekommen, die Kontrolleure erneut auf das Gelände zu lassen. Amano hatte deswegen Mitte November 2010 eigens einen Brief an den syrischen Außenminister Walid al-Muallim geschrieben, ein einmaliger Vorgang. Doch haben die Syrer immer noch "nichts Konkretes" zugesagt, wie es aus Diplomatenkreisen in Wien heißt. Nur allgemein ihre Bereitschaft zur

Zusammenarbeit hätten sie bekundet. Ganz und gar unwahrscheinlich erscheint es daher, dass Syrien den Kontrolleuren etwa erlauben würde, mit einer Bohrung unter dem neuen Gebäude nach Hinweisen zu suchen, wie es Geheimdienstler für nötig halten.

## Glück für die Atomdetektive?

Mehr Glück könnten die Atomdetektive dagegen in Marj as-Sultan haben, 15 Kilometer östlich von Damaskus. Dort befindet sich ein Komplex mit zwei Hauptgebäuden, der an einen Militärstützpunkt grenzt. Genau das führt Syrien als Begründung an, warum es eine Inspektion nicht zulassen könne. In der Umgebung wohnen offenbar betuchte Syrer, Villen lassen sich auf den Satellitenfotos erkennen, Swimmingpools in fast jedem Garten. Und anders als in al-Kibar stehen die verdächtigen Gebäude hier noch, die zumindest in früheren Jahren von einer Mauer umgeben waren.

Der SZ liegen Fotos vor, die aus dem Inneren der beiden Bauten stammen sollen. Es ist nicht bekannt, wann genau sie aufgenommen wurden. Zusammen mit anderen Informationen aber lassen sie erstmals die begründete Vermutung zu, dass Syrien dabei war, dort eine Anlage zur sogenannten Urankonversion zu errichten - eine Vorstufe zur Produktion von Brennstäben, wie sie für den mutmaßlichen Reaktor geeignet gewesen wären. In einem chemischen Prozess wird dabei Uran-Konzentrat - auch Yellow Cake genannt - in metallisches Uran umgewandelt, das dann zu Brennelementen weiterverarbeitet werden kann. Dies könnte ein wichtiges Teil in dem verwirrenden Puzzle sein, das die IAEA-Inspektoren seit bald drei Jahren zusammensetzen versuchen.

Die Fotos sind westlichen Geheimdiensten bekannt und mindestens in Teilen auch der IAEA. Die SZ hat sich bereiterklärt, die Aufnahmen nicht zu veröffentlichen, weil sie eventuell Rückschlüsse darauf zulassen, wann sie gemacht wurden - und somit auf mögliche Quellen. Die Anlagen waren zu dem Zeitpunkt zwar zum Teil installiert, manche Ausrüstungsgegenstände wurden aber gerade erst montiert. Die Atombehörde, die in den kommenden Tagen ihren neuesten Bericht zu Syrien vorlegen wird, lehnte ein Stellungnahme ab. Die meisten anderen Quellen - Geheimdienstler, Diplomaten oder Experten - bestanden auf Anonymität.

Die Bilder aus dem kleineren Gebäude zeigen chemische Apparaturen dem Anschein nach aus Edelstahl, wie man sie nach Aussage eines westlichen Geheimdienstmitarbeiters "in einer Urankonversionsanlage erwarten würde". Ein unabhängiger Experte bewertete die Informationen über die Ausrüstung ähnlich. Die Fotos zeigen etwa eine säulenförmige Apparatur, gut eineinhalb Stockwerke hoch, mit der vermutlich Verunreinigungen aus dem Uran entfernt werden sollten. Ähnliche Technik gibt es in der iranischen Konversionsanlage Isfahan. Dagegen wird sie in Nordkorea nicht eingesetzt, wie ein Experte sagte, der den nordkoreanischen Nuklearkomplex in Yongbyon gut kennt.

Fotos aus dem anderen, größeren Gebäude zeigen einen Gaswäscher und spezielle Anlagen zur Reinigung von Abluft, wie sie unter anderem benötigt werden, um Uranpartikel und gefährliche Chemikalien auszufiltern, die beim Produktionsprozess entstehen, vor allem Fluorverbindungen. Zudem gibt es nach Angaben eines westlichen Geheimdienstlers "Verbindungen" zwischen el-Kibar und Marj as-Sultan. Offenbar wurden dieselben Personen an beiden Orten gesichtet oder Transporte zwischen den Anlagen beobachtet.

Eine weitere Person, die mit den Fotos vertraut ist, deutete an, dass die Anlage möglicherweise auch zur Produktion von Brennelementen dienen sollte. Fotos von speziellen Öfen, wie sie für diesen Prozess nötig wären, fehlen jedoch bisher. Ein europäischer Geheimdienstler gab sich denn auch vorsichtiger: Er sagte, die auf den Aufnahmen erkennbaren Geräte seien zwar für die Urankonversion geeignet, ließen aber nicht zwingend auf eine solche Verwendung schließen.

Ob sich die Apparaturen noch in Marj as-Sultan befinden, ist fraglich. Denn nachdem die IAEA im Mai 2008 Zugang verlangt hatte, zeigen Satellitenbilder von Ende Juli plötzlich auffällige Aktivitäten um die beiden Gebäude. Es sind weiße Objekte zu erkennen, wahrscheinlich Lastwagen. Nach Angaben der IAEA wurden nach

ihrer Anfrage bezüglich der drei Orte dort "große Container" weggeschafft und zudem Veränderungen an dem Gelände vorgenommen - in Marj as-Sultan wurde offenbar der Bodenbelag ausgetauscht oder erneuert. Wie in el-Kibar und auch in Masyaf rief das den Verdacht hervor, die Syrer hätten versucht, Spuren zu verschleiern. Es kann sich auch um einen Zufall handeln. Zumindest aber verlangten die Inspektoren eine "Erklärung für diese Aktivitäten" - bis heute vergebens.

Trotz dieser Indizien bleiben manche Experten weiter skeptisch. Der frühere IAEA-Inspektor Robert Kelley etwa bezweifelt, dass Syrien eine Urankonversionsanlage in unmittelbarer Nähe eines gehobenen Wohnviertels errichten würde. "Warum sollte man so was mitten in Beverly Hills bauen, wenn man Tausende Quadratkilometer Wüste zur Verfügung hätte?", fragt er. Das Risiko, in einer besiedelten Gegend aufzufliegen, ist zweifellos größer. Vielleicht aber wollte Syrien durch die Standortwahl vor allem vermeiden, dass die beiden Gebäude in Marj as-Sultan von Spionagesatelliten aufgespürt werden - nahe einem Militärdepot würde man zum Beispiel Transporte erwarten.

Wenn überhaupt, wird sich all das wohl nur noch klären lassen, wenn Syrien die IAEA-Inspektoren das Gelände untersuchen lässt. Aber auch Damaskus scheint kein Interesse daran zu haben, das Geheimnis von el-Kibar endlich zu lüften.

Item 5(d) of the provisional agenda  
(GOV/2011/2)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. This report of the Director General to the Board of Governors is on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic<sup>1</sup> (Syria).

## A. The Dair Alzour Site

2. On 2 June 2008, the Director General informed the Board of Governors that the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria, destroyed by Israel in September 2007, had been a nuclear reactor. The information further alleged that the reactor was under construction but not operational at the time of its destruction, and that it had been built with the assistance of the Democratic People's Republic of Korea (DPRK). By the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building.<sup>2</sup>

3. Syria has maintained, since May 2008, that the destroyed building was a non-nuclear military installation and that Syria had had no nuclear related cooperation with the DPRK.<sup>3</sup> While it cannot be excluded that the destroyed building was intended for non-nuclear use, the Agency has assessed that the features of the building and its connectivity to adequate pumping capacity of cooling water are similar to what may be found at nuclear reactor sites.<sup>4</sup> While Syria has indicated that its efforts to procure pumping equipment and large quantities of graphite and barite were civilian and non-nuclear in nature, the Agency has assessed that these items could also support the construction of a nuclear reactor.<sup>5</sup> Additionally, the involvement of the Syrian Atomic Energy Commission (AECS) in some of the procurement and the inconsistency between end use information provided by the AECS and other information available to the Agency raise further questions regarding Syria's declarations of the civilian and non-nuclear nature of this procurement. Syria has also maintained that the particles of anthropogenic natural uranium found in samples taken during the Agency's June 2008 visit to the Dair Alzour site originated from the missiles used to destroy the building.<sup>6</sup>

4. As indicated in previous reports, the Agency has assessed that the probability that the particles originated from the missiles used to destroy the building is low. The Agency also assessed that there is

a low probability that the particles were introduced by aerial dispersion. The presence of such uranium particles points to the possibility of nuclear related activities at the site and adds to questions concerning the nature of the destroyed building. Syria has yet to provide satisfactory explanations for the origin and presence of these particles.<sup>7</sup> In this context, information yet to be provided by Israel might be helpful in clarifying the matter.<sup>8</sup>

5. Syria's statements concerning the nature of the destroyed building, the Dair Alzour site, the three other locations allegedly functionally related to it, the procurement activities referred to above and the alleged foreign assistance are limited in detail and no supporting documentation has been provided by Syria. The information and access provided by Syria to date have not allowed the Agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building. Since the Agency's visit to the Dair Alzour site in June 2008, the Agency has made repeated requests to Syria for:

- information concerning the Dair Alzour site, the infrastructure observed at the site and certain procurement efforts which Syria has stated were related to civilian non-nuclear activities;
- access to technical documentation and any other information related to the construction of the destroyed building;
- access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are now situated; and
- further access to the Dair Alzour site and access to three other locations allegedly functionally related to the Dair Alzour site.

6. Syria has maintained that, due to the military and non-nuclear nature of the Dair Alzour site and three other locations allegedly functionally related to Dair Alzour, it had no obligation to provide more information under its Safeguards Agreement with the Agency.<sup>9</sup> The Agency has explained to Syria that there is no limitation in comprehensive safeguards agreements on Agency access to information, activities or locations simply because they may be military related. The Agency has repeatedly offered to establish the necessary modalities for managed access to sensitive information and locations, including the Dair Alzour site and the three other locations.

7. As mentioned by the Director General in his 2 December 2010 statement to the Board of Governors, in a letter dated 18 November 2010, the Director General wrote to H.E. Walid Al-Moualem, Syria's Minister for Foreign Affairs, to request, inter alia, that Syria provide the Agency with prompt access to information and locations previously indicated by the Agency.

8. In a letter dated 6 February 2011 addressed to the Director General, Syria's Minister for Foreign Affairs stated that the Director General of the AECS would continue to work with the Agency to resolve all outstanding technical issues in accordance with Syria's commitments under the Agency's Statute, the Treaty on the Non-Proliferation of Nuclear Weapons and Syria's Safeguards Agreement.

9. Syria has not engaged substantively with the Agency on the nature of the Dair Alzour site since the Agency's June 2008 visit and, since August 2009, has not responded to the other issues noted in paragraph 5 above. The Agency continues to request Syria to provide access to the information, material, equipment and locations previously indicated by the Agency.

## **B. Activities at Other Locations in Syria**

10. As previously reported, particles of anthropogenic uranium of a type not included in Syria's reported inventory were found at the Miniature Neutron Source Reactor (MNSR) in 2008 and in 2009. Syria's initial explanations in June 2009 that the particles had originated either from standard reference materials used in neutron activation analysis or from a shielded transport container were not supported by the results of sampling carried out by the Agency.<sup>10</sup> During the November 2009 inspection, and contrary to its earlier statements, Syria explained that the anthropogenic particles had originated from previously unreported activities performed at the MNSR related to the preparation of tens of grams of uranyl nitrate using yellowcake produced at Homs.<sup>11</sup> At the March 2010 physical inventory verification (PIV), another small quantity of undeclared uranyl nitrate was found at the MNSR. Syria explained that the unreported activities had taken place in a different location in the MNSR than previously declared to the Agency.<sup>12</sup> As reported earlier, Syria submitted inventory change reports in June 2010 for the newly declared material shown to the Agency during the PIV. However, inconsistencies between Syria's declarations and the Agency's findings remain unresolved.

11. As previously reported, during a meeting on 3 September 2010, agreement was reached with Syria on a plan of action for resolving these inconsistencies which included, inter alia, actions related to the amounts and use of nuclear material at the MNSR, scientific publications concerning uranium conversion experiments different from those declared by Syria to have occurred at the MNSR, indications of nuclear material under the control of the Waste Management Department of the AECS, and the Agency's requests for access to Homs. Syria's initial response to the plan of action did not provide the necessary clarifications.<sup>13</sup>

12. In a letter dated 9 February 2011, Syria informed the Agency that the Syrian "Authority approved [the] Homs visit, but detailed arrangement[s] of activities and date, have to be agreed upon between both sides; taking into consideration that [the] Homs location is not under the Safeguards obligations of Syria". In the letter, Syria requested that the Agency propose a meeting where arrangements could be made for that visit.

13. In a letter dated 18 February 2011, the Agency welcomed Syria's approval of an Agency visit to Homs and indicated that it looked forward to unrestricted access to the requested locations at Homs and the opportunity to perform the necessary activities at those locations. In the letter, the Agency also proposed a meeting in Damascus on 27 February 2011 to make arrangements for that visit and to perform activities at the Homs locations on 27 and 28 February 2011. Syria responded to the Agency's proposal by indicating that it was prepared to discuss the arrangements for the visit to Homs during a meeting in Vienna on 28 February 2011.

14. Based on the information currently provided by Syria, the Agency cannot draw conclusions regarding the origin of the anthropogenic natural uranium particles found at the MNSR. Additionally, the location and scope of conversion experiments and the quantities of purified uranium and commercial depleted uranium involved in those experiments remain unclear to the Agency.

## **C. Summary**

15. Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.

16. With the passage of time, some of the information concerning the Dair Alzour site is deteriorating or has been lost entirely. It is critical, therefore, that Syria actively cooperate with the Agency on these unresolved safeguards implementation issues without further delay.

17. Concerning the MNSR, Syria's responses to date under the agreed plan of action do not resolve the inconsistencies identified by the Agency. For the Agency to draw conclusions about the source of the uranium particles at the MNSR, it is essential that Syria provide further clarification regarding outstanding inconsistencies.

18. The Agency considers that the letter from Syria's Minister for Foreign Affairs stating that the AECS would continue to work with the Agency to resolve all outstanding technical issues, together with the recent communication by Syria that it has approved the Agency's proposed visit to Homs, could represent a step forward.

19. The Director General urges Syria to bring into force an Additional Protocol to its Safeguards Agreement, which would further facilitate the Agency's work in verifying the correctness and completeness of Syria's declarations.

20. The Director General will continue to report as appropriate.

## **Diplomats say Syria has evaded UN nuke agency's request for new inspections**

The Canadian Press - George Jahn

Feb 25, 2011

VIENNA — Diplomats say Syria has evaded a request from the head of the U.N. atomic agency for access to a suspected nuclear site.

Israeli warplanes destroyed what the U.S. says was a secretly built nuclear reactor in 2007. Syria allowed International Atomic Energy Agency inspectors to visit the site once, but has refused subsequent requests.

IAEA chief Yukiya Amano had directly asked Syria's foreign minister in November to allow a new visit — in an unprecedented direct request. But a senior diplomat said Friday the foreign minister's response avoided mention of that site, promising only co-operation in vague terms.

Other diplomats said that amounts to a rejection of the request

The agency is attempting to probe both Syria and Iran. It is to release reports on both nations later Friday.

The diplomats spoke anonymously because their information was confidential.

## **Obama ignoring Syrian nukes, lawmaker says**

Published: Feb. 25, 2011 at 12:06 PM

*[EXCERPT]*

WASHINGTON, Feb. 25 (UPI) -- It is "dangerous" for Washington to ignore the nuclear threat from Damascus, a top U.S. foreign affairs official said amid allegations of a new site in Syria.

U.S. Rep. Ileana Ros-Lehtinen, R-Fla., chairwoman of the House Foreign Affairs Committee, said in a statement she was "gravely concerned" about evidence emerging that indicates Syria may have additional nuclear sites in the country.

U.S. Ambassador to Syria Robert Ford presented his credentials to Syrian President Bashar Assad in January. U.S. Republican lawmakers protested the Ford nomination in part because of Syria's alleged role regarding Hezbollah and Scud missiles in Lebanon.

Commercial satellite imagery published Wednesday by Washington's Institute for Science and International Security shows what appears to be a suspected nuclear site near Damascus, The Wall Street Journal reports.

## **UPDATE 2-UN nuclear inspectors to visit Syria plant soon**

By Fredrik Dahl

Wed Mar 2, 2011 4:32pm GMT

VIENNA, March 2 (Reuters) - Syria has agreed to allow U.N. nuclear inspectors into a plant with possible uranium material, diplomatic sources said, but Washington said the gesture would not be enough to address allegations of covert atomic activity.

The sources, familiar with a long-stalled U.N. nuclear watchdog inquiry into U.S. intelligence suggesting Syria tried to build a reactor suited to producing plutonium for atom bombs, said Syrian and International Atomic Energy Agency (IAEA) officials agreed at a meeting this week to a visit on April 1.

One IAEA source said two sides had also worked out a programme for the trip to the Homs acid purification plant, where uranium concentrates, or yellowcake, were a by-product.

But letting inspectors only go to Homs would not satisfy Western concerns about Syria, which has stonewalled repeated IAEA requests for further access to a desert site seen as crucial to resolving the matter.

For over two years, Syria has refused IAEA follow-up access to the remains of a complex that was being built at Dair Alzour in the Syrian desert when Israel bombed it to rubble in 2007.

U.S. intelligence reports said it was a nascent North Korean-designed nuclear reactor intended to produce bomb fuel. Inspectors found traces of uranium there in June 2008 that were not in Syria's declared nuclear inventory, heightening concerns.

Syria, an ally of Iran, whose nuclear programme is also under IAEA investigation, denies ever concealing work on nuclear weapons and says the Vienna-based agency should focus on Israel instead because of its undeclared nuclear arsenal.

Glyn Davies, U.S. ambassador to the IAEA, said Dair Alzour was the main issue regarding Syria and that allowing the agency to travel to Homs would amount to only "relatively minor" cooperation by Damascus.

### **SPECIAL INSPECTION?**

"That (IAEA access to Homs) is good as far as it goes, but that is not the central question. The central concern is Dair Alzour," Davies told reporters.

Late last year, after repeated entreaties to Syria's nuclear agency went nowhere, IAEA Director-General Yukiya Amano appealed directly to its foreign minister for cooperation with his agency and access to Dair Alzour and other locations.

As part of its Syria probe, the IAEA has sought to examine the yellowcake at Homs, which if further processed could be used as nuclear fuel. Syria says the plant is for making fertilisers.

Inspectors were likely to check for any links with a Damascus research reactor where they earlier found uranium traces that had not been declared to the IAEA as required.

Enriched uranium can be used to run nuclear power plants, but also provide material for bombs, if refined much further.

During a 2004 visit to Homs inspectors observed hundreds of kilograms of yellowcake, a confidential IAEA report said.

Last week a German newspaper said Western intelligence agencies suspected that Syria may have been building a secret uranium processing facility near Damascus possibly linked to the former Dair Alzour complex.

Diplomats said this was believed to be one of several sites the agency has sought access to since 2008 and which Syria has said are military in nature and therefore beyond the scope of IAEA authority. The IAEA has not commented on the German report.

The United States has suggested the IAEA may need to consider invoking its "special inspection" mechanism to give it authority to look anywhere necessary in Syria at short notice, if Syria does not let inspectors back to Dair Alzour.

The agency last resorted to such inspection powers in 1993 in North Korea, which still withheld access and later developed a nuclear bomb capacity in secret.

The IAEA's 35-nation Board of Governors will discuss the Syria and Iran probes at a March 7-11 meeting in Vienna. "What we are asking is that Syria uphold its obligations and cooperate with the necessary access to sites and equipment," Davies said.

## Syria suspected of nuke activity

By Ely Lake

8:40 p.m., Wednesday, March 2, 2011

The Obama administration and a U.N. watchdog agency want Syria to show inspectors a suspected uranium-conversion facility and two other nuclear sites possibly linked to the remnants of a covert arms program.

Since 2007, when Israel bombed the nuclear site at al Kibar, U.S. intelligence agencies feared the conversion plant near the town of Marj as-Sultan outside of Damascus was built to supply fuel to the bombed reactor, according to two former U.S. intelligence officers. Israeli jets destroyed the reactor site in September 2007, but not the suspected site at Marj as-Sultan.

Recent disclosures about the suspected uranium-conversion plant suggest Syria's nuclear program is more expansive than previously known.

"Both the Bush and Obama administrations had and still have open questions about the facilities the IAEA is looking to inspect in Syria and what has become of the al Kibar site, including a facility that has been reported as Marj as-Sultan," said Chuck Lutes, former director of nonproliferation at the White House National Security Council staff, who served in that capacity until September.

Before that, Mr. Lutes, a retired Air Force colonel, was director of counterproliferation under President George W. Bush.

The U.N. International Atomic Energy Agency (IAEA) will conduct an inspection on April 1 at a chemical-processing plant at Homs, Syria, the Associated Press reported Wednesday. The site, however, is not one of the original three sites the IAEA has asked to inspect in connection with the al Kibar site, also known in IAEA reports as the Dair Alzour site.

"Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it," stated the latest IAEA report to the Board of Governors on Syria's suspected nuclear program.

Syria has publicly denied that al Kibar was a nuclear reactor. When IAEA inspectors found traces of man-made unenriched uranium in soil samples near the reactor in 2008, Syrian officials said the traces came from Israeli munitions, according to the IAEA report released Feb. 25.

Olli Heinonen, who was the chief inspector for the IAEA during the agency's 2008 inspection of al Kibar, said in an interview the Syrian explanation for the traces of uranium was faulty. "We found the particles there," he said. "And there was not a good explanation for that. The Syrians say it was from the Israeli bombs."

The latest IAEA report on the Syrian program concludes, "The Agency has assessed that the probability that the particles originated from the missiles used to destroy the building is low. The Agency also assessed that there is a low probability that the particles were introduced by aerial dispersion."

Officials confirmed suspicions about the three sites after the German newspaper Sueddeutsche Zeitung published a detailed story about the Marj as-Sultan facility last week. The newspaper stated that it had photos from inside the plant but withheld publishing them to protect the source.

The newspaper said the photos allowed them to make a “reasonable assumption that Syria was busy building a facility for the conversion of uranium, a preliminary stage in the production of fuel rods that could have been used in the presumed reactor.”

Mr. Heinonen said the new uranium-conversion facility was likely built for research because it appears too small to produce fuel at larger-scale industrial levels. “Most likely this facility disclosed in the German press was too small,” he said. “It was only research and development. The fuel for al Kibar had to come from somewhere else in Syria or from abroad.”

After the German report was published, the private Institute for Science and International Security (ISIS) in Washington, which tracks illicit nuclear proliferation, published what it said were commercial satellite photographs of the site on its website ([isis-online.org](http://isis-online.org).)

*[<http://isis-online.org/isis-reports/detail/satellite-image-shows-suspected-uranium-conversion-plant-in-syria1/>]*

“The facility’s operational status is unknown,” the ISIS report said. “However, there is suspicion that Syria may have emptied the buildings prior to mid-2008 and taken steps to disguise previous activities at the site.”

A senior U.S. official interviewed for this article said he did not know whether the facility at Marj as-Sultan was operational or not.

“Looking at the stuff that has been in the press and what [ISIS] has shown, there is significant questions about the Marj as-Sultan facility,” said the senior U.S. official. “It remains a question about the scope and breadth of their nuclear program and remains unclear also if there is ongoing activity there. The satellite photos from ISIS indicate that perhaps there is not activity, but it’s hard to know. That is why we need to know what they were doing and what they are doing.”

A spokesman for the Syrian Embassy in Washington declined to comment for the article.

The standoff between Syria and the IAEA over the suspected nuclear sites could also affect Middle East diplomacy.

“There has been a push internationally to possibly invoke special inspections by the IAEA,” said Mr. Lutes, now with the Project on National Security Reform.

Special inspections are more intrusive than the kind of collaborative approach to inspections most countries allow, by which the schedule and content of the inspections are planned out beforehand between the country and the IAEA.

Special inspections, according to Mr. Lutes, have only been invoked twice before, once in Romania after the fall of Nicolae Ceausescu in 1989, and then in 1993 to determine the extent of North Korea’s nuclear program.

In 1993, the call for special inspections resulted in North Korea expelling IAEA inspectors, which touched off the first of several nuclear confrontations with the reclusive Pyongyang regime.

Mr. Lutes said the potential value in calling for a “special inspection” of the Syrian facilities would be that it could force the IAEA to refer the Syria file to the U.N. Security Council if the Syria refuses to allow the inspections as it has since 2008.

If the U.N. Security Council took up the Syria file, Damascus would be in the same kind of diplomatic jeopardy as Iran and North Korea today.

## Lawmakers call on IAEA to examine Syrian nuke facilities

By Eli Lake

The Washington Times

9:40 a.m., Friday, March 4, 2011

[EXCERPTS]

A bipartisan group of senators and House members this week urged the head of the U.N.'s nuclear watchdog agency [IAEA Director General Yukiya Amano] to demand intrusive inspections of Syria's suspected nuclear program.

The letter — signed by 25 lawmakers — follows new disclosures that Syria blocked inspections for three years by the International Atomic Energy Agency to three sites believed to be linked to the al Kibar nuclear reactor that was destroyed by Israeli jets in 2007. The al Kibar reactor is called the Dair Alzour site by the IAEA.

[deletia]

“In light of the Syrian Foreign Minister’s refusal to address the agency’s concerns and the latest in Syria’s apparent efforts to hinder the IAEA’s efforts to carry out its verification activities,” the 19 senators and six House members stated in the letter, dated March 3. “We are concerned that Syria’s recalcitrance, if it continues unabated, will cause lasting harm to the credibility of the IAEA safeguards regime.”

Fifteen Republicans, nine Democrats and one independent Democrat signed the letter, including Sen. Jon Kyl, Arizona Republican and the senate minority whip, as well as Sen. Kirsten Gillibrand, New York Democrat who replaced Hillary Clinton in the Senate.

The letter to the IAEA chief followed reports last month that Syria continued to deny access to a suspected uranium conversion plant located near Damascus outside the town of Marj as-Sultan.

[deletia]

The 25 members of Congress stated that “without direct and unfettered inspections, the IAEA cannot dismiss the evidence you have cited in your report that the Dair Azour site is a nuclear facility, including: the features of the building and its connectivity to adequate pumping capacity of cooling water, the involvement of the Syrian Atomic Energy Commission (AECS), the inconsistency between end use information provided by the AECS and other information available to IAEA, and the type of uranium particles found in samples taken during the IAEA’s June 2008 visit to the site.”

[deletia]

The 20 lawmakers urged Mr. Amano to consider the portion of the safeguard agreement signed by the Syrian government that calls for the “special inspections.” That clause said a special inspection should be invoked “if the Agency considers that information made available by the state, including explanations from the State and information obtained from routine inspections, is not adequate for the agency to fulfill its responsibilities under the agreement.”

## **Gillibrand, Kyl Lead Bipartisan Coalition Of 25 Members Of Congress Calling For Int'l Atomic Energy Agency To Conduct Special Nuclear Inspections In Syria**

**March 4, 2011**

Washington, DC – As Syria denies access to U.N. nuclear inspectors, and with mounting concerns over Syria's suspected nuclear activities at the Dair Alzour site and other possible locations, U.S. Senators Kirsten Gillibrand (D-NY) and Jon Kyl (R-AZ) led a bipartisan effort of 25 Members of Congress today in urging Yukiya Amano, Director General of the International Atomic Energy Agency to bring transparency to the state of Syria's nuclear program. In advance of the IAEA's March meeting next week, the Senators called on the agency to insist on special inspections in Syria to uncover the truth on its potential nuclear development. Syria has obstructed two years of investigations into its nuclear activities.

"Syria's refusal to allow international inspectors entry to suspected nuclear sites is alarming for the security of America, Israel, and all of our allies," Senator Gillibrand said. "If we're going to keep America and our allies safe, we need to know the status of Syria's nuclear activities, and Syria needs to know that there will be consequences if they are engaging in illicit nuclear activities."

"Syria must live up to its international agreements and allow IAEA nuclear inspectors direct and unfettered access," said Senator Ensign. "Syria's past actions and its continued disregard of agreements that require transparency of its nuclear practices lead to the conclusion that it is fostering illegal nuclear programs. If Syria continues to deny access to its facilities, the IAEA must step in and conduct special nuclear inspections to ensure it is not engaging in activities that threaten the safety of our country and our allies."

Reports indicate Syria is harboring a uranium conversion reactor. Syria allowed IAEA inspectors access to the Dair Alzour site once in 2008, but has denied all subsequent requests. According to commercial satellite photos, a second suspected nuclear installation has been identified in Syria.

The full letter signed by Senators Kirsten E. Gillibrand (D-NY), Jon Kyl (R-AZ), Joseph I. Lieberman (I-CT), John Ensign (R-NV), Ron Wyden (D-OR), James Inhofe (R-OK), Robert Menendez (D-NJ), Pat Roberts (R-KS), Robert P. Casey, Jr. (D-PA), David Vitter (R-LA), John Cornyn (R-TX), John Barrasso (R-WY), Roger Wicker (R-MS), Mike Johanns (R-NE), James Risch (R-ID), Richard Burr (R-NC), Marco Rubio (R-FL), Ben Cardin (D-MD), Mark Kirk (R-IL) and Representatives Fortenberry (R-NE), Edward Markey (D-MA), Brad Sherman (D-CA) and Ed Royce (R-CA) and Ted Deutch (D-FL), Adam Schiff (D-CA) to Director General Amano is below:

Dear Director General Amano:

We share your concern about the suspected nuclear activities at the Dair Alzour site and possibly other locations in Syria, as outlined in your most recent report on the [Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic](#). Given the Syrian Foreign Minister's evasion of your direct request for access to all necessary information and locations, we propose that you give urgent consideration to using your authority to call for "special inspections" in Syria.

As a signatory to the Nuclear Nonproliferation Treaty (NPT), Syria is legally obligated by its NPT-required IAEA safeguards agreement to make correct and complete declarations of its nuclear materials and related nuclear facilities and equipment. We recognize that Syria has agreed to an inspection of the Homs facility;

however, even if Syria were to allow the level of access you have requested, which seems unlikely, such an action would still not adequately address the international community's concerns over Syria's nuclear efforts. Without direct and unfettered inspections, the IAEA cannot dismiss the evidence you have cited in your report that the Dair Azour site is a nuclear facility, including: the features of the building and its connectivity to adequate pumping capacity of cooling water, the involvement of the Syrian Atomic Energy Commission (AECS), the inconsistency between end use information provided by the AECS and other information available to IAEA, and the type of uranium particles found in samples taken during the IAEA's June 2008 visit to the site.

We agree with you that "after two years of investigations constrained by Syria's lack of cooperation, it is critical that Syria positively engage with the Agency on these issues without further delay." As you are aware, Article 72 of Syria's safeguards agreement permits special inspections "[i]f the Agency considers that information made available by the State, including explanations from the State and information obtained from routine inspections, is not adequate for the Agency to fulfil its responsibilities under the Agreement." In light of the Syrian Foreign Minister's refusal to address the Agency's concerns and the latest in Syria's apparent efforts to hinder the IAEA's efforts to carry out its verification activities, we are concerned that Syria's recalcitrance, if it continues unabated, will cause lasting harm to the credibility of the IAEA safeguards regime.

As a bi-partisan group of the U.S. Congress, we urge you to take this next step in order to bolster the safeguards regime and bring transparency to the state of Syria's nuclear program.

**IAEA Board of Governors  
Introductory Statement to Board of Governors  
by IAEA Director General Yukiya Amano**

Vienna, Austria

7 March 2011

*[EXCERPT]*

**Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

Concerning the Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and some other locations. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.

Last month, I received a letter from Syria's Minister for Foreign Affairs in response to my letter of November 2010 in which I requested Syria to provide the Agency with prompt access to information and locations related to Dair Alzour.

I believe that the Minister's response, stating that Syria would continue to work with the Agency to resolve all outstanding technical issues, could represent a step forward. I wish to inform you that we have since reached agreement with Syria on a visit by the Agency to locations at Homs.

## Syria must not be allowed to stonewall IAEA probe: US

(AFP) – 5 hours ago [Accessed 2011-03-09T19:00Z]

[EXCERPTS]

VIENNA — Syria cannot be allowed to continue to block a long-running investigation by the UN atomic watchdog into alleged illicit nuclear activity, the United States said here Wednesday [2011-03-09].

"The United States' position on this is that we are not going to let this matter simply fade away or go away. We are not going to let Syria simply run out the clock on this matter," Washington's envoy to the International Atomic Energy Agency, Glyn Davies, told reporters.

[deletia]

"There is credible information that Dair Alzour was a reactor, that it was constructed with help from North Korea and that -- and this is the key part, -- that it was intended for non-peaceful purposes," Davies said on the sidelines of an ongoing meeting of the IAEA's board of governors here.

Damascus had "actively hindered and stood in the way of the IAEA's investigation by denying the IAEA access to the site, by refusing to provide information and by sanitising or cleaning up the suspected sites," Davies continued.

The IAEA board of governors "cannot accept this tactic this undermining of the nuclear safeguards regime."

Earlier this month, Syria did in fact agree to allow IAEA inspectors visit a much less significant site at Homs, a move which Amano said could be seen as a possible step forward.

The visit looks set to take place on April 1.

IAEA chief Amano said the visit would not "solve all the problems, of course," but, depending on what inspectors found at Homs, "this could be a step forward in my view."

The current EU president Hungary, in its own statement to the IAEA board, was similarly cautious.

"We hope it will be followed by further steps by Syria to help clarify all unresolved issues," Hungary said.

US ambassador Davies said the IAEA could also resort to a rarely-used tool called a "special inspection" if Damascus continued to stonewall the probe.

"That is a tool that could be used to get at this issue," Davies said.

But he added: "I don't think it's up to us... We'll take our lead from (Amano) on the special inspections."

## Syria "can't be allowed" to block nuclear probe -US

By Fredrik Dahl

Wed Mar 9, 2011 6:41pm GMT

[EXCERPTS]

VIENNA, March 9 (Reuters) - The United States warned Syria on Wednesday it "can't be allowed" to stonewall a U.N. watchdog investigation into a desert site where covert atomic activity may have taken place before it was destroyed by Israel in 2007.

[deletia]

"The United States position on this is that we are not going to let this matter simply fade away or go away," U.S. Ambassador Glyn Davies told reporters on the sidelines of a week-long meeting of the IAEA's 35-nation governing board. He suggested the Arab state may still be pursuing secret atomic work, accusing it of "deliberate efforts to conceal the full extent and scope of what we strongly believe were, and may still be, clandestine nuclear activities."

[deletia]

SPECIAL INSPECTION?

Davies said the Syrian case represented a challenge to the IAEA's nuclear safeguards regime. "They can't be allowed to simply stonewall and block the investigation."

[deletia]

The United States has suggested the IAEA may need to consider invoking its "special inspection" mechanism to give it authority to look anywhere necessary in Syria at short notice, if Syria does not agree to inspectors visiting Dair Alzour.

[deletia]

"I think it is still the case that this is a situation that could be addressed by a special inspection," Davies said.

But nuclear expert Mark Hibbs of the Carnegie Endowment for International Peace said he did not believe Amano would do this.

"Were the IAEA to go to these sites and find nothing, Syria would be vindicated and the political credibility of the IAEA could be damaged," Hibbs said.

## **UN inspectors back from trip to Syria: IAEA**

VIENNA,

April 4 (AFP) Apr 04, 2011

UN inspectors have returned from a trip to Syria and are now analysing the data they collected there, the International Atomic Energy Agency said Monday.

"IAEA inspectors have returned from Syria and will now analyse the information they have collected," a spokesman for the Vienna-based watchdog said.

After stonewalling an IAEA probe for more than two years, Damascus finally gave nuclear inspectors permission earlier this year to fly to Syria on April 1 to visit a site at Homs.

The IAEA has been investigating allegations since 2008 that Syria had been building an undeclared reactor at a remote desert site called Dair Alzour until it was bombed by Israeli planes in September 2007.

Damascus granted UN inspectors one-off access to that site back in June 2008 but has not allowed any follow-up visits to either Dair Alzour or other possible related sites since then.

Homs, north of Damascus, is not one of the suspect sites, but the IAEA welcomed Syria's decision to allow the visit, seeing it as a possible first step forward in its hitherto stymied investigation.

## IAEA chief: Syria tried to build nuclear reactor

By JAMEY KEATEN and GEORGE JAHN

Associated Press

Apr 28, 12:29 PM EDT

PARIS (AP) -- The head of the International Atomic Energy Agency said for the first time that a target destroyed by Israeli warplanes in the Syrian desert in 2007 was the covert site of a future nuclear reactor, countering assertions by Syria that it had no atomic secrets.

Previous reports by the International Atomic Energy Agency have suggested that the structure could have been a nuclear reactor. Thursday's comments by IAEA chief Yukiya Amano were the first time the agency has said so unequivocally.

By aligning Amano with the U.S., which first asserted three years ago that the bombed target was a nuclear reactor, the comments could increase pressure on Syria to stop stonewalling agency requests for more information on its nuclear activities.

Amano spoke during a news conference meant to focus on the Fukushima nuclear disaster after a visit to the Paris-based Organization for Economic Cooperation and Development to discuss clean-up efforts at Japan's tsunami-ravaged nuclear plant.

"The facility that was ... destroyed by Israel was a nuclear reactor under construction," he told a full news conference in response to a question from The Associated Press, repeating to the AP in taped comments afterward: "It was a reactor under construction."

Suggesting that Amano had erred in making the public comments, the IAEA later put out a statement that he "did not say that the IAEA had reached the conclusion that the site was definitely a nuclear reactor."

The rollback reflected previous, more circumspect, IAEA language. In a February report, Amano had said only that features of the bombed structure were "similar to what may be found at nuclear reactor sites."

Israel has never publicly commented on the strike or even acknowledged carrying it out. The U.S. has shared intelligence with the agency that identifies the structure as a nearly completed nuclear reactor that, if finished, would have been able to produce plutonium for the fissile core of nuclear warheads.

Syria denies allegations of any covert nuclear activity or interest in developing nuclear arms. Its refusal to allow IAEA inspectors new access to the bombed Al Kibar desert site past a visit three years ago has heightened suspicions that it had something to hide, along with its decision to level the destroyed structure and later build over it.

Drawing on the 2008 visit by its inspectors, the IAEA determined that the destroyed building's size and structure fit specifications that a reactor would have had. The site also contained graphite and natural uranium particles that could be linked to nuclear activities.

The IAEA is also trying to probe several other sites for possible undeclared nuclear activities linked to the bombed target but Damascus has been uncooperative on most counts, saying that most of the sites are restricted because of their military nature.

----

Jahn reported from Vienna

## AP Exclusive: Diplomats say Syria's referral to Security Council likely for nuclear defiance

By George Jahn, The Associated Press

1 hour ago [Accessed 2011-04-29T13:55Z]

VIENNA — The International Atomic Energy Agency is setting the stage for potential U.N. Security Council action against Syria as the organization prepares a report assessing that a Syrian target bombed by Israeli warplanes was likely a secretly built nuclear reactor meant to produce plutonium, diplomats say.

Such a conclusion would back intelligence produced by Israel and the United States. Syria says the nearly finished building had no nuclear uses. It has repeatedly turned down IAEA requests to revisit the site after allowing an initial 2008 inspection that found evidence of possible nuclear activities.

In interviews over the past week, three diplomats and a senior U.N. official said such an assessment — drawn up by IAEA chief Yukiya Amano — would be the basis of a Western-sponsored resolution at a meeting of the 35-nation IAEA board that condemns Syria's refusal to co-operate with the agency and kicks the issue to the U.N. Security Council. They said reporting Syria to the council would likely come as early as a June board meeting and no later than in November.

All asked for anonymity in exchange for discussing confidential information.

In an apparent slip of the tongue that could have opened a window on his plans, Amano said for the first time Thursday that the bombed site was a nearly finished nuclear reactor. He spoke in taped comments at a news conference and later to The Associated Press.

Suggesting that Amano had erred in making such comments publicly, the IAEA later put out a statement that "he did not say that the IAEA had reached the conclusion that the site was definitely a nuclear reactor."

The rollback reflected previous, more circumspect, IAEA language. In a February report, Amano said only that features of the bombed structure were "similar to what may be found at nuclear reactor sites."

Once formally involved, the council has options ranging from doing nothing to passing its own resolutions demanding compliance with the IAEA, followed by sanctions to enforce such demands. This has been the scenario for Iran, under four sets of U.N. sanctions for ignoring council demands to stop activities that could be used to build nuclear arms and to co-operate with an IAEA probe of experiments that could be used to develop such weapons.

The greatest uncertainty, said one of the diplomats, is Syria's current unrest, which could delay or change Western plans to force a resolution and referral to the U.N. Security Council. Since the public uprising in Syria began in mid-March, inspired by revolts across the Arab world, hundreds of people have been killed nationwide, activists say.

Syria sanctions are unlikely. While Tehran continues with its nuclear program, intelligence services believe that the Israeli bombing of the Al Kibar site effectively ended Syria's covert activities. Also, the diplomats said, forcing the issue with Syria would detract council attention from Iran, the main focus of nuclear concern, and could muddy efforts to focus on an end of Syria's bloody crackdown on its grass-roots pro-democracy movement.

Still, Security Council involvement carries both symbolic weight and opens the path for concrete action later, should new evidence be found.

A U.S. official called any referral to the council significant, while the diplomats — all from IAEA board member nations — said that beyond sending a signal to Syria, reporting it to the council also would be a rehearsal for action against Iran further down the road.

They said that after more than four years of gridlock in IAEA attempts to investigate Iran's alleged experiments geared toward developing nuclear arms, Amano also was planning to draw up an assessment saying that such experiments were likely conducted, perhaps by the end of the year.

That, in turn, would open the path for renewed IAEA referral of Iran to the Security Council and lead to potential tightening of existing sanctions or a new set of U.N. penalties, the diplomat said.

One said assessments such as ones for Syria and Iran were rare, if not unprecedented, in the IAEA's history and reflected the agency's frustration with both nation's refusal to co-operate.

Beyond Iran, only four other countries — Saddam Hussein's Iraq, North Korea, Libya and post-communist Romania — have been reported to the Security Council by the IAEA in its 54-year history.

Like Iran, Syria denies allegations of any interest in developing nuclear arms. But its refusal to allow IAEA inspectors new access to the bombed desert site has heightened suspicions that it had something to hide along with its decision to level the structure that was destroyed by Israel and later to build over it.

Drawing on the 2008 visit to Syria by its inspectors, the IAEA determined that the destroyed building's size and structure fit specifications that a reactor would have had. It also found graphite and natural uranium particles that could be linked to nuclear use of the structure.

## **U.S. Presses Nuclear Case Against Damascus**

By JAY SOLOMON

MAY 14, 2011

*[EXCERPT]*

WASHINGTON—The U.S. and its European allies, seeking to pressure Syrian President Bashar al-Assad to end his violent crackdown on protesters, are lobbying the United Nations nuclear watchdog to formally accuse Damascus of covertly building a nuclear reactor.

Such a declaration by Yukiya Amano, director general of the International Atomic Energy Agency, could lead the U.N. Security Council to censure and perhaps penalize Syria in the coming months if it fails to provide information on its alleged nuclear activities, including at a suspected reactor site bombed by Israel in 2007, said U.S. and European officials.

"It is our longstanding view that the Syrian facility...was a nuclear reactor configured for plutonium production," said a senior U.S. official involved in the discussions.

The U.S. and European Union have been seeking ways to further isolate Damascus in the wake of a brutal offensive by Mr. Assad's security forces. Both Washington and Brussels have announced unilateral economic sanctions on senior Syrian officials in recent weeks, although not on Mr. Assad himself.

But the Obama administration and its allies have so far been stymied in their attempts to pressure Mr. Assad through the Security Council, according to diplomats involved in the discussions. Russia, in particular, has resisted U.N. action to punish Syria, a decades-long ally of Moscow. The IAEA is viewed as a separate channel through which to put pressure on Damascus, said these officials.

"We're looking to increasingly isolate Assad," said a European official briefed on the talks. "The IAEA is one of the routes."

Syria's ally, Iran, has been hit with four rounds of U.N. economic sanctions since 2006 as a result of Tehran's own standoff with the IAEA.

For more than three years, the IAEA has been seeking access to at least four Syrian sites the U.N. agency suspects of being part of a covert nuclear program. The facility in eastern Syria destroyed in late 2007 by Israeli fighter jets, Dair Alzour, was a nearly operational nuclear reactor built in collaboration with North Korea, U.S. intelligence agencies believe.

Damascus has repeatedly denied the charges. It has refused to allow IAEA inspectors to visit the suspect sites after an initial mission went to Dair Alzour.

Mr. Amano in recent months has publicly talked about the possibility of utilizing a special power of his office to demand immediate access to Syria. But IAEA officials worry privately that Syria could again refuse to comply, making Mr. Amano's office look weak.

The U.S. and Europe, subsequently, have advised the IAEA to declare in its quarterly report on Syria, due out next month, that its inspectors have concluded that the bombed facility was a reactor. Such a move could lead the IAEA's 35-member board to issue a resolution declaring Damascus in noncompliance with its commitments to the agency. Syria's case could then be referred to the U.N. Security Council.

Mr. Amano, in a speech earlier this month, suggested he might go this route. In Paris, he told a conference that "the facility that was ... destroyed by Israel was a nuclear reactor under construction," his most definitive comment to date on the nature of the Syrian facility. Mr. Amano's representative in Vienna, however, subsequently stated that the IAEA hadn't reached a firm conclusion on the Syria case and wouldn't comment on what action the agency might take.

*[deletia]*

## **Ex-IAEA official adds weight to Syria atom suspicion**

By Fredrik Dahl

VIENNA

Tue May 17, 2011 10:10am EDT

(Reuters) - Satellite images and other information indicate Syria was building a covert atomic reactor when Israel bombed the site in 2007, a former senior U.N. nuclear inspector said on Tuesday.

Olli Heinonen, who stepped down as deputy director general of the International Atomic Energy Agency (IAEA) in 2010, made his remarks at a time when some argue that Damascus may soon be referred to the U.N. Security Council over the issue.

Now a senior fellow at Harvard University's Belfer Center for Science and International Affairs, he said "satellite imagery, procurement, and infrastructure information tend to point (in the) direction that the destroyed building at Dair Alzour was, indeed, a nuclear reactor at an advanced state of construction."

In an email to Reuters, he said, however, that Syria had not "engaged in any substantial discussion" about Dair Alzour.

Israeli warplanes wrecked the desert site in September 2007 and Syria has allowed IAEA investigators to visit it only once, in June 2008, rejecting repeated requests for further visits.

Western diplomats expect the Vienna-based IAEA to use stronger language in its next quarterly report on Syria which is due later this month, possibly by saying it believes the facility was a reactor under construction.

The United States and its European allies are expected to seize on this finding to push for a decision at the June 6-10 meeting of the IAEA's governing board to send the file to the U.N. Security Council -- a move last used against Iran in 2006.

The move would reflect growing frustration in the West over Syria's stonewalling of an IAEA probe into Dair Alzour, which U.S. intelligence reports said was a nascent North Korean-designed reactor intended to make bomb fuel.

Preparations for a possible U.S.-led move by the IAEA's 35-nation governing board coincide with a Syrian crackdown on pro-democracy demonstrations. Western diplomats in Vienna insist the two issues are separate.

"There is a general feeling that there has been a stalemate in the Syrian case for too long and therefore something has to be done," one European ambassador accredited to the IAEA said.

"It is a dramatic step," he said about the possibility that the Syria nuclear case would be handed over to the Security Council, which may debate the issue or take other action.

Syria, an ally of Iran, denies ever having a nuclear weapons program. It has suggested uranium traces uncovered at Dair Alzour after a one-off IAEA visit came with Israeli munitions used in the attack. The agency has dismissed this as unlikely.

## SOME COUNTRIES SCEPTICAL

Diplomats said the IAEA -- which in earlier reports said there were indications nuclear activity may have taken place at Dair Alzour -- was unlikely to make a definitive, final assessment due to a lack of further access to the site.

"They can say that according to everything they know there is a high probability, or that they assume, it was a nuclear reactor," one Western official said.

Western diplomats say Syria's refusal to allow U.N. inspectors follow-up access to Dair Alzour risks undermining the IAEA and the nuclear Non-Proliferation Treaty that underpins its work to prevent the spread of atom bombs, if nothing is done.

The board has the power to refer countries to the Security Council if they are judged to have violated IAEA rules designed to make sure atom technology is not diverted for military aims.

A majority vote in favor would be needed for this step.

"I think it will be feasible to get a decision to refer the issue to the Security Council," the Western official said.

The European ambassador said some countries on the IAEA board may not back such a decision. He expected Russia and China, which last month resisted a Security Council condemnation of Syria's clampdown on demonstrators, to abstain in any vote.

One developing country diplomat said that whatever Syria did at Dair Alzour it was now in the past, unlike the Iran case.

"To send it to the Security Council it has to be a threat to international peace and security," said the diplomat. "Do you have any proof they are doing it right now?"

## **Indications Syria site was nuclear reactor: IAEA**

By David Brunnstrom

BRUSSELS

Thu May 19, 2011 10:28am EDT

(Reuters) - The U.N. nuclear watchdog has information indicating that Syria was covertly building a nuclear reactor when Israel bombed the site in 2007, but has yet to reach a definite verdict, its head said on Thursday.

If Yukiya Amano formalizes the conclusion in his quarterly report on Syria, due within weeks, diplomats say the United States and its allies will seize on the finding to try to have Syria's case referred to the U.N. Security Council.

The West is increasingly frustrated at what it sees as Syria's stonewalling of an international probe into the Dair Alzour site, which U.S. intelligence reports say was a nascent North Korean-designed reactor intended to make bomb fuel.

"We have the allegation that this facility was a nuclear reactor under construction," Amano, director general of the Vienna-based International Atomic Energy Agency (IAEA), said in an interview in Brussels.

"We do have information that indicates that it was the case. But for now, as of today, we haven't yet come to any conclusion."

Syria, an ally of Iran, denies ever having a nuclear weapons program. It has suggested uranium traces uncovered at Dair Alzour after a one-off IAEA visit came from Israeli munitions used in the attack. The agency has dismissed this as unlikely.

Damascus has rejected repeated IAEA requests for follow-up visits to the desert site.

NO ACCESS

Amano, who in earlier reports said there were indications that nuclear activity may have taken place at Dair Alzour, made clear his view that Syria was not cooperating.

"We kept on asking Syria to accept our inspectors and I wrote a letter in November, but I haven't received a positive response regarding the visit of inspectors to Dair Alzour."

But he said Syria had become more cooperative on another facility, a research reactor near Damascus.

The 35-nation IAEA board has the power to report countries to the Security Council if they are judged to have violated IAEA rules designed to make sure that nuclear technology is not diverted for military aims.

It reported Iran to the Security Council in 2006 over its failure to dispel suspicions that it was trying to develop nuclear weapons. Tehran has since been hit with four rounds of U.N. sanctions over its refusal to curb sensitive nuclear work.

Preparations for a possible U.S.-led move on Syria at the board's meeting from June 6 to 10 coincide with a Syrian crackdown on a pro-democracy uprising.

Western diplomats said the IAEA was unlikely to make a final assessment on Dair Alzour due to a lack of further access.

They say Syria's refusal to let U.N. inspectors return to Dair Alzour risks undermining the IAEA and the nuclear Non-Proliferation Treaty, if no action is taken.

Amano said: "Lack of cooperation on their part -- and if we cannot draw conclusions -- is not good for the IAEA, for Syria (or) for anyone."

## Syria faces pressure at U.N. atomic agency: diplomats

By Fredrik Dahl

VIENNA

Mon May 23, 2011 2:27pm EDT

(Reuters) - U.N. inspectors are likely to increase international pressure on Syria this week with a report about suspected illicit nuclear activities that could lead to a referral of Damascus to the U.N. Security Council.

Diplomats say the International Atomic Energy Agency (IAEA) will probably give a clearer indication than in previous such reports that it suspects Syria was secretly building a nuclear reactor in the desert when Israel bombed the site in 2007.

The United States and its European allies may then use the finding to push for a resolution at a June 6-10 meeting of the IAEA's 35-nation board to refer Syria's case to the Security Council -- a step it last took against Iran in 2006.

The move would underline the West's frustration with what it sees as Syria's stonewalling of an IAEA probe into the Dair Alzour site, which U.S. intelligence reports say was a nascent North Korean-designed reactor intended to make bomb fuel.

"We expect that it is going to be a very straightforward, tough report on Syria," one senior Western diplomat said.

If IAEA Director-General Yukiya Amano "makes a clear indication that he believes that this was very likely a clandestine reactor under construction, the board would have to take action, and strong action," he added.

But some non-Western diplomats expressed skepticism about any such step by the board, saying that whatever Syria did at Dair Alzour it was now in the past. "I assume that some countries will not be very happy," said one envoy.

The confidential, quarterly report on Syria is expected to be sent to IAEA member states in the next few days. It coincides with fresh Western sanctions imposed on the Arab country this month over its bloody crackdown on pro-democracy demonstrators, ending efforts to woo Damascus away from its alliance with Iran.

### NUCLEAR TREATY UNDERMINED?

Diplomats in Vienna, where the IAEA is based, insist the two issues are separate and that Damascus has refused agency inspectors access to Dair Alzour for nearly three years.

"These are two different things. What we are concerned about are basically Syria's violations of its international obligations (to cooperate with the IAEA) and the integrity of the (nuclear) safeguards regime," the Western diplomat said.

Syria, an ally of Iran, denies ever having a nuclear weapons program. It has suggested uranium traces uncovered at Dair Alzour after a one-off IAEA visit came from Israeli munitions used in the attack. The agency has dismissed this as unlikely.

The IAEA board has the power to report countries to the Security Council if they are judged to have violated IAEA rules -- designed to make sure that nuclear technology is not diverted for military aims -- by pursuing covert nuclear activity.

It reported Iran to the Security Council in 2006 over its failure to dispel suspicions that it was trying to develop nuclear weapons. Tehran has since been hit with four rounds of U.N. sanctions over its refusal to curb sensitive nuclear work.

Western diplomats say Syria's lack of cooperation risks undermining the IAEA and the nuclear Non-Proliferation Treaty which underpins the agency's work, if no action is taken.

But they said Amano, who in earlier reports said there were indications that nuclear activity may have taken place at Dair Alzour, was unlikely to make a final, definitive assessment about the nature of the site.

"He will, I believe, point out in a stronger way that -- relying on the material and information that the IAEA has -- many things point to a reactor," a senior Western official said.

## **IAEA: Syria very likely hid nuke program**

GEORGE JAHN, Associated Press

Published 08:56 a.m., Tuesday, May 24, 2011

VIENNA (AP) — The U.N. nuclear agency says that a Syrian target bombed four years ago by Israel was very likely a nearly finished, covertly built nuclear reactor.

The finding by the International Atomic Energy Agency backs U.S. findings and sets the stage for potential U.N. Security Council action against Syria.

Syria says the nearly finished building had no nuclear uses. It has repeatedly turned down IAEA requests to revisit the site after allowing an initial 2008 inspection that found evidence of possible nuclear activities.

Diplomats have told The Associated Press that a strong IAEA opinion that the Syrians were trying to build a nuclear reactor secretly would likely result in a Western push to report Syria to the Security Council.

A senior Western diplomat said Tuesday that push would come next month at the next meeting of the 35-nation IAEA board, with the initiative likely to get majority backing.

## Board of Governors

Date: 24 May 2011

**Restricted Distribution**

Original: English

### For official use only

Item 7(f) of the provisional agenda  
(GOV/2011/23)

# Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic

*Report by the Director General*

1. This report of the Director General to the Board of Governors is on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic<sup>1</sup> (Syria). It includes the Agency's assessment of the nature of the destroyed building at the Dair Alzour site.

## **A. The Dair Alzour Site**

2. On 2 June 2008, the Director General informed the Board of Governors that the Agency had been provided with information alleging that an installation at the Dair Alzour site in Syria, destroyed by Israel in September 2007, had been a nuclear reactor that was not yet operational and into which no nuclear material had been introduced. Information subsequently provided to the Agency further alleged that the reactor was a gas cooled graphite moderated reactor, that it was not configured to produce electricity, that it had been built with the assistance of the Democratic People's Republic of Korea (DPRK), and that there were three other locations in Syria that were functionally related to the Dair Alzour site. By the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building.<sup>2</sup> Syria has maintained, since May 2008, that the destroyed building was a non-nuclear military installation and that Syria had had no nuclear related cooperation with the DPRK.<sup>3</sup>

3. The Agency regrets that information concerning the Dair Alzour site was not provided to it in a timely manner and that force was used before the Agency was given an opportunity to establish the facts in accordance with its responsibilities under Syria's Safeguards Agreement.

4. In June 2008, during the Agency's visit to Syria, the Agency requested supporting documentation concerning the past and current use of the buildings at the Dair Alzour site and at three other locations allegedly functionally related to that site. The Agency also requested clarification about procurement activities by Syrian entities, including the Syrian Atomic Energy Agency (AECS), concerning pumping equipment, and large quantities of graphite and barite. During the visit, Syria stated that the function of the destroyed building was missile related. Syria also stated that the destroyed building could not have been a nuclear facility because of the unreliable and insufficient electricity supplies in the area, the limited availability of human resources in Syria and the unavailability of large quantities of treated water.

5. Environmental samples taken during the visit to the Dair Alzour site in June 2008 contained particles of anthropogenic natural uranium, graphite and stainless steel. Syria maintains that the particles of anthropogenic natural uranium found at the Dair Alzour site originated from the missiles used to destroy the building.<sup>4</sup>

Syria also maintains that the pumping equipment and large quantities of graphite and barite that it sought to procure were for civilian and non-nuclear purposes.

6. Syria's statements — concerning the nature of the destroyed building, the Dair Alzour site, the three other locations allegedly functionally related to it, the procurement activities referred to above and the alleged foreign assistance — are limited in detail, are not supported by documentation and have not allowed the Agency to confirm Syria's assertions regarding the non-nuclear nature of the destroyed building. Since the Agency's visit to the Dair Alzour site in June 2008, the Agency has made repeated requests to Syria for:

- information concerning the Dair Alzour site, the infrastructure observed at the site and certain procurement efforts which Syria has stated were related to civilian non-nuclear activities;
- access to technical documentation and any other information related to the construction of the destroyed building;
- access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are now situated; and
- further access to the Dair Alzour site and access to three other locations allegedly functionally related to the Dair Alzour site.

7. Syria has maintained that, due to the military and non-nuclear nature of the Dair Alzour site and three other locations allegedly functionally related to the Dair Alzour site, it has no obligation to provide more information under its Safeguards Agreement with the Agency.<sup>5</sup>

The Agency has explained to Syria that there is no limitation in comprehensive safeguards agreements on Agency access to information, activities or locations simply because they may be military related. The Agency has repeatedly offered to establish the necessary modalities to enable Syria to substantiate its statements while protecting sensitive information related to its activities at the Dair Alzour site and the three other locations.

8. In a letter dated 18 November 2010, the Director General wrote to H.E. Walid Al-Moualem, Syria's Minister for Foreign Affairs, to request, inter alia, that Syria provide the Agency with prompt access to information and locations previously indicated by the Agency.

9. In a letter dated 6 February 2011 addressed to the Director General, Syria's Minister for Foreign Affairs stated that the Director General of the AECS would continue to work with the Agency to resolve all outstanding technical issues in accordance with Syria's commitments under the Agency's Statute, the Treaty on the Non-Proliferation of Nuclear Weapons and Syria's Safeguards Agreement.

10. Notwithstanding the Minister's statement referred to above, Syria has not engaged substantively

with the Agency on the nature of the Dair Alzour site since the Agency's June 2008 visit and, since August 2009, has not responded to the other issues referred to in paragraph 6 above.

## **B. Assessment of the Dair Alzour Site**

11. As further described below, the Agency has assessed that:

- features of the destroyed building are comparable to those of gas cooled graphite moderated reactors of the type and size alleged;
- prior to the bombing, the configuration of the infrastructure at the site, including its connections for cooling and treated water, was able to support the operation of such a reactor and was not consistent with Syria's claims regarding the purpose of the infrastructure; in addition, a number of other features of the site add to its suitability for the construction and operation of a nuclear reactor;
- analysis of samples from the site indicates a connection to nuclear related activities; and
- the features of the destroyed building and the site could not have served the purpose claimed by Syria.

### **B.1. Features of the Destroyed Building**

12. The Agency has assessed that the dimensions, shape and configuration of the destroyed building are comparable to those found in reactors of the alleged type.

13. Based on commercial imagery from 2001 to 2007, the dimensions of the building<sup>6</sup> are comparable to those for nuclear reactors of the type and power alleged, i.e. similar to the 25 MW(th) gas cooled graphite moderated reactor at Yongbyon<sup>7</sup> in the DPRK. The Agency's analysis of a photograph of the bombed building that was provided to the Agency by a Member State corroborates the allegation that Syria attempted to conceal the features of the building's configuration by the addition of wall and roof sections.

14. Analysis of imagery provided by two Member States, taken shortly after the building was destroyed, indicates that internal features of the building correspond to a large central hall, a cylindrical biological shield, a containment structure, heat exchanger shielding structures and a spent fuel pond; all of which would be required for a reactor.<sup>8</sup> The Agency procured a radar image of the building taken shortly after its destruction. Within the limits of the resolution, the image is consistent with those provided to the Agency by the two Member States.

15. The imagery of the destroyed building showed that the feature interpreted as being a containment structure had similar dimensions, shape and layout to other known reactors of the type alleged, and the overall size of the building was sufficient to house the equipment needed for such a nuclear reactor. Photographs of a reactor vessel at the Dair Alzour site released by a Member State simultaneously with the publication of the allegations are not inconsistent with the Agency's assessment of the dimensions of the containment structure. Based on all the information available to the Agency, including the Agency's analysis of these photographs, it is estimated that the reactor core had 843 fuel channels and 79 access ports, and, depending on the heat transfer characteristics of the fuel, the reactor may have had a thermal power of 25 MW or higher.

16. During the June 2008 Agency visit, Syria stated that some equipment which remained functional after the bombing had been removed from the destroyed building. Satellite imagery provided by a Member State confirms Syria's efforts to recover equipment and material from the destroyed building prior to its complete demolition and burial. The efforts included the covering of areas of the destroyed building which may have served to conceal features of the facility during the process. A significant fraction of material and equipment had been removed from the site before the remainder was demolished and buried in the seven weeks following the bombing.

## **B.2. Site Infrastructure and Site Suitability**

17. Based on satellite imagery and the Agency's observations made during the June 2008 visit, the Agency has assessed that the configuration and capacity of the infrastructure at the site prior to the destruction of the building were consistent with the cooling requirements of a 25 MW(th) nuclear reactor. Syria claims that the pumps at the river pump house (RPH) and the Dair Alzour site pump house (SPH) comprised a staged pumping system to supply river water to the civilian water treatment facility (WTF) located approximately 5 km to the east of the Dair Alzour site. Syria's claims in this respect are not supported by the Agency's assessment (see Figure 1 below). Factors considered in the Agency's assessment include:

- Before the destruction of the building, the river water pumping system had the necessary pipes to supply the building with river water. A pipe ran from the building to a point downstream from the RPH. This configuration was consistent with the supply of cooling water to a reactor and the return of water to the river;
- The observed pumping capacity was adequate for cooling 25 MW of thermal power. Additionally, the stated function of the destroyed building (i.e. missile related) would not require connection to the observed river water pumping capacity;
- Before the destruction of the building, the river water pumping system's output was not connected to the WTF; and
- After the destruction of the building, Syria reconfigured the pumping infrastructure to remove sections of the return pipe and to install a new large diameter water pipe connection from the SPH to the WTF.

**Figure 1.** Key infrastructure configurations before bombing and after reconfiguration (not to scale).

18. In contrast to Syria’s statements concerning insufficient electricity supplies in the area, the site infrastructure included buried high voltage power distribution and transformer equipment. At the time of the Agency’s June 2008 visit, the Agency observed electrical infrastructure and the operation of all the river water pumps at the RPH and SPH. The combined electrical load of the pumps represents a significant fraction of the total electrical power requirement for operation of a reactor of the alleged type. Therefore, the Agency has assessed that the electrical infrastructure at the site was possibly sufficient to meet the needs of such a nuclear reactor.

19. Based on the available information, including 1994 AECS seismology data centred on the Dair Alzour site and 2002 geology data concerning the Dair Alzour region, the site has a number of other features which add to its suitability for the construction and operation of a nuclear reactor. These features of the site include a relatively stable geological platform on which to construct a heavy building, low population density in the area, close proximity to a river for the supply of cooling water, and the availability of services, including treated water and electricity. Such features are normally considered in the site selection process for a nuclear reactor.<sup>9</sup>

### **B.3. Sampling**

20. Assessments of samples taken from the Dair Alzour site indicate a connection to nuclear related activities and the presence of materials that could possibly be used in the construction of gas cooled reactors.

21. The presence of a significant number of particles of anthropogenic natural uranium at the Dair Alzour site indicates a connection to nuclear related activities at the site and increases concerns about possible undeclared nuclear material at the site. The Agency has not been able to determine the origin of the particles. Notwithstanding the lack of response to the Agency's requests for additional information concerning the origin of the particles, the Agency's assessment of Syria's explanation for the presence of the particles is that, based on their morphology and distribution, there is a low probability that they could have originated from the munitions used to destroy the building or by aerial dispersion as suggested by Syria.

22. The Agency has examined the samples retrieved from the Dair Alzour site during the June 2008 visit for indications of the presence of construction materials associated with a gas cooled graphite moderated reactor. The results showed the presence of graphite and stainless steel. The graphite particles were too small to permit an analysis of the purity compared to that normally required for use in a reactor. The types of stainless steel detected at the site were compatible with nuclear use, but not exclusively so.

### **B.4. Stated Function of the Dair Alzour Site**

23. The Agency's assessment of the features observed at the Dair Alzour site prior to the building's bombing and immediately thereafter is that it is unlikely that the purpose of the site was missile assembly, storage or launching. Factors considered in the Agency's assessment included the building's configuration, the construction materials, suitability of openings and hatches for missile handling or launching, the assessment of the water infrastructure described in paragraph 17 above, Syria's declaration of the civilian nature of the water infrastructure on the site and normal missile handling practices.

### **B.5. Assessment Summary**

24. The circumstances relating to the Dair Alzour site are unique, in that the building on the site has been destroyed, the debris from the site has been cleared, several years have now passed, and Syria has not provided the necessary cooperation required by the Agency, as detailed in this report and previous reports. Notwithstanding the loss of substantial information, after considering the initial allegations and Syria's responses thereto, and considering all information available to the Agency, the Agency concludes that the destroyed building was very likely a nuclear reactor<sup>10</sup> and should have been declared by Syria pursuant to Articles 42 and 43 of its Safeguards Agreement and Code 3.1 of the General Part of the Subsidiary Arrangements thereto.

## **C. Other Activities and Locations Possibly Related to the Dair Alzour Site**

25. The Agency does not have sufficient information to provide any assessment concerning the function or operational status of the three other locations that are alleged to be functionally related to the Dair Alzour site.

26. Large quantities of barite were purchased by the AECS between 2002 and 2006. Syria has stated that the material was to be used for shielded radiation therapy rooms at hospitals, without providing any supporting information.<sup>11</sup> However, the end use of the barite as stated in the actual shipping documentation indicates that the material was intended for acid filtration. Additionally, the delivery of the barite was stopped at the request of the AECS after the destruction of the building at the Dair Alzour site and the remaining quantity was left undelivered. Given that barite is frequently used to improve radiation shielding properties of concrete, and the inconsistency concerning the end use of the barite and the involvement of the AECS in its procurement, the Agency cannot exclude the possibility that barite may have been intended for use in the construction of shielded spaces for purposes linked to nuclear fuel cycle related facilities.

#### **D. Activities at Other Locations in Syria**

27. As previously reported, particles of anthropogenic uranium of a type not included in Syria's reported inventory were found at the Miniature Neutron Source Reactor (MNSR) in 2008 and in 2009. Syria's initial explanations in June 2009 that the particles had originated either from standard reference materials used in neutron activation analysis or from a shielded transport container were not supported by the results of sampling carried out by the Agency.<sup>12</sup> During the November 2009 inspection, and contrary to its earlier statements, Syria explained that the anthropogenic particles had originated from previously unreported activities performed at the MNSR related to the preparation of tens of grams of uranyl nitrate using yellowcake produced at Homs.<sup>13</sup> At the March 2010 physical inventory verification (PIV), another small quantity of undeclared uranyl nitrate was identified by the Agency at the MNSR. Syria explained that the unreported activities had taken place in a different location in the MNSR than previously declared to the Agency.<sup>14</sup> As reported earlier, Syria submitted inventory change reports in June 2010 for the newly declared material shown to the Agency during the PIV. However, inconsistencies between Syria's declarations and the Agency's findings remained unresolved at that stage.

28. As previously reported, during a meeting on 3 September 2010 to resolve the inconsistencies, agreement was reached with Syria on a plan of action which included, inter alia, actions related to the amounts and use of nuclear material at the MNSR, scientific publications concerning uranium conversion experiments different from those declared by Syria to have occurred at the MNSR, indications of nuclear material under the control of the Waste Management Department of the AECS, and the Agency's requests for access to Homs. Syria's initial response to the plan of action did not provide the necessary clarifications.<sup>15</sup>

29. On 8 March 2011, the arrangements for a visit to Homs by the Agency on 1 April 2011 were finalized. The Agency visited the Phosphoric Acid Pilot Plant and associated locations on that date and performed all of its planned sampling and other activities. The Agency took environmental samples from specified locations and destructive analysis samples from specific batches of the yellowcake by-product of the phosphoric acid purification. The AECS provided some documentation requested by the Agency and made arrangements for relevant research staff to be present for the discussion of the uranium conversion experiments indicated in paragraph 28 above.

30. Analytical results from the samples taken during the visit to Homs are not inconsistent with Syria's statements concerning the origin of the uranyl nitrate prepared during experiments at the MNSR and the origin of the anthropogenic natural uranium particles found at the MNSR.

31. On 19 April 2011, the Agency carried out a PIV at the MNSR where routine verification activities were performed, including the verification of previously undeclared waste material.<sup>16</sup>

32. Based on the information provided by Syria, and the results of the Agency's verification activities, the Agency has concluded that Syria's statements concerning the origin of the anthropogenic uranium particles found at the MNSR are not inconsistent with the Agency's findings. Therefore, the matter will be addressed in the routine implementation of safeguards.

## E. Conclusion

33. The Agency regrets that Syria has not cooperated since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the three other locations allegedly functionally related to it. Based on all the information available to the Agency and its technical evaluation of that information, the Agency assesses that it is very likely that the building destroyed at the Dair Alzour site was a nuclear reactor which should have been declared to the Agency. Concerning the three other locations, the Agency is unable to provide any assessment concerning their nature or operational status.

34. Concerning the MNSR, Syria has cooperated with the Agency by providing the requested access to Homs. Syria's statements concerning the previously unreported conversion activities at the MNSR and origin of the anthropogenic uranium particles found at the MNSR are not inconsistent with the results of the Agency's verification activities. The matter will be addressed in the routine implementation of safeguards.

Mark C. Toner  
Acting Deputy Department Spokesman  
Daily Press Briefing  
Washington, DC  
May 25, 2011

[EXCERPT]

MR. TONER: Yeah. Go ahead, Michelle.

QUESTION: I'm sorry. One other about Syria because the –

MR. TONER: Yeah. You want to do both IAEA reports together?

QUESTION: Yeah. The – because the IAEA report on Syria said that this – it was very likely that this was as nuclear plant that Iran – that Israel bombed in 2007, and I wonder if this serves as a basis now to bring this up to the UN Security Council for sanctions on Syria.

MR. TONER: Sure. Well, you're right, it does confirm our longstanding concerns about Syria and its – again, its lack of compliance with its international nuclear obligations. The actual – or the attempt by Syria to construct a clandestine nuclear reactor site is obviously a matter of concern, and we fully expect that the IAEA board will address this issue when it meets, I believe, next week. And I believe that's also the next – natural next step. The IAEA board will meet and then decide whether to advance it to the UN Security Council.

QUESTION: But is it the U.S. policy to take it all the way to the Security Council? Is that what you would like to do?

MR. TONER: Again, I don't want to preview how we will, but you can guess at how we'll vote. But you can guess that we view this as a matter – or you don't even need to guess; we view this is a matter of tremendous concern, and we'll make our views clear at the board meeting.

## **Under pressure, Syria offers nuclear cooperation**

By Fredrik Dahl

Mon May 30, 2011 11:27am GMT

VIENNA, May 30 (Reuters) - Syria, in a policy reversal, has offered to cooperate fully with the U.N. atomic agency, which wants to inspect a suspected nuclear reactor site that was bombed by Israeli warplanes in 2007, diplomats said.

The move comes as Western nations were pushing to report Syria to the U.N. Security Council for its uncooperative stance.

Damascus had insisted the site known as Dair Alzour was a military, non-nuclear complex before it was destroyed in 2007.

But that assertion by Syria -- which is also facing Western sanctions over a violent crackdown on pro-democracy unrest in the country -- was rejected in an IAEA report on May 24 which said Dair Alzour was "very likely" to have been a reactor.

U.S. intelligence reports said the desert site was a nascent, North Korean-designed reactor intended to produce plutonium for atomic bombs.

Damascus has rebuffed repeated requests by the International Atomic Energy Agency (IAEA) for follow-up access to the site after a one-off inspection in 2008.

The United States and its European allies were expected to seize on the IAEA report's finding to lobby for a resolution by the agency's 35-nation board, meeting on June 6-10 in Vienna, to send the Syrian file to the Security Council in New York.

In a move that could complicate this, Syria offered in a letter to IAEA chief Yukiya Amano late last week to fully cooperate with the agency to resolve outstanding issues related to Dair Alzour, diplomats said.

The promise may make some non-Western IAEA board members more reluctant about taking the issue to New York now.

"It will make it more difficult, there is no question about that," one senior diplomat from a developing country said. "It is a very smart move."

But a Western envoy said he expected the letter to have "close to zero impact" on the board's decision, saying it was an apparent last-minute attempt by Syria to undermine support for a vote to refer it to the Security Council.

"I think the letter will be seen, except by very close friends of Syria, as just going through the motions," he said.

"IN THE PAST"

Another Western diplomat said Syria's letter only "pledges cooperation in an attempt to stave off a resolution and Security Council referral. Syria has stonewalled the IAEA for three years, and this is more of the same."

The board has the power to refer countries to the Security Council if they are judged to have violated global non-proliferation rules by engaging in covert nuclear work.

It reported Iran to the Security Council in 2006 over its failure to dispel suspicions that it was trying to develop nuclear weapons. Tehran has since been hit with four rounds of U.N. sanctions over its refusal to curb sensitive nuclear work.

Syria, an ally of Iran, denies harbouring a nuclear weapons programme and says the IAEA should focus on Israel instead because of its undeclared nuclear arsenal.

Western diplomats said their approach to the Syrian nuclear issue was not linked to anti-government protests inside the country, saying Damascus had long failed to cooperate over Dair Alzour and it was now time to act.

But some non-Western members of the IAEA board have expressed doubt about taking strong action against Syria, saying that whatever happened at Dair Alzour was now history.

The new Syrian letter may further strengthen this view.

"Is it really something which you need to send to the Security Council, something that has happened in the past?" said the developing country diplomat.

## June Board of Governors Meeting Convenes

*[EXCERPTS]*

IAEA Director General Yukiya Amano opened the Board of Governors meeting on 6 June 2011 with his statement focusing on, among other issues, the Fukushima Daiichi nuclear accident, nuclear applications, and nuclear safeguards.

*[deletia]*

### Syrian Arab Republic

"As you will have seen from my report on the Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, the Agency has come to the conclusion that it is very likely that the building destroyed at the Dair Alzour site was a nuclear reactor which should have been declared to the Agency. This is the best assessment of the Agency, based on all the information in its possession.

"The Syrian Government was given ample time by the Agency to cooperate fully concerning the Dair Alzour site, but did not do so. Nevertheless, we had obtained enough information to draw a conclusion. I judged it appropriate to inform Member States of our conclusion at this stage as it was in no one's interest to let this situation drag on indefinitely. On 26 May, I received a letter from the Atomic Energy Commission of Syria, the contents of which have been shared with you. I am confident about our conclusion and I look forward to engaging further with Syria to resolve related outstanding issues.

"It is deeply regrettable that the facility was destroyed - allegedly by Israel - without the Agency having been given an opportunity to perform its verification role. Rather than force being used, the case should have been reported to the IAEA.

"Concerning the Miniature Neutron Source Reactor, Syria has cooperated with the Agency by providing the requested access to Homs, among other sites. Syria's statements concerning the previously unreported conversion activities at the MNSR and the origin of anthropogenic uranium particles are not inconsistent with the results of the Agency's verification activities. This matter will be addressed in the routine implementation of safeguards."

## **Russian Official: Moscow Will Not Support Any US resolution against Syria at IAEA** **Jun 07, 2011**

VIENNA, (SANA) – Moscow will not support the US draft resolution on Syria submitted to the International Atomic Energy Agency, Russian representative at the IAEA Board of Governors Gregory Berdennikov said on Monday.

Itar-Tass Agency reported Berdennikov as saying in Vienna that Russia considers this draft resolution as unbalanced and comes at an inappropriate time. Russia will vote against it.

The Russian official added that Syria sent a message to the IAEA that it is ready for cooperation, pointing out that instead of supporting this Syrian initiative, they suggest that we should adopt that resolution which could spoil everything. We are trying to convince the US that this is wrong.

## Russia resists Western push on Syria nuclear issue

By Fredrik Dahl

Tue Jun 7, 2011 6:57pm GMT

VIENNA, June 7 (Reuters) - Western powers pressed ahead on Tuesday with a bid to report Syria to the U.N. Security Council over covert nuclear activity, despite opposition from Russia and some other states, diplomats said.

They said the United States and allies put forward a draft resolution at a board meeting of the U.N. nuclear watchdog that would rebuke Damascus for its three years of stonewalling a probe into a Syrian desert site destroyed by Israel in 2007.

U.S. intelligence reports have said Dair Alzour was a nascent, North Korean-designed reactor intended to produce plutonium for atomic bombs before it was reduced to rubble.

The U.N. International Atomic Energy Agency (IAEA), giving independent weight to the U.S. allegation, said in a report last month that the facility targeted at Dair Alzour had "very likely" been a reactor.

The proposed resolution on Syria -- which is also facing Western sanctions over its violent crackdown on pro-democracy protests -- would refer the case to the Security Council in New York if adopted by the IAEA board, the diplomats said.

The agency's 35-nation governing body, holding a regular June 6-10 meeting in Vienna, was expected to debate the issue later in the week.

"It is a non-compliance resolution," one senior Western diplomat said, referring to Syria's international obligations to disclose any nuclear activities to the IAEA.

But several non-Western board members oppose or are doubtful about sending the issue to the Security Council. Some argue that whatever happened at Dair Alzour was now in the past and did not represent a current threat.

Along with Russia, the sceptics include China and some Arab states, diplomats said.

"Obviously the Russians have thrown a spanner in the works," one envoy from a developing country said.

### WARNING TO IRAN?

Western diplomats suggested the draft could still be amended if that would help to win wider support, even though they expressed confidence that they already had enough votes.

Russia and China are especially important because they are among five permanent and veto-wielding members of the Security Council. The others are the United States, France and Britain.

"Some European states and developing countries argue that, if only three of the P5 countries at the IAEA vote in favour of the resolution, and if Arab states oppose it, the resolution will have far less weight," said proliferation expert Mark Hibbs of the Carnegie Endowment for International Peace.

Russia and China have also resisted a Western call for the Security Council to condemn Syria's clampdown on anti-government protests, making clear they dislike the idea of council involvement in what they see as a domestic issue.

The IAEA board has the power to refer countries to the Security Council if they are judged to have violated global non-proliferation rules by engaging in covert nuclear work.

It reported Iran to the Security Council in 2006 over its failure to dispel suspicions that it was trying to develop nuclear weapons. Tehran has since been hit with four rounds of U.N. sanctions over its refusal to curb sensitive nuclear work.

Syria, an ally of Iran, denies harbouring a nuclear weapons programme and says world powers should focus on Israel instead because of its reputed nuclear arsenal.

In an apparent bid to derail any censure by the IAEA, Syria offered last month to fully cooperate with the agency, after earlier rebuffing repeated requests for access to Dair Alzour.

Western diplomats dismissed the Syrian initiative as a stalling tactic, and said action by the IAEA board was important in order to deter other countries from secret atomic activities. (Editing by Dan Williams)

## Board of Governors

**GOV/2011/40**

Date: 7 June 2011

**Restricted Distribution**

Original: English

### **For official use only**

Item 7(f) of the agenda  
(GOV/2011/36 and Add.1)

# Implementation of the NPT safeguards agreement in the Syrian Arab Republic

**Draft resolution submitted by Australia, Belgium, Canada, Czech Republic, Denmark, France, Germany, Italy, Republic of Korea, Netherlands, Portugal, United Kingdom and United States of America**

### The Board of Governors,

- (a) Noting the Director General's May 24, 2011 report (GOV/2011/30) on the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, and previous reports by the Director General regarding Syria (GOV/2008/60, GOV/2009/9, GOV/2009/36, GOV/2009/56, GOV/2009/75, GOV/2010/11, GOV/2010/29, GOV/2010/47, GOV/2010/63, and GOV/2011/8),
- (b) Recalling that Syria undertook to accept safeguards, in accordance with its comprehensive Safeguards Agreement (INFCIRC/407) concluded pursuant to Article III of the Treaty on the Non-Proliferation of Nuclear Weapons (NPT), on all source or special fissionable material in all peaceful nuclear activities within its territory, under its jurisdiction, or carried out under its control anywhere,

(c) Noting that the Director General in his latest report to the Board expressed regret that information concerning the Dair Alzour site was not provided to the Agency in a timely manner and that force was used before the Agency was given an opportunity to establish the facts in accordance with its responsibilities under Syria's Safeguards Agreement,

(d) Commending the Director General and the Secretariat for their professional and impartial efforts to implement the Safeguards Agreement in Syria and to resolve outstanding safeguards issues in Syria,

(e) Noting with serious concern that Syria's statements concerning the destroyed building at Dair Alzour are limited in detail, are not supported by documentation and have not allowed the Agency to confirm Syria's assertions regarding the non-nuclear nature of the building,

(f) Noting with serious concern Syria's lack of cooperation with the IAEA Director General's repeated requests for access to additional information and locations as well as Syria's refusal to engage substantively with the Agency on the nature of the Dair Alzour site since the Agency's June 2008 visit,

(g) Noting with serious concern the conclusion of the Agency that, notwithstanding the loss of information, and after considering Syria's response to allegations of an undeclared reactor and all relevant information available to the Agency, the building destroyed at the Dair Alzour site in September 2007 was very likely a nuclear reactor and should have been declared by Syria pursuant to Articles 41 and 42 of its Safeguards Agreement and Code 3.1 of the General Part of the Subsidiary Arrangements thereto,

(h) Mindful that the history of concealment of Syria's nuclear activities referred to in the Director General's reports, the nature of these activities, including the presence of a significant number of particles of anthropogenic natural uranium at the Dair Alzour site, procurement activities, and the resulting absence of confidence that Syria's nuclear program is exclusively for peaceful purposes, have given rise to concerns regarding the maintenance of international peace and security, and

(i) Noting that the Director General has repeatedly urged Syria to bring into force an Additional Protocol to its Safeguards Agreement, which would further facilitate the Agency's work in verifying the correctness and completeness of Syria's declarations,

1. Finds, based on the report of the Director General, that Syria's undeclared construction of a nuclear reactor at Dair Alzour and failure to provide design information for the facility in accordance with Code 3.1 of Syria's Subsidiary Arrangements are a breach of Articles 41 and 42 of Syria's NPT Safeguards Agreement, and constitute non-compliance with its obligations under its Safeguards Agreement with the Agency in the context of Article XII.C of the Agency's Statute;

2. Calls upon Syria to remedy urgently its non-compliance with its Safeguards Agreement and fulfill its May 26 pledge to the Director General by responding positively and without delay to the Director General's requests for updated reporting from Syria under its Safeguards Agreement and access to all information, sites, material and persons necessary for the Agency to verify such reporting and resolve all outstanding questions so that the Agency can provide the necessary assurances as to the exclusively peaceful nature of Syria's nuclear program pursuant to Syria's Safeguards Agreement;
3. Decides to report, as provided for in Article XII.C of the Statute, through the Director General, Syria's non-compliance with its Safeguards Agreement to all Members of the Agency and to the Security Council and General Assembly of the United Nations, to provide to the Security Council all reports prepared by the Director General related to the issue, and to make the text of this resolution as well as all previous reports on this issue available to the public;
4. Calls upon Syria to sign and promptly bring into force and implement in full the Additional Protocol and, pending that, to act in accordance with the Additional Protocol so that the Director General can provide the necessary assurances regarding both the correctness and completeness of Syria's declarations pursuant to its safeguards agreement;
5. Requests the Director General to continue his efforts to implement fully the Agency's safeguards agreement with Syria and to report any significant developments to the Board and to the Security Council of the United Nations, as appropriate; and
6. Decides to remain seized of the matter.

## **UN nuclear watchdog refers Syria to Security Council**

9 June 2011 Last updated at 12:23 ET

The UN nuclear watchdog is to report Syria to the Security Council over its alleged covert nuclear programme.

The International Atomic Energy Agency (IAEA) voted to rebuke Syria on claims of an undeclared nuclear reactor.

The alleged structure, which Syria has maintained was a non-nuclear military site, was destroyed by Israel in 2007.

The IAEA's move comes as international pressure mounts on the UN Security Council to censure Syria over its lethal crackdown on protests.

European nations on Wednesday presented a separate draft resolution to the Council condemning Syrian President Bashar Assad's regime.

### **Desert site**

At the IAEA meeting at its headquarters in Vienna, 17 countries voted for and six against, including Russia and China.

Diplomats said that overall 11 countries of the 35-member board of governors abstained and one country was absent from the vote.

Israel bombed the desert site of the alleged reactor - near Deir Alzour in the country's remote north-east - in September 2007.

The IAEA began investigating the allegations in June 2008, but Syria has refused to co-operate and, with the exception of a one-off visit, has not allowed UN inspectors to Deir Alzour or related sites to verify the US claims.

Thursday's motion was proposed by the US and its Western allies who had asked the IAEA's governing body to find Syria in "non-compliance" with its international obligations.

According to AFP news agency, US Ambassador Glyn Davies told the closed-door assembly: "Syria's apparent attempt at constructing a covert, undeclared plutonium production reactor, a reactor with no credible peaceful purpose, represents one of the most serious safeguards violations possible."

He said the intentions of the structure at Deir Alzour were clear and that a resolution was the only responsible course of action.

"The reactor there was built for the express purpose of producing plutonium for possible use in nuclear weapons."

### **'Regrettable'**

Syria's ambassador to the IAEA called the agency's move "regrettable" but pledged that the country would honour its obligations.

"I think Syria has always been committed to its obligations and to its duties and I think we will continue to do so," Bassam Al-Sabbagh said after the meeting.

Syria is a signatory to the Nuclear Non-Proliferation Treaty (NPT), which gives it the right to enrich its own fuel for civil nuclear power, under inspection from the IAEA.

But it has also signed a safeguards agreement with the IAEA under which it is obliged to notify the UN's nuclear watchdog of any plans to construct a new nuclear facility.

The last country the IAEA referred to the Security Council was Iran, in February 2006.

The Security Council has the power to impose sanctions, a move it has taken in the case of Iran no less than four times.

However, diplomats are not convinced that this will happen in Syria's case due to opposition from both Russia and China.

The diplomatic move at the IAEA came a day after Britain, France, Germany and Portugal proposed a draft resolution condemning Syria's crackdown on protesters to the Security Council, despite the risk of a Russian veto.

## **Statement by the Press Secretary on the IAEA Board of Governors Resolution on Syria**

THE WHITE HOUSE

Office of the Press Secretary

June 9, 2011

Today's decision by the IAEA Board of Governors that Syria violated its international nonproliferation obligations marks a significant action by the international community to uphold the nonproliferation rules of the road. As the IAEA reports, with assistance from North Korea, Syria attempted to build a secret nuclear reactor capable of producing large amounts of nuclear weapons-usable plutonium, but with no apparent legitimate civilian purpose. Syria has stonewalled and obstructed the efforts of the IAEA to investigate the nuclear reactor for years, refusing to provide access to associated sites, personnel and documents in violation of Syria's freely-accepted legal obligations. With this resolution, the Board has referred Syria to the UN Security Council for further deliberation, consistent with the Board's mandate and authorities when confronted with noncompliance. The United States remains determined to prevent the spread of nuclear weapons. We will work with partners and allies around the world to stand together to insist that every country meet its responsibilities or be held accountable for its actions.

U.S. DEPARTMENT OF STATE  
Office of the Spokesman

June 9, 2011

2011/934

## **STATEMENT BY SECRETARY CLINTON IAEA Resolution on Syria**

Today in Vienna, the International Atomic Energy Agency (IAEA) Board of Governors adopted a resolution, co-sponsored by fourteen nations, finding Syria in noncompliance with its international nuclear obligations. This is an important step given the troubling findings in the IAEA's latest report -- including Syria's demonstrated refusal to cooperate with the IAEA investigation and its attempts to construct a secret nuclear reactor with the assistance of North Korea. We fully welcome the IAEA's actions today to address this issue with the seriousness it deserves.

The IAEA's latest report outlining the very likely construction of a covert nuclear reactor makes clear that Syria was violating its nonproliferation obligations. The report is also a troubling update of Syria's continued refusal to cooperate with the IAEA investigation and efforts to conceal the true purpose of the facility, which raise further serious concerns about Syria's compliance with its international obligations. Syria must fully cooperate with the IAEA by providing necessary access to all sites, items, and information related to the Dair Alzour investigation and allow the IAEA to verify that Syria is fully complying with its safeguards agreement.

Syria is challenging the authority of the IAEA and the integrity of the nuclear Non-Proliferation Treaty regime. The only way Syria can demonstrate that it has come back into full compliance with the NPT is by cooperating with the IAEA and providing the necessary information and access.

## UN Nuke Agency Sends Syria to Security Council

By Jonathan Tirone

Jun 9, 2011 3:59 PM CT

*[EXCERPTS]*

The U.S. won a divisive vote that sent Syria to the United Nations Security Council over an alleged nuclear-weapon facility destroyed by an Israeli raid in September 2007.

The International Atomic Energy Agency's 35-member board of governors voted 17-6 today to report Syria to the UN's top decision-making body. Eleven countries abstained from voting on the U.S. and European measure that called Syria a threat to "international peace and security" and Mongolia was absent.

"We had in the latest IAEA report a conclusion that was sufficiently robust that we believed we could take action on," U.S. IAEA Ambassador Glyn Davies said after the vote. "It is not appropriate for a country to build a secret nuclear reactor. It had no civilian purpose."

The UN nuclear agency concluded on May 24 that Syria was probably building a surreptitious nuclear reactor. The government in Damascus stymied IAEA inspections and limited access to the bombed site for more than three years. Investigators reported finding traces of modified uranium particles at the bombed Dair Alzour site that they said may have been residue from a reactor.

*[deletia]*

China and Russia led opposition to the measure, which will give the Security Council leeway to impose sanctions against Syria. Russia called the IAEA referral "unfair and not objective," in a written statement to the board.

"Under current circumstances, there is no need to adopt a resolution on the Syrian nuclear issue, and even more unnecessary to refer the issue to the Security Council," China's IAEA Ambassador Wang Minzheng said, according to the state-run news agency Xinhua.

The Security Council referral coincides with a separate European resolution to punish the embattled regime of Syrian President Bashar al-Assad. His security forces have killed at least 1,100 people and detained more than 10,000 since protests against his government began in mid-March, according to human-rights groups.

"When you have a situation where the permanent five members of the Security Council are split, that can make it tough for countries," Davies said about the number of nations that voted against or abstained from voting on the measure.

"It is certainly a new precedent," Peter Crail, a Washington-based Arms Control Association analyst, said in an e-mail response to questions. "Syria doesn't have very many friends, and countries may have been more willing to accept standards of 'good-enough' evidence."

## Syria Faces Sanctions For Alleged Nuclear Facility

by Mike Shuster

June 9, 2011

MIKE SHUSTER: It's been nearly four years since Israel bombed a construction site in the Syrian Desert near the town of Dair Alzour. Almost a year later, Syria allowed a team of inspectors from the IAEA to visit the site, but by that time the Syrians have removed the rubble, scrubbed the site clean and built a warehouse where a suspected nuclear reactor had been under construction.

For another three years, the agency tried to persuade Syria to let it mount a full investigation, involving visits to three more locations in Syria, access to documents for the original site and to the engineers who were building the facility. To all those requests, Syria said no. Finally, earlier this week, Yukiya Amano, the IAEA's director, went public with his conclusions in a speech to the 35 nations that comprise the agency's board of governors.

Mr. YUKIYA AMANO (Director, IAEA): The agency has come to the conclusion that it is very likely that the building destroyed at the Dair Alzour site was a nuclear reactor which should have been declared to the agency. This is the best assessment of the agency based on all the information in its possession.

SHUSTER: With that conclusion in hand, the U.S. along with 12 other nations put forward a resolution declaring Syria in noncompliance with its legal obligations to the IAEA. Today, that resolution received 17 votes in favor, six nations voted against, eleven abstained, and one nation was absent.

After the vote, the U.S. ambassador at IAEA, Glyn Davies, said the reactor under construction had no credible peaceful purpose and was being built solely in order to produce plutonium for possible use in nuclear weapons.

Ambassador GLYN DAVIES (IAEA): They really should come clean about what they were doing in the desert, what they started to do a half a decade ago by building this nuclear reactor.

SHUSTER: Syria's ambassador called the vote today regrettable but pledged full cooperation with the agency.

Frequently in the past, the IAEA's board of governors has preferred to seek consensus on its resolutions, but clearly, the board is deeply divided on this issue. China said there was no reason to refer Syria to the Security Council. Russia called the action untimely and not objective.

But Olli Heinonen, a former senior official of the IAEA, said the action was necessary to protect the agency's credibility.

Mr. OLLI HEINONEN (Former Official, International Atomic Energy Agency): I see it as an erosion in the verification scheme because here we have a partner who doesn't cooperate with the IAEA, and IAEA doesn't use all the tools and means at its disposal.

SHUSTER: With China and Russia now on record opposing the action against Syria, though, it will be very difficult to convince them to support punitive action in the Security Council such as economic sanctions.

## **Sabbagh: IAEA Board of Governors didn't Respond to Syria's Offer to Cooperate with the Agency**

SANA (Syria Arab News Agency)

10 Jun 2011

Vienna, (SANA)- Syria's permanent envoy to the International Atomic Energy Agency (IAEA) in Vienna, Ambassador Bassam al-Sabbagh expressed disappointment and deep regret after the IAEA Board of Governors has adopted a resolution regarding application of the comprehensive guarantees' agreement in Syria, based on assumptions, not on facts or evidence.

"The resolution didn't respond to the offer extended by Syria to cooperate with the international Agency according to its message sent on May 26th, but the response was through issuing this resolution which is considered as a negative sign by the Board of Governors," Al-Sabbagh said in a speech on Thursday.

He underlined that the resolution was unbalanced because it had ignored Israel's military flagrant aggression on the sovereignty of a country member in IAEA and a party in the non- Proliferation Agreement as well as destructing a military- under construction- building that had no relation to any nuclear activities.

" Israel has violated the rules of the international law and international legitimacy resolutions... the resolution has also ignored the concerns regarding Israel's rejection of cooperating with IAEA to provide it with information about the nature of materials used in destructing or polluting the site in Deir Ezzor," the Syrian Ambassador said.

IAEA's Board of Governors had adopted a draft resolution submitted by the Western group asking the General Director to inform the UN Security Council about the evaluation of the Agency regarding the site destructed by Israel in 2007.

Federal Russia, China, Venezuela, Pakistan, Azerbaijan and Ecuador have voted against the resolution while countries of the Non-Aligned Movement abstained.

## **Iran Urges Verification of Israel's Military N. Program**

News number: 9003200586

13:20 | 2011-06-10

**TEHRAN (FNA)- Iranian envoy to the International Atomic Energy Agency (IAEA) called on the UN nuclear watchdog to continue its technical verification activities specifically sampling missile launchers in Israel and report the result of the analysis of contamination.**

Ali Asqar Soltaniyeh made the remarks, addressing the IAEA Board of Governors on Thursday. The full text of his comments which also includes Syrian issue is as follows:

In the Name of God  
The Most Gracious and the Most Merciful

Mr. Chairman,

I have to declare the following:

1- The Issue of Syria is a clear evidence of the instrumental use of the international organizations specifically IAEA and the UNSC.

2- A sovereign Member State of the IAEA has been attacked by Zionist regime of Israel, having the dark record of violation of all international laws. Its very existence is by occupation, expelling millions of innocent Palestinian from their homelands and massacring thousands of children and women.

3- Silence of the United Nations vis-à-vis the aggression which a clear breach of the UN Charter is shameful. Another dark chapter which confirm the legitimate demand for a reform of the UNSC.

4- Director General was officially requested to investigate the source of contamination at the bombard site by taking samples from the Israeli missile launcher. DG has not taken any action. I remind that the principle function of the IAEA related to verification if based on nuclear material. How come DG permit himself to make any conclusion based on couple of Satellite imagery received for US and Israeli intelligence as well as some commercial companies. Agency has to only conclude base on diversion of nuclear material.

5- I recall that according to the Agency's resolution 533 of 1990, any threat or attack against nuclear facilities under construction or under operation constitute violation of UN Charter, IAEA Statute and the international laws. The UNSC must immediately act upon according this resolution. The world faces the shameful silence of the UNSC and some western countries particularly the allies of Zionist regime supporting at any price even damaging the image of their nations. The international community has to know about this bitter facts and the unjust situation we are facing in this century in such international arena. The matter is very simple even if the claim of aggressor is true then has to be condemned and according article XIX of the Statute and based on resolution 533 has to be deprived from the right and privileges of membership of the IAEA.

6- The draft of resolution proposed by the United States has serious legal and technical problem. I only mention some:

A- According to paragraph C of the article XXII, non-compliance has to be recognized by the inspectors then to be reported to the DG where he does report to the Board of Governors. In case of Syria this is not applied. There is no non-compliance. Even if it was a project to construct a reactor it is a failure of delay in reporting civil

construction. As I said the basis of judgment has to be the diversion of nuclear material to military purpose. Which is not applied to Syrian case.

B- The article XII-C written decades ago was for the recipient states that has miss-used the nuclear material received from the Agency and diverted to military purpose. The phrase "Recipient State or States" in this article speak for itself. Syria has not received nuclear material from Agency to use in Dair-Alzor site. Therefore this article does not apply to Syria.

Conclusion:

- 1- Zionist Regime has to be condemned for the violation of the UN Charter and the IAEA Statute.
- 2- DG has to continue its technical verification activities specifically sampling missile launcher in Israel and report the result of the analysis of contamination;
- 3- If the UNSC is once again involved in the IAEA matters, by adoption of the draft resolution, DG is fully accountable for the consequences including damaging the credibility and authority of the Agency since his unbalance, inconclusive, politically motivated, hasty and careless report, which he submitted upon the request of the United States has pave the way. The United States as well as those voting this draft which lacks any legally and technical basis has to share the blame of the consequence specially the polarization and confrontational environment.

Thanks

Other Matters  
Mr. Chairman,

The IAEA is facing a crisis of legitimacy by continuous involvement of the UNSC and weakness of the Secretariat to perform professionally as mandated by the General Conference. The Board of Governor is deviating from the right path. This is to push for the amendment of the Statute for changing the structure and membership on of the Board of Board of Governor. 35 seats mainly from a certain block, blocking any decision and passing resolution damaging the Agency cannot continue. Amendment of article 6 for the increase of membership from 35 to 42 of the Statute is not in force yet. Other provision on the election and appointment of DG has to be amended in such a way that all Member States could have a voice so that the elected DG could have chosen by screening of all membership and nor few in the Board of Governor.

Thanks

<http://www.sana.sy/eng/21/2011/06/26/354928.htm>

## **Habib: Syria encounters conspiracy and mounting pressures, but strong by national unity**

M.Eyon

Jun 26, 2011

DAMASCUS, (SANA)-Minister of Defense Ali Habib on Sunday underlined that Syria encounters conspiracy and mounting pressures by several foreign sides in a bid to internationalize, interfere and instigate internal conflict in the country.

"The US and western countries have imposed sanctions on Syria and exerted pressures on the UN to issue a resolution condemning it and refer the so-called Syrian nuclear file, all to intensify pressures on Syria," Minister Habib said in a speech at a celebration to graduate army officers under the patronage of President Bashar al-Assad.

He added that armed terrorist organizations have sabotaged, burned private and public buildings and properties, killed and mutilated the bodies of the army soldiers, officers and policemen.

Habib underlined that Syria is strong and immune by the unity of its people who support the Syrian leadership to overcome the current crisis.

## **AP Exclusive: Security Council to talk Syria nukes**

By GEORGE JAHN

Associated Press

Published: Monday, July 4, 2011 at 4:58 p.m.

Last Modified: Monday, July 4, 2011 at 4:58 p.m.

VIENNA - The U.N. Security Council plans to meet next week to discuss what to do about Syria's refusal to cooperate with an investigation of its alleged secret nuclear activities, diplomats told The Associated Press on Monday.

The move comes just weeks after the International Atomic Energy Agency referred it the council. The closed session could result in anything from debate to sanctions of the kind imposed on Iran for defying international demands to cease activities that could be used to make nuclear arms.

Sanctions are unlikely: Iran continues to expand its nuclear activities in defiance of the council, whereas Syria's alleged violations appeared to have occurred in the past and thus do not seem to represent a present proliferation threat.

Still, one of the three diplomats who agreed to discuss confidential information on condition of anonymity said the planned July 14 discussions are significant. He pointed to the fact that the council found the issue important enough to take it up less than a month after the June 9 IAEA referral.

The IAEA has tried in vain since 2008 to follow up on strong evidence that a site in the Syrian desert, bombed in 2007 by Israeli warplanes, was a nearly finished reactor built with North Korea's help.

The resolution that reported Syria to the Security Council expressed "serious concern" over "Syria's lack of cooperation with the IAEA Director General's repeated requests for access to additional information and locations as well as Syria's refusal to engage substantively with the Agency on the nature of the Dair Alzour site."

Syria is already on the Security Council's docket. The council on Thursday expressed united support for the U.N. peacekeeping force on the tense Syrian-Israeli border - even while remaining divided over any direct condemnation of Syria's crackdown on peaceful demonstrators and human rights abuses.

All three diplomats said that the council had asked high-ranking IAEA officials to testify at the hearing - another sign of the importance attached to it. They said that IAEA chief Yukiya Amano and Herman Nackaerts, the agency's nonproliferation point man, would either both attend or one of them would go.

IAEA officials contacted after office hours Monday said they could not comment.

Two of the diplomats said that influential Western member nations of the IAEA and the agency itself were concerned that the council might simply decide to throw the case back to the agency.

That could burden the IAEA with additional work on Syria, they said, and thereby deflect from IAEA efforts to concentrate on Iran - considered by most of the agency's 35-nation board to be greatest potential nonproliferation threat.

Western powers pushing referral at the June 9 IAEA board meeting had two goals: to show that Syria could not defy the agency and to clear the decks for potential referral of Iran to the council later this year.

But if the Security Council asks the IAEA to prepare a new report on Syria, it would need to split its work between Syria and Iran, potentially diluting its efforts on pressuring Tehran to heed international demands for nuclear openness and cooperation, they said.

Iran already was reported by the IAEA to the Security Council in 2005, setting into motion four sets of sanctions - which the Islamic Republic has ignored. Western nations hope that a new referral would ramp up the pressure.

The council has demanded that Iran stop enriching uranium, which can create both reactor fuel and fissile warhead material. It also wants Tehran to stop stonewalling IAEA attempts to investigate growing allegations that the Islamic Republic worked on secret experiments that could be used in a nuclear arms program.

Iran denies such experiments and says it is enriching only to create fuel for future nuclear power plants.

## UN Security Council to discuss "secret" Syrian nuclear programme

Jul 13, 2011, 16:10 GMT

New York/Vienna - The UN Security Council planned to discuss Syria's alleged secret nuclear programme with a senior International Atomic Energy Agency (IAEA) inspector who was traveling to New York to present the agency's findings, diplomats in Vienna said Wednesday [2011-07-13].

The 15-nation council meeting on Thursday was to take place behind closed doors with senior IAEA inspector Neville Whiting, but was not expected to adopt any immediate action, diplomats said.

The council is being presided over by Germany for July.

The IAEA's governing board formally referred the case to the top UN body last month, reacting to IAEA chief Yukiya Amano's conclusion that Syria had likely been building a reactor.

Whiting would keep his presentation technical, to make sure that the Vienna-based nuclear agency does not get drawn into the UN Security Council's political process, dominated mostly by the five permanent members, who are often split on controversial nuclear issues, including those in North Korea.

Diplomats said the briefing would include satellite images and intelligence photos of the site that was bombed by Israel in 2007.

'There will definitely be no resolution or presidential statement,' one diplomat said, citing the reluctance of veto powers Russia and China, which in the past preferred to keep discussions confidential.

Russia and China had been opposing referring Syria's nuclear issue from Vienna to New York, along with IAEA board members Azerbaijan, Ecuador, Pakistan and Venezuela.

Western countries had pushed for this step.

Damascus maintains that the Dair Alzour site in the desert was a conventional military installation.

After several years of Syria blocking the IAEA's probe, the nuclear agency concluded it was likely a reactor, based on the layout and dimensions of the buried remains, the local infrastructure and uranium traces found by IAEA inspectors.

## **U.S., Europeans Blocked Anew at UN Over Syrian Nuclear Plant**

By Bill Varner

Jul 13, 2011 1:27 PM CT

The U.S. and its European allies at the United Nations are facing the same opposition to punishing Syria's secret construction of a nuclear facility that has blocked their efforts to condemn government repression of protesters.

The Board of Governors of the International Atomic Energy Agency voted on June 9 to report Syria's violation of non-proliferation accords to the UN Security Council. Neville Whiting, the IAEA's director of nuclear safeguards for the Middle East, is scheduled to brief the council tomorrow on Syria's failure to report the facility and refusal to cooperate with an investigation by the Vienna-based nuclear agency.

Russia is leading opposition in New York that will likely make the briefing and a subsequent private discussion the Security Council's only involvement in the issue. Recognizing the division in the 15-member council, the U.S., Britain, France, Germany and Portugal haven't sought a statement or threatened sanctions against Syria.

The Security Council should play "no role" in the matter, Russia's Deputy Ambassador Alexander Pankin said.

"In a crime investigation, if you don't have a corpse you don't have a case," Pankin said, referring to the fact that Israel destroyed the then-suspected nuclear reactor in 2007. "There is nothing there. We are not an investigation team, we are the Security Council. We deal with imminent or coming threats."

'Won't Fly'

Ambassador Hardeep Singh Puri of India, a Security Council member, said that while he heard that a draft statement might be circulated to the panel, "it won't fly." Russia and China, which voted against the IAEA resolution, would block any proposed statement on the nuclear facility, he said.

Susan Rice, the U.S. ambassador to the UN, acknowledged the division in the Security Council today by telling reporters that "there are several members of the council, including some veto-wielding members, who did not support the referral and who are unlikely to support a council product."

India has joined Russia, China and Security Council members Brazil and South Africa in opposing a draft resolution condemning the repression in Syria. It's been blocked since late May.

Asked Brazil's view of how the Security Council should handle the Syrian nuclear issue, Ambassador Maria Viotti said there were "no grounds for doing anything."

The UN nuclear agency concluded on May 24 that Syria was probably building a surreptitious nuclear reactor. The government in Damascus stymied IAEA inspections and limited access to the bombed site for more than three years. Investigators reported finding traces of modified uranium particles at the bombed Dair Alzour site that they said may have been residue from a reactor.

Syria's Ambassador Bashar Ja'afari said the Security Council shouldn't be discussing the issue. It's the "IAEA's business," he said.

## U.N. nuclear agency brings Syria to Security Council

By Patrick Worsnip and Megan Davies

UNITED NATIONS | Thu Jul 14, 2011 7:46pm EDT

(Reuters) - The U.N. nuclear watchdog brought allegations of covert atomic work by Syria before the Security Council on Thursday, but the 15-nation body took no immediate action amid divisions among key powers.

The International Atomic Energy Agency board of governors voted in June to report Syria to the council, rebuking it for stonewalling an agency probe into the Dair Alzour complex, bombed by Israel in 2007.

Western countries said Thursday's closed-door briefing by Neville Whiting, head of the IAEA safeguards department dealing with Syria and Iran, had made clear that Syria had a secret nuclear plant. They said the council should pursue the issue, but suggested it might not discuss it again before September.

Russia and China, allies of Damascus who can veto any council action, queried whether the council should be involved, as the Syrian complex no longer exists.

U.S. intelligence reports have said the complex was a nascent, North Korean-designed reactor intended to produce plutonium for atomic weaponry, before Israeli warplanes reduced it to rubble. Syria has said it was a non-nuclear military facility.

British Ambassador Mark Lyall Grant told reporters Whiting had given a "devastating briefing ... from which you could only draw one conclusion -- that Syria did have at Dair Alzour a clandestine nuclear plant."

Damascus had "tried to conceal the purpose of that plant ... misled the IAEA about what the purpose was and ... failed to cooperate effectively with the IAEA in following up the questions that the IAEA put to them," he said.

### NEW REPORT

Both Lyall Grant and German Ambassador Peter Wittig noted that the IAEA was due to produce a new report on Syria for its board of governors in September. "And then we take it from there," Wittig said.

But Chinese envoy Wang Min said Beijing was "not very happy" about the council's involvement. "We should not talk about something that does not exist. There are a lot of things that happened in the past -- should we discuss all of them?" he asked.

Russian envoy Alexander Pankin, asked what he had learned from Thursday's briefing, said "not much."

Syrian Ambassador Bashar Ja'afari said the meeting "didn't come to any conclusion because the Security Council considers only matters related to threats to peace and security, not to prefabricated, unfounded accusations against a member state of the United Nations."

"The point is that there is no case for the Security Council to consider in its deliberations," he said.

Diplomats have said council members could strive for language urging Syria to cooperate with the IAEA but that Damascus is unlikely to face U.N. sanctions over the issue.

Syria pledged on May 26 to cooperate with the IAEA and provide access to sites and information related to the probe, but Lyall Grant quoted the nuclear watchdog as saying cooperation had not improved since then.

In a statement, U.S. Ambassador Susan Rice called on Syria to fulfill its pledge and that Damascus's "positive and prompt cooperation with the IAEA would be the best way to resolve outstanding questions about its nuclear program."

## AP Interview: IAEA chief says no progress on Syria

By GEORGE JAHN, Associated Press

1 hour ago [Accessed 2011-07-22T19:26Z]

VIENNA (AP) — International Atomic Energy Agency experts met with Syrian officials recently, but received no information that would change the IAEA's assessment that Damascus tried to secretly build a plutonium-producing reactor, the agency's head said Friday.

"There was nothing concluded" from the talks earlier this month, which arose from a pledge by Damascus to cooperate with an agency probe, IAEA Director General Yukiya Amano told The Associated Press.

He said it was now up to Syria to disprove the agency's assessment that a target destroyed in 2007 by Israeli warplanes was a nearly finished reactor built clandestinely, and meant to produce plutonium, which can be used to arm nuclear warheads .

"We have done our jobs," Amano said. "If there is further cooperation it is very nice. If not, ... the conclusion is there."

The U.N. Security Council met in closed session on July 14 to discuss the IAEA finding and some Western ambassadors said afterward that the agency's assessment has raised concerns the country violated its nonproliferation obligations.

The IAEA has tried in vain since 2008 to follow up on strong evidence that the site in the Syrian desert bombed by Israel was a nearly finished reactor built with North Korea's help.

Syria has said the facility was a non-nuclear military site.

The IAEA resolution that reported Syria to the Security Council on June 9 expressed "serious concern" over "Syria's lack of cooperation with the IAEA Director General's repeated requests for access to additional information and locations as well as Syria's refusal to engage substantively with the Agency on the nature of the Dair Alzour site."

Asked whether the popular uprising in Syria contributed to the lack of progress at the July meeting between Syrian and IAEA officials, Amano said the Syrians "didn't have an explanation to that effect, but our understanding is that they were too busy."

He said the agency was still hoping for cooperation from Damascus, but "if they don't prove otherwise, we continue to be very confident with our conclusion" that the site Israel targeted was a secret nuclear reactor.

## US Air Force Commander Visits Israel

Sat, 23 Jul 2011 - 1:15 AM

Recently, General Mark A. Welsh III, the U.S. Air Forces in Europe commander, was in Israel for a four-day working visit with the Israeli Air Force (IAF). During the scheduled visit, Gen. Welsh was briefed on the capabilities and activities of the General Corps, as well as the increase in US-Israel air force cooperation.

The general also met with Israeli Air Force Commander Major General Ido Nechushtan; part of their scheduled time included a tour of Yad Vashem, the Holocaust Memorial in Jerusalem, and the Nevatim and Palmachim airbases.

At the Nevatim airbase, Gen. Welsh viewed the F-16 squadron, the plane which took part in the IAF attack on Iraq's nuclear reactor. At the Palmachim airbase, he visited the Sword Shield unit which operates the Arrow antitactical ballistic missile program and maintains US-Israel cooperation on missile defense.

In addition, the general addressed the activities of US Air Forces in Europe during working meetings with high-ranking IAF commanders.

## **IAEA head chides Iran, N. Korea, Syria**

**Published: July 27, 2011 at 1:21 PM**

MATSUMOTO, Japan, July 27 (UPI) -- The U.N. nuclear energy chief Wednesday singled out Iran, North Korea and Syria for not complying with a nuclear weapons non-proliferation treaty.

"My approach to nuclear verification since taking up office in December 2009 has been very straightforward," Yukiya Amano, director general of the International Atomic Energy Agency, said in a release. "All safeguards agreements between [member countries] and the agency, and other relevant obligations such as U.N. Security Council resolutions, should be implemented fully."

Iran was not cooperating with IAEA officials in providing "credible assurance about the absence of undeclared nuclear material and activities" and that nuclear material in Iran was used for peaceful purposes, Amano said during the 23rd U.N. Conference on Disarmament Issues in Matsumoto, Japan.

North Korea's nuclear program "remains a matter of serious concern," Amano said, because the IAEA hasn't been able to implement any safeguard measures in the country since April 2009.

"Last year's reports about the construction of a new uranium enrichment facility and a light water reactor in [North Korea] are deeply troubling," he told the conference.

Concerning Syria, Amano said the IAEA concluded it is "very likely" a building destroyed in Dair Alzour in 2007 was a nuclear reactor that should have been declared.

"Following my latest report on this subject, the IAEA board of governors last month adopted a resolution finding Syria to be in non-compliance with its safeguards obligations," he said. "I continue to engage with Syria to resolve related outstanding issues."

Amano said the nuclear agency supports creation of new nuclear weapons-free zones and will help in their implementation. He said he was discussing with IAEA members the possibility of a forum on the relevance of current nuclear weapon-free zones and the consideration of establishing a zone in the Middle East.

## **APNewsBreak: Israel, Arabs, back nuke meeting**

By GEORGE JAHN - Associated Press

AP – Wed, Aug 10, 2011

VIENNA (AP) — Following more than a decade of diplomatic maneuvering, Israel and Arab nations have tentatively accepted an invitation by the U.N. nuclear agency for preliminary talks on a Middle East free of nuclear weapons, in correspondence shared with The Associated Press.

Israel is commonly considered to be the only Middle East nation with atomic weapons — and its secretive nuclear program has long been a heated subject of contention with Arab neighbors.

Letters from Egypt and Israel and passages from a letter from Syria reflect a willingness to meet. But whether the talks take place may depend on willingness to compromise on preconditions.

The Arabs have urged Israel to open up its secretive nuclear program to international inspection. Israel in turn says the proposed talks should not be construed as nuclear negotiations.

Reflecting the sensitivity of the issue, a statement from the office of Israeli Prime Minister Benjamin Netanyahu said Wednesday that Israel's reported willingness to discuss a nuclear weapons-free Middle East "is not correct."

But in a May 2 letter made available to the AP, Shaul Chorev, head of Israel's atomic energy commission, told International Atomic Energy Agency chief Yukiya Amano that "Israel is ready to cooperate with you" with his efforts to convene talks on "the experience of other regions ... relevant to the establishment of a NWFZ" — a nuclear weapons free zone.

The official and members of other delegations describe the chances of success as possibly the best since 2000. That was when IAEA nations first asked the agency to convene such talks.

An official from a delegation accredited to the International Atomic Energy agency says Amano planned to meet with the Arab group on Sept. 5 to try to bridge differences. He and others spoke on condition of anonymity because their information was confidential

Amano himself attaches high importance to the meeting — despite its relatively modest scope, focusing only on "the potential relevance" to the Middle East of nuclear-free zones elsewhere in the world. He told the AP that the talks would be "a very rare and good occasion in which all parties concerned can discuss their issues."

Israel's presumed nuclear power status and constantly flaring Mideast tensions have made any talks the Jewish state and Arab countries a rarity since the mid-1990s, when regional peace negotiations broke down.

But a decision last year by the 189 members of the Nuclear Nonproliferation treaty to convene a U.N.-sponsored conference on establishing a Middle East nuclear-free zone appears to be working as an incentive for the region's Muslim nations to meet this year with Israel for the exploratory Vienna talks.

Arab countries and Iran are aware of the potential of using the 2012 U.N. conference as a platform to pressure Israel to fulfill their long-standing demands: joining the nonproliferation treaty, acknowledging that it has nuclear weapons and allowing IAEA inspectors to probe their atomic activities.

Israel is unlikely to do any of that. It remains unclear whether it will even attend the 2012 talks and Chorev, the Israeli nuclear chief, emphasized in his response to Amano's overture that his country views any Vienna meeting as "solely an informational and discussion event and not a forum for negotiations."

Egyptian Ambassador Ehab Fahwzy drew a clear link between the proposed 2012 conference and the Vienna talks. In his letter to Amano shared with the AP, he said such talks "acquire added significance" in the wake of the decision to hold next year's gathering.

Newfound Arab and Iranian willingness to sit at the same table with the Jewish state was already reflected in a little-publicized closed-door meeting convened in Brussels by the European Union last month, where the two sides exchanged views on nonproliferation and confidence-building.

Even Syria appears ready to compromise, despite traditionally stormy relations with Israel exacerbated by Israel's 2007 air strike that destroyed what the IAEA says was a nearly finished secret nuclear reactor capable of producing plutonium. Its conditions, cited by an official who has seen them, are vague, stressing only "the need for the parties wishing to establish a nuclear free zone in the Middle East to implement international obligations and ratify the relevant treaties."

Iran remains a wild card for the Vienna talks. Its president has called for the eradication of the "Zionist" state and in past years has called for full Israeli openness on its nuclear program as a precondition for any talks. Israel in turn says peace must be established in the Middle East as a precondition for nuclear discussions.

Officials familiar with the proposed Vienna talks said Tuesday that Iran had still not indicated whether it would attend. An AP email to Ali Asghar Soltanieh, Tehran's chief representative to the IAEA, was not answered by Wednesday.

The official who had seen the Syrian letter said that Arab representatives were considering attending the talks even if Iran refuses. That would represent a breach of Mideast Islamic solidarity in dealings with Israel and likely exacerbate tensions between Shiite Iran and its mainly Sunni Arab neighbors.

## **Cheney Says He Urged Bush to Bomb Syria in '07**

By CHARLIE SAVAGE

Published: August 24, 2011

*[EXCERPT]*

WASHINGTON — Former Vice President Dick Cheney says in a new memoir that he urged President George W. Bush to bomb a suspected Syrian nuclear reactor site in June 2007. But, he wrote, Mr. Bush opted for a diplomatic approach after other advisers — still stinging over “the bad intelligence we had received about Iraq’s stockpiles of weapons of mass destruction” — expressed misgivings.

“I again made the case for U.S. military action against the reactor,” Mr. Cheney wrote about a meeting on the issue. “But I was a lone voice. After I finished, the president asked, ‘Does anyone here agree with the vice president?’ Not a single hand went up around the room.”

Mr. Bush chose to try diplomatic pressure to force the Syrians to abandon the secret program, but the Israelis bombed the site in September 2007. Mr. Cheney’s account of the discussion appears in his autobiography, “In My Time: A Personal and Political Memoir,” which is to be published by Simon & Schuster next week. A copy was obtained by The New York Times.

<http://www.seattlepi.com/news/article/APNewsBreak-Syria-reportedly-stonewalling-IAEA-2150603.php>

## **APNewsBreak: Diplomats say Syria stonewalling IAEA**

GEORGE JAHN, Associated Press

Updated 05:59 a.m., Thursday, September 1, 2011

VIENNA (AP) — Syria has reneged on a promise to quickly cooperate with a U.N. probe of its nuclear activities, saying it won't be able to provide more information to challenge an assessment that it tried to build a plutonium-producing reactor until October, diplomats told The Associated Press on Thursday [2011-09-01].

The delayed cooperation will likely add to concerns that Damascus was in the early stages of a secret program that could be harnessed to produce nuclear weapons. It also comes as Syrian leader Bashar Assad faces unprecedented international pressure over his months-long crackdown on anti-government protesters, possibly deflecting attention in Damascus from dealing with the nuclear issue.

The two diplomats, who asked for anonymity because their information is confidential, said U.N. nuclear chief Yukiya Amano will tell board member nations of the International Atomic Energy Agency that he has been unable to make progress in his Syria probe at their 35-nation meeting starting Sept 12.

The board referred Syria to the U.N. Security Council in June for stonewalling IAEA attempts to investigate covert nuclear activities revealed in 2008, a year after Israeli warplanes bombed a secret Syrian desert site.

After trying in vain for three years to secure Syrian cooperation in its investigation, the IAEA drew on evidence available in June to assess that the target was in fact a nearly finished reactor, built with North Korean help, meant to produce plutonium.

Along with highly enriched uranium, plutonium can be used to arm nuclear warheads.

Syria has denied any secret nuclear activities. But the Arab country also has rejected IAEA requests for follow-ups to an initial visit to the desert site and access to others believed linked to it.

In a letter shared with the AP just before the Security Council referral in June, the Syrian government promised "full cooperation" with the probe. Since then, however, Amano has told the AP that meetings with Syrian nuclear officials have produced no results.

The diplomats said Thursday that the Syrians told the agency in a recent letter that they cannot meet requests for access to suspect sites and other information until October. Damascus did not provide substantial details about the reason for the delay.

Amano last month told the AP that — unless the Syrians come forward with new information — the agency stands by its assessment that the facility destroyed by Israeli jets in 2007 was meant to be a plutonium-producing reactor once completed.

The agency has produced regular written reports on its attempts to probe Syria's undeclared nuclear programs since 2008, but the diplomats said that won't be the case for the September board meeting, in another reflection of the fact that Damascus has provided no information to help the IAEA probe.

The U.N. Security Council met in closed session on July 14 to discuss the IAEA assessment. Some Western ambassadors said afterward that the agency's findings raised concerns that Syria violated its nonproliferation obligations.

## Gates and Netanyahu

by Elliott Abrams

Posted on Friday, September 9, 2011

While I've been out of the country a small tempest has, I see, developed about former Secretary of Defense Gates's views of Prime Minister Netanyahu. Jeffrey Goldberg reported this:

Senior administration officials told me that Gates argued to the president directly that Netanyahu is not only ungrateful, but also endangering his country by refusing to grapple with Israel's growing isolation and with the demographic challenges it faces if it keeps control of the West Bank.

In Israel, where of course this is big news, critics of Netanyahu have blamed him for sparking such views from Gates. Even in the United States, it has been Netanyahu who is blamed for evoking such an attitude from Gates.

I beg to differ, for in my experience Secretary Gates had and expressed this exact view in 2007. As Vice President Cheney's new memoir recounts in some detail, there was in the spring and summer of that year long consideration of what to do about the then recently discovered Syrian nuclear reactor. There were endless discussions between Israeli and U.S. officials, and meeting after meeting inside the U.S. government. I participated in most of them.

Vice President Cheney notes that he favored a U.S. bombing of the reactor, and was alone in this. That is my memory as well. I was alone in favoring an Israeli strike, for I thought it would be useful to restore some of the credibility they had lost in the Lebanon War of 2006. Secretaries Rice and Gates favored a diplomatic route, taking the Syrians first to the IAEA and then to the UN Security Council to demand that they take the reactor apart. Cheney believed, and I agreed, that this was folly: the Syrians could drag that out for years while they finished construction of the reactor. When had the UN ever forced a rogue state to give up its nuclear program, Cheney asked. Moreover, once the Syrians found out that we knew about the reactor our military options would be gone: for example, in Saddam Hussein style they could put a kindergarten or hospital at the site and prevent a strike—for once the reactor was "hot" a strike could create dangerous effects for many miles around.

In the end, the president was persuaded to try the diplomatic route and told then Prime Minister Olmert this. Olmert immediately responded that this would not work, and that if we would not bomb the reactor he would. He reminded the president that he had from the first said it had to be destroyed one way or another. President Bush was instantly and thereafter fine with that decision, ordering that nothing be said or done that might compromise Israel's plans.

In our internal discussions Secretary Gates had been firmly in favor of the diplomatic option. The question of course arose in those discussions what we should do if Israel disagreed—as in the end it did. Secretary Gates was firm, as I recall him: Israel was ungrateful and its policies were at times risking our own interests. We needed to be tough as nails and tell them our interests came first and their action would threaten the U.S.-Israeli relationship. Fortunately his policy recommendations were not accepted by President Bush, who understood that Israeli action against the reactor would advance rather than harm U.S. interests.

This story is worth telling for only one reason: that somehow it is now being "explained" that the Gates view of Israel is new and has been provoked by recent Israeli actions and by Prime Minister Netanyahu. Not so. Secretary Gates expressed essentially similar views in the Olmert days. Then as now he was wrong, but back then there was a different president who could listen to his honest and candid advice on how to protect U.S. interests and how to handle Israel—and firmly reject it.

Secretary Gates presided over years of steadily improving U.S.-Israel military cooperation under both President Bush and President Obama. He should get real credit for this, as should the officers who have served as Chairman of the Joint Chiefs of Staff in the last decade, Gen. Myers, Gen. Pace, and Adm. Mullen, and as should above all the two presidents they served. But his views about the Israelis being “ungrateful” are not new and should not, in fairness, be attributed to recent developments or blamed on Prime Minister Netanyahu.

## **Board of Governors' September Meeting Convenes**

Staff Report

IAEA Board of Governors

*[EXCERPTS]*

On 12 September 2011, the 35-nation IAEA Board of Governors convened for their deliberations from 12-16 September, which precede the annual General Conference to be held from 19-23 September 2011.

On Monday morning, the Board session began with a statement by IAEA Director General Yukiya Amano, focusing on several issues including nuclear safety, security, energy and verification.

*[deletia]*

### **Nuclear Verification**

*[deletia]*

### **Syrian Arab Republic**

"Following my last report, in a letter to the Agency dated 26 May 2011, Syria indicated its readiness to fully cooperate with the Agency to resolve issues related to the Dair Alzour site. After a number of meetings with the Agency, Syria, in a letter dated 24 August 2011, stated its readiness to have a meeting with Agency Safeguards staff in Damascus in October. Syria's letter stated that the purpose of the meeting would be 'to agree on an action plan to resolve the outstanding issues in regards to [the] Dair Alzour site'. The Agency subsequently proposed that a meeting take place on 10 to 11 October 2011 with the aim of advancing the Agency's verification mission in Syria."

### **Middle East**

"In September 2000, the General Conference tasked the Director General to make arrangements to convene a forum in which participants from the Middle East and other interested parties could learn from the experience of nuclear-weapon-free zones already established in other regions. I am pleased to inform you that, following my consultations with Member States over the past few months, I believe conditions have become more favourable for the holding of such a forum. I have therefore invited all Member States to a forum, here in Vienna, on 21-22 November. I am also pleased to announce that the Permanent Representative of Norway, Ambassador Jan Petersen, has accepted my invitation to serve as Chairperson for this important gathering. We will continue our consultations in the coming weeks to help ensure that the forum is a success.

### **Issues on the Agenda**

During the September 2011 Board meeting, a number of issues are under consideration, including:

*[deletia]*

Nuclear verification, including, applying safeguards in the Democratic People's Republic of Korea; implementing the NPT safeguards agreement and relevant provisions of United Nations Security Council resolutions in the Islamic Republic of Iran; as well as implementing NPT safeguards agreement in the Syrian Arab Republic.

The Board will further discuss issues under consideration since the 2009 and 2010 sessions of the General Conference, including applying IAEA safeguards in the Middle East, as well as efforts to pursue a target of equal representation of women across all occupational groups and categories in the Agency, especially in senior policy-level and decision making posts.

*[deletia]*

-- By Sasha Henriques and Peter Kaiser, IAEA Division of Public Information

## Syria offers nuclear cooperation, IAEA says

By Fredrik Dahl

VIENNA

Mon Sep 12, 2011 11:45am EDT

(Reuters) - Syria has offered to cooperate with a U.N. nuclear watchdog probe into a suspected reactor site after years of stonewalling, and a meeting on the issue has been proposed for October, the Vienna-based agency's head said on Monday.

International Atomic Energy Agency (IAEA) chief Yukiya Amano said he was hoping to get "full information" about the desert site of Dair Alzour, which was bombed by Israel in 2007.

Western diplomats have expressed caution about previous offers of cooperation from Damascus.

U.S. intelligence reports have said the Dair Alzour complex was a nascent, North Korean-designed reactor intended to produce plutonium for atomic weaponry, before Israeli warplanes reduced it to rubble.

Syria has said it was a non-nuclear military facility, but Amano said he stood by an IAEA conclusion earlier this year that the destroyed site was "very likely" to have been a nuclear reactor which should have been declared to the agency.

In June, the IAEA board of governors voted to report Syria to the U.N. Security Council, rebuking it for failing to cooperate with the agency's efforts to get concrete information on Dair Alzour and other sites.

Russia and China opposed the referral, highlighting divisions among the major powers.

It was the first time the governing board of the IAEA -- the Vienna-based U.N. body tasked with preventing the spread of nuclear weapons -- referred a country to the Security Council since it sent Iran's file there five years ago.

The move coincided with a continuing crackdown on pro-democracy protests in Syria.

Some Vienna-based Western diplomats have suggested that the turmoil inside the Arab state could further complicate efforts to get Damascus to cooperate on the nuclear issue.

Addressing the IAEA's board on Monday, Amano said Syria in a letter last month had "stated its readiness to have a meeting with agency safeguards staff in Damascus in October," according to a copy of his statement released to the media.

The Syrian letter said the purpose of the talks would be to "agree on an action plan to resolve the outstanding issues" regarding the Dair Alzour facility, Amano added.

The IAEA had proposed that the meeting take place on Oct 10-11 "with the aim of advancing the agency's verification mission in Syria," Amano said.

Syria, an ally of Iran, denies harbouring a nuclear weapons program.

Shortly before the IAEA board voted in June to refer the case to the Security Council, Syria offered to fully cooperate with the agency, after earlier rebuffing repeated requests for access to Dair Alzour.

Western diplomats dismissed this at the time as a tactical maneuver and said it was important for the board to act as it would also send a warning signal to other countries such as Iran.

The IAEA board reported Iran to the Security Council in 2006 over its failure to dispel suspicions it was trying to develop atomic arms. Tehran has since been hit with four rounds of U.N. sanctions over its refusal to halt sensitive nuclear work.

## **Effective Approaches for U.S. Participation in a More Secure Global Nuclear Market**

Remarks

Ellen Tauscher

Under Secretary for Arms Control and International Security

Remarks to Bipartisan Policy Center's (BPC) Nuclear Initiative Conference at the Columbus Club at Union Station

Washington, DC

October 3, 2011

As prepared

*[EXCERPTS]*

Good afternoon. Thank you for organizing this workshop and giving me the opportunity to speak here today. I am honored to share the podium with such distinguished panelists, good friends, and patriots. I give many speeches about how the Administration is working toward the President's goal of a world without nuclear weapons.

*[deletia]*

Syria is also being held accountable for non-compliance with IAEA safeguards. In June, the IAEA ratcheted up scrutiny of Syria's nuclear activities by reporting that non-compliance to the UN Security Council.

## **IAEA sees Syria talks for end-October**

VIENNA | Tue Oct 4, 2011 9:58am EDT

(Reuters) - United Nations nuclear inspectors plan to meet Syrian officials this month to try to kickstart a long-stalled probe into a suspected reactor site bombed to rubble by Israel in 2007.

A spokesman for the International Atomic Energy Agency (IAEA), the Vienna-based U.N. agency, said on Tuesday that a meeting was scheduled to take place in Damascus on October 24-25.

IAEA Director General Yukiya Amano said last month Syria had offered to cooperate with the agency's investigation into the destroyed Dair Alzour site after years of stonewalling.

Amano said he was hoping to get "full information" about Dair Alzour. The IAEA has also repeatedly asked for information about other sites that may have been linked to it.

U.S. intelligence reports have said that before the Israeli raid Dair Alzour had housed a nascent, North Korean-designed reactor intended to produce plutonium for atomic weaponry.

Syria says it was a non-nuclear military facility, but the IAEA concluded in May that Dair Alzour was "very likely" to have been a nuclear reactor that should have been declared.

Western diplomats have expressed caution about previous offers of cooperation from Damascus.

Some Vienna-based diplomats have suggested that Syria's crackdown on pro-democracy protests could further complicate efforts to get the Arab state to cooperate on the nuclear issue.

In June, the IAEA board of governors voted to report Syria to the U.N. Security Council, rebuking it for failing to cooperate with the agency's efforts to get concrete information on Dair Alzour and other sites. Russia and China opposed the referral, highlighting divisions among the major powers.

Syria denies harboring a nuclear weapons program, as does its main regional ally Iran.

## **SPIEGEL Interview with Former Nuclear Watchdog**

The Iranians 'Tricked and Misled Us'

10/06/2011

*[EXCERPTS]*

In a SPIEGEL interview, Olli Heinonen, the former deputy director of the International Atomic Energy Agency in Vienna, offers his first assessment of his 27 years at the global nuclear watchdog. He addresses Iran's nuclear program, his concerns about the security of Pakistan's nuclear arsenal and mistakes made in Fukushima.  
Info

*[deletia]*

SPIEGEL: EIBaradei's successor, Yukiya Amano of Japan, who has headed the IAEA since December 2009, has noticeably toughened the rhetoric against Tehran ...

Heinonen: ... which is also more in line with the (IAEA) Department of Safeguard's perspective. **But the situation has also worsened considerably in Syria in recent years.** As Tehran did before it, Damascus is now resisting pressure from the international community.

SPIEGEL: Didn't Israel do the IAEA's job for it back in 2007, when it sent planes to bomb a secret Syrian reactor near Deir al-Sur in a night-time raid? Or are there grounds to doubt this story, which SPIEGEL helped to uncover with its reporting but was never confirmed officially?

Heinonen: **All the evidence seems to suggest that the destroyed building really was a nuclear reactor. But the IAEA only got one opportunity to inspect the site. I feel the IAEA should have exercised its right to a special inspection. We were refused permission to enter Syria to carry out more research there and at other sites, and that remains the case to this day. It's a clear, sanctionable breach of the agreements. Incidentally, the Deir al-Sur reactor bears a striking resemblance to the North Korean Yongbyon reactor.**

*[deletia]*

## **Jordanian bank tied to illicit weapons?**

Published: Oct. 7, 2011 at 2:18 PM

WASHINGTON, Oct. 7 (UPI) -- A bank in Jordan, a strong U.S. ally in the region, may have unknowingly moved cash for the North Koreans to finance illicit weapons programs, cables suggest.

Sensitive cables distributed by WikiLeaks and reviewed by The Wall Street Journal suggest Jordan's Arab Bank PLC was used by North Korea to get money from Syria and Iran to help with its proliferation activity.

An August 2007 cable from the U.S. State Department to Washington's embassy in Amman expressed concern "that Iran, Syria and DPRK (North Korea) proliferation entities are using the Arab Bank network to process what may be proliferation-related transactions."

Arab Bank, in a statement published by the Journal, said it "does not believe" it carried out business with the North Koreans. The bank was fined in 2005 by U.S. banking regulators for not having mechanisms in place to prevent money laundering and terrorist financing, the newspaper adds.

The cables suggest the Jordanian bank processed the North Korean activity without knowing about it.

## **U.S. hopes IAEA report clearer on Iran nuclear fears**

By Alexandra Ulmer

SANTIAGO | **Thu Oct 13, 2011 3:38pm EDT**

*[EXCERPTS]*

(Reuters) - The United States hopes the U.N. atomic watchdog will be more detailed about its concerns Iran is covertly developing nuclear missiles in a report due out next month, a senior U.S. diplomat said on Thursday.

But it is too early to say if the report about Iran's uranium enrichment program could prompt Tehran's referral to the U.N. Security Council, Glyn Davies, the U.S. envoy to the watchdog, the International Atomic Energy Agency, told reporters in Santiago on the first stop of a Latin American trip to study uses of nuclear power.

*[deletia]*

### **SYRIAN REACTOR PROBE**

Davies said he didn't know what progress would be made at a planned meeting between United Nations nuclear inspectors and Syrian officials this month to try to kick-start a long-stalled probe into a suspected reactor site bombed to rubble in Syria by Israel in 2007.

"The Syrians have said once again they'll cooperate... I don't know where it's going to go," he said.

U.S. intelligence reports have said that before the Israeli raid, Dair Alzour had housed a nascent, North Korean-designed reactor intended to produce plutonium for atomic weaponry.

Syria says it was a nonnuclear military facility, but the IAEA concluded in May that Dair Alzour was "very likely" to have been a nuclear reactor that should have been declared.

**"They (Syria) have been covering up like nobody's business," Davies said. "Obviously there is a bit of hierarchy of safeguard cases ... and for us, Iran looms largest."**

## **IAEA seeks to kick-start stalled Syria probe**

VIENNA |

Fri Oct 21, 2011 11:10am EDT

(Reuters) - U.N. inspectors plan to meet Syrian officials next week to try to make progress on a long-stalled investigation into suspected nuclear activities in the Arab state, but Western diplomats played down any hopes of a breakthrough.

Herman Nackaerts, head of nuclear safeguards inspections worldwide at the U.N. International Atomic Energy Agency, will travel to Damascus on Monday for talks expected to take place the following two days, an IAEA official said.

The official declined to give any details on who Nackaerts, an IAEA deputy director general, was expected to meet and what the discussions would focus on.

<http://www.guardian.co.uk/world/julian-borger-global-security-blog/2011/oct/23/syria-nuclear-iaea?newsfeed=true>

## UN nuclear inspectors to visit Syria

Against the backdrop of the Syrian revolt, the IAEA will seek answers on a 'likely' nuclear reactor

Posted by Julian Borger

Sunday 23 October 2011 02.31 EDT

In the next few days, inspectors from the International Atomic Energy Agency are due to arrive in Damascus for the first time in more than three years to talk about the Dair Alzour site, bombed by Israel in 2007. In May, the IAEA declared that the site was 'very likely' a covert nuclear reactor under construction, and has referred the issue to the Security Council.

Since an agency visit in 2008, Syria stonewalled on further cooperation. The regime however is now fighting for its life and seeking to prevent the formation the kind of international consensus on its fate that proves so fatal for Muammar Gaddafi. So the inspectors are on their way back to Damascus, which should make for an interesting mix of nuclear politics and pro-democracy revolt.

Olli Heinonen, the IAEA's former chief inspector, sent these thoughts on the imminent visit.

First, the IAEA's findings on Syria is an important attestation of an information-driven safeguards approach that underpins strengthened safeguards within the IAEA. The traditional core of IAEA verification continues to be physical access to nuclear material, facilities, sites, and people. But in situations where international inspectors are hampered or denied cooperation in some or all of the above, varied approaches that include examining and corroborating information available from: satellite imagery, procurement activities, on-site inspection observations, and open source data, have been key in supplementing the IAEA's findings. In the case of Syria, these additional tools in the kit have led the IAEA to draw conclusions on the nature of the Dair Alzour facility.

Second, even as Syria's dossier has been referred to the UN Security Council, it remains a case of on-going investigation at the IAEA. Syria's statements regarding the non-nuclear nature of the destroyed building have lacked details. It has also failed to provide a satisfactory explanation to the uranium contamination found at Dair Alzour. Syria has also not lived up to its safeguards' commitments when it failed to report activities conducted at the Miniature Research Reactor (MNSR) in Damascus involving nuclear material.

To move forward on the nuclear dossier, the IAEA together with Syria reached an agreement in September last year that established a plan of action to resolve issues related to MNSR. The plan included, inter alia, actions related to the amounts and use of nuclear material concerning uranium conversion experiments. The IAEA's subsequent investigations showed that its findings were not inconsistent with Syria's statements concerning the origin of uranium used during experiments undertaken, and on the origin of uranium particles found at the MNSR. However, this does not mean that all nuclear material related issues in Syria have been resolved. Questions concerning the source of uranium particles found at Dair Alzour remain open. Uncertainties also continue to surround nuclear material related activities that have a bearing on the destroyed site, in particular, at one of the three locations which the IAEA has unsuccessfully sought access since 2008.

We also know that the kind of reactor which was being constructed at Dair Alzour was neither suitable for isotope production nor for nuclear R&D purposes. And it was also too small to be meaningful for electricity generation. Rather, it resembled a plutonium production reactor similar to one that North Korea operated in Yongbyong.

So while the work plan is important to progress matters when meaningfully applied, the IAEA has the opportunity as well as onus to seek, in its meetings this week with Syria, a broader and more comprehensive scope beyond what is reflected in Syria's current offer. Dair Alzour is the focus of the problem, but it is not the only problem, hence the need to address all nuclear material and activities in Syria – such as foreign involvement in Syria's nuclear program and related offers made including on uranium enrichment.

Ensuring safeguards is kept to a high and comprehensive standard is not an easy business. Neither is it a job that necessarily endears itself to states. That is because safeguards, at the end of the day, is about walking the walk.

## **U.N. agency in Syria nuclear talks, no word on outcome**

Reporting by Fredrik Dahl

VIENNA

Thu Oct 27, 2011 10:38am EDT

*[EXCERPTS]*

(Reuters) - Senior U.N. nuclear inspectors held talks with Syrian officials in Damascus this week to try to kick-start a long-stalled probe into suspected atomic activities in the Arab state, but it was not immediately clear whether any progress was made.

The International Atomic Energy Agency (IAEA), the Vienna-based U.N. nuclear watchdog, said that two days of discussions took place as planned Tuesday and Wednesday in the Syrian capital.

The outcome will be reported to the IAEA's 35-nation board, which next meets on November 17-18, the agency said in response to a question. It gave no further detail.

Western diplomats had played down any hopes of a breakthrough at the talks between Syrian officials and Herman Nackaerts, head of nuclear safeguards inspections worldwide at the IAEA.

*[deletia]*

Olli Heinonen, Nackaerts's predecessor at the IAEA, said Deir al-Zor was not the only problem, "hence the need to address all nuclear material and activities in Syria -- such as foreign involvement in Syria's nuclear program."

## **APNewsBreak: Diplomats: Syria Nuke Probe Stalled**

By GEORGE JAHN Associated Press

VIENNA October 29, 2011 (AP)

*[EXCERPT]*

Syrian officials have turned down a renewed request from U.N. nuclear inspectors to visit suspected secret nuclear sites during talks in Damascus described by diplomats Friday [2011-10-28] as failing to advance a probe of the Arab nation's hidden atomic program.

Meetings between Syrian and International Atomic Energy officials Monday and Tuesday had been highly anticipated after Damascus pledged to end more than three years of stonewalling IAEA inspectors. Since 2008 the agency has been stymied in attempts to seek more information over what the agency says was a clandestine nuclear program centered around a nearly completed reactor.

The offer for cooperation came after the IAEA's 35-nation board reported Damascus to the U.N. Security Council in June on the basis of an agency assessment that a facility destroyed by Israeli war planes in 2007 was a nuclear reactor meant to produce plutonium when completed.

Damascus says the target was a non-nuclear military building but has refused to allow IAEA officials to return to the site after an initial visit that produced samples with traces of uranium and other nuclear footprints.

It has also turned down agency requests to visit three other sites that the IAEA suspects are linked to what it describes as the destroyed reactor.

Officials at the IAEA have refused to comment on the trip, saying details will only be released to the board next month by IAEA chief Yukiya Amano. But diplomats from two IAEA member nations — who spoke to The Associated press on condition of anonymity because their information was privileged — said Friday that the trip had essentially been a failure.

Led by deputy IAEA Director General Herman Nackaerts, the U.N. delegation had asked for a return visit to the destroyed desert site at Dair Alzour, as well as access to the three other facilities that the agency suspects are connected to that site, said one of the diplomats.

They were turned down by the Syrians, who told them that they would present new evidence that the Dair Alzour site was non-nuclear, making any further on site inspections anywhere unnecessary, said one of the diplomats.

He said that the Syrian response was considered disappointing by the agency delegation because it was vague on what new information would be produced and contained no time line, indicating that the offer was nothing more but an attempt by Damascus to buy more time.

*[deletia]*

## **Diplomats: No breakthrough at Syria atomic talks**

By REUTERS

10/29/2011 11:27

*[EXCERPT]*

Visit was disappointing, Syria refuses to provide access to sites, still claims Deir al-Zor was not nuclear reactor, Western diplomat says.

The Vienna-based UN nuclear watchdog has also been seeking information about other sites that may have been linked to Deir al-Zor.

Syria says Deir al-Zor was a non-nuclear military facility, but the IAEA concluded in May that it was "very likely" to have been a reactor that should have been declared.

Diplomats said there was no real progress on this sticking point at the Damascus talks.

"It was a disappointing visit. Syria is still refusing to provide access to additional sites, still claims that Deir al-Zor was not a nuclear reactor," a Western diplomat said.

Another diplomat said that while Syria was sticking to its assertion that Deir al-Zor was a non-nuclear military site it had offered cooperation to back this up. There were no further details.

A third diplomat said the meeting "yielded nothing substantial," adding that Syria's crackdown on more than seven months of pro-democracy protests may be complicating decision-making in Damascus on nuclear issues.

The outcome of the meeting will be reported to the IAEA's 35-nation board, which next meets on Nov. 17-18

**INTRODUCTORY STATEMENT TO THE  
BOARD OF GOVERNORS**

**Vienna**

**17 November 2011**

**Yukiya Amano, Director General**

**INTERNATIONAL ATOMIC ENERGY AGENCY**

*[EXCERPT]*

***Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic***

In my report to the June Board on the Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic, I reported the Agency's conclusion that a building destroyed at the Dair Alzour site was very likely a nuclear reactor and should have been declared by Syria.

A delegation from the Agency's Department of Safeguards visited Damascus in October with the aim of advancing the Agency's verification mission in Syria. Unfortunately, no progress was made in meetings with the Syrian authorities on obtaining the full access which we have requested to other locations which the Agency believes are functionally related to the Dair Alzour site. I urge Syria to cooperate fully with the Agency in connection with unresolved issues related to the Dair Alzour site and other locations.

**Unclassified Report to Congress  
on the Acquisition of Technology  
Relating to Weapons of Mass Destruction  
and Advanced Conventional Munitions,  
Covering 1 January to 31 December 2011**

The Director of National Intelligence hereby submits this report in response to a congressionally directed action in Section 721 of the FY 1997 Intelligence Authorization Act, which states:

"(a) Reports

The Director of Central Intelligence shall submit to Congress an annual report on -

(1) the acquisition by foreign countries during the preceding 6 months of dual-use and other technology useful for the development or production of weapons of mass destruction (including nuclear weapons, chemical weapons, and biological weapons) and advanced conventional munitions; and

(2) trends in the acquisition of such technology by such countries."

*[deletia]*

**Syria**

Nuclear

Syria- despite being a Nuclear Non-Proliferation Treaty Party with full-scope IAEA safeguards- was engaged for more than a decade in a covert nuclear program with North Korean assistance. The program involved construction of a nuclear reactor at AI Kibar without informing the IAEA and while taking measures to preserve the site's secrecy. We assess the reactor would have been capable of producing plutonium for nuclear weapons. The reactor was destroyed in September 2007, before it became operational, and Syria went to great lengths to try to eradicate evidence of its existence and remains generally uncooperative with the IAEA investigation. The covert nature of the program, the characteristics of the reactor, and Syria's extreme efforts to deny and destroy evidence of the reactor after its destruction are inconsistent with peaceful nuclear applications.

IAEA inspectors in June 2008 took environmental samples at the AI Kibar site. The IAEA reported to the November 2008 Board of Governors that analysis of the AI Kibar environmental samples revealed a significant number of chemically processed natural uranium particles. The report also noted the Agency's assessment that the features of the AI Kibar building were similar to what may be found in connection with a reactor site, but stated that the IAEA could not exclude the possibility that the building was intended for non-nuclear use. The IAEA reported to the June 2011 Board of Governors that it is "very likely" that the building destroyed at the AI Kibar site was a nuclear reactor that should have been declared to the Agency. The Board of Governors found Syria in non-compliance with IAEA Safeguards Agreement and reported the finding to the UN Security Council and General Assembly. The IAEA is continuing its investigation of Syria's nuclear file.

## **OLMERT: Iran hasn't crossed line yet**

April 30th, 2012

01:05 PM ET

In his first sit-down interview in years, former Israeli Prime Minister Ehud Olmert is revealing and controversial speaking with CNN's Christiane Amanpour.

by Lucky Gold

*[EXCERPT]*

Olmert was asked to compare the situation in Iran with that in Syria five years ago, when he was Israel's Prime Minister. At that time, Syria was developing a nuclear reactor and Israel reportedly launched a clandestine attack to destroy it.

Olmert said, "I think the attempt to draw a comparison between Iran and Syria is false, misleading and dangerous."

Without ever acknowledging that he ordered an attack, he said: "The reactor in Syria was about to be operated within days, and therefore there was no time to wait. You could either do it or you have an atomic reactor that would produce a bomb."

"In Iran," he said, "The situation is different. There is time. The international is community fully aware. Everyone knows. The President of the United States is fully committed to work against it. And therefore this is a big difference."

## 'Olmert bombed Syria despite US diplomacy'

By HERB KEINON

06/14/2012 22:03

Former prime minister Ehud Olmert decided in September 2007 to bomb the al-Kabir nuclear facility in Syria after then-president George W. Bush told him the US had opted for the diplomatic route and would try to get the International Atomic Energy Agency to close the site, Elliott Abrams told The Jerusalem Post on Thursday.

Asked about Wednesday's Israeli State Comptroller's Report chastising the government for a haphazard decision-making process, Abrams said Bush was provided with impeccable options, policy papers and intelligence.

"We took it all to the president – covert options, military options, diplomatic options – and he chose the wrong option," said Abrams, who at the time was the deputy national security advisor in the White House. "It is a mistake to believe that the process itself will provide you with the right answer."

The State Comptroller's Report was highly critical of Prime Minister Binyamin Netanyahu for not fully empowering his National Security Council, as mandated by law, and for a sloppy, informal decision-making process leading up to the Mavi Marmara raid in May 2010.

Abrams, however, used the Syrian nuclear facility issue to illustrate that what is more important than thorough preparation and a good process is the right people making the right decisions. He also said that some of the best White House meetings were informal ones where no notes were taken.

He said that his preferred option in the summer of 2007, when intelligence information emerged that the Syrians were building a nuclear facility, was for Israel to take it out in order for Jerusalem to rebuild its deterrence capability following the Second Lebanon War a year earlier. He added that then-vice president Dick Cheney argued for the US to bomb the facility itself to rebuild America's deterrence capability.

Cheney, in his memoirs *In My Time*, wrote that not only would a US strike demonstrate America's seriousness concerning nonproliferation, "it would enhance our credibility in that part of the world, taking us back to where we were in 2003, after we had taken down the Taliban, taken down Saddam's regime, and gotten Gaddafi to turn over his nuclear program."

But the option Bush chose, some six weeks before Israel acted, was the one preferred by secretary of state Condoleezza Rice: Make the existence of the facility public and then go to the IAEA and UN and build an international consensus to get the Syrians to close it.

Abrams said he thought the idea was "absurd" and that Syrian President Bashar Assad would defy the IAEA and do nothing.

When Bush informed Olmert of the US decision in July 2007, Abrams recalled, Olmert said the strategy was unacceptable to Israel. It was clear to everyone that from this point on there would be no sharing of plans and that "Israel would let us know afterward," he said.

Indeed, according to Abrams, Israel informed Washington immediately after the September 7, 2007, strike. A decision was then made not to "rub the Syrians' nose in the matter" by making it public, thinking that if everyone remained quiet Assad would not be compelled to hit back. Indeed, news of the attack began trickling out in the Turkish media a couple of weeks afterward when jettisoned parts of Israeli fighter jets were found in Turkish territory.

[Deletia]

## Syria showing 'contempt' for UN nuclear agency: US

(AFP)

7 hours ago [*Accessed 2012-09-14T19:10Z*]

VIENNA — Syria is showing "contempt" towards the UN atomic watchdog by refusing to cooperate over a suspected undeclared reactor destroyed by Israel in 2007, the US envoy to the agency said Friday.

President Bashar al-Assad's government "is using its brutal repression of the Syrian people as an excuse for not cooperating with the agency's investigation," Robert Wood told a meeting of the International Atomic Energy Agency's board.

Syria's "rejection of the international community's calls to remedy its non-compliance shows its continuing contempt for this board and for the system of international safeguards," he said, according to a text of his remarks.

The IAEA board reported Syria to the UN Security Council in June 2011 after watchdog head Yukiya Amano concluded that the Dair Alzour desert site was "very likely" a nuclear reactor which should have been declared to the IAEA under Damascus's safeguards agreement with the agency.

The IAEA says information provided to the agency suggested that the alleged reactor, which was still under construction when it was bombed by Israeli aircraft in September 2007, was being built with North Korean assistance.

Syria's ambassador to the IAEA, Bassam Sabbagh, reiterated at Friday's meeting in Vienna that the site in question was a "non-nuclear military installation" and denied not wanting to cooperate with the agency, diplomats said.

The IAEA visited the site in June 2008 and requested documentation related to buildings there as well to three other allegedly related sites but since then Syria "has not engaged substantively," the agency said in a report last month.

In talks in Damascus in October 2011, Syria offered the IAEA the chance to go back to Dair Alzour but under conditions rejected by the agency. Syria said the other three sites were "not relevant," the IAEA said.

In February 2012, Syria sent a letter to the IAEA indicating it would provide a detailed response at a later date in view of the "difficult prevailing security situation in the country," the watchdog said, referring to the bloody 18-month-old uprising against Assad's rule.

Iran, meanwhile, speaking in its role as head of the Non-Aligned Movement at Friday's closed-door meeting, encouraged Syria and the IAEA to "continue cooperating" and said that access to information, activities and locations must be provided in accordance with Syria's safeguards agreement with the agency.

But it also said it was "essential not to lose sight of the manner in which (the site) was initially brought to the attention of the agency," saying Israel's attack "constituted a flagrant of the UN charter."

## **U.S.: Syria must end nuclear go-slow, conflict no excuse**

By Fredrik Dahl

VIENNA

Fri Sep 14, 2012 2:04pm EDT

(Reuters) - The United States accused Syria on Friday of using the "brutal repression" of its people waging an uprising as an excuse not to address U.N. nuclear watchdog concerns about suspected past illicit nuclear activity in the Arab state.

For its part, Syria insisted at a debate of the governing board of the International Atomic Energy Agency that it had agreed last year with the IAEA on how to handle the issue. This was denied on Monday by the IAEA chief in a speech to the board.

The IAEA has long sought access to a site in Syria's desert Deir al-Zor region that U.S. intelligence reports say was a nascent, North Korean-designed reactor designed to produce plutonium for nuclear weapons before Israel bombed it in 2007.

The Vienna-based watchdog has also been requesting information about three other sites that may have been linked to Deir al-Zor.

IAEA chief Yukiya Amano said earlier this year that Syria had asked for understanding of its "delicate situation" in response to requests for Syrian cooperation with his inspectors' inquiry.

President Bashar al-Assad is fighting a 17-month-old revolt in which more than 27,000 people have been killed.

U.S. IAEA envoy Robert Wood said Syria's "own destabilizing actions are no justification for its refusal" to abide by its commitments under the nuclear Non-Proliferation Treaty (NPT), set up to prevent the spread of atomic weaponry.

"The Assad regime is using its brutal repression of the Syrian people as an excuse for not cooperating with the agency's investigation," he told the closed-door board governors' session, according to a copy of his speech.

### "SO-CALLED ACTION PLAN"

Syria says Deir al-Zor was a conventional military facility but the IAEA concluded in May 2011 that it was "very likely" to have been a reactor that should have been declared to its anti-proliferation inspectors.

"Syria must allow access to all relevant locations, materials and persons, including in particular the three additional sites suspected of having a functional relationship to the clandestine Deir al-Zor," Wood said.

Syrian Ambassador Bassam Al-Sabbagh repeated his country's position that Deir al-Zor was not a nuclear reactor and said an agreement had been reached with senior IAEA officials last October on an action plan on how to clarify the matter.

According to one diplomat present, Al-Sabbagh told the board that if Syria could convince the IAEA that Deir al-Zor was a non-nuclear facility then the issue of the three other sites was "moot".

Amano, the IAEA director-general, did not respond at Friday's board session, but on Monday he told the opening day of the week-long board meeting: "I wish to make clear that no agreement was ever reached on a so-called action plan."

The veteran Japanese diplomat later told a news conference that "some options" had been discussed during the IAEA team's visit to Damascus last year but that they were rejected after a careful review by the IAEA.

"It was not sufficient because the so-called action plan is limited only to the Deir al-Zor site and Syria was not ready to discuss other locations," Amano said.

The Non-Aligned Movement (NAM) of mostly developing states said in a statement read out by Iranian Ambassador Ali Asghar Soltanieh that it welcomed "Syria's resolve to continue cooperating" with the IAEA.

(Editing by Mark Heinrich)

## **The Silent Strike**

How Israel bombed a Syrian nuclear installation and kept it secret.

By David Makovsky

2012-09-17

[EXCERPT]

In the first days of March, 2007, agents from the Mossad, the Israeli intelligence agency, made a daring raid on the Vienna home of Ibrahim Othman, the head of the Syrian Atomic Energy Commission. Othman was in town attending a meeting of the International Atomic Energy Agency's board of governors, and had stepped out. In less than an hour, the Mossad operatives swept in, extracted top-secret information from Othman's computer, and left without a trace.

In recent months, Israel and the United States had become worried by Syria's nuclear ambitions. In the nineteen-nineties, Syrian President Hafez al-Assad sought to buy nuclear research reactors from Argentina and Russia, but the deals fell through under U.S. pressure. Toward the end of 2006, Israel began to pick up intelligence of possible renewed nuclear activity. There were also suspicions about a large, "enigmatic" building under construction in the desert of northeastern Syria, General Michael Hayden, the director of the C.I.A. at the time, told me.

The information the Mossad operatives recovered was damning: roughly three dozen color photographs taken from inside the Syrian building, indicating that it was a top-secret plutonium nuclear reactor. The reactor, called Al Kibar, was nine hundred yards from the Euphrates River and halfway between the borders with Turkey and Iraq. The photographs showed workers from North Korea at the site, which was far from Syria's biggest cities. The sole purpose of this kind of plutonium reactor, in the Mossad's analysis, was to produce an atomic bomb. Inside, the reactor had many of the same engineering elements as the North Korean reactor in Yongbyon—a model that no one but the North Koreans had built in the past thirty-five years.

Two and a half decades earlier, Israel had dispatched bombers to Iraq to destroy the Osirak nuclear reactor. That strike marked the rise of the Begin doctrine, named for Israeli Prime Minister Menachem Begin, which held that no Israeli adversary in the Middle East should be allowed to acquire a nuclear weapon. Israel itself has reportedly possessed nuclear weapons since roughly 1967, although it has never either admitted or denied it; the London-based International Institute for Strategic Studies estimates that today Israel has as many as two hundred nuclear warheads. Off the record, Israeli officials reject any claim of moral equivalence between their reputed possession of nuclear weapons and Syria's. One reason, officials say, is Syria's relationship with Hezbollah and Hamas, both of which are considered terrorist organizations by the U.S. State Department.

On March 8th, days after the raid, Meir Dagan, the director of the Mossad, and two senior officials met with Israeli Prime Minister Ehud Olmert and presented the findings from the raid. During a courtroom appearance last year, at which Olmert was facing corruption charges (he was largely acquitted), he never directly mentioned Dagan or the Syrian site, but he referred obliquely to "a piece of information" that had been put on his desk "such as rarely happens in the country." He added, "I knew from that moment, nothing would be the same again. The weight of this thing, at the existential level, was of an unprecedented scale." Olmert pledged to destroy the reactor as soon as possible; if it went "hot," radiation from its destruction could contaminate the Euphrates.

Five years later, the Al Kibar affair is still not discussed on the record in Israel. When referred to by journalists or military analysts, reports are usually credited to foreign sources. Word has gradually leaked out that Israel destroyed the Al Kibar reactor. Some of the details of the operation have been published. In April, 2008, after several months of secrecy, U.S. intelligence officials finally briefed Congress on their evaluation of the reactor. The most senior members of the Bush Administration, including Bush himself, mentioned in their memoirs how the U.S. responded to the evidence on the reactor. In recent months, I have spoken with about two dozen Israeli and American officials who were knowledgeable about the fate of Al Kibar, to learn exactly what happened and

why details of the affair have remained so closely guarded. As Prime Minister Benjamin Netanyahu and his government consider how to confront Iran's nascent nuclear program, Israel's response to Al Kibar has emerged as both an exemplary and a cautionary tale.

The small suite of offices where Prime Minister Olmert and a half dozen of his aides worked, in a nondescript government office building in Jerusalem, sits behind glass doors and was so closely watched that it was nicknamed the Aquarium. For that reason, in the days after the discovery of the Syrian installation, Olmert began hosting important meetings at his official residence, on Balfour Street, a couple of miles away.

Olmert, a former cabinet minister and onetime mayor of Jerusalem, had come to power in early 2006 on a platform of peace, and the war that summer with Hezbollah, in Lebanon, had been disastrous for his popularity. In December, in an attempt to restore his focus on peacemaking, Olmert had begun holding regular meetings with Mahmoud Abbas, the President of the Palestinian Authority, to address the establishment of a Palestinian state. On February 15, 2007, a few weeks before the Mossad raid in Vienna, Olmert met with Turkish Prime Minister Recep Tayyip Erdogan, in Ankara, and asked him to explore whether Syrian President Bashar al-Assad—the son of Hafez—would be willing to open secret peace talks with Israel. After meeting with Assad on April 3rd, Erdogan reported back to Olmert that Assad was willing. By that time, Israel had discovered evidence of the Syrian reactor, and a grim resolve had set in.

The briefings on Balfour Street began with Israel's former Prime Ministers, including Shimon Peres, Ehud Barak, and Netanyahu, Olmert's political rival. The leaders were summoned one by one, to insure confidentiality and to prevent leaks. A second group—including Amir Peretz, the Defense Minister; Gabi Ashkenazi, the Israel Defense Force's chief of staff; Amos Yadlin, the I.D.F. head of military intelligence; Yuval Diskin, the head of the Shin Bet, Israel's security service; and Dagan, of the Mossad—met most Fridays from late March of 2007 through early September. Each member signed a secrecy agreement.

The time came to inform the Americans. On April 18th, during a routine visit to Israel, Robert Gates, George W. Bush's Secretary of Defense, met with his Israeli counterpart, Peretz. Because Peretz does not speak English fluently, an index card was prepared for him, which he could refer to as he divulged the news about the reactor. Olmert also dispatched Dagan, along with two of Olmert's top personal aides, Yoram Turbowicz and Shalom Turgemen—nicknamed TnT by U.S. officials—to Washington, to report the news to other senior U.S. officials. Dagan briefed his U.S. counterpart, Hayden, the C.I.A. director. Dagan, Turbowicz, and Turgemen met with Vice-President Dick Cheney and the national-security adviser, Steve Hadley. Dagan presented them with the photographs of the site and other information. According to one former senior U.S. official, Cheney, who had been urging the intelligence community to investigate a link between North Korea and Syria, was vindicated by the news.

President Bush instructed his intelligence chiefs to verify the Israeli claims; the disastrous intelligence failure on weapons of mass destruction in Iraq was fresh in everyone's mind. Bush's words, according to the former U.S. senior official, were "Gotta be secret, and gotta be sure." A C.I.A. crisis task force was established, and, according to the same official, the C.I.A. compared "handheld" photographs of the site with "overheads" taken by American satellites. The photographs were then given to the National Geospatial-Intelligence Agency, which analyzes imagery and map-based intelligence for policymakers and the national-security community. The N.G.A. determined that the two sets of photographs were valid, as did nuclear experts at the Department of Energy and an outside nuclear-proliferation authority. Finally, an ad-hoc C.I.A. "red team" concluded, according to the former senior U.S. official, "If it's not a nuclear reactor, then it's a fake nuclear reactor."

While U.S. intelligence officials scrambled to confirm the Israeli report, Hadley, the national-security adviser, directed an interagency deputies committee—known, with deliberate blandness, as the Drafting Committee—to develop policy options. The committee's members included Elliott Abrams, a deputy national-security adviser; James Jeffrey, a top Middle East specialist at the State Department, who was later the deputy national-security adviser; Eric Edelman, a senior aide to Gates who had previously served as the Ambassador to Turkey; and Eliot Cohen, who was counsellor to the State Department under Condoleezza Rice. No personal aides were included

in the group's secure government e-mails. The policy options were not circulated on any government computers, and the committee's members were forbidden from taking any relevant documents out of the White House Situation Room.

From the start, several members of the Drafting Committee were skeptical that diplomacy could neutralize Syria's nuclear program. The fear was that Assad would stall in order to buy time for the reactor to go hot, at which point military action would become too risky. Over several Tuesday afternoons, an even more senior national-security group gathered in Hadley's office in the West Wing of the White House. At the time, few from the group advocated American military action. "Every Administration gets one preemptive war against a Muslim country," Gates told Edelman, half in jest, "and this Administration has already done one."

Moreover, Israel's 2006 war with Hezbollah had weakened Rice's faith in Israel's military judgment. "Condi thought that the Israeli military was unreliable and that they were no longer the ten-foot giants that we had grown up with," a former senior Administration official told me. Rice feared that a strike would lead to a wider conflict, including war with both Syria and Hezbollah. She was also invested in two diplomatic initiatives: six-party talks with North Korea about its nuclear program and a Middle East peace conference that would be held later that year, in Annapolis. Meanwhile, the Administration was staring down the end of its tenure. "We were just turning the corner in Iraq, and there was an uneasy sense about Afghanistan," Eliot Cohen told me. "Many in the Administration were deeply reluctant to start what they thought would be a third Middle Eastern war. They thought the American people would have no patience for it, quite apart from their own aversion to such a prospect."

On June 17th at the White House residence, just before a scheduled visit from Olmert, Bush met with advisers in the Yellow Oval Room, which encouraged intimacy and informality, and which allowed Bush to "be in a listening rather than deciding mode," according to another former senior official. Recounting that period for a 2011 Washington Post article, Hayden said that he "told the President that Al Kibar was part of a nuclear weapons program" and that "we could conceive of no alternative uses for the facility." But, because they "could not identify the other essentials of a weapons program," such as a reprocessing plant or active work on a warhead, Hayden wrote, "we cautiously characterized this finding as 'low confidence.'"

The Administration conceded that the reactor could go hot in the coming months, but, once the term "low confidence" had been invoked, Bush no longer felt he had the political cover to justify a preemptive strike. In his memoir, Bush says that he told Olmert, "I cannot justify an attack on a sovereign nation unless my intelligence agencies stand up and say it's a weapons program." David Albright, a nuclear-proliferation expert at the Institute for Science and International Security, told me that a reprocessing plant has yet to be found; then again, he noted, Syria has not granted anyone permission to look for one.

Olmert met with American officials in Washington on June 19th. He told reporters that he was there to discuss Iran and the Palestinian peace process, but, in his meetings with Bush and Cheney, he urged that the U.S. lead the attack on the Syrian reactor. Olmert argued that a U.S. strike would "kill two birds with one stone," allowing Bush to remind the international community of Assad's villainy and send a message dissuading Iran from pursuing its own nuclear program. Olmert told Bush that if the U.S. did not destroy the reactor, Israel would, even if it lacked support from the Americans. Bush promised an answer shortly.

On July 12th, Bush convened a second meeting, and declared that he would send an envoy to Syria with an ultimatum for Assad to begin dismantling the reactor. The five permanent members of the Council, or P5—the United States, Russia, China, Britain, and France—would oversee the dismantling.

Bush called Olmert at eight o'clock the next morning. If the Americans were to hit the reactor, he said, the Administration would have to explain to Congress that the intelligence had come from Israel. Was this what Olmert wanted? Bush offered to send Rice to the region, but Olmert replied that he was not interested in a visit from Rice, and said he feared that a diplomatic route would simply enable Syria to stall until the reactor went hot. In his memoir, Bush wrote that "the prime minister was disappointed" at the U.S. preference for diplomacy,

adding that Olmert told him, “This is something that hits at the very serious nerves of this country.” The American nuclear-prevention policy toward North Korea and Pakistan was characterized as “too early, too early—oops—too late,” Ariel Levite, a nonresident senior associate in the nonproliferation program at the Carnegie Endowment, told me. The Israelis also believed that a diplomatic focus would undermine the surprise of a military operation. Once Assad realized that he had been caught, as Abrams put it to me, what would stop him from putting a kindergarten near the site, or from deploying anti-aircraft weaponry?

Although the U.S. and Israel agreed on the fundamental facts and risks, they had reached opposing policy conclusions. Until the phone call from Bush, Olmert hoped that the United States would lead the attack. Now he was worried that any U.S. official who was not on board with the Israeli strike would try to sabotage it by leaking information, and he expressed his fears to Bush. The President promised Olmert that the American side would remain “buttoned up.”

Bush probably did not relish further military action and feared a repeat of the intelligence debacle in Iraq, but he seems to have understood Olmert’s position. At no point did Bush suggest that the U.S. would block Israeli action. “Olmert said he did not ask Bush for a green light, but Bush did not give Olmert a red light,” an Israeli general told me. “Olmert saw it as green.”

The Israelis began preparations for a unilateral attack. The I.D.F. and the Israeli Air Force considered three possible strategies: a wide strike by the Israeli Air Force, nicknamed Fat Shkedi, after Israel’s Air Force chief, General Eliezer Shkedi; a narrower strike, nicknamed Skinny Shkedi; and a ground attack by special forces. Cartoon “I should have bought toys with better posture.” Buy the print »

A key consideration was the desire to minimize the potential of a response from Damascus. Since discovering the reactor, many Israeli officials had concluded that the lower the signature of the attack the less likely Syria would be to retaliate. By failing to report the presence of a nuclear reactor, Assad would be violating his obligations to the International Atomic Energy Agency. To avoid drawing further attention to this violation—not to mention the humiliation of having its nuclear ambitions exposed and thwarted by Israel—Assad might prefer to bury the matter. Psychologists consulted by the I.D.F., who had profiled Assad for years, argued that Syrian retaliation might be avoided if Israel did not corner the President by publicly claiming credit for a strike, thus preserving for Assad what Israeli security officials called a “zone of denial.” Assad’s decision not to take any direct hostile action against Israel during its 2006 war with Hezbollah, in Lebanon, demonstrated that he saw the advantage of avoiding military confrontation with Israel. Also, from what the Israelis could discern, the Al Kibar reactor was in a remote location; a strike would be unlikely to cause civilian fatalities or even draw public attention.

Given these factors, the I.D.F., the Mossad, and the Foreign Ministry, led by Tzipi Livni, all favored a low-signature attack on the reactor. Back in June, an Israeli special-operations unit had been dispatched to within a mile of the site to take and transmit additional photos, bring back soil samples, and provide Israel with other information it needed for a strike.

By June, Peretz had lost the Labor Party leadership and the position of Defense Minister passed to Ehud Barak, the former Prime Minister, former Army chief of staff, and one of the most decorated soldiers in Israeli history. The “two Ehuds,” Olmert and Barak, had a cordial relationship, despite belonging to different parties. When Olmert was the mayor of Jerusalem, in the nineties, he defended Barak, then the Prime Minister, from the usual refrain from the right that a Labor leader would cede half of Jerusalem to the Palestinians. (In fact, Barak did offer significant parts of Jerusalem during the Camp David summit in 2000.)

But the friendship did not endure. Barak told his fellow cabinet ministers that he feared a repeat of the 2006 war, and thought it would be better to delay the attack on Al Kibar. This would give Israel’s military command in the north sufficient time to prepare for possible Syrian retaliation. For Olmert, the 2006 Lebanon war had established deterrence; Hezbollah had not openly fired a shot at Israel since then. Olmert suspected that Barak had another reason for putting off an attack on Al Kibar. The final report of the Winograd Commission, a

government-appointed inquiry into the decisions involved in the 2006 war with Hezbollah, was anticipated around the end of the year and was expected to criticize Olmert for his handling of the war and weaken him politically. Olmert worried that Barak would seize upon the report's findings, trigger Olmert's ouster as Prime Minister, and lead the operation against the Syrian reactor himself.

In Israel, all major military actions that could lead to war must be approved by the security cabinet. Olmert invited several members of the security cabinet separately to his home and briefed them on Al Kibar. Each signed a written vow of secrecy, agreeing to face investigation if he or she leaked information. Over the next five weeks, a half-dozen extraordinary security-cabinet meetings unfolded. Barak argued that a careful attack in the early phases after the reactor went hot would not contaminate the Euphrates. Olmert gave a long and persuasive rejoinder. "It may have been the most dramatic set of sessions that I can ever recall in the security cabinet," one of the cabinet ministers in attendance told me.

On September 1st, Turbowicz told the White House that preparations were almost complete. Israel informed one other country's intelligence service before the strike—Britain's MI6—but did not share the exact timing of the attack with either country.

On September 5th, the security cabinet deliberated for the last time, and voted to strike. (The only minister to abstain from voting was Avi Dichter.) The cabinet also voted to grant Olmert, Barak, and Livni sole power to approve the military approach and the timing of the strike. Barak and Olmert had made several handwritten amendments to the text of the resolution that ordered the strike, explicitly indicating the potential for war. After the cabinet session, Olmert, Barak, and Livni reconvened in the briefing room adjacent to Olmert's office. The chief of staff came into the room and recommended attacking that night, using the Skinny Shkedi approach. After the chief of staff left, Olmert, Barak, and Livni voted unanimously to proceed.

Just before midnight on September 5, 2007, four F-15s and four F-16s took off from Israeli Air Force bases, including Ramat David, southeast of Haifa. After flying north along the Mediterranean Coast, the planes turned east and followed the Syrian-Turkish border, to avoid detection by radar. Using standard electronic scrambling tools, the Israelis blinded Syria's air-defense system. In Tel Aviv, in a room of the underground I.A.F. command-and-control center known as "the pit," Olmert, Barak, Livni, and senior security officials followed the planes by radar. The room would serve as a bunker for Olmert in the event that the strike sparked a war; the Israelis had also prepared a military contingency plan.

General Shkedi tracked the pilots by audio in an adjacent room. Sometime between 12:40 and 12:53 A.M., the pilots uttered the computer-generated code word of the day, "Arizona," indicating that seventeen tons of explosives had been dropped on their target. "There was a sense of elation," one participant recalled. "The reactor was destroyed and we did not lose a pilot."

The next day, the Syrian Arab News Agency announced that Israeli planes had entered Syrian airspace but had been repelled: "Air-defense units confronted them and forced them to leave after they dropped some ammunition in deserted areas without causing any human or material damage." The Israelis say that not a single Syrian air-defense missile was launched. At least ten, and perhaps as many as three dozen, workers were killed in the strike.

As the planes returned to their bases, Olmert went to his secondary office, at the Kirya defense complex, in Tel Aviv, and asked to be connected to Bush, who was in Australia. "I just want to report to you that something that existed doesn't exist anymore," Olmert told him. "It was done with complete success."

Syria has consistently denied that it had a reactor, and the responses from its administration officials have been contradictory. Three weeks after the strike, President Assad told the BBC that Israeli warplanes had attacked an unused military building and said that Damascus reserved "the right to retaliate," though not necessarily in a "bomb for bomb" manner. Meanwhile, Bashar Ja'afari, the Syrian Ambassador to the United Nations, continued to insist that nothing was bombed in Syria and that Israeli planes "were encountered by our air defense fire" and were forced to drop their ammunition and fuel tanks.

“Nobody in Syria believed that Israel did this,” Andrew Tabler, a Syria expert who is a fellow at the Washington Institute and was in Damascus at the time, told me. “People believed the regime.” Syrians were incredulous on two accounts, Tabler said: that Assad had secretly built a reactor and that Israel had demolished it. Even as confirmation of some sort of strike came out in the world press, Syria did not strike back. This reinforced Israel’s initial psychological reading: as long as Assad could deny the existence of the reactor, he would not feel pressured to retaliate.

The Israelis helped secure that zone of denial. They briefed their regional allies, including Egypt and Jordan, and urged their leaders to refrain from making public statements about the strike. Olmert flew to Moscow to brief Russia, which has close ties with Assad. Dick Cheney was eager to expose the flagrant role of North Korea in the Syrian project and argued for disclosure. But Condoleezza Rice, keen to preserve the six-party diplomatic talks with North Korea, urged that the request for silence be honored. She prevailed.

On October 23rd, Olmert met Erdogan in London to brief him on the attack and on Israel’s motives. During the meeting, Olmert asked Erdogan to gauge Syrian interest in re-starting peace negotiations. Assad agreed to indirect peace talks, which began in Ankara in February, 2008; they ended that December, when Syria and Turkey withdrew in protest over Israel’s war against Gaza. Israelis say the two sides never discussed the Al Kibar strike.

As the months went by, and the odds of Syrian retaliation diminished, Bush asked Olmert for permission to tell certain senators and representatives what had happened. Details had begun to leak out, and members of the congressional intelligence committees were upset that they had not been briefed. Moreover, there was a fierce debate within the Administration over the decision not to go public about North Korea’s role in the construction of the Syrian reactor. Olmert relented; in Israel, however, official restrictions remain.

After rebuffing repeated requests by the I.A.E.A. to visit the site, Syria ultimately permitted a small group of inspectors, including Olli Heinonen, to visit for one day in June, 2008. The inspectors found particles of man-made uranium in the samples, which Syria claimed were the residue of the bombing. In 2009, the inspectors reported that graphite had also been found at the site; Syria again issued a denial. In its most recent report, the I.A.E.A. concluded that the site was “very likely” a nuclear reactor.

When I met with Heinonen this past spring, he told me that the site had been cleaned up before the inspectors’ visit. His statement echoed a cable, released by WikiLeaks in 2010 to an Israeli daily, that Condoleezza Rice sent to State Department representatives around the world on April 25, 2008, after the congressional briefing. “Syria’s concealment and lies about what happened for months now after the Israeli air strike is compelling proof that it has something to hide,” Rice wrote. “In fact, after the attack on the site, Syria went to great lengths to clean up the site and destroy evidence of what was really there.” Syria’s cleanup effort was also monitored and confirmed by I.D.F. satellites.

Heinonen said that one of the inspectors’ escorts at the site was General Mohammed Suleiman, who served as a primary regime contact on various issues related to Iran. An Israeli general called him the head of the Syrian “shadow army,” meaning he dealt with issues unrelated to Syria’s conventional Army, such as transferring Iranian weapons to Hezbollah. Israeli officials say that Suleiman, a fellow-Alawite and longtime friend of the Assad family, was believed to be one of the very few senior regime officials who knew of the reactor’s existence.

On August 1, 2008, Suleiman was killed by snipers while hosting a dinner at his weekend home overlooking the sea at the Syrian port city of Tartus. The operation is believed to have been carried out jointly by the Mossad and the Shayetet 13, or Flotilla 13, an élite commando unit of the Israeli Navy that specializes in sea-to-land incursions and counterterrorism. Nobody else was injured. Israel has never acknowledged the assassination.

Olmert’s poll numbers did not recover after the fallout of the 2006 war, and the rest of his term as Prime Minister was marred by corruption charges, even as he continued Palestinian peace talks with Abbas. In July, 2008, he

announced that he would resign his position, and he left office after elections the following February. This July, Olmert was cleared of charges of receiving illicit cash payments and of double-billing Israeli organizations for travel expenses, but convicted on breach of trust. He faces another trial on corruption charges related to a Jerusalem real-estate deal, but some recent polls show that if Olmert were to head a new centrist coalition it would run strongly against Netanyahu's party. If he is acquitted of the final charge, many analysts in Israel expect him to attempt a political comeback, though he has denied it in public.

For Israel, the raid on Al Kibar was an unparalleled success. The Begin doctrine was reaffirmed, and neither Syria nor Hezbollah has encroached on Israel since. The pressing question today is whether the lessons of that success can be applied to Iran, which has insisted, against all evidence, that its nuclear ambitions are limited to civilian purposes, and whether Israel and the U.S. view the threat the same way.

*[deletia]*

## **Bombing the Syrian Reactor: The Untold Story**

Elliott Abrams

February 2013

As the civil war in Syria enters its third year, there is much discussion of the regime's chemical weapons and whether Syria's Bashar al-Assad will unleash them against Syrian rebels, or whether a power vacuum after Assad's fall might make those horrific tools available to the highest bidder. The conversation centers on Syria's chemical weaponry, not on something vastly more serious: its nuclear weaponry. It well might have. This is the inside story of why it does not.

Relations between the United States and Israel had grown rocky after Israel's incursion into Lebanon in 2006, for Secretary of State Condoleezza Rice believed the Israelis had mishandled both the military and the diplomatic sides of the conflict. While Prime Minister Ehud Olmert's personal relations with President George W. Bush were excellent, those with Rice were sometimes confrontational—especially when Rice worked at the United Nations to bring the war to a close while Olmert sought more time to attack Hezbollah. Olmert always seemed to ask for 10 days more, while Rice believed the war was not going well and that more time was unlikely to turn the tables.

By the war's end on August 14, 2006, Olmert's political status had been diminished and his ability to negotiate any sort of peace agreement with the Palestinians was in doubt. The autumn of 2006 and winter of 2007 saw no movement on the Israeli-Palestinian front, and all the Israeli analysts we consulted said there would be none. We were stuck. And there was another surprise in store.

In the middle of May 2007, we received an urgent request to receive Mossad chief Meir Dagan at the White House. Olmert asked that he be allowed to show some material to Bush personally. We headed that off with a suggestion that he first reveal whatever he had to National Security Adviser Stephen Hadley and to me; I was then the deputy national-security adviser in charge of the Middle East portfolio on the National Security Council. Vice President Dick Cheney joined us in Hadley's office for Dagan's presentation. What Dagan had was astonishing and explosive: He showed us intelligence demonstrating that Syria was constructing a nuclear reactor whose design was supplied by North Korea, and doing so with North Korean technical assistance. Dagan left us with one stark message: All Israeli policymakers who saw the evidence agreed that the reactor had to go away.

There then began a four-month process of extremely close cooperation with Israel about the reactor, called al-Kibar. As soon as our own intelligence had confirmed the Israeli information and we all agreed on what we were dealing with, Hadley established a process for gathering further information, considering our options, and sharing our thinking with Israel. This process was run entirely out of the White House, with extremely limited participation to maintain secrecy. The effort at secrecy succeeded and there were no leaks—an amazing feat in Washington, especially when the information being held so tightly was as startling and sexy as this.

Initially, there were doubts that Bashar al-Assad could be so stupid as to try this stunt of building a nuclear reactor with North Korean help. Did he really think he would get away with it—that Israel would permit it? But he nearly did; had the reactor been activated, striking it militarily could have strewn radioactive material into the wind and into the nearby Euphrates River, which was the reactor's source of water needed for cooling. When we found out about the reactor, it was at an advanced construction stage, just a few months from being "hot."

The consideration of what to do about the reactor continued alongside tense meetings between Rice and Israel on how to proceed with the Palestinians, but the two initiatives did not collide. For the most part, this was because different people were involved. Military and intelligence personnel uninvolved in peace negotiations were the

key interlocutors for Israel in considering the al-Kibar reactor, as were individuals on the vice president's staff who were sympathetic to Israel's position. The work on al-Kibar was a model both of U.S.-Israel collaboration and of interagency cooperation without leaks. Papers I circulated to the group were returned to me when meetings ended or were kept under lock and key; secretaries and executive assistants were kept out of the loop; meetings were called under vague names such as "the study group."

The debates were vigorous in our secret meetings in the White House Situation Room. The role of those in the Situation Room was not to decide what was to be done about the reactor; it was merely to be sure every issue had been thoroughly debated and was covered in the memos we drafted for the administration's principal officials on foreign-policy matters and for the president. This was an excellent example of how policy should be made. Several times, principals—Rice and Hadley, Defense Secretary Robert Gates, CIA Director Michael Hayden, Director of National Intelligence Mike McConnell, Joint Chiefs of Staff Chairman Peter Pace and Vice President Cheney—trooped over to the president's living room in the residence section of the White House to have it out before him, answer his questions, and see what additional information he sought.

I attended all these meetings as note taker, and the notes are under lock and key at the National Archives.

**From above: A satellite image of the Syrian reactor site one month after it was bombed by Israeli forces in September 2007.**

The day I left those notes on the floor under my chair in the president's living room, and discovered when back at the NSC that I no longer had them, remains emblazoned in my mind. These were among the most sensitive notes then existing in the U.S. government, amazing precautions for secrecy had been taken, and I had simply left them on the floor. Pale and drenched with sweat, I ran back to the residence, where the butler graciously let me back in and accompanied me to the Yellow Oval Room where we had met. There was my portfolio, under the chair, untouched. Well, I thought, if the butler keeps his mouth shut, I may actually not be shot after all.

The facts about al-Kibar were soon clear, and about those facts there was no debate: It was a nuclear reactor that was almost an exact copy of the Yongbyon reactor in North Korea, and North Koreans had been involved with Syria's development of the site. Given its location and its lack of connection to any electrical grid, this reactor was part of a nuclear-weapons program rather than intended to produce electric power.

The array of options was clear as well: overt or covert, Israel or United States, military or diplomatic. The United States and Israel both had an obvious military option: Bomb the site and destroy the reactor. This was not much of a military challenge, General Pace assured the president. Whether anything short of a military strike could destroy the reactor was another question, and the difficulties with such an option were obvious: Just how would you get the needed explosives to the site except through a military attack? It was soon agreed that a covert option did not exist, and military options were quickly designed to make the reactor disappear; as Dagan had said when he first visited us, the Israelis clearly believed it had to go away. We developed elaborate scenarios for U.S. and Israeli military action addressing these issues: Whom would you inform when, what would you announce and what would you keep secret, and what if anything would you say to the Syrians?

But a diplomatic option existed as well, and we did draw up elaborate scenarios for it. We would begin by informing the International Atomic Energy Agency (IAEA) of the facts and making them public in a dramatic session before the IAEA Board of Governors in Vienna. We would demand immediate inspections and that Syria halt work on the reactor. If Syria refused, we would go to the UN Security Council and demand action. If there was no action, the military option in theory remained open.

However, this diplomatic option seemed faintly ridiculous to me. For one thing, it would never be acceptable to Israel, whose experience with the United Nations was uniformly bad. The Jewish state would never trust its national security to the UN. For another, it would not work; Syria's friends in the UN, especially Russia, would protect it. At the IAEA, we had plenty of experience with Director General Mohamed ElBaradei, an Egyptian. He was redefining the director general's role from that of inspector and cop to that of peacemaker and diplomat; he would seek a deal with Syria rather than concerted action against it. Moreover, taking the reactor issue to the UN and the IAEA meant handing it over to the State Department, and I thought an issue of this importance should be handled in the White House.

Finally, the argument that there would always remain a military option as a last resort was misleading at best. Once we made public our knowledge of the site, Syria could put a kindergarten right next to it or take some similar move using human shields. Military action required secrecy, and once we made any kind of public statement about al-Kibar, that option would be gone.

The vice president thought the United States should bomb the site. Given our troubles in Iraq and the growing confrontation with Iran, this would be a useful assertion of power and would help restore our credibility. As he later wrote:

I again made the case for U.S. military action against the reactor. Not only would it make the region and the world safer, but it would also demonstrate our seriousness with respect to non-proliferation. . . . But I was the lone voice. After I finished, the president asked, "Does anyone here agree with the vice president?" Not a single hand went up around the room.

My hand did not go up (and as we left the president's living room that day, June 17, I apologized to the vice president for leaving him isolated) because I thought the Israelis should bomb the reactor, restoring their credibility after the annus horribilis of 2006 with the Second Lebanon War and then the 2007 Hamas takeover of Gaza. It seemed to me that Israel would suffer if we bombed it, because analysts would point out that Israel had acted against the Osirak reactor in Iraq in 1981 but had become paralyzed when it came to Syria. Such an analysis might embolden Iran and Hamas, a development that would be greatly against American interests. Moreover, hostile reactions in the Islamic world against the bombing strike might hurt us at a time when we were fighting in Afghanistan and Iraq—another argument for letting Israel do the job. (I did not think there would be any such reactions, but this was an argument worth deploying in our internal debate.)

Secretaries Gates and Rice argued strenuously for the diplomatic option. Gates also argued for preventing Israel from bombing the reactor and urged putting the whole relationship between the United States and Israel on the line. His language recalled the “agonizing reappraisal” of relations Eisenhower's secretary of state, John Foster Dulles, had threatened for Europe in 1953 if the Europeans failed to take certain defense measures: They simply had to do what we demanded or there would be hell to pay.

I thought I understood why Gates did not want the United States to bomb Syria: America was a steward of wars in two Islamic countries already, so striking a third one seemed terribly unattractive to him. Why he was almost equally insistent that we prevent Israel from bombing it was never comprehensible to me, nor was Rice's similar position. It seemed clear to me that if we could not prevent Syria from undertaking a nuclear-weapons program, our entire position in the Middle East would be weakened, just as it was being weakened by our inability to stop the Iranian program. If there were too many risks and potential complications from striking Syria ourselves, we should not only allow but encourage Israel to do it; a Syrian nuclear program in addition to Iran's should be flatly unacceptable to the United States.

I tried to think my way through Rice's reasoning, but came up with only one theory. She had simultaneously been expressing opposition to a new program of increased military aid to Israel. This indicated to me that she had an underlying strategy: She did not want Israel feeling stronger. Rather, she wanted Israel, and especially Prime Minister Olmert, to feel more dependent on the United States. That way she would be able to push forward with plans for an international conference on Israeli-Palestinian issues and for final-status talks leading to the creation of a Palestinian state before the end of the second Bush term.

I hoped this was not her intention, because it seemed to me that such designs were sure to fail. An Israel that was facing Hamas in Gaza and now two hostile nuclear programs, in Iran and just across the border in Syria, would never take the risks she was asking it to take. I thought we had learned that lesson with Ariel Sharon as Bill Clinton had learned it with Yitzhak Rabin: Wrap your arms around Israel if you want it to take more risks, so it feels more secure, not less.

The arguments for going to the IAEA and UN seemed so flimsy to me, despite the length and detail of the planning memos and scenarios to which they gave rise, that I did not much worry about them. Who could believe these organizations would act effectively? Who could believe we would not be sitting there five years later entangled in the same diplomatic dance over the Syrian program that we were in with respect to Iran?

In the end, our near-perfect policy process produced the wrong result. At a final session in the gracious Yellow Oval Room at the Residence, Bush came down on Rice's side. We would go to Vienna, to the IAEA; he would call Olmert and tell him what the decision was. I was astounded and realized I had underestimated Rice's influence even after all this time. The president had gone with Condi.

I tried to figure this one out and could not. Perhaps it was the same worry that Gates had about making another American military strike in the Islamic world. But that would not explain why he bought the IAEA/UN strategy lock, stock, and barrel; instead, he could have said, “Let the Israelis do what they want; let's just tell them we will not do it.” Years later I asked him if he thought he had been wrong; he said no. It was then, and is still,

baffling. In his memoir, Bush explains one key consideration: The CIA told him it had “high confidence” that the facility in Syria was a nuclear reactor but “low confidence” that Syria had a nuclear-weapons program, because it could not locate the other components of the program. The president thought that the “low confidence” judgment would leak, as it surely would have, and the United States would have been attacked for conducting the bombing raid despite the “low confidence” report. That is a reasonable argument, but it explains only why we did not bomb—it does not explain why he urged the Israelis not to do so.

**On July 10, I gave Hadley a memo explaining my views on where we stood with the Israelis.** First, we were on the verge of telling the Israelis that we had considered which of us should act against the reactor and had decided that neither of us should use force. Moreover, we were going to say we would pressure them not to do so even if they disagreed. And we would be saying all this after Hamas had just taken over Gaza (which it did, in a coup against the Palestinian Authority, in June 2007). Hezbollah was back fully rearmed in Lebanon despite all those UN Security Council resolutions we had told the Israelis would work. Iran was moving toward nuclear capability. Syria was building a reactor that could only be part of a nuclear-weapons program.

It also looked as if we would be telling them we were about to call for an international meeting on the Palestinians that Israelis did not want and that they feared—and would be doing so in a presidential speech that talked about negotiations for Palestinian statehood “soon” (the word was in the speech drafts). Such a big international conference was the State Department’s answer to unsticking a “peace process” that was stuck.

The editorial comment from our friends on the right, I told Hadley, will be that we have taken leave of our senses: Hamas takes over Gaza, Syria and Iran build nukes, and we are handing things over to the UN and then pushing final-status talks? I still did not think there was a need for any presidential speech, but if there were to be one, I wrote that it should be sober about the situation and supportive of the new Palestinian prime minister, Salam Fayyad.

At that point, Fayyad had been prime minister for about a month, and already the PA was changing. It now had a serious, talented, incorruptible executive at the top of the government. This had never been tried before. The least we could do was to back him, firmly and fully, and not spend all our political capital on great conferences. It was, as I recall it, a terrific memo, yet like all the wonderful memos about the Syrian reactor, it had no impact whatsoever. On July 16, the speech that Condi had sought was given. “Bush Calls for Middle East Peace Conference,” the headlines read.

**Three days earlier, on July 13, President Bush had called Prime Minister Olmert from his desk in the Oval Office and explained his view.** I have gone over this in great detail, Bush explained on the secure phone to the Israeli prime minister, looking at every possible scenario and its likely aftermath. We have looked at overt and covert options, and I have made a decision. We are not going to take the military path; we are instead going to the UN. Bush recounts in his memoir that he told Olmert, “I cannot justify an attack on a sovereign nation unless my intelligence agencies stand up and say it’s a weapons program” and that “I had decided on the diplomatic option backed by the threat of force.” We will announce this approach soon, Bush said on the secure line, and we will then launch a major diplomatic campaign, starting at the IAEA and then the UN Security Council. And of course a military option always remains available down the line.

I wondered how Olmert would react and believed I could predict his response: He would say, “Wait, give me some time to think about this, to consult my team, to reflect, and I will call you tomorrow.” I was quite wrong. He reacted immediately and forcefully. George, he said, this leaves me surprised and disappointed. And I cannot accept it. We told you from the first day, when Dagan came to Washington, and I’ve told you since then whenever we discussed it, that the reactor had to go away. Israel cannot live with a Syrian nuclear reactor; we will not accept it. It would change the entire region and our national security cannot accept it. You are telling me you will not act; so, we will act. The timing is another matter, and we will not do anything precipitous.

This is not the account President Bush gives in his memoir, in which he writes that Olmert initially said, “George, I’m asking you to bomb the compound.” Someday transcripts of their conversation will be available, but Bush’s recollection does not comport with mine.

After that conversation, there was a nearly two-month gap, from July 13 to September 6. We now know the time was filled with Israeli military calculations—watching the weather and Syrian movements on the ground—with the aim of being sure that Israel could act before the reactor went “critical” or “hot.” We knew the Israelis would strike sooner or later. They acted, in the end, when a leak about the reactor’s existence was imminent and Syria might then have gotten notice that Israel knew of its existence. That would have given Assad time to put civilians or nuclear fuel near the site. The Israelis did not seek, nor did they get, a green or red light from us. Nor did they announce their timing in advance; they told us as they were blowing up the site. Olmert called the president on September 6 with the news.

As I had sat in the Oval Office on July 13, listening to his conversation with Olmert, I had wondered how the president would react to the Israeli action. With anger? Or more pressure? None of it. He heard Olmert out calmly and acknowledged that Israel had a right to protect its national security. After hanging up, the president said something like “that guy has guts,” in an admiring tone. The incident was over; the differences over al-Kibar would obviously not affect Bush’s relationship with Olmert or his view of Israel.

So quickly did he accept the Olmert decision that I wondered then, and do still, if the president did not at some level anticipate and desire this result. He had sided with Condi and shown that she was still in charge of Middle East policy, but her “take it to the UN” plan had been blown up along with the reactor. He did not seem very regretful. What is more, he instructed us all to abandon the diplomatic plans and maintain absolute silence, ensuring that Israel could carry out its plan.

The Israeli assessment of Syria’s likely reaction was correct. The Israelis believed that if they and we spoke about the strike, Assad might be forced to react to this humiliation by trying to attack Israel. If, however, we all shut up, he might do nothing—nothing at all. He might try to hide the fact that anything had happened. And with every day that passed, the possibility that he would acknowledge the event and fight back diminished. That had been the Israeli theory, and the Israelis knew their man. We maintained silence and so did Israel—no leaks. As the weeks went by, the chances of an Israeli-Syrian confrontation grew slim and then disappeared. Syria has never admitted that there was a reactor at the site. Soon after the bombing, the Syrians bulldozed the reactor site, but the only way they could be sure their lies about it were not contradicted was to prevent a full examination. When a 2008 site visit by IAEA inspectors found some uranium traces, Syria made sure never to permit a return visit.

Two final points are worth noting. First, in May 2008, Turkish-mediated peace talks between Israel and Syria were publicly announced in Istanbul. The discussions had begun secretly in February 2007, and obviously had continued after the Israeli strike on al-Kibar. It would appear that the strike on al-Kibar made the Syrians more, not less, desirous of talking to the Israelis because it made them afraid of Israeli power. It also made them more afraid of American power until we undermined our own position, which is the second point.

A very well-placed Arab diplomat later told us that the strike had left Assad deeply worried as to what was coming next. He had turned Syria into the main transit route for jihadis going to Iraq to kill American soldiers. From Libya or Indonesia, Pakistan or Egypt, they would fly to Damascus International Airport and be shepherded into Iraq. Assad was afraid that on the heels of the Israeli strike would come American action to punish him for all this involvement. But just weeks later, Assad received his invitation to send a Syrian delegation to that big international confab of Condi’s, the Annapolis Conference, and according to the Arab envoy, Assad relaxed immediately; he knew he would be OK. I had not wanted Syria invited to Annapolis because of its involvement in killing Americans in Iraq, but Condi had wanted complete Arab representation as a sign that comprehensive peace might be possible. It was only years later that I learned that Assad had instead

interpreted the invitation just as I had: as a sign that the United States would not seriously threaten or punish him for what Syria was doing in Iraq.

Since the day the Israelis struck the Syrian reactor in September 2007, much has changed in the neighborhood: Assad faces a civil war he cannot win, the “Arab Spring” has replaced Hosni Mubarak with a Muslim Brotherhood government in Egypt, and Israel has now fought two wars with the Hamas statelet in Gaza, in December 2008/January 2009 and in November 2012. Yet there are three lessons from this incident that still bear noting.

First, good “process” and good policy are related but distinct. In the end what counts is output, not input: the foreign policy we adopt, not the proposals that are advanced. And that output depends, when it comes to foreign policy, mostly on one man: the president. That’s the second lesson. Advisers advise; the president decides. All the books about how rival bureaucracies or powerful lobbies determine policy are off the mark; the simpler and truer conclusion is that at any given moment our foreign policy reflects the views of the president.

Finally, this incident is a reminder that there is no substitute for military strength and the will to use it. Think of how much more dangerous to the entire region the Syrian civil war would be today if Assad had a nuclear reactor, and even perhaps nuclear weapons, in hand. Israel was right to bomb that reactor before construction was completed, and President Bush was right to support its decision to do so. Israel was also right in rejecting fears that the incident would lead to a larger war and in believing that it, and the United States, would be better off after this assertion of leadership and determination. That lesson must be on the minds of Israeli, and American, leaders in 2013.

## Report: Syrian rebels take over Al-Kibar nuclear facility

Roi Kais

Latest Update: 02.23.13, 06:20 / Israel News

According to Syrian opposition sources, the Free Syrian Army has taken over a nuclear facility in Al-Kibar, the Al-Jazeera network reported.

According to foreign media reports, the Al-Kibar facility was reportedly struck by Israel in 2007.

The rebels released a video, in which they are seen in a base storing missiles, most likely scud missiles.

## Syrian rebels say willing to work with IAEA

Roi Kais

Published: 02.24.13, 10:20

A spokesman for the Free Syria Army hinted Sunday [2013-02-24] that the rebels would be willing to allow International Atomic Energy Agency (IAEA) inspectors into the Al-Kibar nuclear facility, which they seized last week.

The Al-Kibar facility, according to foreign media reports, was nearly leveled by a 2007 air strike, presumably launched by Israel.

"We're willing to cooperate with the IAEA if our conditions are met," the FSA said in a statement.

The London-based Arab newspaper Al-Sharq Al-Awsat further quoted a commander of one of the rebel brigades as saying that the rebels would be willing to lend the IAEA their cooperation in investigating the site, "As long as the revolution is protected."

He added that the FSA has set up a special security parameter around Al-Kibar, to protect it.

The IAEA has never been allowed to visit the suspected nuclear site.

The spokesman said that an FSA officer has been made the liaison to the UN agency and will present it with the rebels' demands, which he said were "Primarily political, technical and logistical, the kind that mean to serve the revolution's intelligence's needs."

He further confirmed earlier reports of the facility's takeover, saying that the rebels found it empty. He refused to tell the newspaper whether anything was found on the premises to suggest that the facility was used for nuclear work.

"Those details will be given only to the IAEA," he said.

## **IAEA has no contacts with Syrian opposition on Al-Kibar site - Amano**

04/03/2013 | 10:28 PM

VIENNA, March 4 (KUNA) -- Director General of the International Atomic Energy Agency (IAEA) Yukiya Amano said Monday the agency has so far no contacts with the Syrian opposition forces who captured Al-Kibar site in the eastern Deir Al-Zor Governorate recently.

There are sticking issues related to the alleged nuclear site which was bounded by the Israeli warplanes on September 6, 2007, Amano told reporters here after the IAEA Board of Governors began its first meeting of the year.

"As far as the implementation of the NPT Safeguards Agreement in the Syrian Arab Republic is concerned, I renew my call to Syria to cooperate fully with us in connection with unresolved issues related to the Deir Al-Zor site and other locations," he said.

The rebel Free Syrian Army (FSA) claimed control over the site on February 24 after fierce fighting against the regular troops.

## **Syrian opposition captures ballistic missile facility**

By Doug Richardson

3/5/2013

The Syrian opposition has captured what appears to be a ballistic-missile facility equipped with fixed-site launchers for 'Scud'-type ballistic missiles. Located at Al Kibar, often referred to as Deir Az-Zor, it takes the form of a hanger-like building erected on the site thought to have been formerly used by a Syrian nuclear facility. In September 2007 the latter was destroyed by an Israeli air strike, and the shattered building was subsequently razed to its foundations by the Syrians.

In February 2009, the New York Times reported that Ibrahim Othman, the head of the Syrian Atomic Energy Commission, had told a closed technical meeting of the International Atomic Energy Agency (IAEA) in Vienna that a missile facility had been constructed on the site.

The recent capture of the Al Kibar site has been credited to the Ja'far al-Tayyar brigade and the al-Nusra front. Ja'far at-Tayyar is an alternative name for Ja'far ibn Abi Talib, son of Abu Talib ibn 'Abdul Muttalib, the uncle of the Islamic prophet Muhammad.

Poor-quality video, probably taken using cellphones, shows that the building now present on the Al Kibar site houses a number of fixed launchers for missiles.

## North Korea and Syria<sup>27</sup>

North Korea assisted Syria with building a nuclear reactor that may have been part of a Syrian nuclear weapons program, according to U.S. official accounts.<sup>28</sup> Both the United States and the International Atomic Energy Agency (IAEA) assessed that Damascus was building a nuclear reactor; Israel destroyed the facility in a September 2007 air strike.<sup>29</sup> According to a May 2011 IAEA report, the agency assessed that the destroyed Syrian structure “was very likely a nuclear reactor,” a claim Syria denied.<sup>30</sup> The IC assessed that the reactor’s purpose was to produce plutonium for nuclear weapons, a senior intelligence official stated during an April 2008 briefing, but added that the IC had “low confidence” in this judgment.<sup>31</sup> According to a 2013 State Department report, the United States assessed that “the reactor’s intended purpose” was to produce plutonium, rather than to conduct research or produce electricity, “because the reactor was not configured for power production, was isolated from any civilian population, and was ill-suited for research.”<sup>32</sup>

<sup>27</sup> In addition to its dealings with Syria, North Korea was also a probable supplier to Libya’s nuclear weapons program. According to a February 2013 Defense Department report, “North Korea provided Libya with uranium hexafluoride,” which is the material fed into the uranium enrichment process. (*Military and Security Developments Involving the Democratic People’s Republic of North Korea*, February 15, 2013). Conveying slightly less certainty about the matter, a September 2011 International Atomic Energy Agency report stated that “it is very likely that” natural uranium hexafluoride contained in a cylinder that Libya received in 2001 via the Khan network “originated in” North Korea (*Application of Safeguards in the Democratic People’s Republic of Korea*, GOV/2011/53-GC(55)/24), September 2, 2011).

<sup>28</sup> Although there have been press reports regarding nuclear cooperation between Syria and Iran, they are not corroborated by official U.S. open-source assessments. See, for example, Erich Follath and Holger Stark, “The Story of ‘Operation Orchard’: How Israel Destroyed Syria’s Al Kibar Nuclear Reactor,” *Der Spiegel*, February 11, 2009; and Hans Rühle, “How Iran Pushed Forward Syria’s Nuclear Armament; Background of the Israeli Action Against the Reactor of Al-Kibar,” *Neue Zürcher Zeitung*, March 19, 2009.

<sup>29</sup> Richard Cheney, Vice President during the George W. Bush Administration, wrote in 2011 that Israel destroyed the reactor. (Dick Cheney, *In My Time: A Personal and Political Memoir* [New York: Threshold Editions], 2011, p. 472.) See also George W. Bush, *Decision Points* (New York: Crown Publishing), 2010, p. 422; and Elliott Abrams, “Bombing the Syrian Reactor: The Untold Story,” *Commentary*, February 2013.

<sup>30</sup> *Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic*, GOV 2011/30 May 24, 2011. The IAEA also wants information about “three other locations allegedly functionally related” to the reactor site, the May 2011 report said. According to an August 2012 IAEA report, the IAEA “remains unable to provide any assessment concerning” these sites’ “nature or operational status.” (*Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic*, GOV 2012/42, August 30, 2012). Syria has not since complied with the board’s request.

<sup>31</sup> “Background Briefing with Senior U.S. Officials on Syria’s Covert Nuclear Reactor and North Korea’s Involvement,” April 24, 2008.

<sup>32</sup> *Adherence to and Compliance with Arms Control, Nonproliferation, and Disarmament Agreements and Commitments*, Department of State, July 2013.

Syria was constructing the reactor with “North Korean assistance,” the same 2013 report said.<sup>33</sup> A senior U.S. intelligence official stated during the 2008 briefing that “North Korea has assisted Syria with this reactor,” citing similarities between the Syrian reactor and the North Korean reactor that has produced plutonium for that country’s nuclear weapons program.<sup>34</sup> The official also cited the “involvement of nuclear-related North Koreans in a project somewhere in the area,” as well as “evidence of cargo being transferred from North Korea, most likely to [the] reactor site, in 2006.” More recently, a February 2014 Defense Department report stated that North Korea “provided Syria with nuclear reactor technology until 2007.”<sup>35</sup>

It is worth noting that an IAEA investigation discovered Syrian uranium conversion activities that the government had failed to declare to the IAEA. Uranium conversion is the process by which uranium hexafluoride (the feedstock for centrifuges) is produced. However, the IAEA has apparently resolved its concerns regarding these activities.<sup>36</sup>

## Iran and North Korea

U.S. intelligence officials have expressed concern that North Korea might export its nuclear technology or fissile material. According to testimony from DNI Clapper before Congress in February 2012, North Korea’s export of “ballistic missiles and associated materials,” as well as its assistance to Syria’s nuclear reactor, “illustrate the reach of the North’s proliferation activities.” The IC “remain[s] alert to the possibility that North Korea might again export nuclear technology,” he added.<sup>37</sup>

<sup>33</sup> *Military and Security Developments Involving the Democratic People’s Republic of North Korea*, 2013.

<sup>34</sup> “Background Briefing with Senior U.S. Officials on Syria’s Covert Nuclear Reactor and North Korea’s Involvement,” April 24, 2008.

<sup>35</sup> *Military and Security Developments Involving the Democratic People’s Republic of North Korea*, 2014.

<sup>36</sup> GOV 2011/30.

Ex-atomic agency chief: Netanyahu using scare tactics on Iran nuclear program

Ronen Bergman

Published: 05.08.14, 11:53

*[EXERPTS]*

Brigadier General (res.) Uzi Eilam, who for a decade headed the Israel Atomic Energy Commission, does not believe that Tehran is even close to having a bomb, if that is even what it really aspires to.

Uzi Eilam comes from the heart of Israel's secret security mechanisms, having served in senior roles in the defense establishment that culminated in a decade as the head of the atomic agency.

"The statements and threats made regarding an attack on Iran did not help," Eilam says. "We cannot lead the charge on this front. As far as the project goes, Iran's nuclear facilities are scattered and buried under tons of earth, concrete and steel. **This would require more than one strike, such as on the nuclear reactors in Iraq and Syria.** A strike on Iran's nuclear facilities would in effect be the opening salvo in all-out war."

## Russia and West at odds over Syria at U.N. nuclear meeting

By Fredrik Dahl

VIENNA

Wed Sep 17, 2014 6:38am EDT

(Reuters) - Russia is pushing for the issue of Syria's alleged past nuclear activities to be removed from the agenda of the U.N. atomic agency's board, diplomats said on Wednesday.

Western members of the 35-nation board of the International Atomic Energy Agency are against the Russian initiative as they believe Damascus should be kept under pressure to cooperate with the IAEA's long-stalled inquiry, the diplomats said.

As in previous meetings over the last six years, Syria will be debated by the IAEA board later this week during a quarterly meeting of the governing body, even though there has been little movement on the file since 2011.

The IAEA has long sought to visit a Syrian desert site U.S. intelligence reports say was a nascent, North Korean-designed reactor geared to making plutonium for nuclear bombs, before Israel bombed it in 2007.

Syria has said the site at Deir al-Zor in its east was a conventional military base but the IAEA concluded in 2011 that it was "very likely" to have been a reactor that should have been declared to its anti-proliferation inspectors.

IAEA inspectors examined the site in mid-2008 but Syrian authorities have barred them access since. In February last year, opposition sources in eastern Syria said rebels had captured the destroyed site near the Euphrates River.

The IAEA has also been requesting information about three other sites that may have been linked to Deir al-Zor.

IAEA Director General Yukiya Amano said on Monday that his agency remained "unable to provide any assessment concerning the nature, or operational status" of those locations.

"I urge Syria to cooperate fully with the agency in connection with all unresolved issues," he told the board.

Diplomats said Russia had circulated a proposed decision by the board -- whose members also include the United States, China, Britain and others -- asking Amano not to include the issue in the agenda of future meetings, without elaborating.

It was unclear whether Russia would request a vote on the matter. Russian diplomats were not available for comment.

Russia, a veto-wielding permanent member of the U.N. Security Council, has given President Bashar al-Assad crucial backing in Syria's civil war, which has killed more than 200,000 people.

One Western diplomat said Syria still had questions to answer and it was not yet time to take it off the agenda.

Western and Israeli security experts in early 2013 said they suspected that Syria may have tonnes of unenriched uranium in storage and that any such stockpile could potentially be of interest to its ally Iran, which denies Western allegations that it is seeking a nuclear weapons capability.

Even if Syria did have such a stockpile, it would not be usable for nuclear weapons in its present form.

(Editing by Janet Lawrence)

## Syrian nuclear activities divide global powers at UN atomic meeting

[ca. 2014-09-19]

[EXCERPTS]

Western states defeated a Russian proposal on Friday to remove Syria's alleged past nuclear activities from the agenda of meetings of the UN atomic agency, diplomats said.

But in a vote that highlighted how polarizing the global political debate has become, China supported Russia's initiative while only about half of the nations on the International Atomic Energy Agency (IAEA) board - 17 out of 35 - voted against.

Western diplomats argued that Damascus should be kept under pressure to cooperate with the IAEA's long-stalled inquiry, even though this has hardly advanced in the last three years as the country descended into bloodshed.

US envoy Laura Kennedy told the meeting ahead of the vote that the Russian proposal if adopted "would threaten the credibility" of the IAEA's board of governors.

Russia, a veto-wielding permanent member of the UN Security Council, has given Syrian President Bashar Assad crucial backing during the civil war, which has killed more than 200,000 people.

Apart from China, Venezuela was the only other country which backed Russia while most other countries abstained. One representative was absent from the vote, a diplomat said.

The Syrian case has been on the agenda of the IAEA board's quarterly meetings over the last six years, and Washington believes it should remain in the "focus of the agency," Kennedy said.

[deletia]

The IAEA has also been requesting information about three other sites that may have been linked to Deir al-Zor.

IAEA Director General Yukiya Amano said on Monday the agency remained "unable to provide any assessment concerning the nature, or operational status" of those locations.

"I urge Syria to cooperate fully with the agency in connection with all unresolved issues," he told the board.

Diplomats said Russia had circulated a proposed decision by the board - whose members also include Britain and France - asking Amano not to include the issue in the agenda of future meetings, without elaborating.

[deletia]

Western and Israeli security experts in early 2013 said they suspected that Syria may have tons of unenriched uranium in storage. Even if Syria did have such a stockpile of material that can be used to fuel research reactors it would not be usable for nuclear weapons in its present form.

Israel's IAEA envoy, Merav Zafary-Odiz, told the board that the "whereabouts of the nuclear fuel, which was supposed to be introduced to the nuclear reactor that Syria built ... is just one example to the many open questions that remain in relation to the Syrian file."

**IAEA Board of Governors Meeting**

**November 26-27, 2015**

**Agenda Item 4**

**Implementation of the NPT safeguards agreement in the**

**Syrian Arab Republic**

**U.S. Statement**

Thank you, Mr. Chairman,

The United States thanks the Director General for his remarks today and for his ongoing commitment to addressing the important issue of Syria's non-compliance with its safeguards agreement, which remains as urgent today as when it was first raised to the Board's attention. We note that Syria has taken no actions to address this non-compliance.

This inaction has been the standard since this Board found Syria to be in noncompliance with its NPT safeguards agreement more than four years ago. At that time, this Board called on Syria to remedy urgently its noncompliance, to provide the Agency with access to all information, sites, materials, and persons necessary to verify the exclusively peaceful nature of its nuclear program, and to sign and bring into force an Additional Protocol. Unfortunately, the Asad regime has taken no steps since that Board finding, and in fact has taken no steps in over seven years to remedy its noncompliance or to address the international community's concerns regarding the nature and scope of its nuclear program. Likewise, Syria's refusal to sign and implement the Additional Protocol denies the Agency the necessary tools to provide assurances regarding the completeness and accuracy of its declarations.

The United States takes note of the recent physical inventory verification of the Syrian miniature neutron source reaction (MNSR), and commends the Agency's inspectors for undertaking this activity under difficult security arrangements. However, we underscore that this work is a normal inspection of a declared facility in Syria, a routine action required by Syria's safeguards agreement, and does not at all address Syria's ongoing non-compliance, nor its continued failure to cooperate with the IAEA to remedy that non-compliance.

To do so, Syria must engage substantively with the Agency without further delay, and provide access to all relevant locations, materials, and persons that it retains reasonable access to, including the three sites with a potentially functional relationship to the reactor at Dair Alzour. Until Syria fully cooperates to resolve the international community's concerns, the Board must remain seized of this matter, and should be prepared to consider further action if necessary.

Thank you, Mr. Chairman.

**Introductory Statement to the Board of Governors** *[by IAEA Director General Yukiya Amano]*

Vienna, Austria

07 March 2016

*[EXCERPT]*

**Nuclear Verification**

**Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

As far as implementation of safeguards in the Syrian Arab Republic is concerned, there have been no new developments since my last report to the Board. I renew my call to Syria to cooperate fully with us in connection with unresolved issues related to the Dair Alzour site and other locations.

## **Ex-CIA director: I was sure if we didn't strike Syria's nuclear reactor, Israel would**

Ronen Bergman|Published: 30.12.16 , 23:50

Gen. Michael Hayden provides an inside look into the attack that stopped Assad's nuclear ambitions in their tracks. From that fateful moment when Meir Dagan entered his office with photos of the reactor, through the clash between the Mossad director and the CIA's analysts, who feared an all-out-war with Syria, to the secret meeting at Bush's residence in which Hayden announced: 'Mr. President, the Syrians are building a nuclear reactor, and it is part of a weapons program.'

"It was one of the most candid conversations I've ever had with him," says Gen. Michael Hayden as he recounts that fateful meeting with Mossad director Meir Dagan on the seventh floor of the United States Central Intelligence Agency headquarters in Langley, Virginia.

It was in April 2007, at the office of General Hayden, the director of the CIA at the time. When Hayden with his broad smile talks about a "candid conversation," he means one between two people who have known each other for many years and had great respect for one another. But at least in that conversation, there was total disagreement between them.

That charged conversation at Langley revolved around one question: "How can this thing, which undoubtedly endangers the peace in the region, be destroyed without starting an all-out war in the Middle East?"

"This thing" was the Syrian nuclear reactor that was secretly being built at the time in Deir ez-Zor, not far from the Euphrates River.

Several months earlier, Hayden recounts, at that very same desk, the late Mossad director showed Hayden photos of that secret site, the first the Mossad was able to obtain. Since then, the two nations' intelligence communities have mounted a worldwide covert intelligence gathering operation in an effort to understand what exactly was happening in Deir ez-Zor and at what stage of the construction was the reactor.

The conclusion the two intelligence communities reached, according to Hayden, were more or less the same: North Korea was building a nuclear reactor in Syria that was similar to the one in its capital of Pyongyang, and this clandestine project could only have one objective: developing nuclear weapons.

But the two intelligence chiefs were of different minds regarding one question: What should their countries do with that information?

Hayden says that Meir Dagan tried to convince him to walk into the Oval Office and convince President Bush to send a squadron of B2 stealth bombers to destroy the reactor. Hayden, who was basing his position on what he heard from the CIA's expert analysts, was sure that if the US did that, Assad would launch an all-out-war.

"In hindsight," Hayden says, "it turns out Meir was right to think Assad would actually show restraint and not retaliate, and my analysts were wrong."

What happened next is no secret. In September 2007, Israel mounted an airstrike on the Syrian reactor and destroyed it.

Despite the fact nine years have passed and Syria is currently being torn by a civil war, this complex operation, which remains shrouded in mystery, still ignites the imagination of journalists from across the globe, who continue publishing contradictory reports about the strike.

I met Hayden recently at his corner office, overlooking Washington, DC's beautiful views, at Chertoff Group, one of the biggest security consultancies in the US, of which he is a partner.

The meeting was in honor of the release of his autobiography, “Playing to the Edge,” which includes a chapter on the discovery and bombing of the reactor. Hayden agreed to share his fascinating testimony of the Syrian reactor affair—from the moment Dagan showed up in his office with the implicating photos, through the arguments at the top echelons of Israeli and American leaderships, to the decisive meeting at the White House, the attack on the reactor, and the series of events that followed it both in the Middle East and in Washington.

Hayden recounted every moment of one of the most dramatic events of that time, with President Bush and Prime Minister Olmert at the helm and Hayden and Dagan as the senior intelligence officers at their side.

On the agenda: Syria, an enemy state to Israel with close ties to Iran and Hezbollah, which was working to obtain a nuclear bomb that would change the balance of power in the Middle East.

The stakes: Syria’s missile arsenal includes chemical warheads that cover the entire Israeli territory. American analysts warned that bombing this reactor could lead to a war whose outcome was unknown. On the other hand, Dagan makes it absolutely clear: “Israel cannot accept a situation in which an enemy state is armed with nuclear weapons.”

And now, a fateful decision had to be made that could alter the course of history.

### **The smoking gun, or: The Syrian ‘Godfather’ allegory**

In 1991, then-Syrian President Hafez Assad made a military acquisition alliance with the dictatorial regime in North Korea. He purchased missiles, as well as a lot of knowledge on how to produce more advanced missiles. He viewed this arsenal as a counterbalance to nuclear weapons he believed Israel had. For many years, the Israeli intelligence community believed that the Syrian leadership thought its chemical weapons were enough to maintain the balance of power against Israel and that Damascus was not trying to obtain nuclear weapons.

But what Israel did not know was that near the end of the 1990s, something changed for the Syrian president. It might have had something to do with the tragedy that befell him when his beloved elder son and heir, Bassel, was killed in a car accident. Since his second son, Maher, was considered hot-headed (if not worse than that), Assad senior was left with only one option for heir: His third son, Bashar, who was in London at the time, doing his postgraduate degree in ophthalmology.

Seen as the more absent-minded, timid daydreamer among his brothers, Bashar was nevertheless summoned from London by his father Hafez who, until his death in June 2000, trained his son to be the next leader of Syria.

At the time—it’s unclear on whose initiative—the possibility arose for Assad senior to buy a nuclear reactor from the North Koreans that would create military-grade plutonium to be used in building a nuclear bomb. Assad eventually signed a contract with North Korea to build that reactor, but construction was done at a relatively slow pace.

“It’s quite possible,” Hayden says, “that the reason he started this project was because he was worried his son was too weak and not really fit to lead Syria after his death, and he sought to leave Bashar with a powerful weapon that would ensure his survival.”

Bashar Assad tied his fate to Iran and Hezbollah. His representative in this alliance, the “Radical Front” as it is referred to by the IDF’s Military Intelligence Directorate’s Research Division, was a mysterious man called Gen. Muhammad Suleiman. He was so mysterious that his name and appearance remained a secret until his death, despite the fact he was a general. Suleiman was an engineering graduate of Damascus University, underwent countless of technology and military training courses in the Soviet Union, and was a man whose great talent was surpassed only by his extremism.

The ties to Iran and Hezbollah, Syria’s involvement in terror activity and in drug trade, and its continued presence in Lebanon among other reasons, have all led the American intelligence community to underestimate the new Syrian president.

In the argument that would take place several years later between Hayden and Dagan over what should be done about the Syrian reactor, the CIA director told his Mossad counterpart that the Assad family reminded him of the Corleone family from Mario Puzo's *The Godfather*.

"There is no doubt the Assads, along with the Makhloufs who are tied to them in bonds of marriage and partnerships, were just as busy with crime and committing particularly cruel acts as they were with ruling over Syria," Hayden told Dagan.

Just like in *The Godfather*, the Assad family also lost its older son, the heir apparent. In *The Godfather*, that son is Sonny, who in the movie is murdered by assassins.

"But when Sonny was rubbed out, the Don had the gifted Michael to replace him. When Basel Assad was killed in an accident, Hafez had to settle for the one who represented Fredo, the weak and lazy brother, the one no one had ever imagined would ever get to a position of power—Bashar."

Assad junior was known in the CIA as a "serial miscalculator." Hayden reveals that "we tried to cooperate with him against the terrorists who were fighting us in Iraq, but almost without success. The Syrians looked the other way when this activity crossed into their territory."

Assad junior may have been a failed serial gambler, but on one thing he took no chances: His fear of just how much the Mossad and the Israeli Military Intelligence Directorate knew about what was going on inside his country. Bashar became truly obsessed with his loathing—and admiration—to the Israeli intelligence community. He was convinced that any phone call or digital message in Syria was being intercepted by Israeli intelligence. "He truly believed that every time Mustafa was calling Mohammad, Moishe'le was listening in," says a senior intelligence officer in the IDF's elite 8200 unit with a smile.

To evade the Israeli intelligence community's watchful eye, General Suleiman carried out his special clandestine missions through a bureaucratic and operational body, which was completely separated and isolated from the rest of the Syrian defense establishment. Assad authorized Suleiman to keep knowledge of the existence and operations of this body even from the most senior military figures in Syria, including the army's chief of staff and the defense minister. When Israel discovered this activity—quite late in the game—officials in the Military Intelligence Directorate would dub it "General Suleiman's Shadow Army."

Suleiman instructed his men to send any important message, any plan, only in envelopes sealed with wax, using a network of messengers on motorcycles. It worked. Suleiman's operations were kept completely hidden from the Israeli intelligence community despite the great resources invested to ensure it missed nothing important.

General Suleiman kept the greatest secret of all hidden in Deir ez-Zor, in northeastern Syria. There, at an isolated and faraway area, construction was underway on the nuclear reactor the Syrians bought from North Korea with the help of Iranian funds (intelligence officials both in Israel and the US are still split on whether or not Iran knew what the money it was giving Syria was being used for).

Such a reactor could produce plutonium for a nuclear bomb, which the young Assad believed would help Syria reach strategic equality with Israel. The nuclear reactor project was so clandestine and compartmentalized that even Syrian Chief of Staff Ali Habib Mahmud didn't know anything about it. When he heard that Israel attacked a facility in the area, he thought they had got the wrong address.

For many years, Israel had no idea what was going on in the isolated compound in Deir ez-Zor. The fact Israel didn't know the reactor was being built "is a failure akin to that of the Yom Kippur War (the surprise attack in October 1973) for the Israeli intelligence community," one of the former intelligence heads told me.

Hayden says that already in 2001, the CIA began to gather scattered, unverified and ambiguous information about nuclear ties between Syria and North Korea. It will be years before the real meaning of this information comes to light. Only after Dagan came to Hayden with the photos of the reactor.

In 2004, according to Hayden's notes, the National Geospatial Intelligence Agency—an agency in the US Defense Department whose primary mission is collecting, analyzing, and distributing geospatial intelligence—discovered the reactor site and marked it as “enigmatic,” but “we couldn't exactly tell what it was,” Hayden explains.

That year, the US National Security Agency intercepted a series of transmissions from the Deir ez-Zor area to North Korea, in a North Korean code the CIA was unable to break.

The turning point was when the Mossad was able to obtain photographs that the head of the Atomic Energy Commission of Syria, Ibrahim Othman, took with him on a trip to Europe. The German weekly *Der Spiegel* claimed the Mossad managed to get the photos from him in London, while the *New Yorker* reported it happened in Vienna.

Either way, the knowledge that Syria was at an advanced stage of its nuclear project and that Israel was oblivious to it hit the Israeli intelligence community hard.

“Meir came to me with this material (the photos taken from Othman's laptop),” recalled Ehud Olmert, “and it was like an earthquake. I realized that from now on everything would be different.”

### **The options on the table, or: Dagan's brilliant trick**

According to few reports, the IDF's Military Intelligence Directorate and the Mossad launched a wide-scale operation to gather intelligence about the reactor, Suleiman, and his “Shadow Army.”

A report by David Makovsky in the *New Yorker* claimed that in June 2007, Olmert instructed to dispatch a special operations unit to within a mile of the reactor to gather soil, water and vegetation samples that would help determine whether the reactor had already gone hot and to conduct observations of the security at the facility.

At the same time, Olmert sent Dagan, along with his chief of staff Yoram Turbowicz and political advisor Shalom Turgemen, to Washington to brief Hayden and the White House.

By this time, when he rode the elevator up to the seventh floor of CIA HQ at Langley, he was already a familiar—and welcome—guest.

Dagan first met with Hayden in 2003, when the latter was leading the NSA. “He was to the point, an intelligence officer in every bone in his body, and he listened to what I proposed,” Dagan said. The result was very impressive and initiated an era of deep cooperation between the two agencies.

Thus it came to pass that Dagan, who lacked the niceties and polish of the American elites, and whose English was pretty basic, succeeded in establishing the closest ever mutual trust between the top echelons of the intelligence agencies of the two countries.

“I never felt being manipulated,” Hayden says of Dagan. “No, no. He was representing Israel, and he was representing Mossad, and he was representing Israeli policy. But I never had the impression that he was trying to mislead me for Israeli advantage.”

Dagan, according to Hayden, was “straightforward, plain spoken, bluntly honest, unpretentious, sincere and very knowledgeable.”

The former CIA chief also described the relationship between the two intelligence agencies: “We're big, we're rich, technologically sophisticated, and we're global,” while the Israelis are “small, focused, culturally and linguistically smart and relevant to the targets (Jihadist terrorism and attempts by Middle Eastern countries to develop weapons of mass destruction).”

When Hayden was named head of the CIA in 2005, he further deepened collaboration with the Mossad. Every time that Dagan came to visit, he brought with him sensitive information and suggestions—some of them quite imaginative—for joint operations.

But at that April meeting, not even the experienced Hayden anticipated the bombshell. “Dagan sat down, opened his briefcase and took out color copies of the pictures of the reactor at Deir ez-Zor.”

For an hour, Dagan “walked me through the intelligence” and wanted to know whether the CIA experts agreed with the Mossad’s analysis of the intelligence material.

Dagan, Hayden says, realized that with all due respect for the Mossad’s capabilities in Syria, his agency had almost no information about what was happening at the other end of the nuclear deal—North Korea. So he asked Hayden to take the information he had brought “and plug it into the CIA’s broader knowledge of North Korea.”

Incidentally, the fact Dagan was sharing the Israeli intelligence’s top secret with his American colleague surprised the CIA director, considering the “less-than-glamorous record of the American administration with keeping secrets,” Hayden says.

During the interview, Hayden wonders aloud whether that generosity might have had another reason, which Dagan did not state specifically. “He wanted me to influence American policy on this matter,” Hayden offers.

In other words, Dagan wanted the American intelligence community to tell the decision-makers at the White House that they share Israel’s factual assessment of the situation, which could have an effect on the kind of measures Israel was going to ask the US to take in light of this monumental development.

After that meeting, Dagan left the CIA headquarters and headed to the White House with Turbowicz and Turgemen to apprise Stephen Hadley, the then-US National Security Council chief, of the situation.

Back at Langley, Hayden was left with a group of his closest senior aides. “Meir never told me where they got the photos from,” Hayden recounts. “Our guess was that they downloaded them from the computer of a careless Syrian scientist. But none of that really mattered. What Meir showed me was pretty convincing. The question was only whether this was authentic material or a form of very sophisticated forgery.”

The first task Hayden gave his experts was to ascertain whether the photos had been doctored. Hayden did not suspect the Mossad of doctoring the photos, but because he did not know where Israel had obtained the photos from, he instructed his experts to make every effort to determine whether the photos were real.

Hayden’s experts had doubts concerning one of the photos Dagan had brought them. They zoomed in to closely examine the side of one of the trucks in the photo, and thought the writing on it might have been photoshopped. But the rest of the photos passed the strict examination and were found to be authentic. The CIA’s photo lab even constructed three-dimensional computerized models of the facility in Deir ez-Zor based on the photos and compared them to other photos. Everything matched exactly.

The day after his meeting with Dagan, Hayden was called to the White House for an urgent meeting. President Bush had already received a general update from Hadley on the matter. While the gathered officials waited for Bush to join them, Hayden turned to Vice President Dick Cheney, who has been claiming Syrian was trying to obtain nuclear weapons for a long time, and whispered in his ear: “You were right all along, Mr. Vice President.”

Hayden presented Bush with the photos he got from Dagan. “That was the very last thing he needed,” Hayden recounts, “having to take action in a region where any action could spark a war, with an ally that has the ability and the desire to work alone.”

President Bush already learned a sobering lesson when US intelligence agencies had told him that Saddam Hussein had weapons of mass destruction, leading him into a long, bloody war in Iraq. He summed up the meeting with two clear-cut but rather contradictory orders: “Number one, be sure. Number two, this can’t leak.”

Hayden went back to Langley wondering how to corroborate the Israeli information without spreading the word about. “To be sure, you want to get more people involved, but that increases the risks of spilling the secret.”

Hayden joked with his close aides that if Assad learned that his reactor had been found out and that the Americans and Israelis were investigating the matter, he'd immediately get rid of all of the implicating evidence "and claim that this was a daycare center." After all, "the building itself," Hayden says, "looked from the air like a Walmart store."

But the head of the CIA was well aware that if the information does leak, the joke would be at his expense. In an attempt to reconcile the president's two orders, Hayden formed an inquiry team, in what was later described in a classified cable from Condoleezza Rice as "an intensive, months-long effort to confirm and corroborate the information Israel provided us on the reactor and to gather more details from our own sources and methods."

The conclusions of the team—which included experts from the Pentagon, the CIA and the NSA—were deeply troubling: "the facility is in fact a nuclear reactor of the same type North Korea built indigenously at its Yongbyon nuclear facility ... We have good reason to believe this reactor was not intended for peaceful purposes."

Hayden says he had formed a "red team" that was instructed to "build an alternative case as to why it's not a nuclear reactor." The team, made up of analysts who had not yet been "read in" on the intelligence regarding the Syrian reactor, received all of the data and intelligence, and after close examination and thorough investigation came back with the following conclusion: "If it isn't a nuclear reactor, it must be a fake nuclear reactor." In other words: It's a Syrian plot to make it appear as if they were covertly building a nuclear reactor. Of course, such a thing would be highly unlikely, and so the red team essentially confirmed the conclusion that what Syria was building in Deir ez-Zor was indeed a nuclear reactor.

In a meeting between Olmert and Bush, recounted by the president in his autobiography, the Israeli prime minister asked the Americans to bomb the Syrian reactor. When he returned home, Olmert reported to a small group in his cabinet that it was his understanding that Bush was going to bomb the reactor.

But during that time, a heated argument took place between Hayden and his analysts and Dagan and his men. The background to that argument was the murder of Lebanese Prime Minister Rafic Hariri a year and a half earlier by Hezbollah assassins who were sent by Syria. The outcry from the international community and the immense pressure that Bush and then-French President Jacques Chirac put on Assad have led to the withdrawal of Syrian forces from Lebanon.

"Assad could not stand another embarrassment after the (2005) withdrawal from Lebanon," Hayden said. "Out of weakness, he would have to show his strength and retaliate with war."

Dagan took the exact opposite view: "You had to look at it from Assad's point of view," he said. "On the one hand, he had always wanted to reach strategic equality with Israel, and therefore get his hands on nuclear weapons. On the other hand, Bashar Assad always preferred not to confront us directly. Furthermore, if he went to war after the bombing, it would expose the existence of the nuclear installation—that he had built an atomic facility in violation of his signature on the NPT—which even the Russians, his allies, don't know about, and for sure would not be happy to know of it. If we were to attack covertly, and keep it totally under wraps without publicizing it and embarrassing him, Assad would not do anything."

Dagan's recommendation was to bomb posthaste, before the reactor becomes active and its destruction could cause radioactive pollution. Hayden says that Dagan was very firm in his stance: "Israel cannot accept a situation in which an enemy state is armed with nuclear weapons."

On the other hand, if war with Syria had broken out, it is safe to assume that while it would have ended in Israel's victory, this win would be costly: Thousands of victims and a significant change of the political situation in the region.

The dark prophecies of Hayden's analysts led to intense consultations at a series of forums in the American intelligence community, at the National Security Council, and at the White House.

"It was clear to us that a strictly diplomatic approach would not lead anywhere," Hayden says.

Theoretically, the Americans could make the existence of the reactor public and hand over the information they had gathered to the International Atomic Energy Agency (IAEA). But the Americans realized that this would eventually lead to endless stalling by Assad, who would repeatedly postpone visits by the IAEA's inspectors to the reactor. The damage would be enormous: The entire world would realize the US was sitting on this information and failed to act decisively. Meanwhile, Assad would hide the evidence so "eventually, we would have looked completely pathetic," Hayden asserts.

Another possibility that was raised was a commando operation of a Delta Force—the Navy SEALs—or another American Special Forces unit. The advantage of such an operation is, of course, that it is low profile, doesn't point an accusatory finger at anyone, and might stop Syria from launching an all-out-war in retaliation. The downside is that Syria will probably blame the United States regardless, and that "it wasn't clear whether the force would be able to carry enough explosives to blow up the entire facility. And, of course," Hayden adds, "the danger the SEALs would be caught."

A third operation on the table: Bombarding the facility. "B2 stealth bombers that would take off from one of our bases in the Mediterranean or the Persian Gulf could reach the facility and destroy it," Hayden explains. "Syria's aerial defense was respectable, but nothing we couldn't handle."

But the American intelligence analysts believed that such a public attack risks an all-out-war breaking out. "The more we thought about it, the more we reached the conclusion a hybrid option was preferable: Diplomatic action that entails an ultimatum of military action," Hayden says.

The American intelligence community's recommendation was "To *démarche* the Syrians with a threat," to publish the incriminating photos in a special White House statement, and give the Syrians only a few days or weeks to dismantle the installation and to allow IAEA inspectors access to the site to ascertain that this had been done. If the Syrians refused—immediately follow up with an attack on the reactor.

"The weak point of this solution was that it gave Assad enough time to gather some of the 7,000 American citizens in Syria and take them hostage."

With these options, Hayden went into the boss's office. It was time to make a decision.

### **Meeting in the Yellow Oval Room, or: 'No Core, No War'**

The crucial meeting took place at the White House. The matter was so secret that the meeting wasn't held in the West Wing, but on the second floor of the White House's residential area—in the Yellow Oval Room—to keep it out of the president's public schedule. The meeting included President Bush, his vice president, the defense and state secretaries, the Chairman of the Joint Chiefs of Staff, the national security adviser, the heads of the American intelligence community, and others.

As the guests sank into the comfortable arm chairs, the staff served them iced tea and then left. Stephen Hadley turned to Hayden and asked him for the latest intelligence update.

"Mr. President," Hayden began, "I have an update that contains four main points. The first: it is a nuclear reactor; the second: the Syrians and North Koreans have been cooperating on nuclear matters for about a decade; the third: the North Koreans are the ones who built the facility in Deir ez-Zor; and the fourth: the facility is part of a (greater) plan to produce nuclear weapon.

"I imagined that after I said those things, everyone would think about the Iraq affair," Hayden remembers. That is why he quickly explained why the Syria case was different and why this time there was a very high degree of certainty that the facility is in fact a nuclear reactor.

Hayden then explained that the nuclear reactor was "an exact copy of the reactor in Yongbyon and that the Koreans were the only ones to build these reactors since they purloined the designs from the British in the 1960s."

At this point Hayden paused for a moment, allowing the gathered officials to take a deep breath, and continued with a statement just as dramatic: “But Mr. President, I was unable to locate the other parts of the Syrian nuclear weapon program: Not the reprocessing facility (chemically separating and recovering fissionable plutonium from irradiated nuclear fuel); nor the “weapons group” (of scientists and engineers building the bomb itself and its explosive mechanism). Therefore, Mr. President, there is only a low degree of certainty regarding these parts.”

During the silence that followed, then-Secretary of State Condoleezza Rice said she wished she had such intelligence officers several years earlier, referring of course to the search for the Iraqi WMDs that were never found. Rice knew the danger posed by the existence of a nuclear reactor, but objected to an American attack against it. Vice President Cheney disagreed, arguing that the US must attack to send out a strong message to Syria, North Korea and Iran—that the United States would not tolerate such behavior.

Hayden said that one thing was clear to him, “that we kind of used up all of our preemptive attack chips. And besides, we stuck to the mantra that: No Core, No War (referring to an active nuclear core). I could not say with certainty that the Syrians didn’t have a weapons group or a reprocessing facility but neither I nor the Israelis had any proof those exist.”

President Bush, who was deeply entangled in two wars against Muslim nations, concluded the discussion with: “What Mike (Hayden) just told me is this is not imminent danger, and therefore, we will not do this.”

The option that was then raised—and was accepted by most of the officials present—was making an ultimatum to the Syrians. But the implementation of this plan depended on the agreement of the Israelis, who provided the US with the photos and information, to make this knowledge public. But Dagan would in no way allow that.

Despite reaching a dead end, Hayden remembers that “I was pretty comfortable that if we didn't strike the Syrian reactor, Israel would.”

Olmert, President Bush reveals in his memoir, was bitterly disappointed by the American decision not to strike. Many in Israel saw the American refusal to take military action as a sign that the US was not willing to take too great a risk upon itself to protect Israel, especially in the era that followed the invasions of Iraq and Afghanistan.

“We can only rely on ourselves,” the Israelis said during internal discussions.

## **The strike**

On the night between September 6 and 7, 2007, Israel Air Force warplanes bombed and completely destroyed the nuclear reactor under construction in Deir ez-Zor.

The Syrians suffered huge embarrassment as it became known that they were advancing a project that blatantly contradicted the Non-Proliferation Treaty they signed.

The great victor of this operation was Dagan, whose organization was the one to bring the information that exposed the Syrian project and also the one “who truly understood President Assad more than anyone else,” as Hayden put it.

At first, Syria refused to give the IAEA inspectors access the site of the bombed reactor. When it finally consented, following immense international pressure, to allow the inspectors to visit the site, it was months later, after General Suleiman and his men have had time to clear the site and remove any implicating evidence of nuclear development. Despite this, the inspectors found evidence of uranium and graphite and concluded that the site bore features resembling an undeclared nuclear reactor.

Later, the UN nuclear watchdog asked to send its inspectors to three other sites in Syria that were suspected to be part of the nuclear project, but the Syrians refused. On June 9, 2011, the agency announced that Syria failed to declare the construction of a nuclear reactor and that it was in non-compliance with the Nuclear Non-Proliferation Treaty it signed.

Meanwhile, General Suleiman was furious. Within a few months, he lost both Imad Mughniyah, his colleague and close friend, and his life's work—the nuclear reactor in Deir ez-Zor.

According to documents obtained by Wikileaks, Syrian's mobile missile systems were on high alert following the strike, but Bashar Assad decided not to pull the trigger. This kind of behavior "requires self-discipline," Prime Minister Olmert will later tell the US House Minority Leader John Boehner, "Assad is not stupid at all."

Olmert had a different opinion on Suleiman. "Suleiman was a piece of shit, with extraordinary organizational and logistical abilities," he said.

In April 2008, the CIA's analysts reached the conclusion that Assad was not going to war over the strike on the reactor and that there was no longer a need to keep the matter a secret. They could use the material gathered for other purposes. At the time, there was a heated argument in the American administration on whether to sign yet another nuclear disarmament deal with North Korea, the likes of which it had already violated several times in the past.

Israel, Hayden remembers with a sigh, fiercely objected to making the photos from the Syrian reactor public, but the CIA chief decided differently.

"We needed to make this (the Syrian reactor affair) more public because we were about to enter into an agreement with North Korea, that had been guilty of the greatest proliferation crime in history. We had to inform the Congress," he remembers.

The CIA even prepared a video about the discovery and bombing of the Syrian reactor. Michael Hayden, along with another senior intelligence official, presented it to the Senate's Intelligence Committee and to a group of American journalists during a briefing. The discovery of the reactor was an impressive triumph of intelligence, and the agency was happy to be able to present a victory.

To "add a dimension of drama" and tie Damascus's shadow operative to those in Pyongyang, the CIA also added a photo they obtained from their own clandestine sources—General Suleiman with North Korea's nuclear chiefs—and included many details about the Syrian general, his influence and power.

Except that Suleiman was not long for this world. In August 2008, the head of Syria's "Shadow Army" was assassinated while having dinner at his summer home in the coastal city of Tartus in Syria.

According to US cables made public by Wikileaks, the IDF's Special Forces naval commando unit Shayetet 13 was behind that assassination.

## **IAEA Director General's Introductory Statement to the Board of Governors**

Vienna Austria

11 September 2017

(As prepared for delivery)

*[EXCERPT]*

### **Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**

As far as safeguards implementation in the Syrian Arab Republic is concerned, our assessment remains that it was very likely that the building destroyed at the Dair Alzour site in 2007 was a nuclear reactor that should have been declared to the Agency by Syria under its Safeguards Agreement.

I renew my call on Syria to cooperate fully with the Agency in connection with unresolved issues related to the Dair Alzour site and other locations. Syria has yet to respond to these calls.

## STATEMENT

BY

Mr. Zeev Snir

Head  
Israel Atomic Energy Commission

The 61st General Conference of the International Atomic Energy Agency

September 2017

*[EXCERPT]*

Madame President,

Ten years ago the secretive nuclear reactor at the Dair Alzour site in Syria was revealed to the international community. Many questions remain regarding this clear breach of Syria's safeguard agreements.

Syria's lack of cooperation and transparency is a source of significant concern, and sets a dangerous precedent. We strongly support the Director General's call on Syria to cooperate fully with the Agency on issues relating to all relevant sites.

The international community must persist in demanding that Syria urgently remedy its non-compliance and provide full access to all information, sites, material and persons.

## **The Secret Operation Revealed a Decade Later**

**21.03.18**

During the night of September 5th and 6th, 2007, the Israeli Air Force destroyed a nuclear facility in its last stages of construction in the Deir ez-Zor region in Syria, 280 miles north-east of Damascus. Four F-16 jets eliminated a nuclear threat not only to Israel, but to the entire region.

### **Background and Preparations for the Operation**

For two years, officials in the Military Intelligence Directorate had been monitoring the Syrian nuclear project. Their intelligence suggested that the facility would become active toward the end of 2007, which prompted the IDF to initiate an attack on the facility.

The Israeli Air Force had very little time to prepare the attack and account for possible contingencies, such as retaliation by the Syrian forces. Once the attack plan was ready, however, it was possible to execute it within 12 hours from the moment the order was to be given.

Before the destruction of the Nuclear Facility

### **The Attack**

Shortly after midnight, the Prime Minister, Defense Minister, Minister of Foreign Affairs, Chief of the General Staff, Deputy Chief of the General Staff, Head of the Military Intelligence Directorate and Head of the Operations Directorate assembled in the aerial war room.

From there, they attentively followed all aircraft's aerial locations and the communication systems. Two different groups of aircraft including the F-16I and the F-15I left the base at 10:30 pm and flew low to stay undetected. The whole operation took four hours.

## The Result

The Military Intelligence Directorate estimated that the nuclear facility was damaged beyond repair. As the IDF was preparing for retaliation, it decided that information about the operation shouldn't be disclosed to the general public at the time. The operation was deemed a success by the Chief of the General Staff. The nuclear facility was destroyed and an escalation in the region prevented.

After the destruction of the nuclear facility

Only a few years later, ISIS captured the Deir ez-Zor region. One could only imagine how much havoc they could have wreaked with a nuclear facility in their hands.

## Israel admits bombing suspected Syrian nuclear reactor in 2007, warns Iran

stephen farrell

March 20, 2018 / 10:13 PM / Updated 3 hours ago

JERUSALEM (Reuters) - Israel for the first time admitted that it bombed a suspected Syrian nuclear reactor in 2007 and said on Wednesday the strike should be a warning to Iran that it would not be allowed to develop nuclear weapons.

**A still frame taken from video material released on March 21, 2018 shows a combination image of what the Israeli military describes is before and after an Israeli air strike on a suspected Syrian nuclear reactor site near Deir al-Zor on Sept 6, 2007. IDF/Handout via Reuters TV**

The Israeli military released previously classified cockpit footage, photographs and intelligence documents about its Sept. 6, 2007, air strike on the Al-Kubar facility near Deir al-Zor in eastern Syria.

It said the reactor was being built with help from North Korea and the facility had been months away from activation. Reuters has been unable to immediately verify the Israeli material.

Israel's decision to go public comes after repeated calls in recent months by Prime Minister Benjamin Netanyahu for the United States and international community to take tougher action on Iran, Syria's ally.

Israel's intelligence minister, Israel Katz, said on Twitter: "The (2007) operation and its success made clear that Israel will never allow nuclear weaponry to be in the hands of those who threaten its existence - Syria then, and Iran today."

The Israeli military described in detail events leading up to the night of Sept 5-6, 2007, in which, it said, eight warplanes, F-16s and F-15s, carried out the mission after taking off from the Ramon and Hatzetim air bases and flying to Deir al-Zor region, 450 km northwest of Damascus. Eighteen tonnes of munitions were dropped on the site, it said.

In his 2010 memoir “Decision Points,” former U.S. President George W. Bush disclosed that he discussed intelligence about the Syrian facility with then Israeli Prime Minister Ehud Olmert before it was destroyed but did not give him the green light for the raid.

James Jeffrey, Bush’s deputy national security adviser, said on Wednesday the former U.S. president had been “absolutely supportive” of Israel.

“(He) made it clear that we were very happy that events had eliminated this threat and that if there were any threats to Israel that would emerge from this situation, the United States would stand with Israel, period,” Jeffrey told Israel’s Army Radio.

In 2008 the United States presented what it described as intelligence showing that North Korea had helped Syria with “covert nuclear activities.” At the time Syria dismissed the accusations as part of a campaign to discredit the Damascus government.

“The Syrian government regrets the campaign of lies and falsification by the U.S. administration against Syria, including allegations of nuclear activity,” said a government statement issued on the Syrian state news agency.

Iran, which says its nuclear program has only peaceful aims, signed a 2015 deal under which it accepted curbs on its nuclear program in return for sanctions relief. U.S. President Donald Trump and Netanyahu have both been critical of the deal.

“TOP SECRET”

The Israeli military declassified internal “top secret” intelligence reports, in Hebrew, some of them partly redacted.

One, dated March 30, 2007, said: “Syria has set up, within its territory, a nuclear reactor for the production of plutonium, through North Korea, which according to an (initial) worst-case assessment is liable to be activated in approximately another year. To our assessment [REDACTED] secretive and orderly [REDACTED] for achieving a nuclear weapon.”

Israeli intelligence predicted that the suspected reactor “would turn operational by the end of 2007”.

The mission to destroy the facility started at 10.30 p.m. on Sept. 5 and ended with the return of the warplanes at 2.30 a.m. the next day, the Israeli military said.

The event was first made public by Syria, which, as reported by Reuters at the time, said in the early hours of Sept. 6 that Syrian air defenses had repelled an incursion by Israeli warplanes.

Syria, a signatory of the 1970 nuclear Non-Proliferation Treaty (NPT), has always denied that the site was a reactor or that Damascus engaged in nuclear cooperation with North Korea.

The Israeli military’s announcement on Wednesday noted that the area in question, around Deir al-Zor, was captured by Islamic State after the Syrian civil war erupted in 2011.

Had there been an active reactor there, the Israeli military said, it would have had “severe strategic implications on the entire Middle East as well as Israel and Syria”.

The Israeli release contains a black-and-white aerial photograph captioned “before the attack” and showing a box-like structure amid desert dunes with smaller outlying buildings.

A series of black-and-white videos, taken above the target, shows the structure in cross-hairs. A male voice is heard counting down three seconds, a cloud of black smoke rises from the structure as it explodes. Other footage appears to show the aftermath - a smoldering hole in the ground.

Wednesday's release came ahead of the publication of a memoir by Olmert containing passages about the 2007 strike.

## Inside Israel's Secret Raid on Syria's Nuclear Reactor

By YOSSI MELMAN and DAN RAVIV

March 20, 2018

Even if President Donald Trump is able to reach an agreement with Kim Jong Un, with North Korea promising to freeze or even dismantle its nuclear program, there will always be uncertainty about possible cheating.

Just ask Israel—which, despite having one of the world's most competent and aggressive intelligence services, the Mossad—nearly missed the fact that North Korea was helping build a nuclear reactor in next-door Syria, a country long viewed by Israel as a dangerous threat.

The American CIA missed it, too, and now, 11 years after Israeli air force jets bombed the clandestine Syrian facility, Israel's military censor is finally lifting the veil of secrecy and permitting locally based reporters to publish interviews with participants in the operation for the first time. We spoke with dozens of former cabinet ministers, including Prime Minister Ehud Olmert, as well as military and intelligence chiefs and commanders and even some of the pilots who took part in the operation. The codename for the Sept. 6, 2007, raid, conducted near the remote desert city of Deir ez-Zur: "Outside the Box." Before today, Israel has never officially acknowledged its existence.

Years later, Israeli spooks are still raising bitter questions about the CIA's intelligence failure. Former Mossad director Tamir Pardo asked in an interview with us: "Where were the Americans? North Korea is a highly important target for them. And it still isn't clear whether [Syrian President Bashar] Assad was running the nuclear project, or was it the North Koreans?" The former spy chief added that he has some doubts that Syria was going to keep the plutonium, or perhaps it was going to be shipped to North Korea as a supply of which the West would be unaware. "This is a resounding failure by the Americans," Pardo said.

Pardo's questions raise another: If one of the best intelligence communities in the world, and certainly the most formidable in the Middle East, could be fooled by North Koreans and Syrians, what might the CIA be missing? That could be true in Korea, in Iran, or almost anywhere on Earth.

The Israeli air force raid on a secluded, unmarked building in northeastern Syria took place—a few minutes after midnight between 5th and 6th of September. To attack deep in enemy territory is *[sic]* easy, but Israel's American-made F-15 and F-16 jets enjoyed protection by sophisticated electronic jamming that blinded Syria's air defenses, and they had no trouble dropping tons of explosives on the target and confirming visually that it had been flattened. (Photos, many provided by Israeli intelligence, were released by the CIA to Congress – and immediately leaked to the media in Washington.)

The Syrian facility was almost identical to the Yongbyon nuclear complex in North Korea that produced plutonium for nuclear bombs, according to Israeli intelligence officials, and it was only weeks away from beginning to produce highly radioactive materials.

Deir ez-Zur, the largest city in eastern Syria, would be captured in 2014 by ISIS forces and then held by the Islamic militants for more than three years. Just imagine if ISIS had gotten its hands on plutonium and other parts designed to construct nuclear bombs. Israel's action – a difficult decision by then-Prime Minister Olmert, after he unsuccessfully asked President George W. Bush to bomb the building – prevented the world's most bloodthirsty terrorists from acquiring the world's most lethal weapons.

Israeli ministers and officials are proud of it. Olmert, who later resigned amid accusations of corruption, which eventually after being indicted by a court landed him in prison for 18 months, told us it was one of his most important and difficult decisions. Even his nemesis, then defense minister Ehud Barak, said in an interview: "Olmert deserve full credit for the brazen decision."

Lifting the veil of secrecy also reveals an ego battle for credit between Israel's two largest intelligence agencies. "The exposure of the reactor is one of the great achievements of Military Intelligence [the agency known by its Hebrew

acronym, Aman] in particular, and of Israeli intelligence in general,” said Brig. Gen. Shalom Dror, who in 2007 was a major in charge of Aman’s research on Syria. Yet Pardo, who was deputy director of the Mossad at the time (and from 2011 through 2015 the spy agency’s chief), differs: “For years, Syria built a nuclear reactor under our noses, and we did not know about it for years. It was not built on the dark side of the moon, but in a neighboring country where we always thought we know almost everything.”

Israel’s highest ranking general at the time, Chief of Staff Lt. Gen. Gabi Ashkenazi, recalled receiving reports on many Arab countries from Aman and the Mossad, but none linked the words “Syria” and “nuclear” in any serious way. “Sure, suspicions arose, but there was no proof,” continued Ashkenazi, who has since retired. “And in intelligence work there were a lot of suspicions. Syrian nuclear was not a subject considered to be important.”

Ram Ben-Barak, senior man in the Mossad for many years who was then head of one of its operations, told us: “Anyone who says that he knew that Syria was building a nuclear reactor either doesn’t know or isn’t telling the truth. When we brought the information, it was a complete surprise. Until then, the assessment was maybe yes, maybe no—that perhaps they were planning a nuclear project by the route of enriching uranium, and perhaps a reactor to produce plutonium. In short, we didn’t know at all what to look for.”

The fact that there was any attention paid to the possibility of a secret Syrian program at all was the result of a trauma suffered by Israeli intelligence near the end of 2003. Libya’s dictator, the late Col. Muammar Gaddafi, publicly admitted that he had a nuclear weapons program. Western governments quickly discovered that the knowhow and materials had been sold to the Libyans by Abdul Qadeer Khan, the so-called father of Pakistan’s nuclear bomb, who later became a freelancer and made a fortune as a nuclear trafficker.

Israel’s spy chiefs winced as they admitted they had made an error comparable to the 1973 war, when the Jewish state was taken by surprise by its neighbor’s armies on Yom Kippur. Israeli intelligence had not completely ignored A.Q. Khan. They had strong evidence that he helped Iran launch its military, unacknowledged, nuclear ambitions. But they did not realize that his sales efforts had succeeded elsewhere.

Shabtai Shavit, who was the director of the Mossad in the 1990s, told us a few years ago that Israeli intelligence knew about Khan’s travels in the Middle East – hawking his wares – but did not understand how the Pakistani engineer could provide a quick and relatively easy kit for starting the route toward a nuclear arsenal. “If we had understood, I would have recommended that he be assassinated,” Shavit said, “and that would have been one of the few times that eliminating a person could have changed history.”

After the revelation that Gaddafi’s Libya was dangerously advanced in its nuclear work, Israel’s military intelligence chiefs ordered that every scrap of evidence that had been collected – but filed away without much analysis – be looked at again. Aman found reports of Khan’s visits to Saudi Arabia, Egypt and Syria. Because the first two countries were friends of the United States, it seemed highly unlikely they would pursue nuclear weapons. The agency doubled its focus on Syria, where President Bashar Assad had come to power in 2000 by default when his father died – because his elder brother, groomed for leadership, had perished in a car crash.

Israeli intelligence saw the new dictator, who had been working as an ophthalmologist in London, as having a borderline personality—an inexperienced man who could be tempted to act recklessly or adventurously. Because his aspirations could be lethal and he sat on Israel’s northeastern border, Aman commanders decided not to underestimate Assad.

“I had to explain to my people why I insisted on concerning ourselves with Syria,” said a research head in the agency, retired Brig. Gen. Eli Ben-Meir, because the top topics at that time had been Iran and its proxy force in Lebanon, Hezbollah. Israel fought a war against the Lebanese Shiite militia in the summer of 2006 that was notably frightening due to the constant rain of rockets from Lebanon that compelled almost a million Israelis to descend to shelters or move temporarily to southern Israel.

Ben-Meir told us there were clues in Israel’s deep and constant monitoring of Syria. Ships arrived from Asia with no apparent purpose. Trucks moved toward the east. Israel’s intelligence liaisons asked friendly services, including the CIA, if they had noticed anything of a nuclear nature in Syria. The answer was negative.

Pardo's boss at the time, Meir Dagan (who was director of the Mossad from 2002 to 2011 and died two years ago) joined Chief of Staff Ashkenazi in asking Prime Minister Ariel Sharon for an extra budget specifically to look for a nuclear project in Syria. Aman's renowned Unit 8200 greatly increased its monitoring of all Syrian communications.

Ibrahim Othman, director of Syria's Atomic Energy Commission, was considered to be the man who had to know the secrets. He became a high-priority target for Israeli intelligence.

As reported elsewhere, Israel Mossad's operatives broke into rooms where he stayed in Europe, including an apartment Othman maintained in Vienna, Austria, near the headquarters of the International Atomic Energy Agency—and found a gold mine. Othman had left a digital device and all its data was sucked out and sent to Israeli intelligence laboratories.

Surprisingly, because no one believed any vital information had been obtained, deciphering it was not a priority. The data was waiting on the laboratory's shelves a few days until it was finally deciphered. "My intelligence officer entered my room," recalls Ben Barak, "and showed me the photos taken from the phone." He added, smiling, "Sometimes intelligence operations need luck."

The photos from Othman's device showed him in the company of some North Korean scientists and most importantly were shot inside the structure, which clearly revealed that it was a nuclear reactor to produce plutonium.

The photos were the "smoking gun"—the ultimate evidence to corroborate Israel's suspicions. The information was rushed to Prime Minister Olmert, who approached U.S. President George W. Bush to ask him if the U.S. would do something about it. Bush said no, explaining that U.S. forces were fully engaged in Iraq and Afghanistan and that he didn't want to open a third front. Nevertheless, Bush didn't say anything about an Israeli raid. For Olmert, that was all he needed. He interpreted Bush's silence as a green light and instructed Lt.-General Ashkenazi to prepare an air strike.

After the raid, Israel kept silent—and so did Assad. Syria didn't want to admit it had violated its international commitments. Israel, for its part, figured out that if it said nothing in public, Assad would swallow his pride and not retaliate. Privately, Israeli leaders and chiefs of the military and intelligence contacted or met their allies in the West—the U.S., UK, France, Germany—and in the Arab world (Egypt and Jordan) to share with them the information behind the raid. Olmert also personally called Russian leader Vladimir Putin. Israel's calculation that Syria would not strike back proved correct, and the world seemed relieved that someone had removed a potentially serious threat to peace.

But to remove Iran's or North Korean nuclear threats will be a much more difficult task if President Trump decides to exercise the much-trumpeted military option.

## **No Longer a Secret: How Israel Destroyed Syria's Nuclear Reactor**

By Amos Harel and Aluf Benn

Mar 21, 2018

This is the story of a single night more than a decade ago, and a daring, hair-raising operation executed by the Israeli air force, army and intelligence community that destroyed an atomic plant in northeastern Syria. Yet no less, it is also a story of a big intelligence failure – the worst since the Yom Kippur War, according to a number of top intelligence people – in which Israel somehow managed for years not to notice a reactor being built right under its nose, in a neighboring country on whose surveillance Israel was spending vast amounts of money.

The operation was the finest hour of a prime minister who just a year earlier had led Israel into a failed war in Lebanon and who less than two years later would be compelled to resign before going on to serve a prison term for crimes of corruption. And it was also the start of the intense hostility between that prime minister and his defense minister, which took root during that summer of 2007, and of the impassioned war over who among the top brass in the military organizations deserved the credit.

It is especially surprising that this is also the story of a secret that was maintained for a long time here in Israel despite the considerable personal interests of a number of those who are now involved in its publication. Only now, more than a decade later, has the military censor allowed the Israeli media to report the history of this affair – and even that, still with restrictions.

The Haaretz investigation of the bombing of the nuclear reactor is based on conversations with 25 of the individuals who were involved in the operation and in the events connected to it, in Israel and in the United States. One of the key figures who led to the decision to bomb the Syrian reactor, the head of the Mossad at the time, Meir Dagan, died in March last year.

“Many of the people involved in the action deserve to get credit and also demand it,” said one person who played a key role in planning the operation. “Ultimately, however, the bombing of the reactor would not have happened without three people who believed in the mission and pushed the operation forward, unstintingly, throughout: Prime Minister Ehud Olmert, Mossad chief Meir Dagan and Israel Air Force commander Eliezer Shkedi.”

### The Cube

A large, cubical building that was still under construction in the heart of the Syrian desert, not far from Deir al-Zour, was a focus of the Israeli defense establishment starting from the end of 2006. Very quickly, it was given a name: the Cube. As the months went by, the suspicion grew that beneath the broad roof of the building hid President Bashar Assad’s secret flagship project: a nuclear reactor produced in North Korea, intended to provide the younger Assad with the achievement that had eluded his father, Hafez Assad, on the battlefield and between wars – and to lead toward a point of strategic balance that could cancel out Israel’s clear military and technological advantage.

The first indication of the Syrian regime’s interest in purchasing nuclear research facilities came to the notice of Israel and the Western countries in the late 1990s, toward the end of the elder Assad’s rule. However, Israel began to pay serious attention to that inclination only after the discovery of a serious intelligence gap in another country: Libya.

“On December 19, 2003, a Saturday morning, I turned on the radio and heard on a news broadcast that the Americans and the British had persuaded Libya to dismantle its nuclear program,” says Amnon Sufrin, who was then head of the intelligence division at the Mossad. “The next morning I assembled my people and I said we had experienced two total failures here: We’d had absolutely no idea that such a program even existed and, second, we didn’t know that negotiations to dismantle it had been going on for eight months. We started to back-analyze the Libyan program and try to figure out where else in the region similar programs could be hiding.”

According to Sufrin, after a month and a half of investigating, the Mossad research team concluded that Syria was working on a nuclear program of its own. The Mossad intelligence division distributed a document with an assessment to that effect in February 2004. Meir Dagan was skeptical about the findings; Syria was not a top priority for Mossad activity and the assessment did not constitute a breakthrough in the gathering of substantial proof.

A similar possibility regarding Syria was also considered during those years at the research branch of Military Intelligence. In 2005, Col. (today reserve brigadier general) Eli Ben Meir had taken up the position of head of the technology field in the research branch. "Iran was the focus of our interest," Sufrin says now, "but we delegated a team of researchers to examine the possibility of a nuclear program in Syria. All the intelligence people who knew Bashar told me: It's not like Bashar. But when you put researchers on a project, if there's something they will find it."

In the course of the examination, the researchers identified the Cube. At a distant and isolated site called Al Kibar, less than a kilometer west of the Euphrates River, the Cube aroused their interest in particular. It was a square building with an area of about 1,600 square meters (more than 17,200 square feet), which was 20 meters (close to 66 feet) high. "We had satellite pictures of a large building in the middle of the desert, with no explanation," says the MI chief at the time, Gen. (res.) Amos Yadlin.

According to Sufrin, "The Koreans and the Syrians built a camouflage structure on top of the reactor that made it look like a factory from the outside. You don't see what is happening inside. It is far from any settlement. There is no reason for anyone to be in this area except for herdsmen. We began to suspect that there, in broad daylight, a reactor was hiding."

Rubble was scattered around the building and the place looked fairly neglected, perhaps intentionally so. There was not much traffic in the area. The people who were seen nearby mostly arrived on motorcycles; it looked as though the structure stood empty at night. No security arrangements – fences or guards – were visible there nor had batteries of ground-to-air missiles been stationed there for defense from air strikes.

The first research breakthrough occurred in November 2006. Major Y., a researcher in MI's technology branch, composed a document headed "An Issue for Examination." This is a well-known procedure in MI whereby, with the approval of the head of the organization and the head of the research division, a researcher is permitted to publish a dissenting assessment, even if it is not accepted by the chain of command, in order to prompt examination of a new hypothesis. Until then MI had been focusing on the more accepted channel of countries working their way toward a nuclear project – an installation for enriching uranium, based on centrifuges. Y. reached the conclusion that they were looking in the wrong place. Assad was building a plutonium nuclear reactor, he argued. The 20-page document was distributed to top defense officials. At the Mossad they remained skeptical.

In January 2007, a pipeline leading from the Cube to the Euphrates was identified in satellite photos. The researchers believed that this was the sign of the existence of a cooling system, an essential element in a reactor. At both MI and the Mossad, they started to act to confirm or refute the hypothesis proposed by Major Y. The Mossad led several overseas operations as part of that intelligence gathering. "Dagan assigned us the task of finding out whether or not there was a nuclear project," says Rami Ben-Barak, a senior Mossad official at that time. "The approach was: confirm or rule out. There is no in-between. Meir Dagan was very determined. A lot of people told him that it wasn't possible that there was a reactor, and that it would be a pity to waste the resources and the time. However we, under his orders, did not let go of it for a long time."

Smoking gun in Vienna

The next breakthrough, in fact the turning point of the whole affair, occurred in Vienna in early March 2007. Israel has never officially acknowledged or accepted responsibility for it, and the following is based on an investigative report published by American journalist David Makovsky in The New Yorker in 2012. According to the report, Ibrahim Othman, head of the Syrian Atomic Energy Commission, had come to Austria to participate in the deliberations of the International Atomic Energy Agency. A cell of Mossad agents from the Keshet unit broke into the apartment where Othman was staying and within less than an hour "vacuumed up" the information that was on the Syrian official's personal computer, which had remained in the apartment while he was taking part in the conference.

Othman's negligence turned out to be the worst security offense in the history of Syria. Had it not been for his carelessness and the Mossad's brilliant work, it is doubtful that the operation to destroy the reactor would have taken place.

When the material taken from the computer was received in Israel, it was found to include about 35 photographs from inside the mysterious building in the Syrian desert. In the pictures, the inside of the reactor is visible, and in it are fusion cylinders and bars and also some Korean workers.

When the intelligence people analyzed the material from Vienna, they were appalled. The material left no room for doubt: The plutogenic reactor that Y. had written about did indeed exist – it had been found in the heart of the desert and was in advanced stages of construction, and nearing completion.

“The material was analyzed on a Wednesday night,” recalls Amnon Sufrin. “Dagan's weekly meeting with the prime minister in Tel Aviv was scheduled for 8 A.M. the next day. It is a plutogenic reactor,” the head of the Mossad told Prime Minister Ehud Olmert.

The intelligence people say they told him: “There are no more question marks. Now there are only exclamation points.” The prime minister “breathed a sigh and asked: ‘What do we do with this?’ We said to him: ‘We destroy.’” (In Olmert's circle, as often happens in such cases, they remember an opposite course of events. “Dagan asked: ‘Mr. Prime Minister, what do we do?’ Olmert replied: ‘We destroy it.’”)

In a rare public reference to these developments while giving testimony in the trial against him in the affair involving Morris Talansky (involving unlawful acceptance of gifts of cash from a New York businessman), the prime minister related: “The head of the Mossad called me. I meet with him as a matter of course. It's only rarely that a Mossad chief calls and says: ‘I have to see you.’ The Mossad chief arrives and sits in my office. They put on the table an intelligence finding of the type rarely encountered in this country. There was silence. I looked at them. He looked at me I knew that from that moment on nothing would be the same. [The threat] at the existential level is of an unprecedented order of magnitude.”

After the photographs were shown to nuclear experts, among the head of the Israeli Atomic Energy Commission at the time, Gideon Frank, and his deputy, Eli Levita, it emerged that the Cube was indeed a North Korean reactor, which was in turn a copy of an outdated British reactor built in the 1950s. The technology experts at MI located the plans of the British original.

“We were able to say with certainty: This reactor is intended to produce plutonium – and for military purposes only,” says Yadlin.

Depressed PM and army

In Olmert's circle they describe a bleak mood prevailing after the discovery. “It had never happened that they came to an Israeli prime minister and told him: Very close to your home something is being built that could destroy the state. This isn't about bunkers with centrifuges 1,500 kilometers [more than 900 miles] away. This is right next door. This is very serious.”

In the background, of course, there was the historical memory of “the Begin doctrine” and the precedent of the bombing of the reactor in Iraq in 1981 (an operation in which MI chief Yadlin had been one of the eight pilots who carried out the attack). It was the prime minister at that time, Menachem Begin, who established the doctrine whereby Israel will not allow any of its foes in the Middle East to develop nuclear weapons.

Olmert was a very unpopular prime minister. Israel was still grappling with its disappointment after the Second Lebanon War. In some public opinion polls, the level of support for the premier didn't rise above the single digits. In April 2007 the Winograd commission published its devastating interim report on the conduct of the war, in which it was very critical of Olmert's functioning the previous year. The politicians were waiting in suspense for the final report, which was due to be published in January 2008. Alongside the urgent necessity of removing the surprising new threat in Syria, Olmert was keen to mend the flaws revealed in his functioning in Lebanon – as well as the public's impression of him.

The vast majority of those who took part in the meetings describe a very sharp, determined leader, almost chomping at the bit. Moreover, this time careful attention was paid to the procedures of the discussions and decision-making, for the neglect of which Olmert was severely chastised in the interim report. The process, say many, was very organized, strictly by the book and a paragon of order by Israeli standards.

To hear opinions from individuals beyond the heads of the military and the intelligence communities, Olmert consulted (as did then-Defense Minister Amir Peretz, separately) other experienced people and external oversight teams. The advisers, as well as a number of ministers, first and foremost Foreign Minister Tzipi Livni, were for the most part summoned individually for personal meetings with the prime minister at his residence, where they were informed about details of the affair, mostly by Yadlin and Dagan. Later, somewhat larger forums were also convened.

Olmert consulted, individually, three of the previous prime ministers: Shimon Peres (who a few months later was elected president of Israel), leader of the opposition Benjamin Netanyahu and citizen Ehud Barak. In those meetings Netanyahu and Barak were very firm in their opinion that Israel had to attack the reactor. Peres, who as leader of the opposition at the time of the bombing of the reactor in Iraq had expressed reservations about that attack as well, surprised Olmert with the suggestion that Israel should attempt to talk with the Syrians first. The prime minister chose to ignore this suggestion.

An extensive process of preparation got underway in the IDF. The then-newly appointed chief of staff, Gabi Ashkenazi, found an army that was depressed and mired in a deep crisis after some of its top brass had resigned, while others were still fighting the conclusions of the internal investigations and on edge about what might be said about them in the final report on the Second Lebanon War. The war and the investigations revealed huge gaps in the army's capabilities and the readiness of its units. The new chief of staff initiated a process of rehabilitation but when he was shown the findings from Othman's computer, Ashkenazi realized that he was facing a series of problems completely different from what he had been preparing for: how to get rid of the new threat in a way that would not spark a new war with Syria and Hezbollah – and if a war did break out – how to ensure that the IDF would win this time.

To make sure the reactor would be destroyed, it was necessary to deploy tremendous firepower, in the form of a relatively extensive aerial bombardment. However, an extensive action was liable to be perceived as a humiliation by President Assad and push him into a corner so that he would feel obliged to retaliate. A quiet and relatively clandestine action would probably be perceived in Syria less emotionally but in such a case, there would be no certainty that the nuclear threat had been eradicated. Olmert had to take into account a reaction that was liable to include direct hits on civilian and military infrastructures, from northern Israel to the Tel Aviv area.

The dilemma Israel faced with respect to the choice between effectiveness and secrecy did not end with the question of the operation itself. If the IDF had to prepare for the pessimistic scenario of Assad retaliating massively and a war breaking out – how could that be accomplished without preparing the units in advance, thereby revealing the secret and enabling the Syrians to prepare to thwart the bombing of the reactor?

Americans enter the picture

After mulling everything over, and at the advice of former Chief of Staff Amnon Lipkin-Shahak, Olmert decided to share the sensitive new information about Syria with the Americans. He hoped that perhaps the George W. Bush administration would take it upon itself to destroy the reactor. **Defense Minister Amir Peretz briefed his American counterpart Robert Gates, who was in Israel on a routine visit. Gates was “pretty much in shock.”** The prime minister's two close advisers, Yoram Turbovich and Shalom Turgeman, flew to Washington to brief top administration people. In Washington the Israeli delegation met with Vice President Dick Cheney and top people in the CIA and the National Security Council.

Gradually, it became clear that there were three competing approaches within the administration, and that the president was trying to choose among them. Cheney, as usual the rapacious hawk, wanted the United States to attack and destroy the reactor as a public and deterrent message, a warning against the development of additional secret nuclear programs in other countries. Secretary of State Condoleezza Rice was recommending a diplomatic move to thwart the reactor by means of applying pressure on Assad. Gates and some of Bush's advisers believed that an attack should be left in Israel's hands. They were concerned about the possibility of a blunder that could develop from

mistaken intelligence information, as had happened to the Americans in the affair of the weapons of mass destruction (that were not found) on the eve of the Iraq War in 2003.

In mid-June, Olmert arrived in the United States for a meeting with Bush. Prior to the meeting the president consulted his advisers. Michael Hayden, the head of the CIA, wrote years later in *The Washington Post* that he told Bush that his agency had concluded that the site at Al Kibar was part of a nuclear weapons program and there was no other explanation for its existence. However, Hayden added a reservation: No other elements of such a program were identified, such as development of a warhead. Therefore, the findings from the reactor were presented as findings “at a low level of certainty.” In Israel they were surprised by that conclusion.

In his memoirs, Bush wrote that following Hayden’s assessment, he told Olmert at their meeting on June 19 that he could not justify an American attack on a sovereign state. Olmert implored Bush and Cheney to attack nevertheless, and argued that such a move would also help deter Iran. “I am able to defeat Syria,” said Olmert in that conversation, “but I need you to act there specifically because of the Iranian nuclear program.”

On July 13, Bush informed Olmert in a conversation over the direct and secure “red phone” line between the White House and the Prime Minister’s Office in Jerusalem that he opposed a military attack on the reactor. However, said the president, he had decided to send an envoy to Syria to pose an ultimatum to Assad to demolish the reactor, under international supervision. The prime minister warned the American president that setting the diplomatic channel in motion would make it possible for the Syrians to play for time in the talks while hastening the completion of the construction of the reactor. Israel and the West, he said, would lose the element of surprise.

In the Israeli defense establishment, the concern was that if the diplomatic channel were employed, Assad was liable to position anti-aircraft batteries near the reactor or even to establish something like a kindergarten there as a “human shield.” The prime minister was also afraid of a leak to the media by American officials who opposed an Israeli attack. He succeeded in persuading Bush to halt the diplomatic move and to commit to preventing leaks. Olmert did not ask Bush for authorization of an Israeli attack but let the president understand that he was of a mind to order the IDF to act. “If you don’t do it, we will,” he said.

One of the president’s close advisers later told a senior Israeli official that Bush replied in his typical Texas style: “A man’s gotta do what a man’s gotta do.” Bush also had another crude observation, about Olmert: “You see why I love him? Because he’s got the world’s biggest balls.”

Barak strikes again

In the week the prime minister went to Washington, a person who did not share Bush’s enthusiasm for Olmert returned to the core of decision-makers in Israel: Ehud Barak. In mid-June the former prime minister won the primary for Labor Party leadership, replacing Peretz in that position, and he announced that he himself would be the new defense minister. Though the relations between Olmert and Barak were fairly good, and it appeared that Olmert wanted Barak in Defense, Barak had voiced some harsh criticism of the prime minister’s conduct during the war in Lebanon. He did not revise his opinion when they sat together in sensitive deliberations in the cabinet and in smaller forums. Olmert’s behavior toward top people in the defense establishment seemed too “folksy” to him – too much hugging and backslapping, not enough considered judgment. At times, Barak told someone, he had the feeling that Olmert was playing the role of a leader based on what he had seen in American movies.

The differences of opinion between Olmert and Barak on the matter of the reactor became evident relatively quickly. The prime minister was imbued with a sense of urgency and a desire to act. The prime minister was concerned about two possibilities that could thwart the operation – a prior leak to the media or the reactor becoming “hot” (activated) – a development that intelligence assessed was liable to happen toward the end of September. That was marked as a point of no return, because an attack on a “hot” reactor was liable to cause tremendous environmental damage.

Barak, however, began raising reservations. He believed that the operational plans the IDF had formulated for attacking the plant had not yet matured sufficiently and did not ensure complete success. He pushed for formulation of alternative proposals. Barak also thought an attack could embroil Israel in a war with Syria, in which it would again become clear that the IDF and the home front were not properly prepared. The new defense minister believed that before any attack on the reactor, the IDF had to be “98 percent prepared, not 80 percent.”

With the approach of summer, temperatures inside the conference rooms also rose. In a series of cabinet meetings, the hostility between the prime minister and his defense minister became more extreme. “These are discussions that none of the participants will ever forget,” says one of the cabinet ministers. “Barak tried to block approval of the operation and Olmert read out arguments from a piece of paper like a lawyer arguing in court, for the record. Come to think of it – the court of history. This was a breathtaking drama, and unfortunately it played out in front of the top military commanders.”

When Olmert expressed concern about the possibility that the Syrians would preempt Israel and activate the reactor, Barak downplayed the risk of attacking a “hot” reactor. A number of those who were present later observed that, as one of them put it, “Gideon Frank, chairman of the Atomic Energy Commission, blanched and nearly fainted. Attacking a hot reactor was liable to create tremendous environmental pollution. We said to Barak: For every baby who is born in the next 200 years along the Euphrates with a deformity or a genetic defect, they will blame us straightaway.” In a meeting on August 1, Barak forbade head of the IDF Planning Directorate Ido Nechushtan (who two years later would replace Shkedi as commander of the air force) to screen a presentation that reviewed the strategic picture and recommended a swift attack. Barak, shouting, argued that he had not authorized the presentation.

Olmert, a few of the ministers and some of the army officers who clearly favored the prime minister, suspected Barak of being driven by hidden personal motives. The prevailing conspiracy theory held that Barak was waiting for the final version of the Winograd commission investigative report on the second Lebanon war, which was to be published within a few months, in the expectation that the commission would obligate Olmert to resign. Then, even if Livni were to replace him as prime minister, Barak would lead the Syria operation and take all the credit.

Barak’s behavior, says one of the top defense people, was simply deplorable, “Especially taking into account the disagreement about bombing the nuclear sites in Iran, which erupted two years later. Then, he in fact presented opposite arguments: Suddenly there wasn’t a problem in rushing to bomb, even though an attack in Iran was a far greater challenge than bombing in Syria. Historians in the future who will examine the minutes of those discussions won’t know what to do with this dissonance.”

In contrast, however, another senior officer says: “Had a war with Syria indeed broken out following the bombing and had the IDF been caught unprepared again, Barak was liable to have finished like Moshe Dayan after the Yom Kippur War. I don’t know what was going through his conspiratorial mind, but Barak’s view was correct in my opinion: Leave no stone unturned before you make such a fateful move.”

Barak, in a conversation with Haaretz, rejects the claims against him outright. All his arguments, he says, were to the point. It was in fact his comments that pushed the IDF to present alternative plans, one of which was ultimately the one that was carried out. And during the time that passed, the IDF’s preparedness for war was improved immeasurably. According to him, he did not recommend attacking a hot reactor, but rather said that it was necessary to prepare for any eventuality and that the reactor becoming operational should not cause the decision-makers in Israel to despair. Olmert, according to Barak, tended to act almost automatically, without due consideration. The disagreement between them was a meeting between “a certified lightweight who had never approved any real operational planning” (Olmert) and “a professional who had engaged in that for decades,” from the days of Sayeret Matkal (the elite commando force Barak had led), and up through the weekly discussions on operations and incursions in the defense minister’s and the chief of staff’s offices (Barak). There were no political considerations behind his recommendations.

### The denial space

Assad conducted the nuclear project in great secrecy, with very few partners to the secret. The contacts with North Korea were coordinated by the head of the Atomic Energy Commission, Othman, and by Gen. Muhammad Suleiman, the regime’s person for dark ops, who also oversaw military relations with Iran and Hezbollah. This small and secret coterie headed by Suleiman was directly subordinate to the president; in Israel it was called “the shadow army.”

An analysis of the operational possibilities for destroying the reactor, gradually led Israel to a realization that would ultimately guide the decision on the method of action that would be used. The planners came to the conclusion that an Israeli attack had to leave the Syrian president inside “the denial space.” If the attack avoided embarrassing and humiliating Assad publicly, there was a reasonable chance he would decide to hold back and not respond by going to

war. An event with a relatively “small footprint,” a sharp and quiet action at a site far from where people were living, if Israel did not take responsibility for it and if its leaders did not prattle in its aftermath, would enable Assad to downplay the event. In this matter, the Mossad concurred with the Military Intelligence assessment.

Nechushtan, the head of the Planning Directorate, has said that according to the scenario the planning and intelligence directorates had drawn up, “We were going to take Assad by surprise. The trick was not to take responsibility and immediately after the bombing to push ahead with a diplomatic effort that would convince other countries of the reliability of the information about what the Syrians were preparing and spur them to act to restrain him.”

Two different air force strike options were on the table, the difference between them was the size of the aerial force that would be used. The first involved many planes and could have ensured swift and very nearly certain destruction of the reactor, but it would leave behind a large footprint and was liable to spur the Syrians to a harsh response. The second option that was ultimately accepted, was sketched by the air force commander on a paper napkin in a brief conversation with the prime minister. Eight planes would be allocated to the mission – four F-15I "Ra'am" (Thunder) and four F-16I "Sufa" (Storm) – carrying 16 tonnes of bombs. “The idea was to create redundancy. To go in with two kinds of planes, with different kinds of armament, because every plane is vulnerable to blocking in a different way, but this way, the second kind could compensate. With high certainty, one of the two types would reach the target.”

The air force dubbed the plan with the code name “Soft Melody” (the general staff operation had a different code name, “Ein Habasor,” while at Military Intelligence they referred to the preparations as “Outside the Box”). The squadrons to which the mission was assigned were brought into the picture during the month of June, and only in a limited way. In the air force it was decided to brief only the top command in each of the two operational squadrons about the nature of the target that was to be attacked. The greatest challenge, relates “Col. Amir,” one of the F-15 pilots who took part in the attack, was dual: to advance the operation without most of the crews knowing what it was about and at the same time to prepare the rest of the squadron for the possibility that as a result of the operation, hostilities might break out, and all this while this group was not privy to preparations for the attack itself.

“In the preparations for the operation, we practiced ways of arriving, implementation, routes, distances, without telling the pilots and the navigators who were taking part what the target was. People realized that there was something bigger here.” Between June and September, the operational planning became more detailed, additional precise information about the destination came in, different methods of action were assembled and finally the crews were slotted into the operation.

“We had a number of kinds of weapons, a mix that wouldn’t leave you with a single malfunction point without the ability to compensate for it. If a certain weapon or one of the platforms didn’t work, there would be something to cover for it,” says Amir. In manning the crews, “We choose the best. The squadron commander and his deputy take the ones on whom they agree hands down will get the bombs to the target.”

Concurrently, the preparations began in the IDF for the possibility of things going sour, but in order to maintain the secrecy of the operation, it was necessary to tailor a false narrative for most of the commanders, and later also for the public and the media. The explanation that was offered was concern about the possibility of hostilities breaking out over mutual miscalculations: Israel and Syria are suspicious of each other and exchanging threats in the context of the results of the last war in Lebanon. The tension is liable to lead to an unplanned deterioration in the situation, and in order to prepare for that possibility the IDF must increase its level of readiness.

A leak and a decision

Olmert ordered the briefing of the United States concerning his decision to attack, which he was close to arriving at. In mid-August, Olmert convened a dramatic cabinet meeting to discuss the implications of the attack. The prime minister dwelled in particular on the meaning of life in Israel under the shadow of a nuclear threat and warned that this was a condition that was liable to cause profound demoralization of Israel’s populace. Olmert quoted one of Assad’s speeches from early June in which the Syrian president predicted that toward the end of the summer there would be a development that would completely change the reality of the Middle East. “We do not want a war,” Olmert told his ministers. “The disagreement here is not between those who want a war and those who oppose it. Rather, the question is whether to take a risk in order to prevent greater risks – and for that reason there is no alternative to demolishing the reactor.”

Associates of Olmert describe an angry correspondence with Barak that day, which was conducted via messengers. In a one-on-one conversation Olmert tried to resolve their differences of opinion, but according to him Barak continued to try to convince ministers that a premature bombing of the reactor would cost Israel a war. On August 31, Olmert and Barak held a limited operational consultation with the heads of the defense organizations. The Israeli leadership began to converge on the decision – bombing of the reactor in the near term – and the selection of the more limited action by the air force. Shkedi, a man of profound historical awareness, went up to Olmert at the end of the meeting and said to him: “Mr. Prime Minister, trust the air force pilots. They are the best in the world. Authorize the operation.”

On Tuesday, September 4, the air force conducted its last mock maneuver in advance of the attack. “And then – a phone call came in from Dagan that there was a query from the United States,” relates Shkedi. One of the American media organizations had asked the Pentagon a question about the presence of a nuclear installation in Syria. This was, of course, one of the two scenarios that had been feared in Israel during the summer. Any report in the media was liable to awaken the Syrians out of their complacency, alter their defensive preparedness around the reactor and deny the IDF the advantage of surprise. The chief of staff asked the prime minister to convene the cabinet urgently and vote on approving the attack. It was then 2:00 A.M. on Wednesday.

The cabinet met for a discussion in Jerusalem in the morning. In the meantime, Shkedi went to the Hatzetim and Ramon air bases to talk with the crews that would take part in the operation and to reveal the real target to most of them. “I said to them: You are going to do something of incredible significance. By no stretch of the imagination will you come back without the reactor having been destroyed. However, you must avoid aerial dogfights with enemy planes. Their mission this time was not to take down enemy aircraft. For combat pilots to hear a thing like that – it is completely contrary to their intuition and ethos.”

At the cabinet meeting, Ashkenazi presented the various alternatives and recommended attacking. It was decided to attack but to authorize a small forum – the trio of Olmert, Barak and Livni – to decide upon the timing of the attack and the nature of the operation. The trio met just before 6:00 P.M. in a room adjacent to the government meeting room, heard Ashkenazi, Dagan and Yadin, and afterward remained with just the chief of staff. The operation was approved unanimously – and at the army’s recommendation the limited air attack option was chosen. At the beginning of the discussion Livni still hesitated, but she was convinced by the chief of staff’s arguments that the proposed military action would ensure a more certain outcome.

“Suddenly a moment comes when all the theoretical discussions become the here and now, and it could be that this will lead to a war,” she relates. “The odds were low but they did exist. There was unease because the home front was not aware of what might be waiting for it. And that is after the missiles we had absorbed in the Lebanon War and even before we had an interception system like Iron Dome. It occurred to me that we could wake up the next morning and the horizon would be full of [incoming] missiles. However, there were no doubts about the decision itself. We went through the whole process until the correct decision was made. I was very much in agreement with the decision to attack, even though it was with a heavy heart.”

Ashkenazi went back to the General Command building in Tel Aviv. There, his deputy had already convened the men of the General Staff. Some of them heard for the first time about the presence of the reactor in Syria. That evening, the wedding of the chief of staff’s secretary, Liron, went ahead as planned. Ashkenazi showed up together with many of the generals, in part so as not to arouse suspicion that something was afoot. He recently recalled: “I looked at the dancing guests and I said to myself: Five hours from now, we could be waking them up with sirens and Scud missiles falling in the center of the country. At the cabinet meeting I had already warned the ministers: Anyone who talks will be responsible for Assad reacting. Anyone who goes running to television risks causing a war.”

Olmert stayed in his office to work. At 8 P.M. he summoned leader of the opposition Netanyahu to the prime minister’s residence. “Bibi,” he said to his veteran opponent, “it’s at midnight tonight.” Netanyahu wished him success and said, “I will react in accordance with the circumstances.” Olmert, like Ashkenazi, stressed the need for secrecy after the attack as well. The prime minister, who managed to take a two-hour nap, went on to Tel Aviv to follow the operation from the air force underground command post together with Barak, Livni, the chief of staff and the air force commander.

## ‘Soft Melody’

In the meantime, final preparations were under way in the air force. In the force they were worried about a series of possible complications during the attack, ranging from the presence of a concealed battery of anti-aircraft guns in the area of the reactor to the concern that it was not possible to determine with certainty that the reactor would be destroyed in a single sortie, so that a second one, immediately following the first, might be needed to complete the mission, this time under more complicated circumstances, in which the aim of the operation had already been revealed to the Syrians.

According to David Makovsky, a researcher at the Washington Institute for Near East Policy, in addition to eight attack planes, a number of other aircraft also took part in the operation. The planes took off from Ramon and Hatzetim and headed northward along the shore of the Mediterranean, with ample use of electronic warfare as camouflage.

“We set out around 10:30 P.M.,” recalls Amir. “It’s a very long flight, secret, on a dark night and a low altitude of 100 meters above sea level. You have to make all kinds of split-second decisions. Mostly it went according to plan, but not everything. The weather along the way surprised us in a number of places. We had to figure out an answer on the spot. According to what had agreed upon in advance, there was no communication between the planes: We maintained complete silence during the flight. Each of us solved things in his own cockpit, after dilemmas and misgivings. In one plane, a problem was solved, after [it had become clear that] not all the systems were working. We were flying in a hostile area. If the ground-to-air-systems wake up, you are in a vipers’ nest. But the flight to the target was relatively calm, without our getting discovered and without any direct threat.

“And then you get to the target area, climb a bit higher, pulling into execution mode. Everything goes according to the advance briefing. Each plane drops two bombs. You feel a slight shaking of the wing as they are released. There is a bit of excitement before the bomb hits. We made certain five times that it was ‘all systems go.’”

Even today, he remembers the moment of impact. “Everything happens within a few seconds. I see on the thermal system I have on the plane and also outside – the bombs are hitting the structure. There is a tremendous explosion that you see in the darkness and after that, total destruction. The target gets covered in smoke and afterwards you see that it has been demolished. We were over the target for two or three minutes. And then we started to fly back, in accordance with the planning, at a low altitude. There is a brief moment when you feel excellent, because you have achieved what was required – and then you are very vigilant. We had hundreds of miles to fly, some of them in an area full of missiles. We were very focused on the escape route because it could elicit surprises.”

According to the plan, upon hitting the target, all the planes were required to report to the others over the communications network. Following that, one of the F-16s was supposed to broadcast the word “Arizona” on long-range radio back to Tel Aviv – to indicate that the target had been bombed according to plan. All eight planes confirmed a precise hit and returned to the radio blackout. When the F-16I crew reported “Arizona,” it was 12:25 A.M., Israel time, on Friday, September 6.

Amir relates that a number of years later he watched a video that had been filmed in the command post during the attack. “Everyone there is jumping up and down in excitement, like in a Hollywood movie. At 1:30, we got back to Israel and landed at the base. Our assumption was that possibly the operation would be revealed publicly, and the Syrians would respond, and then it would become the opening move in a war. In the underground hangar that our plane returned to, Brig. Gen. Shelly Gutman, the commander of the Hatzetim base, was waiting. He was waiting for us outside the plane as we landed, with hugs. He is usually a pretty reserved person. I can’t remember him ever hugging me on any other occasion but this time he was all smiles. Shelly said to us: You are champions.”

On the way back, in order to reduce weight and save fuel, one of the planes jettisoned an empty fuel container. The tank landed on the Turkish side of the Syrian-Turkish border, creating two problems: First, the incident, and the photos of the tank with Hebrew writing on it, were evidence that an Israeli force had been in the area. Secondly, it caused huge embarrassment vis-à-vis Turkey, which at the time was a country friendly to Israel, even though Recep Tayyip Erdogan was already serving as prime minister. In the air force, they characterized the release of the fuel tank into Turkey as an operational error, although tactically it was possible to have justified the crew’s considerations. The hitch, however, did not cast a pall on the success of the operation. After the attack, Ashkenazi sent MI chief Yadlin to the Turkish chief of staff to explain the considerations and circumstances and to reassure him that there had been

absolutely no violation of Turkish sovereignty during the operation. The Turks were not happy, but they decided not to make an issue of it, apparently in part because of their retrospective realization that a threat to them was also inherent in Assad's secret project.

The lack of immediate response from the regime reinforced the prior intelligence hypothesis that Syria would show restraint following the attack.

Shkedi emerged from the control booth [in the command post] only after the planes were out of the range of danger. "I went to Olmert. Both of us were very excited. We had a big hug. I said to him: The air force did what it was assigned to do."

The prime minister celebrated the achievement by raising a toast. "There was a crazy high all around him," said one of those who were present. His chief of staff, Yoram Turbovich, in a state of total euphoria, said to Olmert: "You can resign now. You have done your bit for the people of Israel."

The day after Arizona

Shortly thereafter Olmert phoned call President Bush, who was on a visit to Australia that week. The two spoke, at Olmert's request, on a secure line.

"Do you remember something in the north that was bothering me?" said the prime minister to the president. "It isn't there any more."

"Very good," replied Bush.

The following afternoon, the Syrian news agency issued a laconic statement to the effect that during the night its air defense system had chased away Israeli planes that had penetrated Syria's air space. In Israel they saw this mendacious statement without many details as reinforcement of the assessment that Assad intended to show restraint. The silence on the Israeli side, which overall was maintained in accordance with the advance planning, helped reduce the sense of humiliation felt by the Syrian president and gave credence to his range of plausible deniability.

Immediately after the attack, Israel embarked on a diplomatic blitz that had been prepared in advance by the Prime Minister's Bureau, the Mossad, MI and the Foreign Ministry. Top Israeli officials, most of them intelligence people, set out for Western countries and a number of friendly countries in the region to share the incriminating information about the secret Syrian reactor. The detailed intelligence helped convince those countries of the justice of the Israeli move – and neutralized the possibility that the attack would become the cause of an international scandal. The Syrian silence helped this.

"It's a story that ended well," says Amos Yadlin. "There was successful cooperation here among the intelligence organizations and between us and the government. It was an extraordinary process, at the end of which the reactor was destroyed."

Ido Nechushtan believes that "this is the kind of problem that it's important for Israel to know how to solve on its own. No one is going to solve them for us. Olmert conducted himself in this affair with courage and skill and did not shy away from making decisions. That was no simple matter, a year after Lebanon."

"An existential threat to the State of Israel arose here and we dealt with it, the way the air force had dealt with the reactor in Iraq in the past," says Col. Amir, the F-15 pilot who took part in the attack. "For me, today it connects with our ability to remove threats in distant countries in the third circle [meaning, Iran]. Since the attack in Syria we have also improved wonderfully – in intelligence, in our range of action, in our ability to attack secretly."

During the course of the past decade, the two operational air force squadrons have fiercely guarded the secret of the attack. Amir says he never told his wife about that night in eastern Syria. "Efrat will know about it only now, when the articles and interviews are published. There are things you don't talk about. She is familiar with this."

## Epilogue

Even after the reactor was bombed, ripples in the Syrian-Iranian axis continued, with the incessant involvement of Hezbollah. General Mohammed Suleiman, commander of the Syrian “shadow army,” was the contact person for the Revolutionary Guard Corps leaders and for Imad Mughniyeh, who headed Hezbollah’s terrorism effort.

Mughniyeh was in the know about the most top-secret missions of Hezbollah’s patrons, Iran and Syria. The year before, he commanded the mission to kidnap two Israeli army reservists on the northern Israeli border near Zarit that triggered the Second Lebanon War. As far as is known, it was carried out without the advance permission or involvement of Iran or Syria.

The Syrian regime completed the destruction of the building. When the IAEA wanted to visit the site, following reports of the attack and leaked allegations that it had actually been a nuclear reactor, the Syrians claimed there was nothing to see because there had been nothing there. Yet in 2008, IAEA inspectors found traces of radioactive substances there, and the agency said there was a high probability that a nuclear reactor had been in operation at the site. As was its wont, Damascus denied everything, and the IAEA did nothing about all this despite Syria’s blatant violation of a treaty to which it was a signatory.

By then, Mughniyeh was dead. He had been killed in 2008 in Damascus while leaving a reception at the Iranian embassy. When he turned on the ignition of his jeep, it blew up. According to reports in the American media, his assassination was a joint Mossad-CIA operation in revenge for Mughniyeh’s role in hijacking a TWA airliner in Beirut in 1985, and for attacking U.S. Marines in Lebanon two years earlier. Hezbollah accused Israel of the hit, but Israel never officially responded.

According to various reports at the time, Mughniyeh’s friend General Suleiman had no kinder a fate. Half a year later, the commander of the “shadow army” was attending a banquet at his holiday home in the Syrian seaside town of Latakia when he was shot by snipers from a boat. As in Mughniyeh’s case, Israel was accused of the killing but Jerusalem never officially responded.

Despite the shadow of failure in Lebanon, if all these claims are true, the Olmert administration demonstrated an aggressive and particularly active line against the nuclear threat and against the threats of terrorism and guerrilla warfare in neighboring countries. By the time Olmert left office less than two years later, Israel had – again according to the foreign press – heavily bombed an Iranian convoy in the heart of Sudan that was en route to Gaza. And before that, at the end of 2008 and beginning of 2009, came the Israeli military operation known as Cast Lead against Hamas in Gaza.

Western intelligence sources sold the Washington Post in 2015 that General Qasem Soleimani, the commander of the Quds Force of the Islamic Revolutionary Guard Corps, had been with Mughniyeh in Damascus that night, but somehow he did not die in the blast that killed the Lebanese terrorist. Today that same Soleimani commands Iran’s military moves in the Middle East, including the basing of the Shi’ite militias in southern Lebanon, the next front where Israel is likely to find itself acing Syria and Iran. Olmert stayed in his office to work. At 8 P.M. he summoned leader of the opposition Netanyahu to the prime minister’s residence. “Bibi,” he said to his veteran opponent, “it’s at midnight tonight.” Netanyahu wished him success and said, “I will react in accordance with the circumstances.” Olmert, like Ashkenazi, stressed the need for secrecy after the attack as well. The prime minister, who managed to take a two-hour nap, went on to Tel Aviv to follow the operation from the air force underground command post together with Barak, Livni, the chief of staff and the air force commander.

## **Syria Strike Revealed The Intelligence Failure: It Took Years for Israel to Discover Syria's Reactor**

Amos Harel and Aluf Benn

Mar 21, 2018 4:59 AM

The excitement of the Israeli political and security leadership after the successful operation to bomb the Syrian reactor quickly obscured a critical question: How did Bashar Assad's secret nuclear project escape the notice of Israel's intelligence community, which boasted for years about its ability to track even the slightest shifts in military deployments by its northern neighbor?

Neither the Olmert government nor the intelligence community seriously addressed this question by means of an in-depth investigation. The failure to detect the Libyan nuclear program (see main article) in 2003 led to extensive criticism and a classified investigation by the Knesset Foreign Affairs and Defense Committee, which became a source of much tension between committee chair MK Yuval Steinitz (Likud) and the heads of the various intelligence branches. In the case of the Syrian reactor, however, the tremendous lapse seems to have somehow been forgotten – apart from mention in some internal reviews in the intelligence organizations that were never fully addressed or resolved in an intra-organizational framework.

A person who held different senior roles in the intelligence community says that the belated discovery of the reactor, about six months before it was due to become active, was "Israel's greatest intelligence failure, maybe even greater than the Yom Kippur War."

"The operation went smoothly, fine," he says. "The government decided to carry it out and it did so, but the scary thing about the whole story is that its detection happened completely by chance. Assad and the North Koreans were building a plutogenic reactor right under our noses in Deir al-Zour for five or six years. God knows how long. And we had no idea, with respect to our most highly covered intelligence target, that there was this reactor that was nearly at the activation stage. The reactor was practically finished when we bombed it, it wasn't just the foundations. If the Mossad hadn't happened to bring in materials from Vienna that proved that a reactor had indeed been built there – the project would have been completed. We had to rev up from zero to 100 very quickly. How could this have happened?"

He adds: "The failure can be ascribed to a conception, one held by the West and not just Israel. This conception says that an Arab state would not enter into a project like this with a third party. Building a nuclear reactor that can only be for military use, when there is no local trained manpower to operate it – this is something that's unprecedented in the history of nuclear weapons. The Koreans did everything there. It's crazy. We didn't know that the number of people within Syria who were in on the secret was so small. There is no technician in Syria who would know how to operate the reactor. The Iraqi reactor in Osirak that we bombed in 1981, on the other hand, was an openly known project."

In retrospect, the former intelligence official says he thinks that the North Koreans may have intended to operate the reactor themselves: "They were the ones who would have reaped the main benefit from this project. North Korea is a target country for the West. All eyes are on it. We removed the threat by bombing the reactor, but the Americans went to sleep and didn't understand what went on here. There's a question as to whether there aren't more such reactors in other places in the world."

He notes that the North Korean threat to the Americans and to South Asian countries still exists, of course, but since the bombing in Syria, no intelligence relating to North Korean activities in that country has been forthcoming.

"Publicly, it's convenient for everyone that the reactor was destroyed – but it was a disgrace," he continues. "Israel was oblivious as the reactor was being developed for years right under its nose. And the United States just didn't want to know. But when they're handing out medals, there aren't going to be any commissions of inquiry."

Haim Ramon – who, at Prime Minister Olmert's request, rejoined the government in June 2007 as his deputy – recalls a conversation he had with Olmert a few days before assuming his new role.

“He had everyone else leave the room, and then he said to me: I’m about to commit a serious censorship offense, but I’ll be forgiven because I’m the prime minister,” says Ramon. “Then he told me about the reactor and said he needed me in the cabinet. Based on what Olmert described, this was one of the intelligence community’s biggest failures ever. This thing had been moving forward for five years or so and we didn’t know a thing about it. I was in shock.”

Military Intelligence officials take a bit more forgiving view of the lapse. Maj. Gen. (res.) Yossi Baidatz, who headed MI’s research division at the time, says now: “It’s the kind of thing I would have liked to have detected at least a year earlier. If we had found ourselves with a hot reactor that couldn’t be attacked from the air – that would have been another matter, even if it was still a long way from producing a bomb. But that didn’t happen.”

According to then-Col. Eli Ben Meir, head of technology in MI’s research branch: “This was a success. Perhaps we could have discovered it three months earlier based on the information that was available. The important thing is that we found it before the reactor became operational.”

Gabi Ashkenazi, Israel Defense Forces chief of staff at the time, says: “Just as the intelligence community is being criticized for not having detected the reactor project earlier, it should be credited for its insistence on clarifying the situation and locating the reactor and preparing the operation to destroy it.”

People who worked with Olmert at the time say the realization that this was a grave, years-long lapse really dawned on them when the pictures arrived from Vienna. But they say that dealing with the problem itself, by destroying the reactor, took top priority. For this reason, in the months that passed between the discovery of the reactor and the actual bombing operation, there was no comprehensive investigation by the intelligence agencies about how such dramatic developments in Syria were missed. And even after the military strike, there was no such investigation of the critical intelligence fiasco that had gone on for years. Each agency apparently conducted its own review, but friction and rivalries among the heads of the various agencies kept a more in-depth investigation from taking place. Nor did Olmert call for such an inquest – perhaps because his people were already weary after being cross-examined by the Winograd Committee and opted to focus on the operation’s positive outcome.

Olmert: 'What we did in Syria can't be done in Iran'

Iyar 15, 5778, 4/30/2018

*[EXCERPT]*

Former Prime Minister Ehud Olmert spoke on Sunday [2018-04-29] at the Jerusalem Post conference in New York and discussed, among other things, the Israeli strike on the nuclear reactor in Syria which took place during his time in office in 2008.

"What we did with Syria cannot be done with Iran. Syria is relatively close, there was one structure, one nuclear reactor and that was the whole thing. When it was destroyed, their entire nuclear capabilities were destroyed until they decide to build a new one and that will take years," he said.

"In Iran the situation is completely different. The distance is greater," Olmert explained. "Second, the structures are scattered in different locations, especially underground. Israel's ability to destroy Iran's potential for nuclear weapons is much smaller. It requires a different kind of capability."

"When I was prime minister, Israel did a lot of unusual things by any standard, that you will not hear about for many years, in order to ensure we were not under the threat of a nuclear Iran," said the former prime minister.

Air Force marks planes to commemorate bombing Syria reactor in 2007

By TOI staff

7 September 2018, 10:35 am

The Israeli Air Force marked the 11-year anniversary of its destruction of Bashar Assad’s secret nuclear reactor, in a ceremony that saw special markings placed on the warplanes that took part in the strike.

The strike against the reactor in the Deir el-Zour region of Syria took place on the night between September 5 and 6, 2007, but was only officially acknowledged by Israel earlier this year. The reactor had become operational a short time earlier, leading then-prime minister Ehud Olmert to order its destruction.

Three squadrons took part in the attack, dubbed by the military “Operation Outside the Box”: Squadron 69, known as “Hapatishim,” or “The Hammers” flying F-15i fighters; Squadron 119, “Ha’atalef,” or “The Bat” and Squadron 253, “The Negev,” flying F-16is.

The ceremony at the Hatzerim Air Force Base, west of Beersheba, saw the marking of the planes from squadrons 69 and 253. Squadron 119’s planes will be marked in a separate ceremony on September 14.

Pilots who took part in the operation, technical crews who armed the planes in 2007 and the commander of Squadron 69, Lt. Col. G., placed on the planes stickers bearing the symbol of the operation, the army said in a statement.

The symbol includes a triangle, symbolizing an attack and painted in the colors of the Syrian flag, with a radioactivity symbol at its center, symbolizing the nuclear reactor.

[EXCERPT]

**Nuclear**

As I [John Bolton] informed Congress last fall [*i.e.*, fall of 2002], we are concerned about Syria's nuclear R&D program and continue to watch for any signs of nuclear weapons activity or foreign assistance that could facilitate a Syrian nuclear weapons capability. We are aware of Syrian efforts to acquire dual-use technologies—some, through the International Atomic Energy Agency (IAEA) Technical Cooperation program—that could be applied to a nuclear weapons program. In addition, Russia and Syria have approved a draft program on cooperation on civil nuclear power. Broader access to Russian expertise could provide opportunities for Syria to expand its indigenous capabilities, should it decide to pursue nuclear weapons. The Syrians have a Chinese-supplied “miniature” research reactor under IAEA safeguards at Dayr Al Hajar.

Syria is a party to the Non-Proliferation Treaty, and has a standard safeguards agreement with the IAEA but, like Iran, has not yet signed or, to our knowledge, even begun negotiations on the IAEA Additional Protocol. The Additional Protocol is an important tool that, if fully implemented, could strengthen the IAEA's investigative powers to verify compliance with NPT safeguards obligations and provides the IAEA with the ability to act quickly on any indicators of undeclared nuclear materials, facilities and activities. We believe the Additional Protocol should be a new minimal standard for countries to demonstrate their nonproliferation bona fides.

## **I Skövde lärde sig syrierna utvinna uran**

Av Johan Wallqvist

[johan.wallqvist@expressen.se](mailto:johan.wallqvist@expressen.se)

Publicerat 20 februari 2004

Uppdaterad 20 februari 2004

GT berättade i går att Syriens atomenergikommission har köpt avancerad kärnteknisk utrustning av göteborgsföretaget MEAB Metallextraktion AB. I dag kan vi berätta att MEAB i samarbete med kärnteknikföretaget Ranstad Mineral AB, utanför Skövde, har utbildat syriska atomforskare i hur man utvinner uran. Hösten 1997 anlände chefen för Syriens atomenergikommission till Ranstad med fem syriska kärnkemister. De lärde sig uranutvinning hos mig i tre omgångar åren 1998 och 1999, säger Bengt Lillhja, ägare till Ranstad Mineral. Blir kärnbränsle Företaget utvinner varje år 1,5 ton anrikat uran från atomsopor som bryts ned i en kemisk process. Uranet bearbetas sedan till kärnbränsle. USA och andra västländer påstår att Syrien är en skurkstat som i smyg skaffar sig massförstörelsevapen och stödjer terrorister. Borde inte alla röda lampor ha blinkat hos Säpo? - Jo, men vi fick veta det här först 2002, säger Håkan Forsström, kriminalkommissarie vid Säpos särskilda grupp för ickespridning av massförstörelsevapen. Frågade om syrierna Säpo ringde då MEAB:s styrelseordförande Hans Reinhardt: - Säpo frågade om syrierna. Jag sa att det var folk som lärt sig hantera en anläggning i Syrien som vi sålt, och som är identisk med anläggningen i Ranstad. Jaha, sa Säpo, säger Reinhardt. Håkan Forsström, Säpo: - 2002 kontaktade vi också SKI, Statens Kärnkraftinspektion, det är deras ansvar att vidta åtgärder. SKI hade redan 1999 fått besked om det vetenskapliga utbytet med Syrien, i en rapport från Ranstad Minerals vd Bengt Lillhja. Men utan att göra något. - Först tre år senare ringde en tjänsteman på SKI till Lillhja och frågade om han hade överfört känslig kärnteknisk information till Syrien? Nej, svarade han. Och det nöjde vi oss med, berättar en källa på SKI. SKI har sedan bedömt att utbildningen av de syriska atomforskarna var tillåten, med hänvisning till en EU-förordning.

## **Han säljer teknik för kärnvapen**

Av Johan Wallqvist

[johan.wallqvist@expressen.se](mailto:johan.wallqvist@expressen.se)

Publicerat 19 februari 2004

Uppdaterad 19 februari 2004

**Expressen kan i dag avslöja att ett svenskt företag har sålt avancerad kärnteknisk utrustning till Syrien.**

**Tullkriminalen i Göteborg har startat en förundersökning av ärendet.**

**- Syrien har nu förbättrat sin kapacitet att få fram kärnbränsle av uran och i värsta fall - kärnvapen, säger en svensk kärnkraftsexpert.**

Det är Göteborgsföretaget MEAB Metallextaktion AB som sålt utrustningen till Syrien. - Syftet är att rena fosforsyra från uran, så att den kan användas i livsmedelsindustrin, säger Hans Reinhardt, styrelseordförande i MEAB. - Utrustningen har svenska underleverantörer gjort. Sedan har vi skickat allt till Syrien där vi byggt upp anläggningen. Priset var 40 miljoner kronor. Utvinna uran Men utrustningen kan också användas för att utvinna uran till kärnbränsle för civil kärnkraft - eller för radioaktiva vapen. - Företaget saknar tillstånd för export av teknik med dubbel användning. Förundersökningen får visa om företaget begått smuggelbrott eller ej, säger tullinspektör Bertil Weingarten. "Vi säger bara SAEC" Expressens granskning visar att det är den syriska atomenergikommissionen SAEC som köpt utrustningen av MEAB. Detta försöker Hans Reinhardt dölja under intervjun. Vad står bokstäverna SAEC för? - S står för Syrian... Och A? - Ja, vad blir det... eeh, nej, det vet jag inte. Jaså? - Hehe, nä, vi säger bara SAEC. Har anläggningen med kärnkraft eller kärnvapen att göra? - Inte ett dugg, säger Hans Reinhardt, doktor i kärnkemi och specialist på uranutvinning. Senare medger han: - Det är fullständigt klart att tekniken och utrustningen som vi sålt till Syrien också går att använda till att återvinna kärnbränsle och till att göra uran. USA och andra västländer hävdar att Syrien är en "skurkstat" som i smyg skaffar sig massförstörelsevapen och stöder terrorister. I staden Homs har MEAB anslutit sin anläggning till en konstgödsselfabrik, ägd av Syriens atomenergikommission som ansvarar för landets kärnkraftsprogram. Utpekas som centralort Enligt amerikanska uppgifter är Homs "centralort för Syriens utveckling av massförstörelsevapen". Det internationella atomenergiorganet, IAEA, konstaterar att konstgödsselfabriken i Homs ingår som en del i Syriens kärnkraftsprogram.

<http://www.gt.se/nyheter/1.82134/foretagets-vinst-skot-i-hojden-1999>

Företagets vinst sköt i höjden 1999

Ranstad Mineral brukar ha en årlig inkomst på 10-20 miljoner kronor.

1999 var ett undantag: då steg företagets inkomster till 66 miljoner.

Det året avslutade företaget utbildningen av syriska vetenskapsmän.

Av Johan Wallqvist

[johan.wallqvist@expressen.se](mailto:johan.wallqvist@expressen.se)

Publicerat 20 februari 2004

Uppdaterad 20 februari 2004

Ranstad Mineral redovisar 46 miljoner kronor mer i intäkter 1999, jämfört med många andra år, visar GT:s granskning. - Jag har absolut inte sålt något till Syrien. De 66 miljoner jag tjänade 1999 kom till stor del från aktiespekulationer, säger Bengt Lillhja, företagets ägare. Fick du inget betalt för att du lärt syrierna hur man utvinner uran från atomsopor? - Nej, det internationella atomenergiorganet IAEA var ju införstådda med projektet så jag såg det som en ära att få hjälpa dem utan ersättning. Värt 100150 miljoner GT har tillgång till ett e-postbrev som Lillhja skickade den 11 april 2002 till Statens Strålskyddsinstitut, SSI. Där skriver Lillhja att han värderar sin metod att återvinna uran ur atomsopor, till 100-150 miljoner kronor. Lillhja uppmanar SSI att inte beskriva metoden i en säkerhetsredovisning av hans anläggning. Detta för att förhindra att inte utomstående ska kunna komma över hans livsverk, skriver Lillhja.

## **SYRIENS GEHEIMES ATOMPROGRAMM**

Die Spur führt nach Hanau

Von Sebastian Knauer

28. Februar 2004, 10:27 Uhr

Ein Ermittlungsverfahren Stockholmer Behörden sowie Recherchen der CIA erregen einen schweren Verdacht. Syriens Diktator Baschar al-Assad betreibt womöglich ein geheimes Nuklearprogramm - mit schwedischer und deutscher Hilfe. Das Know-how zum Umgang mit dem Spaltmaterial soll aus der Atomfabrik Hanau stammen.

Hamburg/Stockholm - Der freundliche Amerikaner im Business-Anzug kam ziemlich schnell zur Sache. In den Räumen der US-Botschaft in Stockholm an der prachtvollen Dag Hammarskjölds Väg 31 stellte er sich als Mitarbeiter der CIA vor. "Sie können uns vielleicht helfen?", sagte er dem zuvor telefonisch kontaktierten schwedischen Kernkraftexperten.

Der konnte helfen. Er berichtet dem bärtigen Amerikaner im vergangenen November von seinen internen Kenntnissen der Nuklearanlage "Randstad Mineral" im mittelschwedischen Skövde, eine knappe Flugstunde südwestlich von Stockholm. In der Anlage, die mit dem US-Konzern Westinghouse kooperiert, arbeiteten zwischen 1999 und 2002 syrische Techniker an einer so genannten "Extraktionsanlage" zur Gewinnung von Uran.

Der dazu notwendige Rohstoff kam aus Deutschland: Nach den Transportgenehmigungen des Bundesamtes für Strahlenschutz waren es "unbestr. kontaminierte Reststoffe" mit "5 Prozent angereichertem Uran (Uranoxid)" aus der stillgelegten hessischen Nuklearfabrik in Hanau. "Der Ami wurde ganz wach, als er das hörte", erinnert sich der schwedische Kernkraftexperte.

Hilfslieferungen für Syriens Bombe?

Damit bahnt sich für die hessische Nuklearfabrik möglicherweise ein neuer internationaler Atomskandal an. Während der bündnisgrüne Bundesaußenminister Joschka Fischer noch verzweifelt Wege sucht, den von Kanzler Gerhard Schröder zugesagten Export der Hanauer Neu-Anlage nach China zu verhindern oder wenigstens zu verzögern, entpuppt sich die alte Brennelementefabrik immer mehr als politische Zeitbombe. Mehr als 40 Tonnen uranhaltige Abfälle aus Brennelementen der Firma Siemens für deutsche Atomreaktoren wurden seit 1996 bis 2000 offiziell nach Schweden verkauft.

"Wir liefern keine radioaktiven Abfälle, sondern werthaltige Reststoffe ins Ausland", sagt Helmut Rupa, Chef der Hanauer Nuklearanlage. Doch die "kontaminierten Reststoffe", so die offiziellen Transportpapiere des Bundesamtes für Strahlenschutz in Salzgitter, verhelfen möglicherweise heute dem arabischen Syrien zur Bombe.

Denn in der syrischen Stadt Homs nördlich der Hauptstadt Damaskus steht auf dem Gelände des syrischen Atomforschungszentrums ein kastenförmiges Gebäude aus blau-grauen Metallwänden.

Geliefert hat das offiziell als "Reinigungsanlage für Phosphorsäure" deklarierte Innenleben die schwedische Firma Meab mit Sitz bei Göteborg und einer Zweigniederlassung im nordrhein-westfälischen Aachen. Schwedische Kernkraft-Insider berichten, dass die Fabrik baugleich mit der inzwischen still gelegten "Ranstad Mineral" ist, mit der Uran gewonnen wurde.

Inhaber und Gesellschafter der 1970 gegründeten Meab ist jeweils Hans Reinhardt, 68, einer der führenden Nuklearchemiker Schwedens. Er hat diverse Patente für chemisch-physikalische Verfahren zur Abtrennung von Stoffen aus Mineralien entwickelt. "Unsere Anlage in Schweden dient der Produktion von lebensmittelreiner Säure, sagt Reinhardt, "die für die Herstellung von Düngemitteln gebraucht wird".

Tatsächlich steht die Exporthalle hinter den meterhohen Mauern und mit Wachtürmen gesicherten Gelände einer "Düngemittelfabrik". Hausherr und Betreiber ist allerdings die Atom Energy Commission of Syria (AECS). Westliche Geheimdienste vermuten schon lange, dass hier Teile des ABC-Waffenprogramms von Damaskus vorangetrieben wird - Plutonium statt Blaukorn, Anthrax statt Narkosemittel, Nervengas statt Pestizide. Der tatsächliche Nutzen der Dual-Use Anlagen in Syrien, sagt der Berliner Sicherheitsexperte Oliver Thränert, "sind unklar". Wenig weist jedenfalls auf Bestände von Massenvernichtungswaffen hin, wie sie bei den von Washington erklärten "Schurkenstaaten" vorhanden seien.

Der schwedische Deal ist jedoch ein weiterer Hinweis, dass Syrien, das bereits Raketentechnologie aus China oder potenzielle Giftgas-Technik aus den USA, Frankreich oder Deutschland importierte, in den Club der Atomkräfte strebt. Das Land des Nachwuchs-Diktators und Staatsoberhauptes Baschir Assad verfügt selbst über keine zivil genutzten Reaktoren zur Energieerzeugung.

Immerhin kooperiert Damaskus mit der Internationalen Atomenergiebehörde (IAEA) in Wien bei der Entwicklung von "Kleinanlagen", um uranhaltigen "Yellow Cake" zu gewinnen. Nach Überzeugung des Center for Nonproliferation Studies in Monterey, der "erste Schritt in einem nationalen Atomprogramm".

Auch die Beschäftigung der syrischen Experten wurde in Schweden von den Atomaufsichtsbehörden abgesegnet. Seit 1999 befand sich auch der jetzige AECS-Generaldirektor, Ibrahim Osman, mit fünf weiteren Mitarbeitern über wechselnde Zeiträume im schwedischen Skövde zum "Wissenschaftsaustausch".

Schon damals wunderten sich die schwedischen Kraftwerksingenieure über das besondere Interesse der nahöstlichen Kollegen an der Mineral Randstad-Anlage, in der ursprünglich Uran aus heimischem Schiefer gewonnen wurde. Syrien verfügt über ähnliche uranhaltige Phosphatvorkommen. "Irgendwas war da im Busch", sagt ein Beteiligter. Erst als einige Gramm Plutonium aus der Aufarbeitung der Hanau-Chargen auf einer örtlichen Müllkippe gefunden wurden, reagierte die schwedische Atomaufsicht. (SPIEGEL 18/2002, Atommüll im Birkenwald) Zudem waren aus Mineral Randstad einige sorgfältig inventarisierten Mengen des hochgiftigen Plutonium spurlos verschwunden.

"Ich sage nichts. Auf Wiedersehen"

Vergangene Woche eröffneten die schwedischen Sicherheitsbehörden ein Ermittlungsverfahren gegen den Importeur. Meab-Chef Reinhardt hatte den Nachbau der Urananlage ohne behördliche

Genehmigung bereits seit 1999 ins syrische Homs verschiffen lassen. Kaufpreis: vier Millionen Euro. Im Januar 2004 soll in Damaskus Probelauf gewesen sein. Reinhardt zum SPIEGEL: "Lächerlich, ich sage dazu nichts. Auf Wiedersehen."

Gegenüber der schwedischen Tageszeitung "Expressen" zeigte sich Reinhardt, dessen Sohn und Diplom-Ingenieur Niclas als Gesellschafter mit einer Einlage von 25.000 Euro in Aachen fungiert, ahnungslos: "Ich weiß nicht einmal, was die Abkürzung AECS bedeutet."

Das ist nicht ganz glaubwürdig. Denn auf der Internetseite der Meab steht zur Eigenwerbung: "Schlüsselübergabe der AECS-Anlage in Homs, Syrien."

## **German Article Claims Syrian WMD Program Receives Swedish, German Help**

EUP20040229000106 Hamburg Spiegel Online WWW-Text in German

29 Feb 04

[Article by Sebastuan Knauer: "Syria's Secret Nuclear Program: The Trail Leads to Hanau." The first paragraph is an introduction.]

Strong suspicion has arisen as a result of investigations by Stockholm authorities and CIA research regarding the possibility that Syrian dictator Bashar al-Asad is conducting a secret nuclear program, with Swedish and German assistance. The know-how required for handling the fissile material is believed to have come from the Hanau nuclear plant.

The meeting took place last November in the US Embassy in Stockholm, located at number 31 on the city's imposing Dag Hammarskjolds Vag street. Having introduced himself as a CIA agent, the amiable, bearded American in the business suit quickly came to the point: "Maybe you can help us?" he asked the Swedish nuclear expert he had previously contacted by telephone.

He certainly was able to help. He informed the American of what he had found out through his internal inquiries at the Ranstad Mineral nuclear facility in the central Swedish town of Skovde, just under an hour's flight southwest of Stockholm. Between 1999 and 2002, this factory, which works in cooperation with the American Westinghouse Corporation, served as the base for a group of Syrian technicians working on a uranium extraction plant there.

The raw materials required came from Germany: The transport permit issued by the Federal Office for Radiation Protection [Bundesamt fuer Strahlenschutz: BfS] listed them as "unirradiated contaminated residues" with "5 percent enriched uranium (uranium oxide)" from the decommissioned nuclear plant at Hanau, in the region of Hesse. "The Yank became very alert when he heard that" recalls the Swedish nuclear expert.

### **CONSIGNMENT OF SUPPLIES FOR SYRIA'S BOMB?**

This marked the possible start of a new international atomic scandal surrounding the Hesse nuclear plant. Federal Foreign Minister Joschka Fischer, who represents the Alliance 90/ Greens, is still racking his brains to find ways of either preventing, or at the very least delaying the export of the new Hanau plant to China, despite Federal Chancellor Gerhard Schroeder's pledge that the deal would go ahead. The old burned fuel elements plant has been proving to be more and more of a political time-bomb. Between 1996 and 2000, more than 40 metric tonnes of uranium-containing waste from burned fuel elements produced by the Siemens firm for German nuclear reactors [as published] were officially sold to Sweden.

"We do not supply radioactive waste, but we do send high-value residues abroad" stated Helmut Rupaar, director of the Hanau nuclear plant. But the "contaminated residues" described in the official dispatch documents issued by the Federal Office for Radiation Protection in Salzgitter may now be assisting the Arab state of Syria in producing its atomic bomb.

North of the Syrian capital city of Damascus lies the town of Homs, where the site of Syria's nuclear research center includes a tin-shaped building with blue-gray metal walls. This was supplied by the Swedish firm of Meab, based near Gothenburg, with a branch in the German city of Aachen, in the region of North Rhine -

Westphalia. Though Meab officially described the building as a "cleaning facility for phosphoric acid", Swedish nuclear power specialists report that its structure precisely matches the one previously used by Ranstad Mineral to extract uranium, and since shut down.

The proprietor and one of the partners in Meab, which was founded in 1970, is 68-year old Hans Reinhardt. As one of Sweden's leading nuclear chemists, he has taken out various patents for chemical-physical processes for separating materials from minerals. According to Reinhardt, "Our plant in Sweden is used for producing acids of sufficient purity for use in foodstuffs, and are used for the manufacture of fertilizers."

#### EXPORT SHED BEHIND METER-HIGH WALLS

Though the export shed is indeed located on the site of a "fertilizer factory," behind meter-high walls guarded by watch towers, its actual landlord and operator is the Atomic Energy Commission of Syria (AECS). Western intelligence services have long suspected that this is where parts of Syria's nuclear, biological, and chemical weapons program are carried out. In other words, that its products are plutonium, rather than blue corn; anthrax, rather than anesthetics; nerve gas, rather than pesticide. Berlin security specialist Oliver Thraenert regards the actual purposes of dual-use plants in Syria as "unclear," though there is little evidence of the presence of stocks of weapons of mass destruction, as claimed in Washington's "rogue state" characterization of Syria.

However, following its acquisition of missile technology from China and potential toxic gas technology from the United States, France, and Germany, the Swedish link is yet another indication of Syria's determined attempts to join the club of nuclear-armed states. President Bashar Assad's Syria does not itself possess any civil nuclear reactors for energy production.

#### SMALL-SCALE PLANTS FOR "YELLOW CAKE"

Damascus is nevertheless cooperating with the International Atomic Energy Agency (IAEA) in Vienna over the development of "small-scale plants" for the extraction of uranium "yellow cake." The Monterey-based Center for Nonproliferation Studies (CNS) is convinced that this represents the "first stage in a national nuclear program."

Sweden's atomic supervisory authorities also gave their approval to the employment of Syrian experts. Since 1999, the present Director General of the AECS, Ibrahim Osman, has also spent varying periods of time, along with five of his staff, on "scientific exchange" programs in the Swedish town of Skovde.

At that time, Swedish power station engineers were surprised by the particular interest shown by their Middle Eastern colleagues in the Ranstad Mineral plant, originally used for extracting uranium from indigenous slate. Syria possesses similar reserves of phosphorus. "Something was brewing there" says one of those involved. Only after a few grams of plutonium from the reprocessed Hanau batches were found at a local garbage tip did Sweden's atomic supervisory authorities take action. (see SPIEGEL, 18/ 2002: "Nuclear Waste in the Birch Forest.") There was also the case of the batch of highly toxic plutonium that vanished without trace from Ranstad Mineral, after scrupulous stocktaking.

#### "I HAVE NOTHING TO SAY. GOODBYE."

Last week, the Swedish security authorities launched an investigation into the supplier. Back in 1999, Meab director Reinhardt had arranged for the replicate of the uranium plant to be shipped to Homs, Syria, without obtaining official authorization, for a purchase price of four million euros. A test run is believed to have been conducted in Damascus in January 2004. Reinhardt's comment to SPIEGEL was: "Ridiculous, I have nothing to say. Goodbye."

When he spoke to the Swedish daily newspaper Expressen, Reinhardt, whose Aachen- based son, graduate engineer Niclas, is a business partner with a stake of 25,000 euros, played the innocent, protesting: "I do not even know what the abbreviation 'AECS' signifies."

That does not sound altogether credible, in view of the claim on MEAB's own website: "Key handing over at AECS plant, Homs, Syria."

[Ranstad Mineral: The name appears in three different versions in the original German article; but this version appears to be the correct one.]

[Description of Source: Hamburg Spiegel Online WWW-Text in German -- [www.spiegel.de](http://www.spiegel.de): news web site funded by the Spiegel group which funds Der Spiegel weekly and the Spiegel television magazine.]

## **Swedish nuclear watchdog allays fears about missing uranium**

STOCKHOLM (AFP)

Mar 03, 2004

Sweden's nuclear watchdog on Wednesday rejected claims, attributed to a US secret service agent, that up to 100 kilos of Swedish uranium may have fallen into the wrong hands.

"We keep close tabs on this stuff. None of the uranium is missing," said Anders Joerla, a spokesman for the Swedish Nuclear Power Inspectorate (SKI).

SKI has disclosed that the Swedish company Ranstad Minerals, which recycles nuclear waste into uranium, has shown some discrepancies in records on the amount of nuclear waste treated and the amount of uranium it has in store.

Since the 1990s, as much as 100 kilos (220 pounds) of the potentially bomb-making material is unaccounted for, Joerla said.

But he said such discrepancies were often due to calculation errors and there was nothing to indicate that the uranium had actually gone missing.

"When you produce uranium from nuclear waste, it's a very complex process," Joerla told AFP. "It's very difficult to calculate how much uranium is actually in the nuclear products... If you overestimate how much uranium is in the products, records will show less uranium than expected."

Reports in the Swedish press on Wednesday said the US Central Intelligence Agency feared that the uranium that remains unaccounted for may have fallen into "terrorist" hands.

A CIA agent quoted by the Swedish daily Expressen also charged that Ranstad Minerals was a "security risk".

"We have acted at a high level to get the Swedes to stop the company in Ranstad," the agent, whose name was not revealed, told the paper. "It is incredible that the the Swedish security police haven't stopped (this) company."

Joerla however insisted that SKI keeps all dealings with nuclear material under tight supervision.

"We don't have much faith in the CIA," he added. "They couldn't find any (nuclear weapons) in Iraq, and they're not going to find any missing uranium in Sweden."

## **Syria Revisited**

BY Jackie Bennion

April 04, 2007

*[EXCERPTS]*

Following her visit to Israel and Lebanon, House Speaker Nancy Pelosi arrived in Damascus, Syria, this week to hold talks with President Bashar al-Assad...

*[deletia]*

All this reminded FRONTLINE/World series editor Stephen Talbot of his own meeting in Damascus with President Bashar al-Assad in May 2004, during a trip of U.S. news editors sponsored by the International Reporting Project of Johns Hopkins University in Washington, DC. Below, we are reprinting Talbot's impressions of the Syrian leader at that time.

*[deletia]*

### **My Photo-Op with Bashar al-Assad**

by Stephen Talbot

*[deletia]*

On the matter of WMDs, Assad stressed that Syria had no nuclear capability: "We do not even have a nuclear reactor for peaceful means." The International Atomic Energy Agency announced recently that there was no evidence Syria was trying to develop nuclear weapons. Assad also denied U.S. accusations that Syria has an advanced chemical weapons capability and a stockpile of the nerve gas sarin.

Assad made the case that U.N. inspectors had uncovered all of Saddam Hussein's weapons of mass destruction.

*[deletia]*

## **Baradei poohpoohs Bolton's nuke scare**

Saturday, **June 26, 2004**

### **Syria says UN nuclear inspectors welcome**

It looks like those pesky "diplomats" are upsetting Baradei and the State Department with their wacky allegations. ("diplomat can only mean John Bolton, who has been riding this dead horse for months) Baradei, who is leading the investigation into the Khan nuclear ring insists that nothing points to Syria having nuclear weapons and claims the "diplomat's" evidence is fishy. I guess Baradei is tired of being bullied by ideologues, who don't care whether they are right or not. Louis Charbonneau of Reuters is getting the dust up.

"The Syrians told me they would be happy if we go and verify whatever we need to verify," International Atomic Energy Agency (IAEA) chief Mohamed ElBaradei told reporters on Saturday during a flight to Moscow for a four-day official visit. "But we haven't gotten any piece of information on why we should be concerned about Syria."

Last week, diplomats told Reuters that the IAEA considered Damascus a top candidate for being the fourth customer of the nuclear black market that supplied uranium enrichment technology to Iran, North Korea and Libya.

But ElBaradei said no country had provided any hard evidence that would implicate Syria as a customer in the black market set up by Abdul Qadeer Khan, the father of Pakistan's atomic weapons programme. "This is something I read in the paper. Nobody came to us with any information (about Syria)," ElBaradei said. The IAEA, along with governments and intelligence agencies, has been investigating the details of Khan's network so that it can be dismantled. The results of the investigation are classified.

Syria, which has called for the creation of a Middle East free of weapons of mass destruction, has denied any interest in nuclear weapons.

Last month, diplomats and nuclear experts told Reuters that an experimental high-tech intelligence technique developed by the United States had detected what appear to be operating uranium-enrichment centrifuges in Syria. Diplomats said the centrifuges, which spin at supersonic speeds to purify uranium for use as fuel for power plants or weapons, could only have come from Khan's network. But some U.S. officials -- as well as ElBaradei -- are skeptical about the centrifuges.

"We don't have super high-tech detectors, and if somebody detected something they'd better come to us. We are the ones who can clarify fact from fiction," ElBaradei said.

<http://www.arabicnews.com/ansub/Daily/Day/040722/2004072204.html>

## **Baradei: no evidence on banned nuclear activities in Syria**

Syria, Politics, 7/22/2004

The International Atomic Energy Agency IAEA on Wednesday denied the existence of any evidence that Syria has made banned nuclear activities.

In a statement to Egyptian TV in Cairo yesterday, General-Director of the IAEA Mohammed el-Baradei said " the Agency has no evidence on Syria's attempts to build any nuclear program that violates the Non-Proliferation Treaty." He called all the regional states to work on preventing the spread of weapons of mass destruction in the region.

**US embassy cables: US sought financial pressure on top Syrian officials**

**SUBJECT: TREASURY TEAM'S DAMASCUS CONSULTATIONS ON FINANCIAL SANCTIONS**

REF: A. DAMASCUS 0108 B. 05 DAMASCUS 6224

Classified By: Charge d'Affaires Michael Corbin, reasons 1.4 b/d

*[EXCERPTS]*

1. (S/NF) Summary: Treasury representatives recently visited Post to discuss options for using financial sanctions to apply pressure to the Syrian regime. We discussed:

-- Treasury's requirements for finalizing the pending designations of Mohammad Sulayman *[Suleiman]* and Ali Mamluk, and Treasury's information requirements for a public statement;

-- Treasury's need to maintain the legal thread between the classified designation packet and the public statement announcing the designation;

-- Post's support for designating Mohammad Nassif Kheirbek, SARG pointman for its relationship with Iran;

-- How designating regime financiers like Rami and Mohammad Mamlouf could be problematic without a new Executive Order on corruption. End Summary.

2. (S/NF) PENDING DESIGNATIONS: Post understands the designations for Mohammad Sulieman, Syrian Special Presidential Advisor for Arms Procurement and Strategic Weapons and Ali Mamluk, Chief of the Syrian General Intelligence Directorate, are pending due to a lack of unclassified material necessary for Treasury's public SIPDIS designation statement. In post's estimate, Mohammad Sulayman is a relatively low-payoff target. His activities are not widely known, which will make it difficult to obtain unclassified information for a public statement and, SIPDIS likewise, make it unlikely that his designation would resonate inside Syria. Ali Mamluk, on the other hand, is more well-known within Syria, especially for involvement in his objectionable activities regarding Lebanon, and his suppressing Syrian civil society and the internal opposition. Therefore, Mamluk's designation will likely have a larger impact with local and regional audiences if the public statement announcing his designation also discusses his oppression of Syrian society.

3. (S/NF) We understood from our visit with Treasury representatives that although we are limited to designating regime members under the existing Executive Orders, there is some flexibility in Treasury's public statement announcing the designation. Post has advocated that no matter the legal basis of the designation, any public designation should focus on themes that resonate inside Syria:

corruption, suppression of civil society, and denial of basic human rights (ref A). The need to maintain the "legal thread" between the designation packet and the public announcement could be challenging on cases like Mohamad Sulieman whose links to corruption are less clear. In cases like Ali Mamluk, however, the role of the organization he heads in suppressing internal dissent is publicly known in Syria and stating as much in our statement would resonate well here.

**SUBJECT: APHSCT TOWNSEND TAKES STOCK OF BMENA REGION WITH  
MOSSAD DIRECTOR DAGAN**

Classified By: Charge d'affaires Gene A. Cretz for reasons 1.4 (B/D).

[EXCERPTS]

1. (S) SUMMARY: Frances Fragos Townsend, Assistant to the President for Homeland Security and Counterterrorism (AFHSC), met Mossad Director Meir Dagan on July 12 for a general discussion of regional security threats. On the Iranian nuclear program, Dagan proved surprisingly optimistic about the effects of United Nations Security Council (UNSC) resolutions and their impact on Iranian elites. On most other fronts, however, Dagan expressed deep skepticism regarding any near-term solutions. Dagan believes that the Syrians were emboldened by the Second Lebanon War, and argued for a concerted international effort to enforce UNSC resolutions in Lebanon as a means of removing Syria from Iranian influence. In Dagan's personal opinion, present attempts to prop up the government of Prime Minister Salam Fayyad will fail, and "an entirely new approach" with the Palestinians is required. Dagan and Townsend surveyed political developments in North Africa, Turkey, and the Gulf, and shared concerns about Pakistan's ability to withstand the challenge of Islamic radicals. END SUMMARY

[deletia]

Syria Taking Dangerous Risks

5. (S) Dagan echoed other reports that Syria expects an Israeli attack this summer, and has raised its level of readiness. Despite the fact that Israel has no intention of attacking, said Dagan, the Syrians are likely to retaliate over even the smallest incident, which could lead to quick escalation. Dagan believes that Syria's strategic alliance with Iran and Hizballah has not changed, and that Assad views these policies as both "successful and just." There is a tendency to assume that Syria can be separated from Iran, said Dagan, and that this offers the key to weakening Hizballah. Dagan argued that the opposite is true: by enforcing UN resolutions on Lebanon and increasing efforts to disarm Hizballah, the international community can remove the glue that binds Iran and Syria. Enforcing the resolutions would put additional pressure on Assad, who fears being tried for the assassination of Lebanese Prime Minister Rafiq Hariri above all else. The advantage of such an approach, continued Dagan, is that the legal ground is already in place for action by the UNSC. This credible threat could sufficiently frighten Syria away from Iran and towards more natural allies in the Arab League.

Assyrian International News Agency

## **Syria's Secret Nuclear Program and Long Term Threat**

Posted GMT 8-14-2006 15:25:33

Washington -- On May 5, 2004 RPS reported that there is growing concern in the Bush administration that Syria has been pursuing a clandestine nuclear weapons development program, and may already have centrifuges that can purify uranium for use in bombs. Centrifuges are a vital component in any nuclear weapons development program, as they can be used to purify uranium for use as nuclear fuel or in weapons. Experts say getting weapons-grade material is the biggest hurdle for any country that desires the bomb.

On September 16, 2005, John Bolton, then Undersecretary for Arms Control & International Security - U.S. Department of State, testified before the Middle East and Central Asia Subcommittee of the House International Relations Committee on Syria's bio/chem and atomic programs. In his testimony, Mr. Bolton said: "...on the nuclear side we are concerned about Syria's nuclear R&D program and continue to watch for any sign of nuclear weapons activity or foreign assistance that could facilitate a Syrian nuclear weapons capability. We are aware of Syrian efforts to acquire dual-use technologies that could be applied to a nuclear weapons program."

Since Washington began its post-September 11 policy of aggressively pursuing countries it believed had weapons of mass destruction that could be used against the United States and its allies, it has repeatedly issued warnings about Syria. Recent reports issued by the CIA have highlighted growing concern over Syria.

As an important player in the U.N. Oil for Food program, Syria also diverted important resources to its nuclear program by purchasing equipment, expertise, and delivery systems from other rogue nations or individuals.

Early on, various countries such as Belgium, China, Germany, and the former Soviet Union assisted Syria in their nuclear research. Additionally, over the years, Syria has solicited proposals from other countries including Argentina, India, and Italy. Further, the IAEA helped Syria on numerous projects including uranium exploration, uranium extraction from phosphoric acid, isotope production, construction of a cyclotron facility, development of nuclear research laboratories, and preparation for a nuclear power program.

A report by Middle East Newline (MENL) in July of 2004 disclosed that the Bush administration has expressed concern that Syria might exploit dual-use components and technology approved by the International Atomic Energy Agency for a nuclear weapons program.

MENL further went on to say that officials said the United States has been tracking Syrian orders for dual-use components and technologies for its civilian nuclear research program. They said Russia has also been offering Damascus expertise and cooperation in the development of a Syrian nuclear reactor.

### **Nuclear Site**

Sources close to RPS have disclosed that Syria is involved in military nuclear research not too far from Deir el-Hajjar, a tourist area in Syria. *[Sourcebook note: The location of the Israeli strike in Deir al-Zawr Province is close to the Halabiyya site, a popular tourist destination.]* Deir el-Hajjar is also known for agricultural research, which is intended to hide the real purpose of nuclear research. Experts believe that some of the satellite early detection technology will be dismissed because of the agricultural component of the location.

"The CIA is aware of the site and is monitoring the situation closely" Sources told RPS. The site is built underground and has two facilities: civil and military. The civil facility is a cover for the military one, the real purpose of the site.

Furthermore, the Central Intelligence Agency has unclassified recently a report that was sent to Congress on the "Acquisition of Technology Relating to Weapons of Mass Destruction and Advanced Conventional Munitions". In it, the CIA accuses Syria of promoting a nuclear, chemical and biological programs.

The report states: "Syria...has a nuclear research center at Dayr Al Hajar. Russia and Syria have continued their long-standing agreements on cooperation regarding nuclear energy, although specific assistance has not yet materialized. Broader access to foreign expertise provides opportunities to expand its indigenous capabilities, and we are monitoring Syrian nuclear intentions with concern.

#### Nuclear Scientists

RPS is aware of three Syrian nuclear scientists who work closely with the regime of Assad. The most prominent is Dr. Ibrahim Othman who heads the Atomic Energy Commission (AECS), an organization established in 1979 by Hafez al-Assad for, in disclosures to the IAEA, peaceful use of nuclear technology for power plants. Dr. Othman is a habitual visitor to all IAEA annual meetings in Vienna. It is believed that he was the contact man with the Pakistani nuclear scientist Abdul Qadeer Khan known to have delivered important secrets to rogue nations.

The other two scientists are Dr. Mustapha Hamolella, a Kurdish nuclear physicist and Dr. Faris Al-Asfari. Both work closely on the Syrian nuclear program and are closely associated with the regime.

It is also believed that Iraqi nuclear scientists may have escaped to Syria and are working closely with the Syrian regime to build a nuclear bomb. A group of about 12 middle-ranking Iraqi nuclear technicians and their families were transported to Syria before the collapse of Saddam's regime. The transfer was arranged under a combined operation by Saddam's now defunct Special Security Organization and Syrian Military Security, which was headed until recently by Assef Shawqat, Assad's brother-in-law.

The Iraqis, who brought with them CDs crammed with research data on Saddam's nuclear program, were given new identities, including Syrian citizenship papers and falsified birth, education, and health certificates. Since then they have been hidden away at a secret Syrian military installation where they have been conducting research on behalf of their hosts.

#### Expertise and Equipment

According to an IAEA official, Abdul Qadeer Khan, who has sold nuclear secrets to Iran, Libya and North Korea, is also behind the proliferation of sensitive nuclear technologies to Syria.

"The leadership of Pakistan was well aware of the export of Pakistani nuclear technologies," the unnamed source in the International Atomic Energy Agency was quoted as saying by a Russian news agency, RIA Novosti.

"It is not ruled out that besides Iran, Libya and North Korea, such supplies could have been made to Syria" the official said.

Several Western diplomats who follow the U.N. nuclear watchdog, the International Atomic Energy Agency (IAEA), have been saying for months that Syria was a customer of Khan's.

"Syria certainly had contact with Khan," said a non-U.S. Western diplomat, adding that suspicions of Syrian research in atomic weapons have existed for decades.

MENL reported on August 25, 2004 that the U.S. intelligence community obtained evidence that the Khan network sold and delivered components for an unspecified number of Pakistani-designed P1 centrifuges to Syria.

On April 29, 2004 then U.S. Undersecretary of State for Arms Control John Bolton said that Abdul Qadeer Khan had "several other" customers who may want the bomb. Western diplomats in Vienna said Bolton was clearly referring to Syria.

And on June 9, 2004, a North Korean expert disclosed to Future Korea that Syrians visited North Korea to acquire equipment. He said that:

- \* Syria ordered a large number of Scud missiles tipped with bio/chem warheads.
- \* Syria ordered Rocket engines that were made at "January 8th Factory" in Kaechon.
- \* Syria ordered Missile bodies that were made at "No. 26 Factory" in Namchon-dong, Kanggye City.
- \* The missiles were assembled at "Shin-eum-ri Factory" in Pyongyang City.
- \* And Bio/chemical warheads, the most sensitive parts, were finished at "Namheung Chemical Factory" and transported via train.

### Enriched Uranium

RPS reported on March 5, 2004 that large amounts of uranium have gone missing from a nuclear technology company in Sweden. The CIA fears a worst-case scenario where the material has already fallen into terrorist hands, newspaper Expressen reports.

"The company (Ranstad Mineral) is a security risk and we have taken the matter to top level to get the Swedes to stop them," a CIA spokesman told the Swedish newspaper.

The CIA operative claims to know that the little Swedish company has educated Syrian nuclear physicists in the treatment of uranium. The Syrian scientists left the company right after the disappearance of the uranium. He also has information that a Swedish consultancy has sold nuclear equipment to Syria that can be used in the treatment of radioactive material.

"If it transpires that radioactive or nuclear material has been sent on from Sweden to Syria then this is a very serious matter for Sweden," the CIA source said.

After a meeting with the CIA operative Swedish authorities raided Ranstad Mineral several times and shut the company down on the grounds of deficient security.

"It was one of the worst things I have seen. The company has extremely serious deficiencies in its registration system," said Carl Magnus Larsson, divisional leader of the Swedish Radiation Protection Authority after their inspection.

*[deletia]*

### The Iranian Role

On February 29, 2005, during a press conference in Beirut - Lebanon, Iranian defense Minister Shamkhani said that his country has signed a Memorandum of Understanding (MOU) with Syria and another with Lebanon to bolster the military apparatuses of both countries. The Syrian MOU in fact was intended to send a clear signal that cooperation between Iran and Syria are an integral part of their foreign policy, which lead many to believe that Iran may be working closely with Syria on a parallel nuclear program.

Moreover, Iran came quickly to the defense of Syria two weeks ago and threatened Israel with retaliation if Syria is attacked. This shows that the NATO-like MOU signed between Iran and Syria will make it very hard to peel Syria off by offering it any incentives.

Iran is calculating that Syria's involvement may distract attention away from its own nuclear program (Which did not happen) but also the intended purpose is to present the US with another challenge that Iran knows well the US will be unable to face simultaneously and because of a multiple fronts opened to confront terrorism.

#### Conclusion

All indications are that Syria is building a potent nuclear program with Iran's assistance and help. The United States government has never disclosed publicly the information but some believe that the CIA is fully aware of the damage that Khan has done and that Syria's nuclear program is more advanced than previously stated.

Syria has a potent chemical arms arsenal with a delivery system that can reach 700km that Assad is willing to use as has been proven through his direct Syrian-made missiles to Hezbollah.

Reform Part[y] of Syria

## **Ex-Officials Say Bolton Inflated Syrian Danger**

By DOUGLAS JEHL

Published: April 26, 2005

WASHINGTON, April 25 - John R. Bolton clashed repeatedly with American intelligence officials in 2002 and 2003 as he sought to deliver warnings about Syrian efforts to acquire unconventional weapons that the Central Intelligence Agency and other experts rejected as exaggerated, according to former intelligence officials.

Ultimately, the former intelligence officials said, most of what Mr. Bolton, then an under secretary of state, said publicly about Syria hewed to the limits on which the C.I.A. and other agencies had insisted. But they said that the prolonged and heated disputes over Mr. Bolton's proposed remarks were unusual within government, and that they reflected what one former senior official called a pattern in which Mr. Bolton sought to push his public assertions beyond the views endorsed by intelligence agencies.

The episodes involving Syria are being reviewed by the Senate Foreign Relations Committee as part of its inquiries related to Mr. Bolton's nomination to become ambassador to the United Nations. Some of the former intelligence officials said they had discussed the issue with the committee, while declassified e-mail messages from 2002 provided to the committee by the State Department allude to one previously unknown episode.

One newly declassified message, dated April 30, 2002, and sent by a senior State Department intelligence official, dismissed as "a stretch" language about a possible Syrian nuclear program that had been spelled out in a draft speech circulated by Mr. Bolton's aides for approval. In the speech itself, delivered five days later, Mr. Bolton made no reference to a Syrian nuclear program.

Until now, Senate Democrats leading the opposition to Mr. Bolton's nomination have focused mostly on a 2002 dispute related to Cuba, in which Mr. Bolton has acknowledged seeking the transfer of two intelligence officials with whom he had differed. But a top Democratic staff member on Monday described the clashes over Syria as "an example, perhaps the most serious one, not of Mr. Bolton's abusing people, but of trying to exaggerate the intelligence to fit his policy views."

In one Congressional appearance, in June 2003 before the House International Relations Committee, Mr. Bolton offered a considerably darker view of Syria's nuclear program than the C.I.A. had in a report to Congress two months earlier. Among other things, Mr. Bolton said American officials were "looking at Syria's nuclear program with growing concern and continue to monitor it for any signs of nuclear weapons intent." The C.I.A. report to Congress in April said only, "In principle, broader access to Russian expertise provides opportunities for Syria to expand its indigenous capabilities, should it decide to pursue nuclear weapons."

In a third episode, in July 2003, the sharp objections raised by intelligence officials from several agencies to proposed Congressional testimony by Mr. Bolton on Syria included a 35-page memorandum from the Central Intelligence Agency. The incident became public at the time, and the government said the assertions spelled out in Mr. Bolton's prepared testimony went well beyond what the United States had previously said about Syria's weapons programs.

In particular, intelligence officials say, Mr. Bolton had planned to say in a classified portion of his testimony that Syria's development of chemical and biological weapons posed a threat to stability in the Middle East. In the face of the objections, Mr. Bolton postponed the testimony until September, though Mr. Bolton has said the main reason for the postponement of the speech is that he was summoned to a White House meeting.

"There were a lot of disagreements about the speech," Mr. Bolton said on April 11, when he was asked about the episode during a confirmation hearing before the Senate Foreign Relations Committee. "It was clear to me that more work needed to be done on it." But Mr. Bolton noted that the testimony he ultimately gave to the House committee in September 2003 had been fully cleared by American intelligence agencies.

Mr. Bolton's office declined to comment Monday, and a State Department spokesman, Tom Casey, referred a reporter to Mr. Bolton's Congressional testimony.

Senator Joseph R. Biden Jr., the top Democrat on the Senate Foreign Relations Committee, has asked the C.I.A. to provide the committee with a copy of its objections to Mr. Bolton's prepared testimony in 2003.

In the versions most recently supplied by the State Department to the Senate committee, the e-mail messages from 2002 included a subject line that said "Clearance Request: Speech by Under Secretary Bolton - New [ ] Language," with the word between the brackets deleted, as were the names of most senders and recipients. But earlier, unredacted copies of the message provided to Congress by the State Department had shown that the messages, including the response that criticized some language as a "stretch," referred to Syria, according to Congressional and intelligence officials.

In a letter to the Senate committee on April 22, Matthew A. Reynolds, the acting assistant secretary of state for legislative affairs, said country names had been "inadvertently included" in the documents previously released to the committee, and he asked that the Senate disregard them.

The exchanges on Syria in 2002 were part of a broader debate on an address that Mr. Bolton ultimately delivered to the Heritage Foundation on May 5. Sharp differences over the assertions on Cuba that Mr. Bolton had sought to make led to a rift between the under secretary and the State Department's intelligence bureau. Mr. Bolton's supporters have said the exchanges were part of the customary back-and-forth in government in advance of such speeches, but his critics say they were unusual in scope and intensity, and reflected the degree to which Mr. Bolton sought in his remarks to go beyond previous intelligence assessments.

In the speech itself, Mr. Bolton pointed to Cuba, Syria and Libya as "rogue states intent on acquiring weapons of mass destruction," a trio that extended "beyond the axis of evil" of Iran, Iraq and North Korea that President Bush had described in his State of the Union address several months earlier. On Syria, Mr. Bolton said in the 2002 speech that the government in Damascus "is pursuing the development of biological weapons and is able to produce at least small quantities of biological warfare agents."

In testimony to Congress in June 2003, Mr. Bolton said American officials "know that Syria is pursuing the development of biological weapons." But a report sent to Congress by the C.I.A. in April

2003 was more guarded in its assessment than Mr. Bolton had been. Using an abbreviation for biological warfare, it said only that it was "highly probable that Syria is also continuing to develop an offensive B. W. capability."

### INTRODUCTION

Good afternoon Chairman Rockefeller, Vice Chairman Bond, and members of the committee. Thank you for this opportunity to testify today and your continued support to the dedicated men and women of the Defense Intelligence Agency. Our nation faces a variety of complex national and transnational threats and challenges. My testimony will outline the state of the insurgencies in Iraq and Afghanistan, the current threat from global terrorism and proliferation of Weapons of Mass Destruction. Finally, I will discuss defense related developments in states and regions of concern and other transnational issues.

[deletia]

### WEAPONS OF MASS DESTRUCTION

*NBC Weapons.* After global terrorism, the proliferation of weapons of mass destruction (WMD) remains the most significant threat to our homeland, deployed forces, allies, and interests. Increased availability of information together with technical advances has the potential to allow many new countries to develop nuclear, biological, and chemical weapons. This is an area of increasing concern.

North Korea continues to develop its WMD capability. North Korea's October 2006 detonation of a nuclear device marked its first nuclear test and an attempt to win international recognition as a nuclear state after a decades-long program to develop these weapons. North Korea could have produced several nuclear weapons from plutonium produced at its Yongbyon facilities. Major uncertainties surround the conditions under which the North would entirely abandon its nuclear weapons capability or the likelihood of the North transferring nuclear weapons-related technology abroad. North Korea's resources include a biotechnical infrastructure that could support the production of various biological warfare agents. DIA believes North Korea has had a longstanding chemical weapons stockpile of nerve, blister, blood, and choking agents.

[deletia]

Syria has pursued development of a strategic deterrent principally based on ballistic missile, chemical, and, to a limited extent, biological warfare programs, as a means of countering Israel's conventional force superiority. Syria's biotechnical infrastructure is capable of supporting limited biological agent development. DIA assesses Syria has a program to develop select biological agents. Syria has had a chemical weapons program for many years and already has a stockpile of the nerve agent sarin, which can be delivered by aircraft or ballistic missiles.

[deletia]

**Major Exporters.** North Korea and entities in Russia and China continue to sell technologies applicable to WMD and missiles for revenue and diplomatic influence.

[deletia]

North Korea remains committed to selling missiles and related technologies. Although sales have declined to most customers due to its increasing international isolation, North Korea's relationship with Iran and Syria remain strong and of principal concern.

[deletia]

**Syria.** Syria continues to support and help arm Hizballah to protect Syrian interests in Lebanon and provide leverage against Israel, which it continues to view as its greatest threat. Syrian interference in Lebanon is likely to continue, aimed at influencing Lebanon's policies on Hizballah, Israel, and the UN investigation of the assassination of former Lebanese Prime Minister Hariri.

The Syrian leadership is trying to balance a complex mix of objectives in Iraq. These include preventing U.S. success in Iraq and encouraging our eventual withdrawal, while at the same time improving relations with the Baghdad government, supporting a

**Syria.** Syria continues to support and help arm Hizballah to protect Syrian interests in Lebanon and provide leverage against Israel, which it continues to view as its greatest threat. Syrian interference in Lebanon is likely to continue, aimed at influencing Lebanon's policies on Hizballah, Israel, and the UN investigation of the assassination of former Lebanese Prime Minister Hariri.

The Syrian leadership is trying to balance a complex mix of objectives in Iraq. These include preventing U.S. success in Iraq and encouraging our eventual withdrawal, while at the same time improving relations with the Baghdad government, supporting a unified Iraq, and avoiding a full-blown Iraqi civil war. Syria remains the primary insurgent gateway into Iraq due to corruption, smuggling networks, and cross-border tribal ties.

Syria continues to make minor improvements to its conventional forces. It did not make any major weapons acquisitions in 2006, continuing a trend begun in the mid-1990s. Instead, the Syrian military has focused its limited defense procurement dollars on low cost-high impact weapons such as anti-tank guided missiles, advanced tactical surface-to-air missiles like the SA-24, and upgrades to existing platforms. Syria also maintains an active chemical weapons program.

We judge the regime is generally stable with no cohesively organized opposition supported by a domestic constituency. The regime considers Islamic extremism its greatest internal threat.

## **Iran: Ex-Defense Official's Whereabouts Remain A Mystery**

By Golnaz Esfandiari

March 08, 2007

Alireza Asghari disappeared in Istanbul (AFP)

March 8, 2007 (RFE/RL) -- The fate of a former Iranian defense official remains a mystery a month after his disappearance in Turkey.

At least one Iranian official has suggested that onetime Deputy Defense Minister Alireza Asghari was kidnapped by Western intelligence services. Others have claimed the retired general defected to the West.

Asghari vanished without a trace shortly after arriving in Turkey in early February.

Radio Farda's correspondent in Turkey, Ali Javanmardi, says Turkish newspapers broke the news of his disappearance.

"On February 27, 'Hurriyet' daily reported that an Iranian who has very important information regarding Iran's nuclear activities had disappeared in Istanbul," Javanmardi says. "For the first time, it was also said that Mr. Asghari arrived in Istanbul from a Damascus flight on February 7 and checked into the Hotel Ceylan three days later. Following a meeting with an unknown individual, he disappeared."

Asghari's hotel reservations, for three nights, were reportedly made before his arrival by two non-Turkish citizens. Some reports have suggested that Asghari moved to an Iranian-owned hotel.

### **Tehran Speaks**

Iranian officials initially remained silent as reports emerged in the Turkish, Israeli, and Arab media. Then in early March, Iranian Foreign Minister Manuchehr Mottaki stated publicly that "a retired staff member" from the Defense Ministry had gone missing during a private trip to Turkey. He said Tehran was pursuing the case through diplomatic channels.

On March 6, Iranian police chief Ismail Ahmadi Moghadam said the former defense official had likely been kidnapped by Western intelligence services because of his background. He did not give further details.

The 63-year-old Asghari was a deputy defense minister under President Hojatoleslam Mohammad Khatami (1997-2005). He reportedly served as a commander in Iran's Islamic Revolution Guards Corps (IRGC) during the Iraq-Iraq War (1980-88).

### **In The Loop?**

Alireza Nourizadeh, a London-based journalist, says the retired general also played a role in Lebanon. He says Asghari owed his political rise to former Defense Minister Ali Shamakhani and his abrupt departure to President Mahmud Ahmadinejad.

"Following the [Iran-Iraq] war, he was among the staff members who were sent to Lebanon," Nourizadeh says. "He led the Revolutionary Guards (IRGC) forces in Lebanon. At that time, he used the name 'Reza Asaker.' Later, because of his relation to Admiral Ali Shamakhani and because Shamakhani trusted him, he became a

deputy defense minister. After Ahmadinejad's government came to power [in 2005], Mr. Asghari was automatically dismissed, but they gave him an advisory [post]."

Nourizadeh claims that Asghari's recent responsibilities included a 2006 military deal between Iran and Syria.

## **Lebanon And Nukes**

Speculation has swirled about Asghari's familiarity with highly classified information about Iranian ties to the Lebanese militant group Hizballah as well as Iran's nuclear program.

Officials in Iran say the country's nuclear activities are entirely peaceful. But Washington and Israel accuse Iran of secretly pursuing nuclear weapons.

Iran also says that it provides only spiritual and moral support to the Lebanese Hizballah. But accusations are rife that Iran is providing the Lebanese group with missiles and other weapons.

Some reports suggest that Asghari might possess knowledge about an Israeli pilot, Ron Arad, who went missing after ejecting from his aircraft over Lebanon in 1986.

## **Usual Suspects**

Some sources have said that Mossad or the CIA might have kidnapped Asghari for his knowledge of top-secret Iranian activities.

Others have suggested that the disappearance bears the hallmarks of the Mujahedin-i Khalq Organization (MKO), a group that seeks the overthrow of Iran's government.

But a number of recent reports have hinted that Asghari defected to the West. "The Washington Post" today quotes an unnamed senior U.S. official as saying that Asghari is "cooperating with Western intelligence agencies, providing information on Hizballah and Iran's ties to the organization."

Ephraim Kam, a retired Israeli intelligence officer and deputy head of Tel Aviv University's Jaffee Center for Strategic Studies, says he thinks circumstances point to a defection.

"I think logically -- and I emphasize only logically -- I tend to assume that he asked for political [asylum] because I think it's going to be quite dangerous for Israel, even for the United States, to kidnap him," Kam says. "Because the Iranians might respond with the same coin, and it's going to put many Israeli officials [in danger] and also the Americans."

Citing an "Iranian military source," the London-based newspaper "Asharq al-Awsat" newspaper reported on March 7 that Asghari "is currently in a northern European country in American custody." The paper claimed that Asghari is being interrogated ahead of his transfer to the United States.

Nourizadeh says he suspects that the former Iranian defense official had planned his defection.

"Asghari has maybe felt that it would be better for him to cooperate on his own, since reportedly the U.S. intelligence services have files on people like him -- this could be one reason," Nourizadeh says. "Another reason might be that he thinks the Islamic republic [Iran] is facing dangerous conditions -- the country is being led toward war -- and he feels that if he parts with the establishment he might prevent a catastrophe."

But in the absence of any firm evidence, Nourizadeh's and others' theories about this prominent disappearance remain so much speculation. And a mystery that Iranian authorities and others are eager to solve.

## Former Iranian Defense Official Talks to Western Intelligence

By Dafna Linzer

Washington Post Staff Writer

Thursday, March 8, 2007

A former Iranian deputy defense minister who once commanded the Revolutionary Guard has left his country and is cooperating with Western intelligence agencies, providing information on Hezbollah and Iran's ties to the organization, according to a senior U.S. official.

Ali Rez Asgari disappeared last month during a visit to Turkey. Iranian officials suggested yesterday that he may have been kidnapped by Israel or the United States. The U.S. official said Asgari is willingly cooperating. He did not divulge Asgari's whereabouts or specify who is questioning him, but made clear that the information Asgari is offering is fully available to U.S. intelligence.

Asgari served in the Iranian government until early 2005 under then-President Mohammad Khatami. Asgari's background suggests that he would have deep knowledge of Iran's national security infrastructure, conventional weapons arsenal and ties to Hezbollah in south Lebanon. Iranian officials said he was not involved in the country's nuclear program, and the senior U.S. official said Asgari is not being questioned about it. Former officers with Israel's Mossad spy agency said yesterday that Asgari had been instrumental in the founding of Hezbollah in the 1980s, around the time of the bombing of the U.S. Marine barracks in Beirut.

Iran's official news agency, IRNA, quoted the country's top police chief, Brig. Gen. Esmail Ahmadi-Moqaddam, as saying that Asgari was probably kidnapped by agents working for Western intelligence agencies. The Israeli newspaper Haaretz reported that Asgari was in the United States. Another U.S. official, who spoke on the condition of anonymity, denied that report and suggested that Asgari's disappearance was voluntary and orchestrated by the Israelis. A spokesman for President Bush's National Security Council did not return a call for comment.

The Israeli government denied any connection to Asgari. "To my knowledge, Israel is not involved in any way in this disappearance," said Mark Regev, the spokesman for Israel's foreign ministry.

An Iranian official, who agreed to discuss Asgari on the condition of anonymity, said that Iranian intelligence is unsure of Asgari's whereabouts but that he may have been offered money, probably by Israel, to leave the country. The Iranian official said Asgari was thought to be in Europe. "He has been out of the loop for four or five years now," the official said.

Israeli and Turkish newspapers reported yesterday that Asgari disappeared in Istanbul shortly after he arrived there on Feb. 7. Iran sent a delegation to Turkey to investigate his disappearance and requested help from Interpol in locating him.

Former Mossad director Danny Yatom, who is now a member of Israel's parliament, said he believes Asgari defected to the West. "He is very high-caliber," Yatom said. "He held a very, very senior position for many long years in Lebanon. He was in effect commander of the Revolutionary Guards" there.

Ram Igra, a former Mossad officer, said Asgari spent much of the 1980s and 1990s overseeing Iran's efforts to support, finance, arm and train Hezbollah. The State Department lists the Shiite Lebanese group as a terrorist organization.

[deletia]

## By Way of Defection

Is Iran hemorrhaging high-level officials?

Michael Young | March 15, 2007

Who is Ali Reza Asgari and why is he important? No one is quite sure yet, but when the Iranian general and former deputy defense minister disappeared in Istanbul earlier this year, suddenly everyone had a good spy story to follow. Did Asgari defect? Was he kidnapped by a foreign intelligence agency? And how does his fate affect the United States in its ongoing confrontation with Iran, if it does at all?

The story is roughly this. In February, Asgari traveled from Syria to Turkey, where he checked into a hotel before apparently going underground. According to Turkey's foreign minister, Abdullah Gul, the Iranian authorities informed the Turks 10 days after Asgari's arrival that they had lost contact with him. The Iranians were said to have initially refused to divulge Asgari's identity, or even provide a photograph. This compelled Gul to defend the Turkish reaction by saying: "If we don't receive information on a specific individual, then this individual can circulate in complete freedom in Turkey."

As the story gained prominence in early March, the London-based Arabic newspaper Al-Hayat quoted an unidentified Turkish source as saying that Asgari had defected. This came as Iran was claiming that the general had been kidnapped by U.S. or Israeli intelligence agents--prompting a tentative Israeli denial. Citing a U.S. official, the Washington Post reported on March 8 that Asgari was "cooperating with Western intelligence agencies, providing information on Hezbollah and Iran's ties to the organization." The paper did not specify who was interrogating him.

Another American official cited by the Post denied an Israeli news story that Asgari was in the United States, before suggesting that his "disappearance was voluntary and orchestrated by the Israelis." An Iranian official told the paper that Iran's intelligence service was unsure of Asgari's whereabouts, "but that he may have been offered money, probably by Israel, to leave the country." The official said the general was thought to be in Europe. "He has been out of the loop for four or five years now," the Iranian was quoted as saying.

Last weekend, London's Sunday Times hardened the mystery a bit further. The author, Israeli reporter Uzi Mahnaimi, quoted unidentified Iranian sources as saying that Asgari "had been spying on Iran since 2003 when he was recruited on an overseas business trip." Mahnaimi threw in some Ian Fleming by pointing out that Asgari had fled in a "daring getaway via Damascus ... organized by western intelligence agencies after it became clear that his cover was about to be blown. Iran's notorious secret service, the Vavak, is believed to have suspected that he was a high-level mole." According to the Sunday Times, Asgari was at a NATO base in Germany being debriefed. "He probably was working for Mossad but believed he was working for a European intelligence agency," an Israeli defense source was quoted as saying. Mahnaimi added that there was "some evidence that the Mossad station in Istanbul was involved in shadowing Asgari after he arrived in Turkey."

An essential question is what Asgari took with him. The London-based Saudi daily Al-Sharq al-Awsat claimed on March 9 that Asgari had left Turkey on a new passport, under an assumed name, in cooperation with "Western parties." (English summary here) He allegedly carried off "military and intelligence maps and documents on the Iranian military establishment, and on relations between the Revolutionary Guards and Hezbollah, the Palestinian Islamic Jihad, the Mehdi Army, and the Badr Organization."

No less significant is whether Asgari managed to get his family out? The Sunday Times claimed that "[a]t least 10 close members of his family had to flee the country" with Asgari, including sons, daughters and daughters in law. If true, this would suggest he had considerable time to plan his departure, or at least was given great leeway, despite Vavak's purported suspicion. However, developments in Tehran on March 13 contradicted this. Asgari's

wife, daughters, sons, and brother--or at least people claiming to be them--held a press conference denying he could have defected. Mrs. Asgari asked the Iranian authorities to find her husband, and claimed that he had actually disappeared in December, not in February.

The journalists present at the press conference were described by the Financial Times as "selected reporters", and the photos and news of the family were carried by the Fars news agency, linked to the Revolutionary Guards--the organization Asgari had been a senior official in. This might suggest the family's appearance was damage control. It also indicates that the details of the Asgari case are more complex than we know, particularly the timing of his vanishing. Moreover, Mrs. Asgari insisted that her husband's stated age of 63 was wrong, and that he was in fact 46, "thereby undermining speculation that he had been a leading figure in the Revolutionary Guards in Lebanon in 1983 when Islamic militants blew up the US embassy and its marine barracks."

Asgari may not be alone. In a story in Israel's Yedioth Aharonot last weekend, journalist Robin [sic] Bergman quoted a British intelligence official as saying that Iran's Consul General in Dubai, who was described as a Revolutionary Guards officer, had defected to British Intelligence. The source suggested the officer was providing information on Iranian activities in the Gulf. And yesterday, Al-Sharq al-Awsat affirmed that three weeks ago the Iranians lost contact with Colonel Amir Muhammad Shirazi, an officer in the Quds unit of the Revolutionary Guards stationed in Iraq. (English summary here.) The paper also reported that many other Iranians have collaborated with or gone over to the American side in Iraq in the past three years. It's always difficult to confirm such stories, however, and the information might conceivably have been exaggerated to destabilize the Iranians further in the wake of the Asgari affair.

The plot thickens, but where does it lead? Assuming a defection, Asgari's importance seems to be that he was the effective head of the Revolutionary Guards in Lebanon sometime in the 1980s. A former Mossad officer, Rami Igra, was quoted by the Washington Post as saying that "Asgari spent much of the 1980s and 1990s overseeing Iran's efforts to support, finance, arm and train Hezbollah."

Dates are important here. Hezbollah was only reorganized by the Iranians and brought together into a cohesive force in the late 1980s, four or five years after the bombings of the U.S. Embassy in Beirut and the Marine barracks. Before then, the organization was a looser patchwork of groups with Iranian ties. It was during those earlier years that foreigners were kidnapped in Lebanon. Which phase, or phases, was Asgari involved in? And is the information he is providing useful for unlocking Hezbollah's decision-making today? Also, what does he know about the downed Israeli flier Ron Arad, who was probably taken to Iran from Lebanon, and was said to have been under Asgari's control? As a member of Iran's political-security elite, and as former Revolutionary Guards officer, he must have had access to sensitive information on Iran's dealings with militant Islamic groups. But the key issue is what operational value his information has.

If the U.S. played a role in Asgari's defection, it will boost morale in Washington after the intelligence debacle in Iraq. The episode shows that there are cracks in the Iranian system, and that these can be exploited by the plethora of intelligence agencies today cooperating against Iran's expanding influence in the Middle East. At a time when there are unconfirmed reports that the U.S. is involved in clandestine activities in Iran--particularly among the Sunni or Kurdish populations--this kind of breakthrough surely reinforces the value of human intelligence and the advantages of more traditional methods of spycraft.

The Bush administration and the Pentagon will be especially interested in Iran's ties with Iraqi Shiite militias, namely the Badr Organization and the Mehdi Army. Given that the head of the Badr Organization, Abdul Aziz al-Hakim, was given an Oval Office audience with President Bush, the U.S. will be happy (or will it?) to know more about the relationship between its Iraqi partner and Tehran. More immediately, the intelligence agencies will probably want to get a better sense of what role Iran is playing in the Iraqi insurgency. If there is disagreement between the agencies, Asgari may turn into a valuable bureaucratic asset for one side or the other.

It may be too soon to judge how big an information coup Asgari's escape will turn into, but it's already a massive political one. The moral of the story is that if the U.S. wants to deal with Iran successfully, it has to do so as much in the darker recesses of state interaction than from the top of aircraft carriers. The Iranians have always been remarkable builders of institutions. If you're going to erode their self-confidence, those institutions have to appear vulnerable. Whatever Asgari divulges, the real impact of his disappearance is that Iran can be penetrated.

## **The Inheritance**

by David Sanger

Harmony Books, 2009

ISBN 978-0-307-40792-4

### Chapter 9 *[EXCERPTS]*

*[deletia]*

In a series of secret conversations, Bush and Prime Minister Ehud Olmert had agreed that any public discussion of the strike -- and the nature of the target -- could force Assad into a corner. "There was a sense," Defense Secretary Robert Gates told me a few months later, that "if you play this wrong there could be a war between Israel and Syria. That was the central worry."<sup>(1)</sup> But the Americans had another concern, on the other side of the world. The airstrike, it turned out, was about a lot more than destroying the crown jewel of a covert nuclear program in Syria.

It was also about North Korea.

What the Israelis had targeted was a nearly completed nuclear reactor built by North Korean engineers in one of the most stunning examples of proliferation in the nuclear age. For six years American spy satellites had watched the mysterious building rise in the desert and analysts had spun out theories about what it could be -- everything from a covert nuclear facility to a water treatment plant. The Syrians had disguised its purpose by building it in plain view with no barbed wire, no military guards. Around 2002, they even erected a benign-looking, square industrial wall and roof over the entire site to hide the telltale shape of a reactor.

The deception worked for years. The Americans were suspicious, but they failed to discover the real purpose of the project. Then, one day in late April 2007, Meir Dagan, chief of the Mossad, Israel's legendary intelligence service, called the White House from Israel and asked for an urgent meeting with President Bush's national security adviser, Steven Hadley.

On a Wednesday morning in early May 2007 *[Apparently May 2, 9 or possibly 16]*, he slipped unnoticed through a White House gate and was ushered into Hadley's large corner office of the West Wing...

*[deletia]*

The Israeli spy chief had brought with him a file folder full of photographs, But Dagan's pictures were different from the overhead satellite images that across Washington had been trying to decipher. Thanks to the work of Israeli agents, Dagan spread out a treasure trove of photos taken from inside the facility... What they showed solved the mystery of al-Kibar.

*[deletia]*

Now, sitting by Hadley's orderly desk, the burly Israeli intelligence chief talked him through each of the photos, some taken three or four years previously, apparently by a Syrian who had been "turned" or paid handsomely for his snapshot collection.

*[deletia]*

...to the American intelligence analysts who were looking at the same pictures, passed on by their Israeli counterparts, the images seemed familiar... The innards of the reactor building bore a striking resemblance to the reactor at North Korea's main nuclear complex half a world away...

[deletia]

"A carbon copy," one official who had reviewed the intelligence told me. "You looked at and said one thing: 'Shit, the Koreans have been screwing around more than we knew.'" It was the first hard evidence that North Korea -- the broke, desperate, isolated kingdom of Kim Jong-Il -- had found a way to bring in millions of dollars in hard currency by selling its most valuable skill, the manufacturing of nuclear bomb material.

The North Koreans and the Syrians appear to have been working together on the project for the better part of a decade, perhaps back to the end of the Clinton administration. Yet apart from vague suspicions that the two countries were working on something together, perhaps even something nuclear, the American intelligence community never put it all together.

"This would be as scene from Monty Python if it wasn't true," observed David Rothkopf, who wrote the definitive history of the National Security Council. "In 2003 you had all these war planners gathered in the Situation Room planning to bomb Saddam for nuclear facilities that didn't exist. Right next door, two of the most spied-on countries on earth are building a reactor."

"And did we know about it?" Rothkopf asks, shaking his head. "Now that's what I call an intelligence failure."

[deletia]

The Syrian case was, as one senior intelligence official told me later, "the Iraq mistake in reverse." In Iraq, he said, the agency had connected dots that were not there and sent up warnings of a revived nuclear program that no longer existed. In Syria, it failed to put the pieces together until the Israelis arrived with the crucial bits of the puzzle. Adding to the embarrassment, the whole project was happening less than a hundred miles from the Iraqi border.

[deletia]

"We've had lots of suspicions [about North Korean nuclear proliferation]," Hadley once told me as we flew together on a small plane that took him on one of his low-profile trips to Russia, "but no solid evidence."

Hadley immediately sent Dagan across the river to Langley, Virginia, to show his portfolio of pictures to Hayden, the director of the CIA. The next day Hayden used his regular Thursday [Apparently 2007-05-03, -10 or -17] briefing to describe to Bush the detailed Israeli intelligence. Bush quickly ordered that the CIA coordinate the analysis and that the agency's reports be restricted to a handful of officials...

[deletia]

Bush's top aides declined to discuss how close the United States came to striking Syria. But Hadley told me that in his mind, the reactor did not meet the standards of the "Bush Doctrine" for a preemptive strike. The CIA declared that because so much was missing at al-Kibar -- including the equipment needed to convert reactor waste into bomb fuel -- the United States could prove only that Syria was developing the capability to build a bomb, not that it was intending to produce one...

[deletia]

Based on the evidence at hand, [a senior administration] official said, "we had low confidence that it's part of a weapons program." And in the end, Bush decided he could not order another military strike on a state he accused of possessing a program to build weapons of mass destruction...

[deletia]

Instead, [Bush] and Rice pressured the Israelis to agree to a different approach – diplomacy with deadlines. “We had an alternative plan,” Condoleezza Rice later told me, “that involved going rapidly to the United Nations, exposing the program, and demanding that it be immediately dismantled.” The thinking was that while Iran had the money and the clout to resist such pressure, Syria did not...

*[deletia]*

After arguing with the administration over the summer, Olmert approved a plan for the attack. Though they had debated the issue tirelessly with Rice, Hadley, and Bush himself, in the end the Israelis did what they wanted to do from the start. They were careful not to inform Washington of the precise timing so that both nations could claim, with technical accuracy, that the Americans had not known about the attack in advance.

E.O. 12958: DECL: 08/29/2017  
TAGS: KNNP XB XF PREL PARM KN IR  
SUBJECT: NORTH KOREAN USE OF ARAB BANK NETWORK

REF: A. STATE 72416  
B. STATE 61222

Classified By: ACTING ISN PDAS GEORGE LOOK FOR REASONS 1.4 (B) AND (D)

1. (U) This is an action request. Please see paragraph 3.

-----  
SUMMARY/BACKGROUND  
-----

2. (S) Washington is increasingly concerned about efforts by North Korea's Foreign Trade Bank to assist Tanchon Commercial Bank to move funds from both Syria and Iran (REF A & B). Tanchon Commercial Bank is the primary financial agent behind the DPRK's weapons programs and was designated by the USG under E.O. 13382 as an entity that provides financial support to the DPRK's pursuit of weapons of mass destruction.

These transactions have occurred through Arab Bank PLC, one of the oldest and most respected banks in the Middle East. Arab Bank is headquartered in Amman, Jordan and is the largest Arab banking network in the world with 400 branch locations. Arab Bank also owns a 64.2 percent majority stake in Arab Tunisian Bank. We urge Jordan to maintain vigilance with regard to Syrian, Iranian, and North Korean financial transactions in its jurisdiction to prevent these countries from using deceptive financial practices to further their proliferation-related activities.

-----  
OBJECTIVES  
-----

3. (S) Washington requests Post deliver the talking points and non-paper in paragraph 4 to appropriate host government officials in the foreign affairs and financial ministries.

-- (S) To alert host government officials to information we have about Syrian, Iranian, and North Korean financial activities that could be occurring in the Arab Bank network, which is headquartered in Amman, and urge appropriate authorities to investigate such transactions, especially correspondent relationships, and to take steps to freeze any accounts or transactions held or conducted in support of proliferation-related activities.

-- (S) To urge the Kingdom of Jordan to maintain increased vigilance over financial or commercial transactions with Syrian, Iranian, and North Korean entities and banks in its jurisdiction.

-- (S) To urge the Kingdom of Jordan to investigate these financial transactions, and to take appropriate action.

-----  
BACKGROUND/NONPAPER  
-----

4. (S/REL JORDAN) Begin points:

-- (S/REL TO JORDAN) In light of our commitment to share as much information with your government as possible on Iranian and DPRK proliferation-related activities, we would like to raise serious concerns about Syrian, Iranian, and North Korean financial activities in the Arab Bank network.

-- (S/REL TO JORDAN) It has long been the policy of the United States to prevent the exploitation of the international financial system for the purpose of conducting illicit or proliferation-related financial transactions, and to urge our international partners to do the same.

-- (S/REL TO JORDAN) We are concerned that Iranian, Syrian, and DPRK-related entities may be assisting each other in engaging in deceptive practices that exploit and weaken the international financial system and undermine global financial standards and best practices.

-- (S/REL TO JORDAN) We are concerned that Iran, Syria, and DPRK proliferation entities are using the Arab Bank network to process what may be proliferation-related transactions.

-- (S/REL TO JORDAN) The United States has information that in 2007, North Korea's Foreign Trade Bank mission in Tripoli, Libya (FTB Libya) has expanded its role as a key node in North Korea's banking network and is

helping Tanchon Commercial Bank, the banking arm of North Korea's primary weapons trading firm, KOMID, to move funds from both Syria and Iran.

-----  
SYRIA-DPRK  
-----

-- (S/REL TO JORDAN) In 2007, FTB Libya provided assistance to Tanchon in making remittances from funds from the sale of unspecified, probably proliferation-related goods in Syria. Our information indicates that Tanchon is establishing this new arrangement because Tanchon could no longer remit funds through a route it had previously used. FTB Libya arranged remittance routes for Tanchon from Syria and other locations via intermediary banks. We have information that Tanchon's financial transfers are conducted surreptitiously by using either aliases or front companies.

-- (S/REL TO JORDAN) By mid-February, FTB Libya arranged remittances of funds for Tanchon through several Arab Bank branches in the Middle East. Remittances going directly from Syria could be sent from Arab Bank-Syria in Damascus, a sister bank to Arab Tunisian Bank.

-- (S/REL TO JORDAN) The United States has information that FTB Libya arranged remittance routes for Tanchon from Syria and other locations via intermediary banks in Europe.

-- (S/REL TO JORDAN) These transfers, which were probably proliferation-related, occurred inside the Arab Bank network and involved both Arab Bank branches and Arab Tunisian Bank, of which Arab Bank is a 64.2 percent stakeholder.

-- (S/REL TO JORDAN) By processing these transactions, Arab Bank could be unwittingly assisting proliferation-related activities.

-----  
IRAN-DPRK  
-----

-- (S/REL TO JORDAN) We have information that FTB Libya was also planning to establish a route for Tanchon to use from Iran.

-- (S/REL TO JORDAN) These transactions could be subject to the restrictions in UN Security Council Resolutions 1737 and 1747.

-- (S/REL TO JORDAN) The U.S. urges countries to maintain increased vigilance over financial or commercial transactions with Syrian, Iranian, and North Korean entities and banks, which may be using deceptive financial practices such as those described above to circumvent targeted sanctions imposed pursuant to UNSC resolutions and continue their illicit or proliferation-related dealings.

-- (S/REL TO JORDAN) In the spirit of our continued non-proliferation cooperation and joint efforts to prevent Syrian, Iranian, and North Korean abuse of the international financial system, we urge your government to investigate these financial transactions, and to take appropriate action.

-- (S/REL TO JORDAN) We look forward to working with you on this and other related security and counter-proliferation matters, and are prepared to provide additional assistance as appropriate.

-----  
REPORTING DEADLINE  
-----

5. (U) Post should report results within seven (7) business days of receipt of this cable. Please slug replies for ISN, T, TREASURY, EAP and NEA. Please include SIPDIS in all replies.

-----  
POINT OF CONTACT  
-----

6. (U) Washington point of contact for follow-up information is Kevin McGeehan, ISN/CPI, (202) 647-5408, McGeehanKJ@state.sgov.gov.

7. (U) Department thanks Post for its assistance.

RICE

## **“Pyongyang’s Upper Hand”**

John R. Bolton

Wall Street Journal, Opinion

August 31, 2007

The Six-Party talks on North Korea’s nuclear weapons program have now descended into a miasma of “working groups,” one of which, on U.S.-North Korea bilateral issues, will meet this weekend in Geneva. It is worth paying attention to the outcome of this gathering.

North Korea wants to be taken off the U.S. list of state sponsors of terrorism and, as soon as possible, to enjoy full diplomatic relations with Washington. Pyongyang may well succeed, as many in the U.S. State Department seem more eager to grant full recognition to the Pyongyang dictatorship in North Korea than to the democracy in Taiwan. This would be a profound mistake on our part.

Nearly 200 days have passed since Feb. 13, when the Six-Party Talks on North Korea’s nuclear weapons program produced an “agreement” to eliminate that program. Despite encomiums about the virtues of diplomacy, little real progress has been made in eliminating Pyongyang’s program. Negotiations in July ended without agreement on a timetable, despite repeated State Department assurances since February that the North would be held to strict deadlines.

The Yongbyon reactor is shuttered, but that reactor was not frequently operational in the recent past, and may well be at the end of, or even beyond, its useful life. The return of International Atomic Energy Agency inspectors to Yongbyon provides North Korea with a new patina of respectability, despite the near certainty that significant nuclear activity is happening anywhere but Yongbyon.

In fact, the key change is that economic assistance is once again subsidizing and reinforcing Kim Jong-il’s hold on power. Heavy fuel oil, food and other “humanitarian” assistance from South Korea, and substantial unpublicized aid from China are all flowing North. Cheeky Pyongyang is once again demanding that the outside world supply it with light-water nuclear reactors. The second North-South Summit in Pyongyang, postponed until October—closer to South Korea’s presidential elections—will provide renewed legitimacy to the North Korean dictatorship, and may bolster the political chances of South Korean advocates of appeasement, in turn providing Kim Jong-il even more breathing room.

Kim is once again besting the U.S. in accomplishing his two central strategic objectives: staying in power and preserving his nuclear-weapons program. The working groups currently underway do nothing to achieve the proper ends of U.S. foreign policy. A few weeks ago in Shenyang, China, the “denuclearization” working group met without visible progress, even on permanently dismantling Yongbyon.

There is still simply no evidence that Pyongyang has made a decision to abandon its long-held strategic objective to have a credible nuclear-weapons capability. This inconvenient fact should make it impossible for the State Department to concede on other issues, even if it were inclined to do so. Creative minds are therefore working on ways to explain that any forthcoming North Korean declaration of its nuclear capabilities is “full and complete,” thus eliminating the remaining troubling obstacles to full normalization of relations.

Consider a possible North Korean “declaration,” perhaps drafted with State’s coaching, which would say something like this: “We manufactured two nuclear devices, one of which we detonated last

October. We detonated the other earlier, but you didn't recognize it as a nuclear explosion. We currently have no nuclear devices. Our plutonium reprocessing efforts were not very successful, which explains why we only had two devices, neither of which produced large yields. We ultimately disposed of our limited remaining plutonium to others, and we have no idea where it now is. We currently have no plutonium. On uranium enrichment, we purchased some UF<sub>6</sub> and a small number of centrifuges for a test cascade from A.Q. Khan, but we could not progress due to inadequate funds. Accordingly, we long ago sold all but a small amount of the UF<sub>6</sub> and the centrifuges to third-parties. We will produce what little we have at Yongbyon shortly. That's it. Are we done now?"

Many will fall for this pretense of "full disclosure," especially those needing a diplomatic "success" to justify long years of faith in the Six-Party Talks. The alternative is to reject any North Korean declaration without full and timely verification. IAEA inspections alone are not enough. Its capacities are limited. Indeed, much of the IAEA's work is accomplished on the basis of intelligence provided by governments.

Precisely because our knowledge of the North's nuclear program is incomplete, we need an intrusive, indeed invasive, verification mechanism before having any confidence that North Korea's nuclear program is in fact being dismantled. We need smart and extensive verification activities inside North Korea, including no-notice inspections, a full range of sensors and sampling, unrestricted interviews and document reviews. If the North rejects effective verification, that is yet another basis to repudiate the Feb. 13 quicksand deal.

We need to know, among other things, precisely how many nuclear weapons the North has manufactured, how and where it manufactured them, how many it now has, and how much reprocessed plutonium remains available for weaponization. If any devices, fissile material or nuclear manufacturing equipment have left North Korea, we need to learn the specifics.

We need to understand the full extent of its uranium enrichment program, and if weapons-grade enriched uranium was produced, where it is and how much there is of it. We also need to know specifically if North Korea possesses any enriched uranium metal or any weapons- or missile warhead-design information.

President Bush has stressed that we must also deal with Pyongyang's biological, chemical and ballistic missile programs. We must address these programs, especially the missiles, soon. Failure to make explicit the important connection between weapons and delivery systems will certainly come back to haunt us, and we are on the verge of allowing this point to slip away entirely.

Finally, we need to learn the details of North Korean nuclear cooperation with other countries. We know that both Iran and Syria have long cooperated with North Korea on ballistic missile programs, and the prospect of cooperation on nuclear matters is not far-fetched. Whether and to what extent Iran, Syria or others might be "safe havens" for North Korea's nuclear weapons development, or may have already participated with or benefited from it, must be made clear.

For our own safety's sake, and that of allies like Japan and South Korea, there can be no compromises on these points.

## **ANALYSIS: The question is, how will Damascus respond?**

By Yoav Stern, Haaretz Correspondent

Last update - 23:08 **06/09/2007**

Much has been said about and written on this year's "hot summer" in the Middle East. Indeed, Israel, on the one hand, and Syria and Lebanon on the other, have spent the past few months disseminating reports and rumors about preparations for war, while simultaneously issuing warnings to the opposite side.

And today we were party to the first significant military escalation in the region for more than a year. But is this the outbreak of war?

According to reports in Syria, this was clearly an isolated incident, not part of a battle or war. Nevertheless, it does raise a number of questions.

This could well be a one-off that will not develop into anything more, for the time being, but it does send shockwaves across the region. Every Arab media outlet is covering it intensely, simply because in the Mideast every incident can have unexpected consequences.

Syria, for its part, stressed from the first moment that the story broke that it is retaining the right to respond. The Syrian information minister further clarified that Damascus' political and military leadership is weighing its reaction.

That Syrian response will determine considerably how the rest of the incident plays out. Since the end of the Second Lebanon War in August of last year, Syria has emphasized that it could well engage in "resistance" activities against Israel's occupation of the Golan Heights.

In the lexicon of Arab diplomatic language, the term "moqawama" (resistance) means violent but legitimate activity against Israel. Even so, it seems that Syria will stick to the usual course of action, namely a request for condemnation of Israel by the United Nations Security Council.

Many questions remain unanswered regarding details of the incident, among them the exact number of IAF planes that entered Syrian airspace, and where exactly they were when they drew anti-aircraft fire. According to the Reuters news agency, witnesses saw four planes close to the Syrian-Turkish frontier, while a lone report on the Al-Arabiya satellite channel said that the IAF plane was attacked in the region of Qamishli, not far from the Iraqi border.

It's also hard to figure out the point of the mission. Syrian analysts, however, say that the aim was to examine flight paths inside their country which the IAF could use without discovery by Syrian radar.

## **North Korea-Syria nuclear ties: déjà vu all over again?**

Fri, 09/14/2007 - 3:43pm

Something didn't smell quite right in Glenn Kessler's recent story in the Washington Post about a possible nuclear link between North Korea and Syria. It looked to me like déjà vu all over again. So I asked Joseph Cirincione, senior fellow and director for nuclear policy at the Center for American Progress, author of *Bomb Scare: The History and Future of Nuclear Weapons*, and a frequent FP contributor, to weigh in. Here's his take:

This story is nonsense. The Washington Post story should have been headlined "White House Officials Try to Push North Korea-Syria Connection." This is a political story, not a threat story. The mainstream media seems to have learned nothing from the run-up to war in Iraq. It is a sad commentary on how selective leaks from administration officials who have repeatedly misled the press are still treated as if they were absolute truth.

Once again, this appears to be the work of a small group of officials leaking cherry-picked, unvetted "intelligence" to key reporters in order to promote a preexisting political agenda. If this sounds like the run-up to the war in Iraq, it should. This time it appears aimed at derailing the U.S.-North Korean agreement that administration hardliners think is appeasement. Some Israelis want to thwart any dialogue between the U.S. and Syria.

Few reporters appear to have done even basic investigation of the miniscule Syrian nuclear program (though this seems to be filtering into some stories running Friday). There is a reason that Syria is not included in most proliferation studies, including mine: It doesn't amount to much. Begun almost 40 years ago, the Syrian program is a rudimentary research program built around a tiny 30-kilowatt research reactor that produces isotopes and neutrons. It is nowhere near a program for nuclear weapons or nuclear fuel. Over a dozen countries have aided the program including Belgium, Germany, Russia, China, and the United States (where several Syrian scientists trained) as well as the International Atomic Energy Agency (IAEA). If North Korea gave them anything short of nuclear weapons it is of little consequence. Syria does not have the financial, technical or industrial base to develop a serious nuclear program anytime in the foreseeable future.

Nor is there anything new about Syria being on the U.S. "watch list"; it has been for years. Unfortunately, this misleading story will now enter the lexicon of the far right. For months we will hear pundits citing the "Syrian-Iranian-Korean nuclear axis" and complaining that attempts to negotiate an end to North Korea's program are bound fail in the face of such duplicity, etc., etc.

The real story is how quickly the New York Times and the Washington Post snapped up the bait and ran exactly the story the officials wanted, thereby feeding a mini-media frenzy. It appears that nothing, not even a disastrous and unnecessary war, can break this Pavlovian response to an "intelligence scoop."

For information on the Syrian nuclear program that any reporter should have read, see the Web site of the Nuclear Threat Initiative.

UPDATE: Washington Post diplomatic correspondent Glenn Kessler responds via e-mail:

I think the world of Joe Cirincione. So I obviously take his concerns seriously.

All I can say in response is that I (and a number of uncredited colleagues) spent more than week knocking on doors of many agencies, seeking answers. No one tried to wave us off the story, including people who normally I thought would have tried their best to prevent us from printing it. I did note a number of caveats and explained that Syria never had much of a nuclear program. There appears to be a connection to the Israeli raid, which is now the subject of some of the tightest censorship in years. We will keep pursuing the story in hopes of providing greater clarity for our readers--and especially experts like Joe.

## REVIEW & OUTLOOK

### **North Korea and Syria** **SEPTEMBER 14, 2007**

A nuclear-armed North Korea is dangerous enough. A North Korea that shares its nuclear technology with other bad actors is worse -- especially if the partner-state is known to be cozy with terrorists. The potential nexus between WMD and terrorism is the biggest threat to the security of the U.S. and its allies.

So reports this week in the New York Times, the Washington Post and elsewhere that North Korea may be cooperating with Syria on some sort of nuclear facility are worth taking seriously. Syria has close ties with Iran and provides sanctuary within its borders for Hezbollah, a group that the National Intelligence Estimate released in July warns may be prepared to launch terrorist attacks against the U.S. Pyongyang has a long, well-documented history of sharing missile technology with Syria, and it is all too believable that sharing nuclear knowhow could be next.

Israel is said to be the primary source of the intelligence on a North Korean-Syrian nuclear connection. But neither Israel nor the Bush Administration has commented officially on this or another mysterious event -- Israel's flyover and apparent raid last week on targets inside Syria. Given the Administration's experience with prewar intelligence on WMD in Iraq, it's understandable that it would want to have solid evidence before going public.

Meanwhile, however, the six-party talks on the dismantling of North Korea's nuclear program have picked up steam, with Pyongyang promising to dismantle its facilities by the end of the year and the U.S. pledging to consider such goodies as fuel aid and removing North Korea from its list of terror-sponsoring states. U.S., Russian and Chinese inspectors turned up at the Yongbyon nuclear facility this week.

If North Korea is moving its nuclear facilities to Syria -- or "merely" proliferating -- it would undermine everything at the heart of that agreement, as well as cross a long-stated American red line that Pyongyang not proliferate. Even if it is unsure of the full implications of the intelligence, the Administration has an obligation not to proceed with a nuclear deal until Pyongyang and Damascus come clean.

## **The Syria-North Korea 'connection'**

By Jonathan Marcus

Diplomatic correspondent, BBC News

Published: 2007/09/18 13:37:52 GMT

**Nearly two weeks on from Israel's incursion into Syrian airspace, the mystery surrounding the operation shows little sign of disappearing.**

Press reports suggest strongly that the Israeli jets destroyed a facility near Syria's border with Turkey.

All sorts of details of the operation have "leaked" out, but still the precise nature of the "target" remains unclear.

By far the strongest theory though suggests a North Korean nuclear connection - a linkage which the North Korean authorities have strenuously denied.

The story put about by largely unnamed US sources and backed up by the former US ambassador to the United Nations, John Bolton, is that North Korea - under international pressure to scale down its own nuclear weapons programme - has recently transferred equipment or technology to Syria.

And it is this equipment - possibly at a fledgling research centre - that the Israelis hit.

### **'Political agenda'**

All sorts of questions remain. Experts on North Korea's nuclear programme are highly sceptical about the alleged technology transfer.

Joseph Cirincione, director for nuclear policy at the Washington-based Center for American Progress, a liberal think-tank, has gone so far as to describe the story as "nonsense".

**“ If this sounds like the run-up to the war with Iraq, then it should ”**

Joseph Cirincione

Center for American Progress

Selective leaks are being used to play up the Syria-North Korea connection, he writes on the online site of the journal Foreign Policy.

"This appears to be the work of a small group of officials leaking cherry-picked, unvetted 'intelligence' to key reporters in order to promote a pre-existing political agenda. If this sounds like the run-up to the war with Iraq, then it should," he writes.

Gary Samore of the Council on Foreign Relations, another leading North Korea nuclear expert, was less dismissive when I spoke to him, but equally sceptical.

"I know that the Israelis have been worried for some time that the Syrians were eager to get nuclear technology from North Korea," he said.

"The North Koreans are looking to liquidate at least part of their enrichment programme, and perhaps want to offload the centrifuges and so on that they obtained from Pakistan."

So the Syrians might be "dabbling" with enrichment technology, but this would not represent "a near-term threat", Mr Samore says.

"There are North Koreans in Syria in connection with missile technology," he said, but on the nuclear front "we just don't know".

One thing he saw as strange, however, was the possible location of the "target" that the Israelis may have hit.

This seems to have been very close to the border with Turkey - an odd place for a potential nuclear research establishment.

### **Scepticism needed**

Of course much of the controversy - given the fact that the Syrians and the Israelis have said very little (which is instructive in itself) - centres on the nature of the messengers, the shadowy leakers in Washington.

Only one of them, Andrew Semmel, a senior non-proliferation official, has gone on the record, and then there is the involvement of the controversial Mr Bolton.

Critics suggest that at least some of these people have a strong desire to derail the Bush administration's current negotiations with Pyongyang.

For whatever reason, the latest round of the six-party nuclear talks involving the two Koreas has been postponed at the last minute, apparently at the North Koreans' request.

But as Mr Samore pointed out: "Just because John Bolton is using this for political purposes doesn't mean that it is not true."

This episode once again highlights the problems for the media in dealing with this kind of story, problems that were exemplified - one has to admit in retrospect- by the run-up to the invasion of Iraq.

Journalists need copy. But they also have to weigh up what they are told. Official sources cannot simply be discounted.

But on the other hand, a sufficient degree of scepticism needs to be deployed. And just sometimes, that mighty media machine has to admit that it just does not know.

September 19, 2007

[EXCERPTS]

[deletia]

**In the last week there has been considerable speculation about an Israeli air incursion into Syria near the Syrian-Turkish border. There have been some reports the Israelis were trying to knock out a North Korean supplied nuclear facility. The North Koreans and the Syrians have both denied this. Do you have a guess on what happened?**

I know the Israelis have been concerned for some time that Syria might be receiving nuclear assistance from North Korea. In particular, I think the Israelis were worried that North Korea was sharing centrifuge systems with Syria, but I haven't seen the evidence for that, so it's hard for me to judge whether that's a solid concern or not. In any event, it seems unlikely that the Syrian program would have been very advanced. Nonetheless, if Israel thought that there was a real risk that the Syrians were beginning to dabble in centrifuge technology, you could understand why they would try to destroy that at a very early stage.

**You would think the Syrians would go to the Iranians for help on centrifuge technology.**

They might have been going to both. And there's always been speculation that A. Q. Khan [the prominent Pakistani scientist and so-called "father" of Pakistan's nuclear program, who sold nuclear technology to third parties] who of course marketed his services throughout the Middle East, might have approached the Syrians as well. Nobody really knows whether they took advantage of that offer.

**Do the North Koreans really have enough left over P-1 centrifuges, provided by Khan, that they would want to sell?**

The Pakistani government has acknowledged that A.Q. Khan provided a small number, less than two dozen, of these P-1 centrifuges to North Korea. So in theory, if the North Koreans wanted to sell or barter that technology to Syria, they could certainly do that.

**North Korea and Syria both deny the nuclear deal, but Syria has, despite announcing the Israeli raid, never said what actually happened.**

Syria has always been an interesting case, because you would think a country in that position, faced with an enemy that has both conventional and nuclear superiority, would want to develop a nuclear option. That would make a lot of sense. But up to now the Syrians seem to have been content with a chemical and biological capability, which they would use as a deterrent against Israel. And it's always been curious that the Syrians have never, as far as we know, developed a nuclear weapons program, unlike many other Arab countries: Egypt, Libya, and so forth.

**The latest round of the Six-Party Talks [North Korea, South Korea, United States, China, Russia and Japan] in Beijing was supposed to have been held today, but Beijing announced a postponement and nobody really knows why. Do you have any thoughts on this?**

Well three different explanations have been offered. One is that the Chinese wanted to avoid a confrontation between the United States and North Korea over this Syrian business and so they decided to postpone the meeting and let tempers cool before they went ahead with it. A second theory I heard was that the technical experts really haven't reached agreement yet on what steps would be required to disable North Korea's nuclear facilities.

As I'm sure you know, a team of experts from the United States, Russia, and China visited the North Korean nuclear center last week in order to review the proposals that North Korea had made. I haven't heard in detail what the North Koreans had proposed, or whether or not it was acceptable to the weapons inspections committee.

## Osirak II?

Israel's silence on Syria speaks volumes.

BY BRET STEPHENS

Tuesday, September 18, 2007 12:01 a.m. EDT

In the late spring of 2002 the American press reported that Israel had armed its German-made submarines with nuclear-tipped cruise missiles. In Israel, this was old news. It was also headline news.

"Washington Post: Israeli subs have nuclear cruise missiles," was how the Jerusalem Post, of which I was then the editor, titled its story of June 16. It wasn't as if we didn't previously know that Israel had purchased and modified the German subs for purposes of strategic deterrence. Nor did we delight in circumlocutions. We simply needed the imprimatur of a foreign source to publish items that Israel's military censors (who operate as if the Internet doesn't exist) forbade us from reporting forthrightly.

So it's more than a little telling that the Israeli newspaper Haaretz chose, in the wake of an Israeli Air Force raid on Syria on Sept. 6 dubbed "Operation Orchard," to give front-page billing to an op-ed by John Bolton that appeared in this newspaper Aug. 31. While the article dealt mainly with the six-party talks with North Korea, Mr. Bolton also noted that "both Iran and Syria have long cooperated with North Korea on ballistic missile programs, and the prospect of cooperation on nuclear matters is not far-fetched." He went on to wonder whether Pyongyang was using its Middle Eastern allies as safe havens for its nuclear goods while it went through a U.N. inspections process.

How plausible is this scenario? The usual suspects in the nonproliferation crowd reject it as some kind of trumped-up neocon plot. Yet based on conversations with Israeli and U.S. sources, along with evidence both positive and negative (that is, what people aren't saying), it seems the likeliest suggested so far. That isn't to say, however, that plenty of gaps and question marks about the operation don't remain.

What's beyond question is that something big went down on Sept. 6. Israeli sources had been telling me for months that their air force was intensively war-gaming attack scenarios against Syria; I assumed this was in anticipation of a second round of fighting with Hezbollah. On the morning of the raid, Israeli combat brigades in the northern Golan Heights went on high alert, reinforced by elite Maglan commando units. Most telling has been Israel's blanket censorship of the story--unprecedented in the experience of even the most veteran Israeli reporters--which has also been extended to its ordinarily hypertalkative politicians. In a country of open secrets, this is, for once, a closed one.

The censorship helps dispose of at least one theory of the case. According to CNN's Christiane Amanpour, Israel's target was a cache of Iranian weapons destined for Hezbollah. But if that were the case, Israel would have every reason to advertise Damascus's ongoing violations of Lebanese sovereignty, particularly on the eve of Lebanon's crucial presidential election. Following the January 2002 Karine-A incident--in which Israeli frogmen intercepted an Iranian weapons shipment bound for Gaza--the government of Ariel Sharon wasted no time inviting reporters to inspect the captured merchandise. Had Orchard had a similar target, with similar results, it's doubtful the government of

Prime Minister Ehud Olmert--which badly needs to erase the blot of last year's failed war--could have resisted turning it into a propaganda coup.

Something similar goes for another theory, this one from British journalist Peter Beaumont of the Observer, that the raid was in fact "a dry run for attack on Iran." Mr. Beaumont is much taken by a report that at least one of the Israeli bombers involved in the raid dropped its fuel tanks in a Turkish field near the Syrian border.

Why Israel apparently chose to route its attack through Turkey is a nice question, given that it means a detour of more than 1,000 miles. Damascus claims the fuel tank was discarded after the planes came under Syrian anti-aircraft fire, which could be true. But if Israel is contemplating an attack on Tehran's nuclear installations--and it is--it makes no sense to advertise the "Turkish corridor" as its likely avenue of attack.

As for the North Korean theory, evidence for it starts with Pyongyang. The raid, said one North Korean foreign ministry official quoted by China's Xinhua news agency, was "little short of wantonly violating the sovereignty of Syria and seriously harassing the regional peace and security." But who asked him, anyway? In August, the North Korean trade minister signed an agreement with Syria on "cooperation in trade and science and technology." Last week, Andrew Semmel, the acting counterproliferation chief at the State Department, confirmed that North Korean technicians of some kind were known to be in Syria, and that Syria was "on the U.S. nuclear watch list." And then there is yesterday's curious news that North Korea has abruptly suspended its participation in the six-party talks, for reasons undeclared.

That still leaves the question of just what kind of transfers could have taken place. There has been some speculation regarding a Syrian plant in the city of Homs, built 20 years ago to extract uranium from phosphate (of which Syria has an ample supply). Yet Homs is 200 miles west of Dayr az Zawr, the city on the Euphrates reportedly closest to the site of the attack. More to the point, uranium extraction from phosphates is a commonplace activity (without it, phosphate is hazardous as fertilizer) and there is a vast gulf separating this kind of extraction from the enrichment process needed to turn uranium into something genuinely threatening.

There is also a rumor--sourced to an unnamed expert in the Washington Post--that on Sept. 3 a North Korean ship delivered some kind of nuclear cargo to the Syrian port of Tartus, forcing the Israelis to act. That may well be accurate, though it squares awkwardly with the evidence that plans for Orchard were laid months ago.

More questions will no doubt be raised about the operational details of the raid (some sources claim there were actually two raids, one of them diversionary), as well as fresh theories about what the Israelis were after and whether they got it. The only people that can provide real answers are in Jerusalem and Damascus, and for the most part they are preserving an abnormal silence. In the Middle East, that only happens when the interests of prudence and the demands of shame happen to coincide. **Could we have just lived through a partial reprise of the 1981 Israeli attack on Iraq's Osirak nuclear reactor? On current evidence, it is the least unlikely possibility.**

[Mr. Stephens is a member of The Wall Street Journal's editorial board. His column appears in the Journal Tuesdays.](#)

## **MIDEAST: Neocons Tie N. Korea to Israeli Strike on Syria**

Analysis by Khody Akhavi

WASHINGTON

Sep 18 [2007] (IPS) -

Nearly two weeks have passed since Israeli warplanes conducted a mysterious raid against an as yet unidentified target in northeast Syria. Details of the incident have been slow to come, as officials from both countries have remained tight-lipped.

In the absence of a clear picture of what happened in the early hours of Sep. 6, speculation in the U.S. mainstream media has grown as to what exactly the Israelis targeted, and why Damascus -- assuming it was the target of an unprovoked attack -- has been so muted in its response.

Was Israel's attack aimed at testing Syria's radar defences? Did the air strike seek to disrupt arms shipments to Lebanon's Hezbollah? Was it a dress rehearsal for a possible future strike on Iranian nuclear facilities?

Feeding the speculation, a familiar clutch of George W. Bush administration hawks appear to be suggesting that Israel's apparent air strike may have targeted a joint North Korea-Syria nuclear venture.

Writing in the opinion pages of the Wall Street Journal more than a week before the incident, former U.S. ambassador to the United Nations John R. Bolton asserted, "We know that both Iran and Syria have long cooperated with North Korea on ballistic missile programs, and the prospect of cooperation on nuclear matters is not far-fetched."

"Whether and to what extent Iran, Syria or others might be 'safe heavens' for North Korea's nuclear weapons development, or may have already benefited from it, must be made clear," he wrote. Bolton resigned his position at the U.N. in late 2006 and currently serves as a senior fellow at the neo-conservative American Enterprise Institute.

Comments made by a State Department official last Friday fanned the flames further and bolstered the neoconservative argument. Andrew Semmel, acting deputy assistant secretary of state for nuclear non-proliferation policy, told the Associated Press that the U.S. believes that Syria may have a number of "secret suppliers" to obtain nuclear equipment as part of a covert programme.

The Bush administration has maintained a hard-line policy stance on Syria. It has not had high-level diplomatic relations with the country since the assassination of former Lebanese Prime Minister Rafiq Hariri in 2005. The U.S. has alleged that Syria played a role in the assassination.

Neoconservatives appear to be re-igniting a political narrative that fits neatly with the infamous cast of the "axis of evil". While not explicitly mentioned, Syria has often been designated as a junior partner of Iran, Iraq, and North Korea's "reign of terror" because of its support for Islamist opposition groups such as Hezbollah and Hamas in Gaza.

"They want to torpedo the North Korea deal, they have clung doggedly to making sure that there is no cooperation in Syria, and they're the same people who got us into this mess in the Middle East in the

first place," said Daniel Levy, a former Israeli peace negotiator and senior fellow at the Washington-based New America Foundation.

The focus on North Korea comes as the U.S. prepares to implement a deal to end the country's nuclear weapons programme, a diplomatic approach that has drawn the ire of policy hawks like Bolton.

"Bolton represents the crowd that is very distressed that the U.S. has declared defeat in North Korea by trusting the North Koreans. They would like to scuttle that agreement," wrote Syria expert Josh Landis, on his widely-read blog, [www.syriacomment.org](http://www.syriacomment.org).

"While doing it, anything they can drag into to boost the notion of weapons transfers between Korea and Syria and Iran will be icing on the cake. Israeli planes were trying to get the goods," he wrote.

Some U.S. analysts have been very dubious of an actual Syrian nuclear threat, describing the speculation surrounding the incident as a manufactured stunt aimed at advancing a neoconservative agenda.

"This story is nonsense. The Washington Post story should have been headlined 'White House Officials Try to Push North Korea-Syria Connection.' This is a political story, not a threat story," said Joseph Cirincione, director for nuclear policy at the Washington-based Centre for American Progress, according to an interview with Foreign Policy.

"Once again, this appears to be the work of a small group of officials leaking cherry-picked, unvetted 'intelligence' to key reporters in order to promote a pre-existing political agenda. If this sounds like the run-up to the war in Iraq, it should. This time it appears aimed at derailing the U.S.-North Korean agreement that administration hardliners think is appeasement. Some Israelis want to thwart any dialogue between the U.S. and Syria," he said.

Cirincione previously served as director for non-proliferation at the Carnegie Endowment for International Peace.

The Israeli media -- bound by an army censor that restricts coverage of the incident -- has relied largely on foreign press reports to reconstruct the incident.

"The Israeli press have gone out of their way to say to the Israeli public, 'we know [the story], we're gonna selectively quote from the overseas rumours and you can fill in the gaps,'" Levy told IPS. "[The press] was dismissive about the reports about arming Hezbollah, and gave greater weight to those connecting Syria and North Korea."

Syria lodged a formal complaint with the U.N. Tuesday over the "flagrant violation" of its airspace last week by the Israeli warplanes, which Damascus claims dropped munitions on its territory. Israel and Syria have technically been at war since 1967, when Israel occupied the Golan during the Six-Day War.

The air strike follows a summer that saw heightened tension between the two countries, a period that provides the necessary context for the eventual Israeli action.

"Something will come to light and will make it clear to everyone -- the Israelis were sitting on intelligence," said Levy.

Experts are still unsure of what that intelligence entails, and whether is it "nuclear", "non-conventional", "chemical", or nothing of the sort. Regardless, in most of the narratives, the North Korea connection remains a salient point.

But whatever happened in the early hours of Sep. 6 does not appear to have soured Israeli Prime Minister Ehud Olmert's efforts to restart negotiations with his adversary. Olmert announced on Monday that Israel was prepared to hold negotiations with Damascus, without preconditions and without ultimatums, according to the Jerusalem Post.

## **Mystery Surrounds Israeli Strike in Syria**

National Public Radio

All Things Considered: September 19, 2007

**MELISSA BLOCK**, host:

Mystery continued to swirl around an Israeli air strike in Syria that took place in the middle of the night on September 6th. Neither Israel nor Syria nor the United States has offered an explanation of why Israel hit Syria or what the target was. But that hasn't stopped the speculation, which is focused on an alleged Syrian-North Korean nuclear connection.

Here's NPR's Mike Shuster.

**MIKE SHUSTER:** Nothing about Israel's air strike on Syria is known for sure. It's not clear how many aircraft were involved nor the route they used to reach their target nor where the target itself was. The target has been reported to be near the Syrian town of Deir ez-Zor in Syria's eastern dessert. But there are also reports the Israeli attack aircraft jettisoned their empty gas tanks over Turkey more than a hundred miles north.

Anonymous American and Israeli intelligence sources have been quoted wildly speculating on the motive for the attack. Among the possible reasons: The site could have held missiles from Iran destined for Hezbollah in Lebanon, the attack could have been a warm-up or a warning for a possible Israeli attack on Iran, or the Israelis believe there was some kind of nuclear cooperation underway between North Korea and Syria.

U.S. government officials have declined to discuss the matter, but Defense Secretary Robert Gates was asked about it on "FOX News Sunday."

(Soundbite of show "FOX News Sunday")

**Secretary ROBERT GATES** (U.S. Department of Defense): All I will say is we are watching the North Koreans very carefully. We watch the Syrians very carefully.

**SHUSTER:** Gates' hinted he is taking the story quite seriously.

**Sec. GATES:** If such an activity were taking place, it would be a matter of great concern, and because the president has put down a very strong marker with the North Koreans about further proliferation efforts. And, obviously, any effort by the Syrians to pursue weapons of mass destruction would be a concern.

**SHUSTER:** Israel's leaders have offered no explanation for the attack, but a few days ago, it emerged that according to unnamed Israeli sources, the air strike occurred three days after a North Korean ship docked at the Port of Tartous in Syria and offloaded its cargo. Damascus has also been largely silent about the matter. But this week, Syrian government minister Buthaina Shaaban did comment on the allegations of nuclear cooperation with North Korea.

**Dr. BUTHAINA SHAABAN** (Minister of Expatriate Affairs, Syria): Syria denies anything of the kind and condemns the Israeli attack on our land, on violation of all our airspace. And it's amazing that it's Washington who explains to the world why did Israel do this attack on Syria.

**SHUSTER:** Syria is not believed to have nuclear weapons or a nuclear weapons program, but it is known there are small experimental nuclear activities underway there. North Korea is not known to have cooperated with

Syria in the nuclear field, but it has worked extensively with Syria on missile technology. North Korea has sold Scud missiles to Syria. North Korean missile specialists are known to have been in Syria and Syrian missile experts have traveled to North Korea.

Joe Cirincione, an expert on nuclear proliferation with the Center for American Progress, has serious doubts about the veracity of the story so far.

**Dr. JOSEPH CIRINCIONE** (Expert on Nuclear Proliferation, Center for American Progress): This is the most overblown story I've seen since before the buildup to the war in Iraq. There's precious little information available, but it hasn't stop people with political agendas from spinning it at such an absurd level as if these claims are facts.

**SHUSTER:** The story may have been a factor in postponing a meeting this week of the six-party talks on North Korea's nuclear weapons program. That was expected to take place today in Beijing, but the Chinese government abruptly canceled it on Monday. Cirincione says some in Israel as well are also using the air strike story to affect possible future talks with Syria.

**Dr. CIRINCIONE:** Certain hard-line Israelis who are aimed at preventing a U.S.-Syrian or an Israeli-Syrian dialogue.

**SHUSTER:** That appears to have been a concern of Israel's president, Shimon Peres, yesterday when he told the foreign press corps that the nervousness, as he put it, between Syria and Israel is over.

**President SHIMON PERES** (Israel): So I'll go back to the almost and speculations and so on. When we say clearly that we are ready to negotiate directly with the Syrians caucus(ph).

**SHUSTER:** But today, another story surfaced about Syria that could complicate matters further. Jane's Defence Weekly is reporting that an explosion in the chemical plant in Syria on July 26th actually resulted from efforts to put chemical warheads on scud missiles. At the time, Syria's official news agency reported 15 military personnel were killed in the blast. The magazine reported that Iranian experts there were also killed.

Syria's chemical weapons program has been well known says Robert Einhorn, a former assistant secretary of state for non-proliferation issues now at the Center for Strategic and International Studies in Washington.

**Dr. ROBERT EINHORN** (Senior Adviser, International Security Program, Center for Strategic and International Studies): Syria has a chemical weapons capability. In fact, quite an advanced chemical weapons capability for the Middle East.

**SHUSTER:** That explosion occurred in Aleppo in western Syria. The Israeli air strike occurred about 200 miles east, but near an area where Syria is known to test missiles.

Mike Shuster, NPR News.

## **Shock Waves From Syria**

Did Israel bomb a secret nuclear facility equipped by North Korea?

Thursday, September 20, 2007; Page A20

THERE'S BEEN no official confirmation of the targets or results of an Israeli air raid in northeastern Syria on Sept. 6. Yet, like a subterranean explosion, the event is sending shock waves through the Middle East and beyond. Syria has protested to the United Nations, though it hasn't been very clear about what it's protesting. On Tuesday [18 September 2007], a front-page editorial in Damascus's main government-run newspaper criticized the United States for not condemning the attack. An Israeli newspaper, meanwhile, noted triumphantly that no nation other than North Korea had come to Syria's defense, rhetorically or otherwise.

What happened? Media accounts are beginning to converge on a report that Israel bombed a facility where it believed Syria was attempting to hatch its own nuclear weapons program with North Korea's assistance. The Post's Glenn Kessler reported that the strike came three days after a ship carrying material from North Korea docked at a Syrian port and delivered containers that Israel believes held nuclear materials. It's not clear whether U.S. intelligence agencies concur with Israel's conclusion, and independent experts have said that Syria lacks the resources for a credible nuclear weapons program.

It nevertheless is beginning to look as if Israel may have carried out the boldest act of nuclear preemption since its own 1981 raid against Iraq's Osirak nuclear complex. If so, its silence is shrewd. It has allowed Syria to avoid a military response and every other Arab state to pretend that nothing happened. So far, the most serious fallout may be China's abrupt and unexplained postponement of scheduled "six-party" talks on North Korea's nuclear program.

The non-news has boosted the previously rock-bottom poll numbers of Israeli Prime Minister Ehud Olmert. This week he jauntily announced that he was open to peace talks with Syria. Still, the lasting repercussions of the raid have yet to become clear. One question is how the government of Bashar al-Assad will respond to what may have been a devastating Israeli blow -- coupled with what can only be interpreted as silent approval by Syria's neighbors and most of the rest of the world. Will Mr. Assad be frightened out of the cocky aggressiveness that has caused him to sponsor or facilitate terrorism in Israel, Iraq and Lebanon? Or will he choose to escalate?

Another choice is faced by the Bush administration, which hopes to complete an accord with North Korea by the end of the year under which North Korea will disclose all of its nuclear programs and disable its facilities. Secretary of State Condoleezza Rice said this week that concerns about proliferation only added to the urgency of moving ahead on the deal. That's true -- but it doesn't mean U.S. negotiators can ignore the possibility that North Korea was shipping nuclear equipment to Syria even while promising to dismantle its own program. Pyongyang's dealings with Syria are a legitimate and necessary subject of inquiry when the six-party talks resume -- and they ought to be part of North Korea's promised disclosure.

## **Middle East Volcano**

By Charles Krauthammer

Friday, September 21, 2007; A19

On Sept. 6, something important happened in northern Syria. Problem is, no one knows exactly what. Except for those few who were involved, and they're not saying.

We do know that Israel carried out an airstrike. How do we know it was important? Because in Israel, where leaking is an art form, even the best-informed don't have a clue. They tell me they have never seen a better-kept secret.

Which suggests that whatever happened near Dayr az Zawr was no accidental intrusion into Syrian airspace, no dry run for an attack on Iran, no strike on some conventional target such as an Iranian Revolutionary Guard base or a weapons shipment on its way to Hezbollah in Lebanon.

Circumstantial evidence points to this being an attack on some nuclear facility provided by North Korea.

Three days earlier, a freighter flying the North Korean flag docked in the Syrian port city of Tartus with a shipment of "cement." Long way to go for cement. Within days, a top State Department official warned that "there may have been contact between Syria and some secret suppliers for nuclear equipment." Three days later, the six-party meeting on dismantling North Korea's nuclear facilities scheduled for Sept. 19 was suddenly postponed, officially by China, almost certainly at the behest of North Korea.

Apart from the usual suspects -- Syria, Iran, Libya and Russia -- only two countries registered strong protests to the Israeli strike: Turkey and North Korea. Turkey we can understand. Its military may have permitted Israel an overflight corridor without ever having told the Islamist civilian government. But North Korea? What business is this of North Korea's? Unless it was a North Korean facility being hit.

Which raises alarms for many reasons. First, it would undermine the whole North Korean disarmament process. Pyongyang might be selling its stuff to other rogue states or perhaps just temporarily hiding it abroad while permitting ostentatious inspections back home.

Second, there are ominous implications for the Middle East. Syria has long had chemical weapons -- on Monday, Jane's Defence Weekly reported on an accident that killed dozens of Syrians and Iranians loading a nerve-gas warhead onto a Syrian missile -- but Israel will not tolerate a nuclear Syria.

Tensions are already extremely high because of Iran's headlong rush to go nuclear. In fending off sanctions and possible military action, President Mahmoud Ahmadinejad has chosen a radically aggressive campaign to assemble, deploy, flaunt and partially activate Iran's proxies in the Arab Middle East:

(1) Hamas launching rockets into Israeli towns and villages across the border from the Gaza Strip. Its intention is to invite an Israeli reaction, preferably a bloody and telegenic ground assault.

(2) Hezbollah heavily rearmed with Iranian rockets transshipped through Syria and preparing for the next round of fighting with Israel. The third Lebanon war, now inevitable, awaits only Tehran's order.

(3) Syria, Iran's only Arab client state, building up forces across the Golan Heights frontier with Israel. And on Wednesday, yet another anti-Syrian member of Lebanon's parliament was killed in a massive car bombing.

(4) The al-Quds Force of the Iranian Revolutionary Guard training and equipping Shiite extremist militias in the use of the deadliest IEDs and rocketry against American and Iraqi troops. Iran is similarly helping the Taliban attack NATO forces in Afghanistan.

Why is Iran doing this? Because it has its eye on a single prize: the bomb. It needs a bit more time, knowing that once it goes nuclear, it becomes the regional superpower and Persian Gulf hegemon.

Iran's assets in Gaza, Lebanon, Syria and Iraq are poised and ready. Ahmadinejad's message is this: If anyone dares attack our nuclear facilities, we will fully activate our proxies, unleashing unrestrained destruction on Israel, moderate Arabs, Iraq and U.S. interests -- in addition to the usual, such as mining the Strait of Hormuz and causing an acute oil crisis and worldwide recession.

This is an extremely high-stakes game. The time window is narrow. In probably less than two years, Ahmadinejad will have the bomb.

The world is not quite ready to acquiesce. The new president of France has declared a nuclear Iran "unacceptable." The French foreign minister warned that "it is necessary to prepare for the worst" -- and "the worst, it's war, sir."

Which makes it all the more urgent that powerful sanctions be slapped on the Iranian regime. Sanctions will not stop Ahmadinejad. But there are others in the Iranian elite who might stop him and the nuclear program before the volcano explodes. These rival elites may be radical, but they are not suicidal. And they believe, with reason, that whatever damage Ahmadinejad's apocalyptic folly may inflict upon the region and the world, on Crusader and Jew, on infidel and believer, the one certain result of such an eruption is Iran's Islamic republic buried under the ash.

## **Israel's Olmert Seeks to Ease Tensions with Syria**

NPR.org, **September 24, 2007**

Prime Minister Ehud Olmert told Israeli lawmakers Monday that he does not want friction with Syria, as his spokesperson spread the word that Israel has no problem sitting down at a Mideast peace conference with its enemy.

Speaking to a closed meeting of Israeli lawmakers, Olmert said Israel has been monitoring Syrian troop movements in recent weeks. The prime minister went on to say that his country is not interested in violent conflict with Syria and expressed confidence that recent tensions between the nations will subside.

"We're not interested in friction, and I think the Syrians aren't either," Olmert said, according to a meeting participant. "I think the tensions in the area will gradually subside." The participant spoke on condition of anonymity because the meeting was closed.

Olmert has been trying to ease fear of a possible outbreak in fighting after a reported Israeli airstrike in Syria on Sept. 6. Israel has not publicly acknowledged the incursion, but tensions between Israel and Syria have heightened since the alleged airstrike.

Meanwhile, Olmert spokeswoman Miri Eisin said Monday that Israel supports the U.S. decision to invite Syria to President Bush's Mideast planned peace conference.

"We have no problem with whomever the United States decides to include at the international meeting," she said.

On Sunday, Secretary of State Condoleezza Rice announced that key Arab nations — including Syria — would be invited to the peace conference this fall. The U.S. hopes the conference will provide the foundation for peace talks meant to end the Israeli-Palestinian conflict.

Earlier this month, Syria accused Israel of invading its airspace and dropping unspecified munitions.

Israel has imposed a news blackout on the matter, but Mideast defense officials have told The Associated Press an Israeli airstrike and commando forces on the ground targeted a Syrian technology installation.

Foreign news reports have cited officials and experts as saying the attack targeted either arms meant for Hezbollah guerrillas in Lebanon or some sort of nonconventional weapon, perhaps a joint Syrian-North Korean nuclear project. Syria has denied both, and North Korea has denied a nuclear link with Damascus.

However, North Korean media outlets have reported that there was an attack.

"Israeli warplanes' intrusion into the territorial airspace of Syria and bomb-dropping are an outright violation of Syria's sovereignty and a grave crime that destroys regional peace and security," South

Korea's Yonhap news agency quoted the North's main Rodong Sinmun newspaper as saying on Monday.

Israel has repeatedly criticized Syria for its support of radical Palestinian groups Hamas and Islamic Jihad, as well as the Hezbollah guerrilla group in Lebanon. Syria also is on the U.S. list of state sponsors of terrorism.

But last week, Olmert called for the reopening of peace talks between the two adversaries without conditions.

Past negotiations broke down seven years ago over Syria's demand for the return of the Golan Heights, a strategic plateau Israel captured in the 1967 Mideast war.

Israel offered to go back to the international border, but Syria insisted on also controlling another small strip of territory — the east bank of the Sea of Galilee, which Syria captured during the 1948-49 war that accompanied Israel's creation. Talks also faltered over the extent of peaceful relations Syria would offer.

Syrian officials have not responded to news of the pending invitation.

## **Israel, Syria and the Glaring Secret**

September 25, 2007 17 54 GMT

By George Friedman

What happened in the Middle East on Sept. 6?

The first reports came from the Syrians, who said their air defenses fired at an Israeli warplane that had penetrated Syrian airspace and dropped some ordnance on the country's North. The plane then fled toward the Mediterranean at supersonic speeds, the Syrians said, noting that sonic booms had been heard.

A Syrian delegation was meeting Turkish officials about the same time, and the Turks announced that two Israeli fuel tanks had been dropped inside of Turkish territory, one in Gaziantep province and the other in Hatay province. That would mean the aircraft did come under some sort of fire and dropped fuel tanks to increase speed and maneuverability. It also would mean the plane was flying close to Turkish territory or over Turkish territory, at the northwestern tip of Syria.

The Israelis said nothing. It appeared at first glance that an Israeli reconnaissance flight had attracted Syrian attention and got out of there fast, though even that was puzzling. The Israelis monitor Syria carefully, but they have close relations with the Turkish military, which also watches Syria carefully. We would assume they have intelligence-sharing programs and that reconnaissance in this area could have been done by the Turks or, more likely, by Israeli reconnaissance satellites. Yet, an Israeli reconnaissance flight seemed like the only coherent explanation.

What was most striking from the beginning was the relative silence on all sides. The Israelis remained mum, not even bothering to leak a misleading but plausible story. The Syrians, after threatening to take the issue to the U.N. Security Council, have been less vociferous than one would expect. The United States had nothing official to say, but U.S. sources leaked a series of incompatible explanations. The Turks, after requesting an explanation for the fuel tanks, dropped the matter.

The leaks, which seemed to be coming from the Americans, raised the scope of the operation from a reconnaissance to something more. It was U.S. sources who said up to eight aircraft were involved in the operation. Early on, a leak originating in the United States implied that there might have been Israeli commandos involved as well. U.S. leaks also mentioned that a shipment of cement had been delivered to Syria from North Korea a few days before the incident and implied that this shipment might have contained nuclear equipment of some sort that was the real target of the attack. All three countries were silent officially on the intent of the attack, but the Americans were filling in some blanks with unofficial hints.

The media also were filled with a range of contradictory speculation. One story said this was a dry run for an Israeli air attack against Iran. Another said the Israelis were demonstrating their ability -- and hence the U.S. ability -- to neutralize Syrian air defenses as a signal to Iran that it, too, is vulnerable. Some stories also claimed that new missiles, not nuclear materials, were being shipped to Syria. There were many other explanations, but these were either pure speculation or were deliberately being fed to the media in order to confuse the issue.

Officials finally started to go public last week. Israeli opposition leader and former Prime Minister Benjamin Netanyahu said he was consulted in advance and supported Israeli Prime Minister Ehud Olmert's action in Syria. U.S. President George W. Bush went out of his way -- commenting directly and through his press secretary -- to make it understood that he also knew a raid had been carried out, but had absolutely nothing to say about it. That drew attention to two things. First, the United States knew what was going on. Second, the United States was going to keep the secret -- and the secret was an important one. Between Netanyahu and Bush, the reconnaissance theory was dead. An important operation occurred Sept. 6. It remains absolutely unclear what it was about.

Another leak appeared via the Sunday Times, this time with enough granularity to consider it a genuine leak. According to that report, the operation was carried out by Israeli commandos supported by Israeli aircraft, under the direct management of Israeli Defense Minister Ehud Barak. It had been planned since June, just after Barak took office, and had been approved by the United States after some hesitation. The target was in fact nuclear "material" provided by North Korea, according to that leak.

All of this makes perfect sense, save one thing. Why the secrecy? If the Syrians have nuclear facilities, the Israelis should be delighted to make it public. Frankly, so should the United States, since the Bush administration has always argued that nuclear proliferation to rogue states, including Syria, is one of the key problems in the world. The Syrians should be spinning the story like crazy as well, denying the nuclear program but screaming about unprovoked Israeli-U.S. aggression. The silence from one or two parties makes sense. The silence from all parties makes little sense.

Looked at differently, Israel and the United States both have gone out of their way to draw attention to the fact that a highly significant military operation took place in Northern Syria, and compounded the attention by making no attempt to provide a plausible cover story. They have done everything possible to draw attention to the affair without revealing what the affair was about. Israel and the United States have a lot of ways to minimize the importance of the operation. By the way they have handled it, however, each has chosen to maximize its importance.

Whoever they are keeping the secret from, it is not the Syrians. They know precisely what was attacked and why. The secret is not being kept from the Iranians either. The Syrians talk to them all the time. It is hard to imagine any government of importance and involvement that has not been briefed by someone. And by now, the public perception has been shaped as well. So, why the dramatic secrecy designed to draw everyone's attention to the secret and the leaks that seem to explain it?

Let us assume that the Sunday Times report is correct. According to the Times, Barak focused on the material as soon as he became defense minister in June. That would mean the material had reached Syria prior to that date. Obviously, the material was not a bomb, or Israel would not have waited until September to act. So it was, at most, some precursor nuclear material or equipment.

However, an intervening event occurred this summer that should be factored in here. North Korea publicly shifted its position on its nuclear program, agreeing to abandon it and allow inspections of its facilities. It also was asked to provide information on the countries it sold any nuclear technology to, though North Korea has publicly denied any proliferation. This was, in the context of the six-party negotiations surrounding North Korea, a major breakthrough.

Any agreement with North Korea is, by definition, unstable. North Korea many times has backed off of agreements that seemed cast in stone. In particular, North Korea wants to be seen as a significant power

and treated with all due respect. It does not intend to be treated as an outlaw nation subject to interrogation and accusations. Its self-image is an important part of its domestic strategy and, internally, it can position its shift in its nuclear stance as North Korea making a strategic deal with other major powers. If North Korea is pressed publicly, its willingness to implement its agreements can very quickly erode. That is not something the United States and other powers want to see happen.

Whether the Israelis found out about the material through their own intelligence sources or North Korea provided a list of recipients of nuclear technology to the United States is unclear. The Israelis have made every effort to make it appear that they knew about this independently. They also have tried to make it appear that they notified the United States, rather than the other way around. **But whether the intelligence came from North Korea or was obtained independently, Washington wants to be very careful in its handling of Pyongyang right now.**

The result is the glaring secrecy of the last few weeks. Certainly, Israel and the United States wanted it known that Syria had nuclear material, and that it was attacked. This served as a warning to other recipients of North Korean nuclear technology -- most especially Iran. At the same time, the United States did not want to publicly embarrass North Korea, out of fear that the North Koreans would simply chuck the disarmament talks. Moreover, Damascus had no interest in publicizing that it had thoughts of a nuclear program, so it quieted down.

We should note that if this theory is true, and the United States and Israel discovered the existence of a Syrian nuclear program only from North Korean information, this would represent one of the most massive intelligence failures imaginable by both Israel and the United States. Essentially, it would mean that, unless this was the first shipment of material to Syria, Israel and the United States failed to detect a Syrian nuclear program on their own. That is possible, but not likely.

It is a neat theory. It might even be a true theory. But it has problems. The biggest problem is why Syria would be trying to obtain nuclear technology. Sandwiched between Israel and Turkey -- a country that has not had great relations with Syria in the past -- and constantly watched by the United States, the probability of it developing a nuclear capability undetected is infinitesimal, and the probability of Israel not taking it out is nonexistent. Moreover, Syria is not Iran. It is poorer, has less scientific and other resources and lacks the capability to mount a decadelong development effort. Syria actually plays a fairly conservative game, taking its risks in Lebanese politics and allowing jihadists to transit through the country on their way to Iraq. Trying to take on Israel or the United States in a nuclear gambit is not the Syrians' style. But certainly they were caught doing something, or they would be screaming to high heaven.

There has been persistent discussion of nuclear material in Syria, which, if we took the words seriously, would tend to indicate that something radioactive, such as enriched uranium or plutonium, was present. If what was delivered was not equipment but radioactive material, the threat might not have been a Syrian nuclear program, but some sort of radioactive device -- a dirty bomb -- that might be handed off to Hezbollah. The head of Israel's military intelligence was quoted as saying something about the attack having re-established Israel's deterrence power after its failures in the 2006 conflict with Hezbollah. Perhaps the problem was that the material was being transferred from North Korea to Syria on its way to Lebanon, possibly to use against Israel.

That would explain Syria's relative silence. Concern that the deal with North Korea will fall apart might keep the United States quiet. But a Syrian transfer of such material to Hezbollah normally would set

Israel to raging at the Syrians. The Americans might have kept quiet, but the Israelis would have leaked much earlier than this. Israel would want to use the threat as a tool in its public relations war.

Another reason for the silence could be psychological warfare against Iran. The speculation above might be true in some variant, but by remaining ominously silent, the Israelis and Americans might be trying to shake Iran's nerve, by demonstrating their intelligence capability, their special operations ability and the reach of their air power. With the Israelis having carried out this attack, this very visible secrecy might be designed to make Iran wonder whether it is next, and from what direction an attack might come.

Normally such international game-playing would not interest us. The propensity of governments to create secrets out of the obvious is one of the more tedious aspects of international relations. But this secret is not obvious, and it is not trivial. Though it is true that something is finally being leaked three weeks after the attack, what is being leaked is neither complete nor reliable. It seems to make sense, but you really have to work hard at it.

At a time when the United States is signaling hostile intentions toward Iran, the events in Syria need to be understood, and the fact that they remain opaque is revealing. The secrecy is designed to make a lot of people nervous. Interestingly, the Israelis threw a change-up pitch the week after the attack, signaling once again that they wanted to open talks with the Syrians -- a move the Syrians quickly rebuffed.

When events get so strange that interpretation is a challenge, it usually indicates it was intended that way, that the events are significant and that they could point to further instability. We do not know whether that is true, but Israel and the United States have certainly worked hard to create a riddle wrapped in a mystery.

## **Did N. Korea give Syria nuclear aid?**

from the **September 26, 2007** edition

### **The US will press for details in the next round of six-party talks, to be held Thursday in Beijing.**

By Donald Kirk |  
Correspondent of The Christian Science Monitor

## **Seoul**

The US faces a dilemma going into the next round of six-nation talks on North Korea's nuclear weapons: how firmly to press North Korea for details of proliferation of its nuclear technology to foreign clients.

Ahead of the Thursday meeting in Beijing, the issue has assumed critical importance with revelations of an Israeli raid early this month on a Syrian base where North Koreans were suspected of imparting not only know-how but also materiel needed for Syria to develop nuclear warheads.

"The US government has some evidence, but they seem to be deciding now is not the right time to talk about it," says Kim Tae Woo, senior research fellow at the Institute of Defense Analyses, affiliated with the South Korean defense ministry.

Indeed, US officials have said almost nothing publicly about what was going on at the base near the Turkish border in northern Syria that according to media reports prompted Israel first to send in commandos and then to bomb it.

Mr. Kim believes that Syria's goal was to get "the technology for enrichment" of uranium, and that North Korea probably supplied uranium fluoride – the gaseous substance from which emerges the highly enriched uranium needed for nuclear warheads.

North Korea's expertise in highly enriched uranium raises another issue for negotiators to consider at the upcoming six-party talks: the exact status of North Korea's highly enriched uranium program.

The chief US envoy, Christopher Hill, says he hopes for "clarity" on the issue at this week's six-party talks at which North Korea's envoy, Kim Kye Hwan, is to list in detail all aspects of his country's nuclear program.

A top North Korean official acknowledged the existence of the program to a delegation to Pyongyang led by Mr. Hill's predecessor, James Kelly, in October 2002, but North Korea since then has denied anything to do with enriched uranium.

## **North Korea-Syria connection**

This week, North Korea may get around the issue of highly enriched uranium, according to analysts here, by admitting that it received advice, and perhaps some centrifuges, from Pakistan in the days

when the Pakistan nuclear program was run by the since-disgraced physicist A.Q. Khan. North Korea can then say it never did anything more to develop warheads with uranium and the Pakistan relationship was short-lived and no longer exists.

North Korea may have more difficulty, however, explaining what was going on at the Syrian base.

"The Israelis must have had pretty good evidence," says Robyn Lim, professor of international relations at Nanzan University in Nagoya, Japan. "The US had to have been told in advance of the raid, and the Turks would have to have known in advance as well."

But why would North Korea have a team at the Syrian base while six-party talks are about to resume?

"The connection with Syria is ongoing business," says Mr. Kim of the Institute of Defense Analyses. "It's not something that can be disconnected. The US must have been aware of that information for a long time."

Indeed, Syria maintains strong relations with North Korea. A Syrian delegation visited Pyongyang last week.

"There's no doubt Syria has long been interested in the enrichment of uranium," says Kim. "The Syrian delegation in Pyongyang was probably talking about both nukes and missiles."

Professor Lim, a former Australian intelligence analyst, says while North Korea will "pretend to come clean" at the talks, the presumption is the North continues to export missiles to Middle Eastern countries and may well have also been selling nuclear secrets. She sees North Korea as participating in the talks for the sake of the enormous aid that's promised if the North convinces the US, South Korea, China, Russia, and Japan that it has abandoned its nuclear program.

"The talks are designed just to keep enough aid flowing to prop up the regime," she says.

## **N. Korea could react**

Analysts doubt, however, that the six-party talks will fail despite the issues of proliferation and highly enriched uranium. North Korea has already shut down its five-megawatt reactor at its nuclear complex at Yongbyon where it's believed to have made up to a dozen warheads, including one that it detonated last October in its only nuclear test to date.

Mr. Hill "will have no other option" but to raise the issue of proliferation in the talks, says Kim Song Han, a professor at Korea University. Nonetheless, he says, the priority will be to make North Korea disable its Yongbyon facilities, which made warheads with plutonium at their core.

"If the US pushes North Korea to be more detailed," Professor Kim says, "North Korea will react very harshly."

This week's talks will help set the stage for next week's North-South Korean summit in Pyongyang at which South Korea's President Roh Moo Hyun is to meet North Korean leader Kim Jong Il. Mr. Roh says he wants to pursue a "peace system" with North Korea while talking only briefly about the nuclear issue since it's already "being resolved."

Kim predicts North Korea will go through with disablement of its facilities at Yongbyon but remains "pessimistic" about dismantlement – the final stage – and is not certain if inspectors will ever see facilities elsewhere, including the site of the underground nuclear test.

## **Seven Questions: The World According to John Bolton**

**Posted September 2007**

*[EXCERPT]*

Negotiations with North Korea are on a knife's edge. Rumors of secret Israeli raids on alleged Syrian nuclear facilities and possible U.S. airstrikes on Iran are roiling political salons from Washington to Riyadh. In this Seven Questions, former U.S. Ambassador to the United Nations John Bolton offers some advice for those confronted with a dangerous world.

FOREIGN POLICY: It's been a tense week on the nuclear front, with Syria accusing Israel of invading its airspace, and then North Korea blasting Israel for doing so. You've been one of the only people who have spoken openly about the likelihood that Israel bombed nuclear facilities in Syria. If that were the case, why do you think Israel wouldn't announce it had done so?

John Bolton: Well, I don't think we really know what the target of the Israeli raid was. There seems to be a lot of indication that there was a North Korean-Syrian project in the nuclear field, although obviously the details of that are not known. And what that suggests is that we need very clear answers from the North Koreans in the context of the six-party talks [as to] whether indeed they are proliferating nuclear technology, whether they're outsourcing their program—or just exactly what it is they're doing.

Now, what the Israeli raid actually hit, I don't think people know. I was certainly reacting against the notion that it was an attack on a shipment of missiles bound from Iran to Hezbollah, because I don't think the Israelis would take the risks inherent in an attack on Syrian territory against a target like that. To me, it suggests that it was a higher-value target, and a nuclear facility of some kind would definitely qualify. But what exactly the target is, I don't know myself, and I'm not sure that there's anything but speculation out there at this point. There has been at least some public acknowledgment through official U.S. sources that there are concerns about not just North Korean ballistic-missile cooperation with Syria, which we've known about for some time, but the possibility that there's cooperation on the nuclear front as well.

## 'So close to war'

We came so close to World War Three that day

James Forsyth and Douglas Davis

Wednesday, 3rd October 2007

### On 6 September, when Israel struck a nuclear facility in Syria

A meticulously planned, brilliantly executed surgical strike by Israeli jets on a nuclear installation in Syria on 6 September may have saved the world from a devastating threat. The only problem is that no one outside a tight-lipped knot of top Israeli and American officials knows precisely what that threat involved.

Even more curious is that far from pushing the Syrians and Israelis to war, both seem determined to put a lid on the affair. One month after the event, the absence of hard information leads inexorably to the conclusion that the implications must have been enormous.

That was confirmed to The Spectator by a very senior British ministerial source: 'If people had known how close we came to world war three that day there'd have been mass panic. Never mind the floods or foot-and-mouth — Gordon really would have been dealing with the bloody Book of Revelation and Armageddon.'

According to American sources, Israeli intelligence tracked a North Korean vessel carrying a cargo of nuclear material labelled 'cement' as it travelled halfway across the world. On 3 September the ship docked at the Syrian port of Tartous and the Israelis continued following the cargo as it was transported to the small town of Dayr as Zawr, near the Turkish border in north-eastern Syria.

The destination was not a complete surprise. It had already been the subject of intense surveillance by an Israeli Ofek spy satellite, and within hours a band of elite Israeli commandos had secretly crossed into Syria and headed for the town. Soil samples and other material they collected there were returned to Israel. Sure enough, they indicated that the cargo was nuclear.

Three days after the North Korean consignment arrived, the final phase of Operation Orchard was launched. With prior approval from Washington, Israeli F151 jets were scrambled and, minutes later, the installation and its newly arrived contents were destroyed.

So secret were the operational details of the mission that even the pilots who were assigned to provide air cover for the strike jets had not been briefed on it until they were airborne. In the event, they were not needed: built-in stealth technology and electronic warfare systems were sophisticated enough to 'blind' Syria's Russian-made anti-aircraft systems.

What was in the consignment that led the Israelis to mount an attack which could easily have spiralled into an all-out regional war? It could not have been a transfer of chemical or biological weapons; Syria is already known to possess the most abundant stockpiles in the region. Nor could it have been missile

delivery systems; Syria had previously acquired substantial quantities from North Korea. The only possible explanation is that the consignment was nuclear.

The scale of the potential threat — and the intelligence methods that were used to follow the transfer — explain the dense mist of official secrecy that shrouds the event. There have been no official briefings, no winks or nudges, from any of the scores of people who must have been involved in the preparation, analysis, decision-making and execution of the operation. Even when Israelis now offer a firm ‘no comment’, it is strictly off the record. The secrecy is itself significant.

Israel is a small country. In some respects, it resembles an extended, if chaotic, family. Word gets around fast. Israelis have lived on the edge for so long they have become addicted to the news. Israel’s media is far too robust and its politicians far too leaky to allow secrets to remain secret for long. Even in the face of an increasingly archaic military censor, Israeli journalists have found ways to publish and, if necessary, be damned.

The only conceivable explanation for this unprecedented silence is that the event was so huge, and the implications for Israeli national security so great, that no one has dared break the rule of omertà. The Arab world has remained conspicuously — and significantly — silent. So, too, have American officials, who might have been expected to ramp up the incident as proof of their warnings about the dangers of rogue states and WMDs. The opposite is true. George Bush stonewalled persistent questions at a press conference last week with the blunt statement: ‘I’m not going to comment on the matter.’ Meanwhile the Americans have carried on dealing with the North Koreans as if nothing has changed.

The Syrian response, when it eventually came, was more forthcoming but no more helpful. First out of the blocks was Syria’s ambassador to the United Nations, Bashar Ja’afari, who happily announced that nothing had been bombed in Syria and nothing had been damaged.

One week later, Syria’s Vice-President, Farouk a-Shara, agreed that there had, after all, been an attack — on the Arab Centre for the Studies (sic) of Arid Zones and Dry Lands (ACSAD). Brandishing a photograph of the Arab League-run plant, he declared triumphantly: ‘This is the picture, you can see it, and it proves that everything that was said about this attack was wrong.’

Well, perhaps not everything. The following day, ACSAD issued a statement denying that its centre had been targeted: ‘Leaks in the Zionist media concerning this ACSAD station are total inventions and lies,’ it thundered, adding that a tour of the centre was being organised for the media.

On Monday, Syria’s President, Bashar Assad, offered his first observations of the attack. The target, he told the BBC disingenuously, was an unused military building. And he followed that with vows to retaliate, ‘maybe politically, maybe in other ways’.

Meanwhile, the Washington Post noted that the United States had accumulated a growing body of evidence over the past six months — and particularly in the month leading up to the attack — that North Korea was co-operating with Syria on developing a nuclear facility. The evidence, according to the paper, included ‘dramatic satellite imagery that led some US officials to believe the facility could be used to produce material for nuclear weapons’. Even within America’s intelligence community, access to that imagery was restricted to just a handful of individuals on the instructions of America’s National Security Adviser, Stephen Hadley.

Why are all sides so reluctant to clarify the details of this extraordinary event? ‘In the Middle East,’ noted Bret Stephens, a senior editorial executive at the Wall Street Journal and an acute observer of the region, ‘that only happens when the interests of prudence and the demands of shame happen to coincide’. He suggested that the ‘least unlikely’ explanation is a partial reprise of the Israeli air strike which destroyed Iraq’s Osirak nuclear reactor in 1981.

Another of the ‘least unlikely’ possibilities is that Syria was planning to supply its terrorist clients with ‘dirty’ bombs, which would have threatened major cities throughout the world. Terrorism is a growth industry in Syria and it is only natural that, emboldened by its Iranian ally, the Syrian regime should seek to remain the market leader by supplying the ultimate weapon to Hezbollah, Hamas and a plethora of Palestinian rejectionist groups who have been given house-room in Damascus.

The Syrians have good reason to up the ante now. The Alawite regime of Bashar Assad is facing a slew of tough questions in the coming months — most particularly over its alleged role in the murder of the former Lebanese leader, Rafiq Hariri, and its active support for the insurgency in Iraq. Either of these issues could threaten the survival of the regime. How tempting, then, to create a counter-threat that might cause Washington and others to pull their horns in — and perhaps even permit a limited Syrian return to Lebanon?

But that does not explain why the consignment was apparently too large to be sent by air. Look deeper and you find an array of other highly plausible explanations. The North Koreans, under intense international pressure, might have chosen to ‘park’ a significant stockpile of nuclear material in Syria in the expectation of retrieving it when the heat was off. They might also have outsourced part of their nuclear development programme — paying the Syrians to enrich their uranium — while an international team of experts continued inspecting and disabling North Korea’s own nuclear facilities. The shipment might even — and this is well within the ‘least unlikely’ explanations — have been intended to assist Syria’s own nuclear weapons programme, which has been on the cards since the mid-1980s.

Apart from averting the threat that was developing at Dayr as Zawr, Israel’s strategic position has been strengthened by the raid. Firstly, it has — as Major General Amos Yadlin, the head of Israel’s military intelligence, noted — ‘restored its deterrence’, which was damaged by its inept handling of the war in the Lebanon last year. Secondly, it has reminded Damascus that Israel knows what it is up to and is capable of striking anywhere within its territory.

Equally, Iran has been put on notice that Israel will not tolerate any nuclear threat. Washington, too, has been reminded that Israel’s intelligence is often a better guide than its own in the region, a crucial point given the divisions between the Israeli and American intelligence assessments about the development of the Iranian bomb. Hezbollah, the Iranian/Syrian proxy force, has also been put on notice that the air-defence system it boasted would alter the strategic balance in the region is impotent in the face of Israeli technology.

Meanwhile, a senior Israeli analyst told us this week that the most disturbing aspect of the affair from a global perspective is the willingness of states to share their technologies and their weapons of mass destruction. ‘I do not believe that the former Soviet Union shared its WMD technology,’ he said. ‘And they were careful to limit the range of the Scud missiles they were prepared to sell. Since the end of the Cold War, though, we know the Russians significantly exceeded those limits when selling missile technology to Iran.’

But the floodgates were opened wide by the renegade Pakistan nuclear scientist Abdul Qadeer Khan, who is revered in Pakistan as the Father of the Islamic Bomb. Khan established a virtual supermarket of nuclear technologies, parts and plans which operated for more than a decade on a global stage. After his operation was shut down in 2004, Khan admitted transferring technology and parts to Iran, Libya and North Korea. Proliferation experts are convinced they know the identities of at least three of his many other clients: Egypt, Saudi Arabia and Syria.

In addition to selling nuclear-related knowhow, the Khan network is also believed to have provided Syria with centrifuges for producing enriched uranium. In 2003, concern about Syria's nuclear ambitions was heightened when an experimental American electronic eavesdropping device picked up distinctive signals indicating that the Syrians had not only acquired the centrifuges but were actually operating them.

If Israel's military strike on Dayr as Zawr last month was surgical, so, too, was its handling of the aftermath. The only certainty in the fog of cover-up is that something big happened on 6 September — something very big. At the very least, it illustrates that WMD and rogue states pose the single greatest threat to world peace. We may have escaped from this incident without war, but if Iran is allowed to continue down the nuclear path, it is hard to believe that we will be so lucky again.

## **U.S. Rift on Israel Could Stall N. Korea Deal**

National Public Radio

All Things Considered: **October 10, 2007**

ROBERT SIEGEL, host:

On to another international matter, one with many more questions than answers right now: Israel's air strike inside Syria last month.

NPR's senior news analyst Daniel Schorr is keeping up with the latest on what's known about the raid, which isn't very much.

DANIEL SCHORR: It was mystifying from the start. On September 6th, Syria claimed that its air defenses had repelled attacking Israeli planes. But there was no word of what, if anything, had been struck. Nor would Israel say anything. And President Bush said emphatically, I am not going to comment on the matter.

With memories of the Israeli bombing of the Baghdad nuclear reactor in 1981, many people wondered whether a Syrian nuclear installation could have been the target, or perhaps nuclear materials transiting Syria on the way from North Korea to Iran. Then finally a week ago, Syria said the target had been an unused military building. Israel limited itself to say it was a military target - unspecified.

**What now emerges is that the Bush administration remained hush-hush about the attack because it had prior knowledge of the Israeli intelligence that led to the raid.**

The issue has now split the president's advisors. According to the New York Times today, Vice President Dick Cheney led the group urging the United States to reconsider its diplomatic overtures to Syria and to North Korea. Ranged against Cheney were Secretary of State Condoleezza Rice and Defense Secretary Robert Gates. They counseled caution about accepting Israeli warnings of an immediate nuclear threat from Syria.

Only last week, an American negotiator reached agreement with North Korea about disabling its nuclear facility and urged the North Korean government not to share nuclear weapons material.

Syria is important to the story because if Syria is getting nuclear aid from North Korea, then the Bush administration's policy of peaceful settlement with the Hermit Kingdom could come to a grinding halt. But few know what it was that Israel attacked in Syria, and those who do know are so far, not telling.

This is Daniel Schorr.

## **Israel-Syria Conflict Reportedly Split White House**

National Public Radio

All Things Considered: October 10, 2007

ROBERT SIEGEL, host:

It is still not known precisely what the target was when Israel carried out an air strike inside Syria on September 6th. Neither the Israeli government nor the Bush administration has offered a full explanation of the attack, even though it appears that the Israelis briefed the administration beforehand.

But there have been leaks to the news media that North Korea was cooperating with Syria on something nuclear-related, this according to Israeli intelligence. The incident has sparked a serious clash within the administration, especially in connection with the ongoing diplomatic effort to rid North Korea of nuclear weapons.

NPR's Mike Shuster has been following it all.

And, Mike, first, exactly, what do we know about the attack of September 6th?

MIKE SHUSTER: Unfortunately, Robert, we know almost nothing. We don't know exactly where the target was. Believed to be somewhere in eastern Syria, but there have been reports that it was near Syria's border with Turkey or that it was not near Turkey. It's not known for certain how many Israeli planes attacked, whether there were Israelis on the ground during the action, how many bombs were dropped, and what was destroyed.

SIEGEL: And what have the Syrians said about it?

SHUSTER: Well, the Syrians haven't said much. Initially, they wouldn't confirm it. And eventually, they did. And in a recent interview, Syria's president, Bashar al-Assad, said the Israelis bombed an unused military building. Both the Syrians and North Korea have denied any sort of cooperation in the nuclear realm. But I should add here that Syria and North Korea have cooperated for many years - this is known - on missile technology. North Korea has sold plenty of scud missiles to Syria, and North Korean specialists have been - and probably - are now in Syria. So an entirely different scenario has the Israelis bombing a delivery of North Korean missiles to Syria. And then possibly misrepresenting this as something nuclear-related because of faulty intelligence.

SIEGEL: But is there anything solid about the nuclear scenario?

SHUSTER: I'm afraid not. There have been wild assertions that the site in Syria was producing plutonium, but that would have to be a nuclear reactor. The construction of which couldn't have been kept secret for this long. So far, there's been no solid evidence have been made public about this.

This intelligence, though, has been very closely held, even within the administration. And what I keep hearing from reliable and thoughtful experts on North Korea, they have been told by those allegedly in the know that if the intelligence could be revealed, it would be astounding. At the same time, there's

clearly a difference of opinion within the administration about the reliability of this intelligence, with Vice President Cheney, it has said, embracing this intelligence fully and Secretary of State Rice and Secretary of Defense Gates being much more cautious.

SIEGEL: Astounding, implying what exactly?

SHUSTER: Implying something very serious, but nevertheless, this sort of gets whispered down the lane and never is asserted exactly what the intelligence is.

SIEGEL: Well, what we have here is at least a touring circus. Syria is an area of great concern, obviously, the Israel also to the U.S. But we're also talking about the diplomacy, the negotiations hearing on with North Korea on its known nuclear weapons activities.

SHUSTER: That's right. The Israelis brought this intelligence to the administration during the summer, just as negotiations with North Korea over their nuclear weapons program was making what seemed like real progress.

North Korea had committed itself to disabling its known nuclear facilities, providing a full inventory of what it's been doing in the nuclear realm. And it did shut down the nuclear facilities at Yongbyon in July.

But those who opposed compromise with North Korea, who opposed dealing with North Korea, like the former U.N. Ambassador John Bolton, were going full throttle against the negotiations with North Korea. Then, the Israeli attack happened on September 6th. And it sure look to a lot of people like this was an effort to undermine the continuing diplomatic efforts with North Korea.

SIEGEL: A hypothetical question. Let's assume that there really is good intelligence of secret North Korea nuclear cooperation with Syria.

If that were the case, why wouldn't the U.S. and Israel want to go public with that?

SHUSTER: I think that's a question that is at the heart of this. You'd think that going public would achieve exactly what the hawks want - the discrediting of negotiations with North Korea and the unveiling of Syria as an aspiring nuclear weapon state. But that hasn't happened. And still, the whole thing remains very murky.

SIEGEL: NPR's Mike Shuster.

Mike, thank you very much.

SHUSTER: You're welcome, Robert.

## **Analysts: Israel Targeted Syrian Nuclear Reactor**

National Public Radio

Talk of the Nation: **October 15, 2007**

**NEAL CONAN**, host:

This past summer, Israeli aircraft attacked a target in northwest Syria, near the border with Turkey. That's been the subject of speculation ever since. The mystery deepened when, not just Syria, but North Korea, protested the raid. Now, the New York Times reports that the target was the construction site of a nuclear reactor believed to be modeled on a North Korean facility that produces enough plutonium to make one nuclear weapon per year.

The implications of this story include concerns about nuclear proliferation on the one hand, and delicate negotiations with North Korea and Syria on the other.

In a moment, David Sanger, the chief Washington correspondent of the New York Times joins us. If you have questions about the story and what it might mean for U.S. relations with North Korea and Syria, our number is 800-989-8255. E-mail is [talk@npr.org](mailto:talk@npr.org). And you can find a link to the New York Times story in our blog at [npr.org/blogofthenation](http://npr.org/blogofthenation).

David Sanger joins us here in Studio 3A. Nice to have you back on TALK OF THE NATION today.

**Mr. DAVID SANGER** (Chief Washington Correspondent, New York Times): Good to be back here.

**CONAN:** And there's a great deal we don't know about the story. We'll get into that in just a moment. But you remind us in your story of a blunt warning that President Bush issued to North Korea on the subject of nuclear proliferation.

**Mr. SANGER:** He did. When North Korea set off its nuclear test, the somewhat failed nuclear test, just a year ago last week - I should say a partially successful test - he went downstairs in the White House issued a very blunt statement about how North Korea would be held responsible if it was ever caught exporting nuclear materials or if it was ever caught proliferating nuclear weapons designs.

It's not clear in this case that they did anything or that they did what President Bush warned against. Here's what we know, Neal. We know that the Israelis struck a site, and we know that Israeli and American analysts who looked at the satellite photographs prior to that strike last night came to the conclusion that they thought that that was the beginnings of a nuclear reactor being constructed, one that Syrians had never talked about publicly.

The Syrians had before tried to obtain nuclear reactors from Russia and Argentina. And it looked to be of a North Korean design. But the North Korean design, you know, does not necessarily mean the North Koreans were deeply involved. We know that North Korea and Syria have very healthy trade in missiles and missile technology from many years. And this whole thing has been surrounded in secrecy. It sort of been the great parlor game of Washington, which is what exactly was it that the Israelis struck.

But I think there's a lot we probably still don't know about this, including who supplied the Syrian, and how far along they have gone.

**CONAN:** This site, about as far from Syria's border with Israel as you can get and still be in Syria, that was part of the confusion because if it was - why would Israel risk a general war - which is what happens when you bomb a site in a neighboring country - why would Israel make that risk? What for? What could possibly be worth it?

**Mr. SANGER:** Well, that's one of the reasons the people have thought, that this was not just an ordinary kind of missile trade or the kind of thing that's going on for sometime.

You remember, Neal, I think you and I talked about this a few years ago. There was a lot of discussion in Washington about preemption after President Bush issued a new national security strategy in 2002.

Well, preemption looks a little more complicated to the Bush administration now after Iraq, and it was certainly complicated enough that they have not been able to use it in the case of even North Korea or Iran. But to the Israelis, this seemed like it was a moment, I think, to send a message. It was a message to the Syrians, many believed, that say we won't let you get started. It was a message to the Iranians that the - that Israel could if Iran's program got along far enough, might be tempted to do the same. That would be a very difficult operation for Israel.

**CONAN:** Mm-hmm. And yet, the analogy that everybody draws that you drew in your piece was to the Israeli raid on the Osiraq reactor in Baghdad some years ago. But that was a facility that was nearly completed...

**Mr. SANGER:** That's right.

**CONAN:** Represented, at least in Israeli minds, an imminent threat to Israel. There was no way that this embryonic site, whatever it may have been, represented any kind of an imminent threat.

**Mr. SANGER:** That's right. The Osiraq reactor was about to be fueled and that, you know, then an attack becomes much more complicated because you risk spreading nuclear material around. That was not an issue here if the Israeli and American analysis is right. If in fact it was a reactor, they were basically saying - you will not even going to start down that line, which was what many Israelis believe the position of Israel should have been about Iran years ago. But they're past that point.

**CONAN:** Mm-hmm. Then, there is the question of intelligence. Intelligence has been wrong - well, not so very long ago and then very important in Syria's ways. This was of an important attack. The Syrians are obviously very upset about it for any number of reasons. How do we know that the Israelis knew what they knew?

**Mr. SANGER:** You know, intelligence has been wrong before, famously in the case of Iraq. They'll be intelligence failures again in the future. And there have been journalistic failures, which we've also discussed when it comes from writing for the intelligence, so we try to write these with some care. We tried, in our story on Sunday, to explain what the American and Israeli analysts believe they saw that led Israel to make this attack.

Does that necessarily mean that they interpreted the evidence correctly? No, it does not. But, you know, we also all forget that there have been huge intelligence failures in the nuclear side in the other direction, in the case of China and the Soviet Union and...

**CONAN:** And in...

Mr. SANGER: ...India and Pakistan. We have failed to pick up indicators of nuclear activity until it was way too late so...

**CONAN:** And Iraq as well.

**Mr. SANGER:** Iraq was a huge failure in the other direction. In fact, Iraq was sort of the first huge failure in the direction of overestimating how close they were. Oh, you're talking about Iraq in 1991.

**CONAN:** Back in '91, yes, when they underestimated Iraq's nuclear program and then overestimated it 15 years later.

**Mr. SANGER:** Absolutely right. And so I try to remind the critics of the U.S. Intelligence Agency and the critics of the New York Times and other newspapers that report on intelligence that we have seen huge intel errors happen in both directions - underestimation and overestimation.

**CONAN:** We're talking with David Sanger, the chief Washington correspondent of the New York Times. 800-989-8255, if you'd care to join us. E-mail: [talk@npr.org](mailto:talk@npr.org). Eric is on the line with us from Auburn, New York.

**ERIC (Caller):** Yeah. I was wondering along these lines, how the Israeli have intelligence? They don't have satellites, I don't believe. So was the U.S. feeding them information? How did they get the information?

**CONAN:** I believe Israel does have satellites, David Sanger?

**Mr. SANGER:** They have some new overhead capability, but they share a huge amount of U.S. data. And frequently, they and other countries that share U.S. satellite data see things on our satellite photographs that the U.S. hasn't seen because the U.S. is focused elsewhere, and you can't be looking at every image and every spot. And we believe - but don't know for certain - that in this case, they were using U.S. intel. I don't know whether they were initially, or they came around with. But certainly, there was a lot of U.S. imagery of this site.

**CONAN:** Good question, Eric. Thank you.

**ERIC:** Thank you.

**CONAN:** There is also the debate, which this intelligence set off within the Bush administration, which has been reported on in your piece and in an earlier piece of the New York Times that, well, one of the implications of this, if North Korea is indeed cooperating with Syria on a nuclear weapons program -well, didn't North Korea just agreed to dismantle its own nuclear facilities? And is the United States approaching Syria in a diplomatic vein as well?

**Mr. SANGER:** That's right. And my colleagues, Mark Mazzetti and Helene Cooper, did some really great pioneering work on this internal debate. There were a couple of levels of debate underway in the Bush administration. One was, simply, even if the intelligence is what the Israelis believed it was, was this project so premature that there was no reason to go out and do a military strike now. That was one level of debate, and that divided across sort of predictable lines in the Bush administration.

The second debate, which was brought up by some people surrounding Vice President Cheney and others who have been deeply suspicious of engaging in negotiations with North Korea is if the North Koreans were exporting these, does that mean that you could trust any agreement you reach with them? The counterargument to that is that these talks would be a way of beginning to restrain North Korean exports.

And if in fact, the North Koreans helped the Syrians - we don't know that for a fact yet - it'd be assumed now when that happened. And it could have been years ago that they sold them a design. Remember, North Korea is first and foremost broke. And when you're broke, you'll sell a lot of things.

**CONAN:** Mm-hmm. Yet, North Korea - after Syria protested this, North Korea did as well.

**Mr. SANGER:** That's a fascinating thing. Here you have an Israeli attack on Syria. Did we hear from the Egyptians, the Saudis, people who you might expect to be upset about the fact with Israel went over a border and bombed an Arab country? Not a word. But the North Koreans, sitting on the other side of the world, about a day or two later issued a big protest. We thought that was interesting.

**CONAN:** And at the same time, Israel, normally not reticent about trumpeting what it might regard as a military success, has said nothing.

They have said nothing and the Bush administration has said a little less than nothing. There was one interesting set of comments by Defense Secretary Gates on one of the Sunday talk shows that was vaguely worded but suggested the North Koreans should be careful about proliferation as a general rule. You know, I've written about North Korea's nuclear programs since 1989 and I have never seen secrecy around a nuclear development or an attack or anything like that, the kind that we have seen around this incident.

**CONAN:** David Sanger, chief Washington correspondent of the New York Times, is our guest. We're talking about a story he wrote in the Sunday editions of the New York Times, which reported that the target hit by Israeli aircraft this summer in northwestern part of Syria was a embryonic nuclear power plant, maybe. We're talking on about this on TALK OF THE NATION from NPR News.

And let's see if we can get another caller on the line, Stephen, with us, Stephen calling from Sacramento.

**STEPHEN (Caller):** Yes, good afternoon.

**CONAN:** Afternoon.

**STEPHEN:** I was curious. It seemed the Syrians were very slow to protest this attack. I originally heard a report of it on the Internet Israeli Radio site. It was two or three weeks later before the Syrians seem to say a thing about it.

**Mr. SANGER:** They did initially say that their airspace had been violated by the Israelis, and they said that relatively quickly after the attack.

**CONAN:** And had repelled an attack.

Mr. SANGER: Right. Then, President Assad said in an interview about a week or week and a half ago that they hit an empty building and a military site, but that it didn't amount to much. That was a slightly different story than we had initially heard. There's a lot of speculation about why it is they haven't said more. One possibility is that they have spent a fair bit of money trying to invest in air defenses and it doesn't look like it did a whole lot of good on this particular case.

**CONAN:** Wasn't it an Israeli correspondent also able to go up to the northwestern part of Syria and stand in front of what he was describing as the target of this attack, which was an agricultural facility, which may or may not have been?

**Mr. SANGER:** You know, we're still having a hard time pinning down exactly where the attack placed. We haven't seen any pictures of the attack itself, and there are a number of coordinates all pretty much in the same neighborhood that people have been looking at as a possible site here. The Syrians invited some reporters up to the town that this was supposed to be closest to and said, look around. Do you see anything that happened here? And, you know, it was nothing.

**CONAN:** Mm-hmm.

**Mr. SANGER:** But I think that has something to do with the fact that we may not all be looking in the right place.

**CONAN:** All right. Thanks very much for the call, Stephen.

**STEPHEN:** Thank you.

**CONAN:** And let's go now to Greg. And Greg's with us from South Dakota. Greg, you're on the air.

**GREG (Caller):** Oh, yes. Yeah, I think you - since I called, you actually started covering something about that the - that maybe the message here is - has more to do with their sort of state-of-the-art defense system in Syria, which the Iranians also have a similar system. And it turned out to be pretty porous, and it's a good message that we can hit you when we want.

**CONAN:** Nevertheless, an Israeli attack on the Iran, given the distances involved and the countries that they would have to overfly, David Sanger, would be a much more ambitious prospect.

**Mr. SANGER:** A much more ambitious project. And remember that the Iranian nuclear program doesn't look anything like whatever this was in Syria. Iran has been using centrifuges to try to enrich uranium. They say for peaceful purposes, they have built at least one deeply underground major centrifuge center in Natanz, which the International Atomic Energy Agency has inspected. It would not be an easy thing taking that out.

But most importantly, the Iranians learned a lot of lessons from Osiraq, the Israeli attack on Iraq in 1981, and they have spread out the nuclear facilities considerably. So it would be quite a job for the

Israelis to go to that and they would probably require American help, and it's not at all clear that the U.S. would be willing to provide that help.

**CONAN:** Hmm. Thank for the call, Greg. One other item that today, the International Atomic Energy Agency in Vienna issued a statement that they had inquired to Syria about this report of a nuclear power plant on which they were uninformed by Syria. You pointed out in your piece, however, that the Syria would not have been obligated at this stage of construction - if it was a nuclear power plant - to report it to Vienna.

**Mr. SANGER:** That's right. There was some debate about at what point in time you have to go to the IAEA and say what you're intending to go build. And the IAEA board has interpreted some of their rules, and this is getting way down into the weeds of international law to say the Syrians would have had to notify them, but it's not at all clear that they would have.

**CONAN:** And finally, as the determination been made that it is - even if North Korea was involved and it was what the Israelis thought it was that the United States should continue its negotiations with North Korea and hope that they are trustworthy and will dismantle their nuclear systems.

**Mr. SANGER:** You know, the Bush administration spent the entire first term coming up with reasons not to talk to the North Koreans, and it didn't work out so well.

By the time we got in and out of - through the initial invasion of Iraq, the North Koreans had reprocessed their collection of spent fuel and now are believed to have enough fuel for six, eight, ten, maybe a dozen nuclear weapons. So in the first term, they tried to disengage an approach. I think in the second term, they fairly committed to trying the reverse approach.

**CONAN:** David Sanger, thanks very much for your time today.

**Mr. SANGER:** Thank you, Neal.

**CONAN:** David Sanger, the chief Washington correspondent of the New York Times, joined us here today in Studio 3A. Again, there's a link to his article at our blog [npr.org/blogofthenation](http://npr.org/blogofthenation).

This is TALK OF THE NATION from NPR News. I'm Neal Conan in Washington.

## **US intelligence does not show Syrian nuclear weapons program, officials say**

Larisa Alexandrovna

Published: **Thursday October 18, 2007**

*[EXCERPT]*

### **Cheney hand seen behind leaks of 'misleading' stories**

Allegations that a Syrian envoy admitted during a United Nations meeting Oct. 17 that an Israeli air strike hit a nuclear facility in September are inaccurate and have raised the ire of some in the US intelligence community, who see the Vice President's hand as allegedly being behind the disinformation.

A United Nations press release discussing the General Assembly's Disarmament Committee meeting mistranslated comments ascribed to an unnamed Syrian diplomat as saying that Israel had on various occasions "taken action against nuclear facilities, including the 6 July attack in Syria."

The UN has since gone through the tape recordings of the meeting and found that there was no mention of the word "nuclear" at all. According to the UN, the error was one of translation, involving several interpreters translating the same meeting.

Recent news articles, however, continue to make allegations and suggest that a nuclear weapons facility was hit -- something that the Syrian government has denied, the Israeli government has not officially confirmed and US intelligence does not show.

**According to current and former intelligence sources, the US intelligence community has seen no evidence of a nuclear facility being hit.**

**US intelligence "found no radiation signatures after the bombing, so there was no uranium or plutonium present," said one official, wishing to remain anonymous due to the sensitivity of the subject.**

**"We don't have any independent intelligence that it was a nuclear facility -- only the assertions by the Israelis and some ambiguous satellite photography from them that shows a building, which the Syrians admitted was a military facility."**

Their statements come as officials claim Syria has begun to 'disassemble' the site. An article today quotes former Administration hawk and onetime Bush United Nations Ambassador John Bolton, who links Syria's alleged action with Iran.

Israel has not spoken publicly about the air raid, other than to confirm that it happened. The confirmation came nearly a month after the Sept. 6 bombing, and provided only that "Israeli officials said the strike took place deep inside Syria."

"'Radiation signatures' are just the particular type of radiation that some activity would give off," Dr. Ivan Oelrich, a nuclear weapons expert at the Strategic Security Project at the Federation of American Scientists, told RAW STORY. "For example, a nuclear bomb would produce a lot of radioactivity and a nuclear reactor explosion would produce a lot of radioactivity but if you measure it carefully so you can tell, not just that it is radioactive, but exactly what particular isotopes are contributing, then it is easy to tell the difference.

"If a reactor explodes or is blown up then I can, with careful measurements of the particular types of radiation, tell what the fuel was for the reactor and how long the reactor had been running when it was hit," Oelrich added.

"It gets complicated because you have to take into account how different species are transported in the air, how fast they decay, etc. but it can be done."

An earlier report by Raw Story cited Vincent Cannistraro, Director of Intelligence Programs for the National Security Council under President Ronald Reagan and Chief of Operations at the Central Intelligence Agency's Counterterrorism Center under President George H. W. Bush, as saying that what the Israelis hit was "absolutely not a nuclear weapons facility."

The Central Intelligence Agency, through a spokesman, declined to comment.

### **Administration said to leak stories to press**

One US intelligence source familiar with the events expressed concern about recent news reports describing Syria as having a functioning nuclear weapons program and cautioned against attributing those reports to the US intelligence community.

"The allegations that North Korea was helping to build a nuclear reactor have not been substantiated by US intelligence," said this intelligence official, adding, "but that hasn't stopped Dick Cheney and his minions at the NSC, Elliot Abrams and Steve Hadley, from leaking the information [to the press], which appears to be misleading in the extreme."

## Raid Revelation

Getting briefed on World War III.

By Stanley Kurtz

NRO Contributing Editor

October 23, 2007 6:00 AM

If people had known how close we came to World War III that day there would have been mass panic. That is how a very senior British ministerial source recently characterized Israel's September raid on what was apparently a Syrian nuclear installation. Whether matters were quite that grave is an open question. Yet it does seem clear that the full story of the Israeli raid has not been told, nor its full significance recognized. Now two key members of Congress have raised an alarm about this event, thereby throwing our nuclear agreement with North Korea into question.

## Briefings

Peter Hoekstra and Ileana Ros-Lehtinen, as senior Republicans on the House Intelligence and Foreign Affairs Committees, respectively, were among the mere handful of members of Congress briefed on the Israeli air strike. What they learned obviously dismayed them greatly, as is evident from "What Happened in Syria?" a Wall Street Journal opinion piece published by Hoekstra and Ros-Lehtinen this past Saturday.

In that piece, Hoekstra and Ros-Lehtinen protest the "unprecedented veil of secrecy, thrown over the airstrike" noting that the vast majority of foreign relations and intelligence committee members have been left in the dark on the details of the raid. Hoekstra and Ros-Lehtinen acknowledge that they have personally been "sworn to secrecy," yet add that: "...based on what we have learned...it is critical for every member of congress to be briefed on this incident, and as soon as possible."

Hoekstra and Ros-Lehtinen obviously believe that Syria obtained "nuclear expertise or material" from outside state sources. And while they base their concern on press reports, it seems likely that their top-secret briefings confirmed this fact. Notable here is Hoekstra and Ros-Lehtinen's repeated use of the phrase "North Korea, Iran, or other rogue states" when referring to Syria's possible nuclear collaborators. After their briefing, Hoekstra and Ros-Lehtinen seem just as concerned about Iranian involvement as North Korean.

Hoekstra and Ros-Lehtinen protest the administration's willingness to provide the press with anonymous information on background, "to shape this story to its liking," while keeping members of Congress in the dark. "We believe this is unacceptable," they say, noting that the administration has ignored numerous letters from Congress asking that all members be briefed. Hoekstra and Ros-Lehtinen specifically express concerns about two administration-influenced stories in the New York Times and one in The Washington Post. Finally, Hoekstra and Ros-Lehtinen threaten to oppose any nuclear deal with North Korea unless all members of congress are briefed on the reasons for the Israeli raid.

While the secrecy that surrounds this issue forces us to read between the lines, two broad factual questions emerge from Hoekstra's and Ros-Lehtinen's oped. First, in what sense has the administration been shaping (or misshaping) the Syria story to its liking? Second, is there more to this story than recent press reports have indicated?

## North Korea's Role

Consider one of the articles singled out by Hoekstra and Ros-Lehtinen, an Oct. 14 New York Times story by David Sanger and Mark Mazzetti.

While this story confirmed that Israel had struck “a partially completed nuclear reactor, apparently modeled on one North Korea has used to create its stockpile of nuclear weapons fuel,” the article also raises doubts: “...American and foreign officials would not say whether they believed the North Koreans sold or gave plans to the Syrians, or whether the North’s own experts were there at the time of the attack. It is possible, some officials said, that the transfer of the technology occurred several years ago.”

Yet the suggestion that North Korean personnel might not have been involved in the ongoing construction of the reactor contradicts a New York Times story of October 9, just a few days before, which said that within the administration “there appears to be little debate that North Koreans frequently visited a site in the Syrian Desert that Israeli jets attacked Sept. 6.” The story on October 9 was that the North Koreans were surely present at the Syrian installation, but that the nuclear nature of the site was less certain. Once nuclear activity at the site was confirmed by the Times on October 14, however, administration sources on background apparently did their best to foster uncertainty about North Korean involvement. In other words, if the Koreans are there, it might not be nuclear, and if it’s nuclear, the Koreans might not be there.

The point is that the administration is subtly attempting to cast doubt on any reported link between North Korea and the Syrian reactor (without directly denying such a link). Otherwise it would become obvious that North Korea is flagrantly violating its nuclear agreement with the United States. Apparently, their secret briefing has led Hoekstra and Ros-Lehtinen to believe that the administration is obfuscating the reality of North Korean proliferation, in order to preserve the six-party deal.

In fact, from the beginning until the present, press reports have given strong indications of ongoing North Korean involvement in the Syrian nuclear project. One of the first reports (and still arguably the most extensive and important report) on the raid, from the London Sunday Times of Sept. 16, quoted Andrew Semmel, who was the acting deputy assistant secretary of state for nuclear nonproliferation policy. Speaking of Syria’s nuclear project, Semmel was asked if North Korean technicians were present there. Semmel replied, “There are North Korean people there. There’s no question about that.”

Another Sunday Times piece, of Sept. 23, offered further evidence of North Korean involvement. Israeli intelligence had suggested to the administration over the summer that North Korean personnel were at the Syrian site, said the Sunday Times. In fact, Israeli defense sources were said to have taken to referring to the target site as the “North Korean project.” The Sunday Times also noted the unusual stridency of North Korea’s condemnations of an event so far from East Asia. In a sense, the North Koreans were outing themselves by their protests. The Sunday Times also reported that diplomats stationed in North Korea and China, based on intelligence reports reaching Asian governments, believed that a number of North Koreans had actually been killed in the raid.

More recent reports have taken up the same theme. On October 7, Washington Post columnist Jim Hoagland noted that a senior official with access to highly classified intelligence reports said that “...the

Israelis destroyed a nuclear-related facility and caused North Korean casualties at the site....” And October 19, ABC News quoted “a senior U.S. official claiming that the Syrians could not have built

their reactor without North Korean ‘expertise,’ meaning that ‘the Syrians must have had ‘human’ help from North Korea.’”

If these reports are true, Hoekstra’s and Ros-Lehtinen’s concerns about efforts by the administration to lead the press away from the North Korean connection (without explicitly denying it), is completely understandable. Again, Hoekstra and Ros-Lehtinen appear to fear that the administration’s now dominant policy-making faction (led by Secretary of State Condoleezza Rice and Defense Secretary Robert Gates) is trying to protect the six-party agreement by suppressing the reality of North Korean proliferation.

## **Iran’s Role**

What about Iran? As noted, the persistent and strong emphasis Hoekstra and Ros-Lehtinen place on possible Iranian participation in the Syrian nuclear program can’t help but make us suspect that their secret briefing contained reports of Iranian involvement. Yet Hoekstra and Ros-Lehtinen refer to press reports of an Iranian role, and there are some such reports.

Former U.N. ambassador John Bolton has expressed concerns that both North Korea and Iran may be “outsourcing” their nuclear programs in Syria. We know that Syria has served as a conduit for North Korean shipments of missile components to Iran, and there are concerns that North Korean nuclear material may have taken the same route (see Sunday Times, Sept. 16). On Sept. 12, a New York Times report said “The Israelis think North Korea is selling to Iran and Syria what little [nuclear material] they have left.” A useful recent overview of the Israeli raid titled “How close were we to a third world war?” adds an important bit of new information based on earlier reports in the Kuwaiti press. Ali Rھےza Ali, a former Iranian deputy defense minister who defected several months ago, supplied intelligence sources in the West with information about the site targeted by the Israelis. Of course, that knowledge would imply close Iranian involvement in Korea’s nuclear project. (For more on possible Iranian involvement, see my “Deterrence Lost.”)

Distress over North Korean and Iranian involvement in nuclear proliferation to Syria — possibly as a way of hiding their own nuclear programs from the United States — would certainly make sense of Hoekstra’s and Ros-Lehtinen’s public complaint. Yet there may be more at work. The American press reports cited by Hoekstra and Ros-Lehtinen have so far seemed to confirm only the existence of a “nascent” plutonium reactor modeled on North Korea’s facility at Yongbyon, a construction project that could take as many as three to six years to complete (see NYT Oct. 14). While Syrian wrath at Israel’s destruction of even a nascent nuclear reactor could certainly have led to a retaliatory attack and general war in the Middle East, worries over a potential “world war three” caused by Israel’s destruction of a reactor three to six years from completion seem a bit overblown. These worries might make more sense if there is something more to this story than what American news sources have confirmed.

## **Warhead?**

Several early and unconfirmed reports on the Israeli raid point to the possibility that in the days immediately before the airstrike, the North Koreans may have shipped a cache of fissile material — possibly including a nuclear warhead — to Syria. According to the Sept. 16 Sunday Times, preparations for the attack began when the head of Israel’s intelligence agency, the Mossad, presented

Prime Minister Ehud Olmert with evidence that “Syria was seeking to buy a nuclear device from North Korea.” The fear was that the warhead would be fitted atop one of Syria’s North Korean-made Scud-C missiles, already armed with North Korean designed chemical warheads. “This was supposed to be a devastating surprise,” said an Israeli source, “Israel can’t live with a nuclear warhead.” The Sept. 16 Sunday Times goes on to connect the warhead story with a Washington Post report that the raid was linked to “the arrival three days earlier of a ship carrying North Korean material labeled as cement but suspected of concealing nuclear equipment.”

A “nascent” nuclear reactor, three-to-six years from completion, does not give off radiation. Yet the London Sunday Times reported on Sept. 23 that Israeli commandos seized samples of nuclear material and returned them to Israel for examination. “A laboratory confirmed that the unspecified material was North Korean in origin.” The Washington Post’s Jim Hoagland reported on October 7 that a senior official with access to highly classified intelligence reports said that the Israelis provided the United States with “physical material and soil samples from the site — taken both before and after the raid.” Soil samples are commonly used to confirm the presence of fissile material.

Here is where we begin to see potential contradictions, or at least difficulties. Some stories speak of nuclear material or even warheads, while other stories refer only to an incomplete reactor, and even deny that fissile material was present at all. For example, the ABC story of Oct. 19, claims that “no fissionable material was found because the facility was not yet operating.” The U.S. hesitated to approve the attack, according to this report, precisely because of the lack of fissionable material. While the ultimate nuclear intentions for the site were “unmistakable,” the U.S. apparently worried that it would be challenged without the sort of absolute proof provided by fissionable material.

## **Reactor and More?**

Yet reports that fissionable material of some sort was involved in the raid persist, and there are a ways in which these reports could be reconciled with the ABC story. The October third edition of Britain’s Spectator carried a more detailed account of the fate of the North Korean shipment of “cement” than earlier reports. This is the same article, by the way, in which “a very senior British ministerial source” said we’d come close to “world war three that day.”

According to the Spectator, the Israelis tracked the North Korean “cement” shipment to the same site that had already been under intense Israeli surveillance as a possible nuclear installation (i.e. the incomplete reactor). It was at this point, just days before the attack, that elite Israeli commandoes were dispatched to collect the soil samples that indicated the ship cargo had been nuclear (and, according to the London Sunday Times, of North Korean origin). So it’s possible that the ABC report and the report from the Spectator could both be correct. The U.S. may have worried through the summer months about attacking the nascent reactor because of the lack of fissile material (and also for fear of what a raid would do to the six-party talks). Yet the arrival of the North Korean shipment of “cement” three days before the attack, and the subsequent Israeli soil samples, may have turned the tide and led the U.S. to approve what the Israelis at that point surely felt compelled to do.

## **Conclusions**

Our examination of diverse news accounts of the Israeli raid on the Syrian nuclear facility yields several conclusions. First, there is significant evidence of ongoing and recent North Korean involvement. Especially given the informed criticisms of Hoekstra and Ros-Lehtinen, apparent efforts by select administration sources to downplay North Korean involvement appear unconvincing. Second,

especially in light of the informed concerns expressed by Hoekstra and Ros-Lehtinen, but also in light of press accounts, there is reason to fear significant Iranian involvement in Syria's nuclear program, either as a facilitator, as a destination for North Korean nuclear material transiting Syria, or both. Third, there is at least some significant evidence for direct North Korean transfer of fissile material — perhaps even a nuclear warhead — to Syria and/or Iran. That, of course, would constitute the most serious possible violation of the six-party agreement, and would be a grave threat to the security of the United States and the world.

In light of this evidence, should Congress now oppose America's nuclear agreement with North Korea? And along with North Korea, should Iran be held to account in this affair? Perhaps. In any case, based on an analysis of press reports, and on the informed protests of Representatives Peter Hoekstra and Ileana Ros-Lehtinen, it's clear that we need more open information before we can confidently sign on to the six-party agreement. At a minimum, the scope of congressional briefings on the Israeli raid needs to substantially increase.

## **Phantoms Over Syria**

Everything Israel wants you to know about its secret airstrike

by Philip Giraldi

October 22, 2007 Issue

On Sept. 6, Israeli F-15s and F-16s attacked a site near Dayr az-Zawr in northern Syria, though the strike wasn't confirmed for nearly two weeks. The Washington Post reported on Sept. 13 that according to a former Israeli official, "it was an attack against a facility capable of making unconventional weapons." Two days later, Syria had an accomplice: "Israel had recently provided the United States with evidence—known by the code name 'Orchard,'" the Post reported, "that North Korea has been cooperating with Syria on a nuclear facility."

Beyond that, details are sketchy—perhaps deliberately so. On Sept. 19, former Israeli Prime Minister Benjamin Netanyahu acknowledged the attack, but said it was "too early to discuss this subject." Pressed at a White House news conference the following day, President Bush twice refused to comment—though he did warn North Korea about selling nuclear weapons or expertise.

American intelligence has been unable to confirm the existence of any Syrian nuclear program, and the Post admitted, "[M]any outside nuclear experts have expressed skepticism that Syria, which has mostly focused on chemical and biological weapons, would be conducting nuclear trade with North Korea." But facts may not be prime property in this situation.

In the intelligence community, a disinformation operation is a calculated attempt to convince an audience that falsehoods about an adversary are true, either to discredit him or, in an extreme case, to justify military action. When such a campaign is properly conducted, information is leaked to numerous outlets over a period of time, creating the impression of a media consensus that the story is true, as each new report validates earlier ones.

We've been here before: the leaking of unreliable information to New York Times reporter Judith Miller was just one example of disinformation used to make the case for the invasion of Iraq. More recently, Iran has been on the receiving end of what appears to be an officially orchestrated but poorly executed disinformation campaign regarding its involvement in Iraq and Afghanistan. Now a new operation—brought to us by the old players—may be unfolding.

A chronology of the case against Syria is revealing, and the role of former UN ambassador and leading neoconservative John Bolton is key. Bolton, now at the American Enterprise Institute, has repeatedly clashed with the intelligence community over the issue of Syrian intentions, most notably in 2002 and 2003 when he was undersecretary of state for arms control. At one point, Bolton was forced to strike from a speech language suggesting that Syria had a nuclear program. On another occasion, Bolton's judgments on Syria were challenged by Robert Hutchings, director of the National Intelligence Council, who charged that Bolton "took isolated facts and made much more of them ... cherry picking ... to present the starkest possible case."

On Aug. 31, one week before the Israeli attack on Syria, Bolton wrote an op-ed for the Wall Street Journal that concluded, “We know that both Iran and Syria have long cooperated with North Korea on ballistic-missile programs, and the prospect of cooperation on nuclear matters is not far-fetched. Whether and to what extent Iran, Syria or others might be ‘safe havens’ for North Korea’s nuclear-weapons development, or may have already benefited from it, must be made clear.” Perhaps this was just good timing. Perhaps it was something more—possibly representing information provided by Bolton’s excellent contacts within the Israeli government.

Comments made by a State Department official on Sept. 14, in the wake of the Israeli attack, bolstered the neoconservative argument that Syria is a serious threat. Andrew Semmel, acting deputy assistant secretary of state for nuclear non-proliferation policy, stated that Syria was on the U.S. nuclear “watch list” and that Damascus “might have” a number of “secret suppliers” from which to obtain nuclear equipment as part of a covert program.

Across the Atlantic, on Sept. 16, the Murdoch-owned Sunday Times of London published an extremely detailed story on the attack that clearly derived from Israeli sources. The piece unambiguously portrayed the bombing as “a successful Israeli raid on nuclear material supplied by North Korea.” A Sept. 23 follow-up claimed that before the site was bombed, an Israeli commando unit had seized nuclear material, which had been tested and confirmed to be of North Korean origin. A second story headlined “Snatched: Israeli commandos ‘nuclear’ raid” also appearing in the Times on the same day, under the same byline, provided additional details, noting that Syria, Iran, and North Korea now constitute a new “axis of evil.” It also quoted David Schenker, of the neocon Washington Institute for Near East Policy, who described Syria as a “client” of Iran.

On Sept. 18, Bolton resurfaced, telling an Israeli journalist that the United States would stand behind any preemptive attack by Tel Aviv on neighboring countries believed to have nuclear-weapons programs. The Wall Street Journal added a piece by editorial board member Bret Stephens asserting that the bombing in Syria was a reprise of the 1981 Israeli attack on Iraq’s Osirak nuclear reactor.

By Sept. 21, the Washington Post also appeared to be convinced by the story, featuring a front-page headline “Israel, US Shared Data on Suspected Nuclear Site.” The article stated that Israel provided intelligence to President Bush during the summer indicating that North Korean nuclear experts were in Syria. Bush was reportedly “troubled” by the information. The Post added, citing anonymous sources, that “the United States is believed to have provided Israel with some corroboration of the original intelligence before Israel proceeded with the raid,” but then, farther down in the article, the Post conceded, “The quality of the Israeli intelligence, the extent of North Korean assistance and the seriousness of the Syrian effort are uncertain...” To give the story even greater resonance, leading neoconservative Charles Krauthammer, in his column in the same issue, accepted as fact that Damascus was pursuing nuclear capability and warned that Israel will not accept a “nuclear Syria.”

In the days that followed, the New York Times offered a more measured headline: “Israeli Raid on Syria Fuels Debate on Weapons” and referred to allegations about Syria’s weapons program as “Israel’s private claims,” noting, “American officials have been extremely cautious about endorsing the Israeli conclusion.” Other outlets also picked up the story, but even those that were careful left the impression that Syria was seeking to obtain nuclear weapons, and North Korea was suspected of having supplied materials.

The pieces have a common thread: they rely entirely on information provided by Israeli sources without independent corroboration. And the ongoing play they are getting in the international media, without much critical commentary and without direct attribution to Israel, mark them as classic disinformation.

A review of the sources for the various stories and the descriptions of them reveals a great deal of ambiguity in the claims being made. The frequently cited Andrew Semmel's apparently damning comments are laced with expressions like "possible," "may have," and "may have been." What Semmel is actually saying is that nearly all of the information he has comes from Israel and cannot be verified. The conveniently anonymous sources who claim to the Washington Post that the U.S. is "believed" to have provided corroboration for Israeli intelligence are clearly unable to state whether it did or didn't, rendering the comment little more than opinion. The Post editor who crafted the headline asserting that there was a "sharing" of information was disturbingly clueless or deliberately misleading as there was no evidence produced in the article or elsewhere to indicate that any American intelligence agency could confirm the Israeli allegations. Any "sharing" went only in one direction: from Israel to Washington.

Also lost in the shuffle is the fact that Syria has vehemently denied having any nuclear-weapons program, and North Korea isn't known to have ever exported nuclear technology or material. The prevailing consensus is that Syria does not have an economic or technical base that would enable it to develop a nuclear weapon even if someone handed it the fissile material. The feverish imagination of John Bolton aside, even Syria's enemies concede that there has been no evidence of nuclear-weapons development. It has but a small Chinese-built research reactor that, by one account, is less capable than those in use at a number of American universities.

There are other reasons that depicting Damascus as the latest nuclear aspirant is suspect. Destroying a weapons facility would scatter traces of radioactive material that could be detected, especially since the attack took place close to the Turkish border. No such evidence has been reported. Also notable is the absence of solid intelligence. If Israel knows conclusively that Syria has a nuclear program, surely it would have made its case in the wake of the Sept. 6 raid. Far from doing so, Tel Aviv has kept a security lid on the incident, suggesting that it would prefer to promote the story of a military success against Damascus without being too specific about the details.

Even the Bush White House, generally willing to use any hint of malfeasance to condemn Damascus and Tehran, has been reluctant to confirm the story. It doesn't need to. Official silence—narrated by a compliant press taking uncorroborated dictation—is cementing a public impression. That's the way disinformation works. Done right, no one stops to ask where it came from—or who benefits.

#### PRIMARY SOURCE

### **Bombing North Korea in Syria?**

Former U.N. ambassador John Bolton talks about pre-emptive strikes on Syria and Iran, and a shady North Korean connection in the Middle Eastern desert.

October 30, 2007

John Bolton, the controversial and spectacularly mustachioed former U.S. ambassador to the United Nations, has a new book out, with the curiously embattled title of "Surrender Is Not an Option: Defending America at the United Nations ." At an Oct. 30 meeting with The Times' editorial board, he said that the book shows how "in September and October of 2004, [Colin] Powell tried to reverse the policy on Iran to be more accommodating to the Europeans, and I was able to stop that, along with some other people. Only to find out when [Condoleezza] Rice came in, she went and changed the policy anyway even though at the time she agreed with my assessment that Powell had been moving in the wrong direction."

Hawky stuff. And plenty more where that came from.

(On North Koreans allegedly helping build nukes in Syria.)

**Bolton:** The Israeli raid on Syria on September the sixth has already raised questions whether during the entire life of the six-party talks North Korea may have been cloning its Yongbyon nuclear reactor in Syria. Which is a, uh, which is a way of, uh, avoiding inspection even better perhaps than building facilities and caves in North Korea, because if the inspectors are only looking in North Korea, and you've created a facility in Syria, it's not likely they're going to find it. [...]

[T]hese unanswered questions about what the North Koreans are doing in the Syrian desert [are] so important. Because if they were building an entirely new reactor in cooperation with Syria, in cooperation with Iran or whatever, they're really much further along in protecting that technology than allowing inspectors in Yongbyon.

**Tim Cavanaugh:** What's the evidence of North Korean involvement with the Syrian reactor, the Syrian project?

**Bolton:** Most of it is circumstantial at this point. And that's one reason why I think it's important that the administration, or the Israelis or somebody, tell us more of what they learned there. The first thing that struck me was that within a few days, maybe even a few hours after the Israeli raid, the North Koreans issued a press release condemning it. You know, because of their deep and abiding interest in events in the Syrian desert.

My gut reaction, and it wasn't anything more than that, was that it probably meant that North Korean personnel had been killed or wounded in the raid. And you know it's a perfectly human bureaucratic response; if your people get killed, you know, you at least can, you issue a statement that condemns the raid. But it would mean that there was a defect that allowed the statement to be issued even before North Korea could say we want silence on the thing. There have since been several very high-level visits between Syrian and North Korea, which is unusual--

**Marjorie Miller:** Where were those?

**Bolton:** Between Pyongyang and Damascus.

Miller: But which way; both ways?

**Bolton:** Both ways. One Syrian went to Pyongyang, and a high-level North Korean official I think recently traveled to Damascus. Um, there were press reports that there had been a North Korean ship, a North Korean flagship that offloaded cargo in Syria a few days before the raid. Um, and I think the official Syrian comment on that was that it was a cargo of cement, which brought back to me the interdiction of a North Korean ship going to Yemen in late 2002, the So San, where Spanish naval personnel interdicted the ship, and the master of the ship said "We're just carrying cement bags," so the Spaniards dug through 15 layers of cement bags until they found crates with a dozen Scud missiles in them. So when I heard "North Korean ship heading to the Middle East with a cargo of cement," that rang that bell.

And now you've seen these, I'm sure these overhead photographs of a facility that a lot of independent experts have said looks suspiciously like the Yongbyon facility in terms of dimensions. [...]

The fact is that it's pretty clear that the reactor has been under construction for some time, and what that means is that if it is a reactor, if it was North Korean in origin, that the North Koreans have been building this facility during the entire duration of the six-party talks. Now there are plenty of things we don't know about it, and I think the most important is whether there were North Korean personnel working at this site in Syria subsequent to the February agreement this year, because that would indicate typical North Korean duplicity in promising to give up their nuclear program when in fact they're cloning it in a different location. [...]

(On pre-emptive strikes to take out nuke plants.)

**Michael McGough:** Ambassador, is there some middle ground between what we've been doing, which you think is too accommodationist, and then the sort of freelancing approach of the Israelis, to just sort of bomb things? Is there any middle ground to get North Korea and Iran to comply, and to be more transparent about what they're doing with, you know, nuclear programs that may or may not be designed to culminate in a nuclear weapon?

**Bolton:** Well, I don't think the Israelis were acting in an irresponsible fashion. They obviously had intelligence that told them this was a very high-value target, and given the tensions that we currently have in the Middle East, I don't think they would have taken military action unless they felt it was absolutely critical to go after this target. I have heard, and I think now it's been reported, that the Israelis actually came to us in the spring of this year, and said "We have a problem with this facility," and that they were prepared to take action then. The U.S. said, "Well, we don't want you to do that, we want more information" or whatever, and the Israelis said that they would withhold until, but not later until the fall. Which appears to be what they did by the September the sixth raid.

So I don't think they acted precipitously, and indeed it raises a real question: If this location was actually under construction since 2000, 2001, why it is that we weren't aware of it, and more concerned about it than we have been?

But the issue for states like Iran and North Korea is whether they will ever voluntarily give up their nuclear weapons program, and I don't think -- for different reasons, they're two very different cases -- but I don't think that either one of them are going to be chatted out of their nuclear capability. For both of them it represents a trump card for the regime, and it's the way the long negotiations that we've had in both cases -- the six-party talks in the case of Korea, and the EU three negotiations in the cases of Iran, have really worked to the benefit of North Korea and Iran, respectively. Because the negotiations have given the proliferators what they need most and can't purchase for any price, and that's time. Time is almost always on the side of the proliferators, and for four years now North Korea was advancing its program and Iran was advancing its program. To the point where our options in both cases are very constrained and not very happy ones.

So I'm not saying that that is invariably the case, but in the case of governments like these I think that's the answer.

**Miller:** Is there a viable military option regarding Iran, and if so who is articulating that outside and inside the administration?

Bolton: I think there is a viable military option, I don't think it's a happy option. I don't like being in this position; my preference would have been to have indigenous forces inside Iran change the regime. Because I think there is historical experience at a time of massive change in regime of governments giving up pursuit of nuclear weapons. When the apartheid government in South Africa was replaced by a democratic government, the new government said we're giving up nuclear weapons. When the Soviet Union fell apart, Ukraine, Kazakhstan and Belarus all said, "We're gonna transport, we're gonna give back Soviet nuclear weapons to the Russian federation." And that same possibility exists I think in Iran. But regime change doesn't happen overnight, and because of this four-plus years of failed European negotiation, given the progress that Iran has made scientifically and technologically, we're now close to a point where the use of force may be the only alternative available in a realistic time frame to prevent Iran from getting nuclear weapons.

This is not, this, and as I say it's a very unhappy option to have to contemplate, but life is about choices, and if the choice is between an Iran with nuclear weapons, and the use of a limited amount of force to prevent that, then I think you have to look at the amount of force.

**Miller:** But what does that look like? What do you attack, what do you accomplish in a military solution?

**Bolton:** Well first it doesn't look anything like Iraq. It does not involve the use of American ground forces in anything like the Iraq context. I think what you have to do is break Iran's mastery over the nuclear fuel cycle at one or more critical points.

## **Bush's North Korea Meltdown**

By John R. Bolton

The Wall Street Journal

October 31, 2007

Facts about Israel's Sept. 6 raid on a suspected nuclear facility in Syria continue to emerge -- albeit still incompletely, especially regarding the involvement of the Democratic People's Republic of (North) Korea. Important questions remain, such as whether its personnel were present when the attack occurred, and whether they had been working to clone the Yongbyon nuclear facility in the Syrian desert since the North Korean commitment in February (the latest in a long series) to give up its nuclear programs.

Seemingly unperturbed, however, the Bush administration apparently believes North Korea is serious this time, unlike all the others. The concessions continue to flow in essentially only one direction, crossing repeated "red lines" Washington had drawn.

These include: (1) the humiliating U.S. collapse on North Korea's access to international financial markets; (2) accepting a mere "freeze" of Yongbyon (misleadingly called "disablement" by the administration) rather than real dismantlement; (3) failing to ensure enforcement of U.N. Security Council Resolution 1718's sanctions, imposed after Pyongyang's nuclear test; and (4) the State Department's palpable hunger to remove North Korea from the list of state sponsors of terrorism and the Trading With the Enemy Act's prohibitions, and re-establish full diplomatic relations.

The Bush administration's most serious concession is forthcoming, in which the U.S. will accept, with little or no concrete verification, Pyongyang's imminent declaration that it actually has very little nuclear activity other than what we have long known about at Yongbyon.

Even critics from the left now worry that State is conceding far more than it should. Jack Pritchard, the special envoy for negotiations with North Korea who resigned during Secretary of State Colin Powell's tenure because our policy was too unyielding, said recently that North Korean officials think "they can ask for and get what they want from the Bush administration because [it] is so eager to demonstrate a diplomatic achievement." Mr. Pritchard concluded, "The North Koreans are rubbing their hands together with glee."

Our current Secretary of State, Condoleezza Rice, and other partisans of the six-party talks respond to all internal administration complaints or criticisms by asking, "What is your alternative? What would you have us do otherwise, risk war on the Peninsula?" Herewith, some responses:

First, it is simply inapposite to judge every tactical decision -- to accede or stand firm on this or that subsidiary point -- by forecasting the complete demise of the entire six-party process if North Korean sensibilities are ruffled by occasionally saying "no." Indeed, showing tactical toughness can frequently enhance the long-term prospects for success, not reduce them. Sadly, however, toughness at the tactical or strategic level is no longer the hallmark of our North Korea policy. Weakness is the watchword.

Second, before it is too late, President Bush has to draw a deep line in the sand on verification. The State Department has yet to say anything publicly about how verification will be accomplished,

especially on the North's uranium-enrichment efforts, giving rise to the suspicion that our negotiators don't really have a clue what they mean. The idea of North Korea for years engaged in cloning Yongbyon in Syria (or anywhere else -- Burma, for instance) should be a fire bell in the night. President Reagan's mantra of "trust but verify" in the Cold War days didn't offend anyone, and if it offends Kim Jong Il, that should tell us something. If anything, however, with North Korea, President Bush should reverse Reagan's order: Let's see real verification, and leave trust until later.

Third, consider the severely negative effect these repeated concessions have on our relations with Japan and South Korea. President Bush used to stress that this was a "six-party" process, but now all of the action is bilateral. The State Department's lust to remove North Korea from the terrorism list is having a profoundly negative impact on our treaty ally, Japan, the nation most directly threatened by Pyongyang's nuclear capability. Thomas Schieffer, the Bush administration's ambassador to Japan, reportedly complained recently to the president that he was "cut out of the process." State should explain why it trusts North Korea more than our ambassador to Tokyo, and why we ignore Tokyo's concerns over North Korea's kidnappings of Japanese citizens.

South Korea is facing a critical presidential election in December. The last thing Washington should do is pursue concessionary policies that might enhance the prospects for a new president who follows the same appeasement line as incumbent President Roh Moo-hyun. If South Korea can discard Mr. Roh's rose-colored glasses, our overall prospects will improve considerably, but our unquestioning embrace of North Korea could have exactly the wrong impact in the South's volatile politics.

Fourth, and most importantly, the right response to the North Korean threat is to apply pressure steadily and consistently, rather than hastily releasing it. After its nuclear test, Pyongyang faced growing pressure from the cumulative impact of Chinese anger, U.N. Security Council sanctions, ongoing implementation of the Proliferation Security Initiative (PSI), and the U.S. Treasury's continuing financial squeeze.

There was a plan, of sorts, and it was producing some evidence of success. Instead of squeezing harder, such as by encouraging refugee flows out of the North, the administration did a U-turn. It let a desperate North Korea up off the mat, provided tangible economic support for this appallingly authoritarian regime, allowed Kim Jong Il to re-legitimize himself, and undercut the PSI world-wide.

The icing on Kim's cake is that for years -- before, during and after the 2005 and 2007 "agreements" -- North Korea was happily violating its commitments. Instead of focusing China on solving the problem of the regime it has propped up for so long, we absolved China, sidelined Japan, inserted ourselves and started life-support for the administrators of the world's largest prison camp.

This will perpetuate the North Korean problem, not solve it. Any by perpetuating Kim Jong Il's regime, and its continuing threat, it is actually the State Department's policy that poses the greater risk to international peace and security. This is true not only for Pyongyang, but for other would-be proliferators watching our ongoing failure to stop North Korea.

The debate within the Bush administration is not yet over, although time is short before irreparable harm is done. Growing restiveness in Congress among Republicans and Democrats may increasingly become a factor. For President Bush, I can only hope he re-reads his first term speeches on North Korea.

Mr. Bolton serves on the American Conservative Union's Board of Directors, is a senior fellow at the American Enterprise Institute, and is the author of "Surrender Is Not an Option: Defending America at the United Nations," out next week from Simon & Schuster/Threshold Editions.

## **Making Sense of Israel's Raid Into Syria**

National Public Radio

Day to Day: **October 31, 2007**

MADELEINE BRAND, host:

This is DAY TO DAY.

*[deletia]*

ALEX CHADWICK, host:

I'm Alex Chadwick.

First, to the deepening mystery about Israel's alleged air raid into Syria last month.

A series of satellite photos have come to light in recent days that may or may not show what might or might not be a Syrian nuclear facility that Israel could or could not have bombed last month.

NPR diplomatic correspondent Mike Shuster is here to make sense of what we know and don't know.

Mike, I see deepening mystery. It's already so deep. How can it get much deeper?

SHUSTER: Making sense of it is very difficult, Alex. The only thing that we really do know is that the Israelis did mount an air strike on a target in Syria, somewhere in the eastern desert of Syria on September 6th.

Beyond that, actually, it's all been speculation, speculation that has dribbled out from alleged Israeli and perhaps American intelligence reports about what the site was. It took weeks to focus on what the - what was actually in these alleged intelligence reports. It's - now it appears that the intelligence reports say that it was something having to do with nuclear activity. Beyond that, we don't know really anything about this.

CHADWICK: But I hear the two words North Korea attached to this.

SHUSTER: Yeah. Well, if you attach North Korea to almost any allegation about nuclear activity anywhere in the world, it certainly gets much more attention, and in fact the alleged Israeli intelligence accounts suggested that there might be some kind of a North Korean link, which apparently got the attention of the Bush administration.

CHADWICK: And what about these satellite photos? Now, there have been a series of them.

SHUSTER: Very interesting. Now, we're talking here about commercial satellite imagery that is in the public domain, and some pictures of a site in Syria near the Euphrates River surfaced in August, and then in late October the same site, and in August, there was some kind of construction going on. There

was a large square building. In late October there was nothing there. It had been erased. So this focused attention on whether this really was the site the Israelis had bombed because something had happened to remove the construction that had been there before.

But what we didn't see was satellite imagery from right after September 6th, in the week or 10 days afterwards, which if it had been rubble could have confirmed that there was an Israeli attack and might have given some hints as to what's inside that large building, because we have no public information about what's inside that building or what was inside that building.

CHADWICK: You know, I've seen these photographs, or at least a couple of them. Some expert on the subject said that building looks like it could be a North Korean nuclear sort of building; and I looked at the thing, I said come on, it's a square building. What is...

SHUSTER: I mean, you're exactly right. There is a building that looks like it in Yangbian in North Korea, where there is a nuclear reactor inside North Korea.

But without actual pictures from inside or after the strike before the site was cleaned up, there can't be any definitive determination that this was a nuclear reactor, let alone that it was a nuclear reactor along the lines of a model that the North Koreans might have provided for Syria.

CHADWICK: Okay. Now, these photographs that you're talking about, these are photographs from quite recent past, going back to August. But suddenly people are talking about yet another satellite photograph, also commercial satellite photograph, I think, that goes back years.

SHUSTER: That's right. To 2003. It turns out that there was a photograph of this site in the public domain in 2003, which suggests that construction started there in 2003. And what we've actually learned since that time is that there was intelligence analysis on the part of the U.S. intelligence community about that site in 2003. And the analysts were skeptical that this had anything to do with nuclear activity on the part of Syria.

So this raises the question as to just how good the Israeli interpretation was four years later.

CHADWICK: Well, what is going on in the background that we're not hearing? What are diplomats saying about this? What's the intelligence community saying about this? It's been, what, six weeks now since the alleged raid. What's going on?

SHUSTER: Well, the fundamental question is what was this for? Was this really to destroy a nuclear capability on the part of the Syrians or to send a signal to Iran? And that's what really everybody is talking about, whether the clock is ticking on an Israeli - potential Israeli attack on nuclear sites in Iran.

CHADWICK: NPR diplomatic correspondent Mike Shuster. Mike, thank you.

SHUSTER: You're welcome, Alex.

## **The Curious Incident in Northern Syria and Its Potential Proliferation Implications**

Prepared Remarks by Daryl G. Kimball, Executive Director, Arms Control Association

### **For the Korea Economic Institute Forum, “What If They Did It? North Korea, Syria, and Nuclear Proliferation,” November 1, 2007**

Nearly two months after Israel’s Sept. 6, 2007 raid on a facility in Northern Syria, there is suggestive but ultimately inconclusive evidence that it may have been a small reactor still under construction. Opponents of the six-party process toward the verifiable denuclearization of North Korea are suggesting that possible North Korean involvement may provide reason for a shift in policy regarding the six-party talks and the implementation of the steps outlined in the October 3 joint statement.

Indeed, any North Korean assistance involving the export or technical training, advice, services, or assistance related to items on the trigger list of the Nuclear Suppliers Group would violate North Korea’s and the recipient state’s obligations under UN Security Council Resolution 1718 of October 14, 2006 “to cease the export” of items “which could contribute to DPRK’s nuclear-related, ballistic missile-related, or other weapons of mass destruction related programmes.”

Furthermore, in the recent six-party talks statement of October 3, 2007: “The DPRK reaffirmed its commitment not to transfer nuclear materials, technology, or know-how.” While North Korean assistance may have predated the October 3 statement and even the October 2006 Security Council resolution, it would clearly violate the spirit of its commitments.

The reports citing unnamed sources alleging that the facility was a nuclear reactor and that North Korea might have provided assistance raise extremely troubling questions about Syrian and North Korean behavior. However, I believe that even if there is strong evidence of North Korean complicity, it would be imprudent for the administration or the Congress to take actions or make statements that might scuttle the six party process.

We must recall that in the fall of 2002, the administration accused North Korea of pursuing a uranium enrichment program on the basis of preliminary intelligence assessments that were later revised to reflect that the program was not as advanced as previously believed. Nevertheless, the United States decided at the time to cut-off heavy fuel oil shipments that were part of the Agreed Framework – an agreement some in the Bush administration were only too eager to rip apart. As a result, North Korea kicked out IAEA inspectors, restarted plutonium operations, produced enough fissile material for about 10 bombs, and, in 2006, engaged in an orgy of missile flight testing, and set off a nuclear test explosion.

In the final analysis, U.S. policymakers must weigh whether the risk posed by the possible construction of a Syrian research reactor and possible North Korean assistance warrants the possible delay in verifiably dismantling a known and greater threat: North Korea’s own research reactor; reprocessing plant, and accounting for and taking out of circulation whatever nuclear bombs, nuclear bomb material, and uranium enrichment equipment North Korea may have.

This does not mean that the U.S. policymakers cannot be “tactically tough” as John Bolton argues they should, it just means that their response needs to be carefully calibrated and must amount to more than overheated rhetoric and name-calling.

If Syria was indeed building a reactor and if North Korea was involved, there are other steps the United States could – and should – take to hold the DPRK accountable and ensure that Pyongyang provides no further nuclear assistance to other states without derailing the prospects of verifiably dismantling North Korea’s nuclear program and risking the possibility of further North Korean proliferation transgressions. I’ll go into further detail about this in a few minutes.

In addition, if there is or was credible U.S. or foreign intelligence information or other evidence that Syria was engaged in building a reactor, I believe it should have been presented to the IAEA and/or the Security Council for evaluation so that a collective response – and follow up investigation -- could be undertaken.

As a signatory to the nuclear Nonproliferation Treaty under comprehensive IAEA safeguards, Syria is obligated under the current interpretation of paragraph 42 of its comprehensive IAEA safeguards agreement (INFCIRC/153) to provide design information on new facilities to the Agency as soon as the decision to construct or authorize construction of a new facility is taken (i.e. well before construction actually begins) in order to create confidence in the peaceful purpose of the facility and to provide adequate lead-time for safeguards preparations.(1)

If Israel or the United States had information suggesting Syria was building a reactor or some other prohibited item, it could have informed the IAEA and/or the Security Council, which could then – and could still -- call upon on Syria to clarify the purpose of the facility and possibly lead to an IAEA investigation and visit to the site.

This is essentially what the United States did in 2002 with information that surfaced about Iran’s unreported nuclear activities at the Natanz site.

Such an investigation could have been and could still be immensely useful not only in understanding the nature of the facility but also the sources of assistance. We must consider that North Korea may not have been the main or sole supplier of nuclear technology and components. Syria is of course suspected of having received assistance from the A.Q. Khan network.(2)

Utilizing the Agency to draw attention to a possible Syrian violation of safeguards would put Syria on the defensive and strengthen the credibility of the institution as an effective and legitimate instrument in monitoring and enforcing compliance at a time when the Security Council and the IAEA are at odds with Iran.

Such a message might also have been more helpful in persuading Iran to suspend its uranium enrichment program, come clean about its nuclear program, and agree to a diplomatic resolution.

In addition, the failure of any state to report any information to the IAEA about possible nuclear safeguards violations, and Israel’s “strike first, ask questions later approach” are also worrisome and unwise and undermine the authority of the IAEA in sifting out the truth in Iran and elsewhere.

## Knowns and Unknowns

While there are still more questions than answers at this point, it is important to sift out the “knowns” from the “unknowns.”

Based on that, we might draw some preliminary conclusions, formulate some reasonable hypotheses that might help explain events that have unfolded to date, and consider what should and should not be done in response to these possibilities.

What we “know” is this:

- Syria and Israel have acknowledged there was a strike on a “military facility” in Syria.
- Satellite imagery suggests the facility could have been a small research reactor similar in design to the 5 megawatt North Korean reactor at Yongbyon. Such a facility by itself would not constitute a clear and imminent danger to either Israel or the United States given that Syria would also need to have a plutonium reprocessing facility to harvest plutonium for a weapon. Syria already possesses a very small research reactor under IAEA safeguards.
- We know from commercial satellite imagery that Syria cleared the site after the raid. By itself, this proves little, though it certainly raises suspicions that Syria is trying to remove evidence that the structure could have been used to house a reactor or something else it doesn’t want others to see. The raid itself and Syria’s clearing of the site clearly would complicate any on site investigation by the IAEA or others to determine whether a reactor was under construction.
- Commercial satellite photos also indicate that construction on the main building was well underway in Sept. 2003, which means Syria may have received assistance sometime before that date. This also likely means that the site has been under Western satellite surveillance for some time and it suggests that U.S. intelligence analysts did not believe that it was a reactor or some other missile or WMD-related facility.
- Some press reports quote unnamed officials saying that North Korean nationals were present at the site. Acting Deputy Assistant Secretary of State for Nuclear Nonproliferation Andrew Semmel also told reporters on Sept. 14: “There are North Korean people there. There’s no question about that,” adding “[j]ust as there are a lot of North Koreans in Iraq and Iran.” Semmel did not clarify what sort of activities the North Koreans were conducting in Syria. This suggests that any information about North Koreans at the site would most likely have come from a human intelligence source or sources, which are not always reliable or precise.
- This is not the first time there has been a controversy over intelligence assessments concerning the Syrian nuclear program. You might recall that Knight Ridder newspapers, The New York Times, The Washington Post, and others reported that in 2003, Undersecretary of State John Bolton was forced to call off congressional testimony because members of the intelligence community were concerned that Bolton was prepared to assert stronger claims regarding concerns over Syria’s pursuit of nuclear weapons than was warranted by the intelligence.(3)
- We know that only the top Congressional intelligence and foreign affairs committee members have been briefed by the U.S. intelligence community on the incident. And two of them, Reps. Hoekstra and Ros-Lehtinen, complained bitterly in an Oct. 21 op-ed in The Wall Street Journal that “until Congress is fully briefed, it would be imprudent for the administration to move forward with agreements with state proliferators.”

- We also know that Administration officials, while declining to publicly comment on the incident itself, have said that the six-party disarmament deal with North Korea would not go ahead if North Korea was found to be smuggling nuclear arms, equipment or know-how abroad.

Asked at a Capitol Hill hearing on Oct. 25 by Democratic Representative David Scott of Georgia if the issue of the Syrian facility had been brought up in disarmament talks with North Korea, Assistant Secretary of State for East Asian and Pacific Affairs, Christopher Hill said: "Yes, I have raised this issue."

During a Sept. 20 press conference, President Bush was asked a question about the Syrian raid and reports of North Korean involvement to which he said: "to the extent that they are proliferating, we expect them to stop that proliferation, if they want the six-party talks to be successful."

### **What May Explain the Events That have Unfolded to Date: Two Theories**

So, what actually might have gone on and why is the administration maintaining official silence on the matter?

If Syria was building a nuclear reactor or some other nuclear facility and if North Korea was involved, what is the appropriate course of action to prevent further proliferation of the kind, while simultaneously ensuring that North Korea's current commitments under the October 3 implementation agreement for the disablement of its nuclear facilities and full declaration of its nuclear program go forward?

Should Congress be fully briefed? What should be done to uncover what Syria was up to and who might have provided illicit equipment and know-how?

Based on what is in the public domain there seem to be two plausible theories:

**Theory 1.** Given that the Syrian facility was under surveillance and construction for some time and given that the U.S. intelligence community apparently did not believe that it was a nuclear-related project, senior U.S. officials were not confident enough to confront Syria publicly with the charge. Recall the 2003 debate about how to characterize the Syrian nuclear program. Likewise, given that the information suggesting a North Korean presence at the site would likely have come from a human intelligence source or sources, senior U.S. officials might not have had high enough confidence in the information to publicly accuse North Korea of violating its nuclear non-assistance pledges.

Still, based on statements by Christopher Hill and President Bush, it is clear that the matter has been pursued with the North Koreans privately and that the Bush administration has probably already made it clear that if North Korea wants to see the six-party agreement implemented, including removing the DPRK from the state sponsors of terrorism list, North Korea cannot be engaged in any proliferation activity.

If the administration has not already done so, it should demand that the "complete and correct declaration of all of North Korea's nuclear programs" -- as called for in the Feb. 13 2007 and Oct. 3 six-party statements -- must include a full accounting of all North Korean nuclear-related commerce or technical assistance to other states or non-state actors.

**Theory 2.** It is also possible that the United States government has information that more clearly demonstrates Syrian nuclear activity at the site and direct involvement by the North Koreans. Even if this is the case, the administration may be forging ahead with the six-party process and taking the matter up with North Korea privately because they correctly understand the value of using the six-party process to verifiably dismantle North Korea's nuclear program and snuff-out its proliferation activities rather than publicly taking issue with North Korea on the matter and risking the possibility that they will deny their involvement, if only to save face.

As Christopher Hill told reporters Sept. 14: "The reason we have the six-party process and the reason we have put together a number of pretty serious countries in this process is to make sure that the North Koreans get out of the nuclear business."

### **Congress' Role**

Under either scenario, it is important that the administration brief relevant Congressional members and committees sooner than later. While there are clearly some members of Congress who will seek to use this incident to undercut support for the appropriation of funds to provide North Korea with heavy fuel oil as called for in the six-party agreement, Congressional support for the administration's policy and the six-party process will likely erode if they are kept in the dark.

Eventually, Congress and possibly the rest of us will find out more about the events surrounding the Israeli raid and the target – either through official channels or from someone like Glenn Kessler. It is important to note that when there are lives at stake, sources to protect, or ongoing intelligence activities underway, there may good reason to delay providing Congress with a full accounting. However, we are now almost two months beyond the Sept. 6 raid and it is difficult to understand why other members of Congress have not yet been briefed.

Furthermore, even if North Korea was engaged in ongoing proliferation activity, it is likely that the administration could persuade Congress that they should not jeopardize the larger aims of the six-party process by withholding support for heavy fuel oil shipments. Rather, the administration could future "benefits," such as removal of North Korea from the state sponsor of terrorism list, if it does not fully account for its nuclear program and cease all foreign nuclear and missile assistance.

### **Conclusions**

So in conclusion, what if North Korea and Syria were colluding on a secret nuclear project?

1. It should be condemned and the IAEA should request access to the site and be provided relevant information from other states as part of an investigation.
2. The Bush administration and Congress should agree to use – not abandon the six party process to ensure that North Korea is no longer engaged in such activities.
3. The Bush administration should brief Congress about the episode in order to solidify support for the six party denuclearization agreement and any actions the administration may pursue through the IAEA Board of Governors and/or the Security Council regarding possible Syrian nuclear activities.

Thank you.

1. Prior to 1992, the phrase in para 42 of the IAEA's comprehensive safeguards agreement (INFCIRC/153), which reads "as early as possible before nuclear material is introduced into a new facility" was translated into meaning that design information for new nuclear facilities needed to be

provided to the Agency "no later than 6 months before the introduction of nuclear material into a new facility". This interpretation was included in the General Parts of the Subsidiary Arrangements that are attached to each comprehensive safeguards agreement.

As a safeguards strengthening measure, the Board agreed to a new interpretation of paragraph 42 proposed by the Secretariat in February 1992 (GOV/2554/Att.2/Rev. 2), which requires that design information on new facilities be provided to the Agency as soon as the decision to construct or authorize construction of a new facility is taken (i.e. well before construction actually begins) in order to create confidence in the peaceful purpose of the facility and to provide adequate lead-time for safeguards preparations. All non-nuclear weapon state NPT parties under comprehensive safeguards were also required to adapt their related Subsidiary Arrangements to take into account the new interpretation.

2. Acting Deputy Assistant Secretary of State for Nuclear Nonproliferation Andy Semmel stated on Sept. 14 that "[w]e do know that there may have been contact between Syria and some secret suppliers for nuclear equipment. Whether anything transpired remains to be seen," further noting that "[w]e're watching very closely."

Semmel's comments mirror a 2004 declassified report to Congress by the director of national intelligence on weapons of mass destruction proliferation. The report, released last year, discusses potential Syrian contacts with the A.Q. Khan network. It indicates that "Pakistani investigators in late January 2004 said they had 'confirmation' of an IAEA allegation that [Abdul Qadeer] Khan offered nuclear technology and hardware to Syria, according to Pakistani press, and we are concerned that expertise or technology could have been transferred. We continue to monitor Syrian nuclear intentions with concern."

3. According to a July 15, Knight Ridder report ("CIA: Assessment of Syria's WMD exaggerated," by Warren P. Strobel and Jonathan S. Landay), "U.S. officials told Knight Ridder that Bolton was prepared to tell members of a House of Representatives International Relations subcommittee that Syria's development of biological, chemical and nuclear weapons had progressed to such a point that they posed a threat to stability in the region. The CIA and other intelligence agencies said that assessment was exaggerated."

James Martin Center for Nonproliferation Studies  
CNS Feature Story

The following story, written by guest contributor Richard Weitz of the Hudson Institute and edited by Leonard S. Spector and Sarah Diehl of the James Martin Center for Nonproliferation Studies, provides a comprehensive look at international reaction to Israel's September 6, 2007, air strike against a site in the Syrian desert, now widely believed to have been a partially completed nuclear reactor.

### **Israeli Airstrike in Syria: International Reactions**

By Richard Weitz, Senior Fellow and Director of Program Management at the Hudson Institute  
November 1, 2007

Much remains unknown about the September 6 incident in which Israeli warplanes entered Syrian air space. Not only do commentators disagree about the various motives of the diverse participants involved, but even the basic facts remain in dispute. Neither the Israeli, Syrian, nor U.S. government has offered a detailed description of what occurred. Outside experts and media commentators have filled the data vacuum by offering their own diverse interpretations about what precisely happened that night.

The mystery surrounding Israel's apparent air strike against Syria on September 6 gave observers considerable leeway to interpret the ambiguous event. Syrian leaders describe the affair as an Israeli stratagem designed to bolster the credibility of Israel's discredited military deterrent or disrupt unwelcome peace initiatives in the Middle East. In contrast, most Western media coverage implies that the target either involved a shipment of nuclear technology from North Korea or some other object of proliferation concern that alarmed Israeli officials sufficiently that they felt compelled to act to counter a genuine threat. Some Western analysts, however, speculate that the Israelis acted in Syria primarily with an eye to shaping future developments in Iran.

### **Background**

According to the most common assessments offered in the open-source literature of what the media termed "Operation Orchard," on September 6, 2007, Israeli jets violated Syrian airspace, dropped munitions somewhere in northeastern Syria, and returned home without experiencing any casualties themselves.

The last time Israeli warplanes carried out operations against Syrian ground targets was in October 2003, when they attacked a training camp for Palestinian militants near Damascus. Israeli warplanes also buzzed the Syrian presidential palace during the summer 2006 war in Lebanon, but, on that occasion, did not release any ordnance. Prior to the 2003 operation, Israeli warplanes had not attacked a target on Syrian territory since the October 1973 War.

Several general background factors shaped media and other interpretations of the September 2007 incident. First, longstanding differences over the status of Golan Heights and Syria's support for anti-Israeli terrorist groups have prevented them from negotiating a peace agreement to end their formal

state of hostilities, Efforts by third-party mediators to improve relations earlier this year, before September 6, proved unsuccessful. [1] When faced with obdurate security threats in the past, Israeli leaders have occasionally pursued a preemptive strategy, most notably with a devastating air strike at the beginning of the 1967 War and the 1981 bombing of the Osirak nuclear reactor in Iraq.

Second, for several years, the international media have published and broadcast reports of security collaboration between Syria and North Korea, including cooperation regarding ballistic missiles.[2] (North Korea is also widely thought to have sold ballistic missiles and their related technologies to other Middle Eastern countries.) Although there has been no definitive publicly available evidence of joint nuclear work between Damascus and Pyongyang, nonproliferation experts have long worried that North Korea would sell or otherwise transfer its nuclear materials and technologies to foreign countries or non-state actors such as terrorists or criminals.

Third, the September 6 incident occurred against the backdrop of escalating international tensions over Iran's nuclear program and the threat that its eventual realization could pose to Israel. French Foreign Minister Bernard Kouchner even warned shortly after the air strike that Iranian leaders' stubborn pursuit of nuclear technologies and threats regarding Israel risked provoking another war in the Middle East. [3] Reporters speculate that Israeli fears of Iran's developing a nuclear weapon might have influenced the Israelis decision to attack Syria, especially if they concluded that North Korea might provide Syria and Iran with nuclear materials or technologies.

Fourth, the tepid reaction by the regional Arab governments to the alleged Israeli air strike underscores the extent to which Syria's past interference in Lebanon, ties to Iran, and other foreign policies have alienated the current Syrian regime from Sunni Arab regimes. This isolation might have encouraged Syrian officials to seek to bolster their country's defense capacities through the pursuit of nuclear weapons.

Finally, the one-year anniversary of the Lebanon War reminded observers throughout the Middle East of Israel's failure to achieve the expected decisive military victory over Lebanese Hezbollah, a Shiite paramilitary group allied with Syria and Iran. Some Israelis feared that their unexpectedly poor military performance weakened the credibility of Israel's conventional deterrent threats. For this reason, several observers reasoned that Israel perceived the raid against Syria as an opportunity to enhance its deterrent capabilities against Syria and its Lebanese and Iranian allies. [4]

### **Israeli Censorship Smothers Domestic Coverage**

Many observers commented on the unprecedented severity of the Israeli military censorship regarding the September 6 incident. [5] The Israeli government initially refused to acknowledge that the air strike had occurred, remaining silent even after the U.S. government confirmed the air strike on September 11. Israeli military censors permitted Israeli journalists to reference only information and arguments that had previously been published in the Western media. [6]

On September 19, Benjamin Netanyahu, former Israeli prime minister and current leader of the opposition Likud party, effectively confirmed the strike when he expressed his support for the operation in an interview with Israeli Channel One TV. Netanyahu also divulged that current Israeli Prime Minister Ehud Olmert had informed him of the operation "from the start." [7] The sharp rebukes he received from his colleagues might have discouraged other Israelis knowledgeable about the incident from offering their own attributable comments to the media.

It was not until October 3, after Syrian President Bashar al-Assad first spoke of the attack, that the Israeli Air Force acknowledged that it had attacked a military target "deep inside Syria" the previous month. [8] Nevertheless, the military censor issued a rare special directive prohibiting publication of operational details regarding the incident, including the target of the attack and which Israeli forces participated in the mission. [9] Subsequent commentary in the Israeli media continued mostly to cite various theories and facts offered by foreign sources because the Israeli government declined to provide any additional information — whether as official commentary or through informal leaks — about the attack.

Traditionally, the purpose of Israeli censorship has been to conceal military secrets. Commentators speculated on this occasion, however, that the Israeli authorities also wanted to minimize pressure on Syrian leaders to retaliate. [10] Other observers thought that the Israeli government might have sought to avoid a public debate about the reasons for the attack because some U.S. analysts and policy makers reportedly considered the available intelligence of a possible Syrian threat — nuclear or otherwise — insufficient to warrant the preemptive air strike. The alleged air strike occurred at a time when the Bush administration was seeking to promote its contentious proposal for a regional peace conference involving both Israel and Syria. [11]

Some Israeli nonproliferation experts did offer their views on the incident, but only several weeks after the event, and only in comments to the Western media. For example, several Israeli analysts expressed doubt about the popular view that the Israeli Air Force had attacked a nuclear target. They questioned why the Syrians would locate a sensitive nuclear facility in a region so close to Syria's troubled borders with Iraq and Turkey. These Israeli experts also observed that, historically, Syrian officials have felt comfortable relying on chemical — rather than nuclear — weapons as an adequate strategic deterrent against Israel. Efraim Inbar, the director of the Begin-Sadat Center for Strategic Studies at Bar-Ilan University near Tel Aviv, commented that the Syrians "have wanted strategic parity for years with Israel. But so far, they went with the cheapest and easiest way, which was chemical weapons." [12]

Other Israeli analysts, however, speculated that the current Syrian government might have felt so threatened by its regional isolation and the hostility of the Bush administration that it wanted to bolster its deterrence capacity by developing a nuclear option. Eyal Zisser, director of the Moshe Dayan Center for Middle Eastern and African Studies at Tel Aviv University, observed that such an alternative "was not on the [Israeli intelligence] agenda before these reports, but this is very logical from the point of view of Syria." [13] Western observers have characterized Bashar Assad, who became president in 2000, as much more of a risk-taker than his cautious father. [14] In any case, an unidentified Israeli source observed that, "We've known for a long time that Syria has deadly chemical warheads on its Scuds, but Israel can't live with a nuclear warhead." [15]

Whatever the motivation, Israeli leaders have given the impression that they consider the operation a success. Amos Yadlin, the head of Israeli military intelligence, reportedly told the Knesset Foreign Affairs and Defense Committee that "Israel's deterrence has been rehabilitated since the Lebanon war." [16]

### **Syrian Denials and Threats**

Syrian officials have offered varying interpretations of what happened on September 6. Although the Syrian government complained immediately about Israel's unauthorized intrusion into its air space,

Syrian representatives initially claimed that the warplanes had rapidly retreated back to Israel after they encountered Syrian air defenses. [17] Subsequently, Syrian officials stated that the Israeli warplanes had dropped their munitions on Syrian territory, but had either failed to hit a concrete target, discarding their ordnance over an unpopulated desert region, or had simply destroyed an "empty warehouse." [18] A few days after the incident, Syrian Foreign Minister Walid Moallem reportedly showed European diplomats alleged photographs of the target site in order to support his contention that the Israelis had struck nothing. [19]

Syrian Vice-President Farouq al-Shara said that the Israeli Air Force had hit an Arab League agricultural facility. [20] More interestingly, al-Shara warned at a press conference that, "Those who continue to talk about this raid and to invent inaccurate details are aiming to justify a future aggression [against Syria]." He specifically attacked "Arab or international parties that write about things that did not happen and who claim North Koreans or others were killed," accusing those who made such arguments of "trying to conduct psychological warfare against Syria." [21]

Al-Shara also claimed that Israeli officials were taking bellicose actions to restore the credibility of their armed forces following Israel's military defeat (in Syria's view) in Lebanon the previous summer: "They want to rehabilitate the Israeli army after the Lebanese resistance broke it. But what Israel needs is to rehabilitate the Israeli mind, only then will a real opportunity for genuine peace be created." [22]

In his first comments on the topic, Syrian President Bashar al-Assad told the BBC in an October 1 interview that the Israelis had bombed an "abandoned army base in the northeast of the country." He warned that "Syria reserves the right to retaliate to the attack," though his remarks left ambiguous whether the retaliation might involve a military counterstrike as opposed to diplomatic countermeasures: "Retaliate doesn't mean missile for missile and bomb for bomb. We have our means to retaliate, maybe politically, maybe in other ways. But we have the right to retaliate." [23] Defense analysts attribute the Syrian leadership's reluctance to retaliate militarily to its regional isolation, Russian opposition to escalatory actions, and to the Syrians' realization that their country would probably lose a conventional war with Israel. [24]

The one constant thus far in the Syrian response has been a resolute denial of rumors that Syria had been constructing a covert nuclear facility at the target site, with or without North Korean, Iranian, or other foreign assistance. In an interview with Newsweek a week after the attack, Imad Moustapha, Syria's Ambassador to Washington, claimed that reports of a North Korean-Syrian nuclear cooperation project were "absolutely, totally, fundamentally ridiculous and untrue. There are no nuclear North Korean-Syrian facilities whatsoever in Syria." Moustapha also denied rumors that the target involved a joint Iranian-Syrian missile plant or a consignment of arms intended for Hezbollah. [25]

Even a translation error at a UN General Assembly meeting devoted to disarmament -- in which the freelance interpreter erroneously made it seem as if the Syrian representative was acknowledging that Israel attacked a nuclear facility — proved sufficient to trigger a rapid and categorical denial that Syria possessed any nuclear facilities. [26] Speaking at a meeting of the World Affairs Council of Dallas/Fort Worth, Ambassador Moustapha called allegations of Syrian-North Korean nuclear collaboration "an absolutely surrealistic story." He also insisted that, "There is no Syrian nuclear program whatsoever, absolutely not. Syria has never tried to acquire nuclear technology." [27]

The Syrian government remains a party to the nuclear Nonproliferation Treaty (NPT), which prohibits it from pursuing nuclear weapons. The treaty does allow all signatories in good standing under the treaty to research and develop civilian nuclear energy technologies, but requires such countries, including Syria, to allow the International Atomic Energy Agency (IAEA) to inspect all nuclear activities on their territories. The blanket denials issued after the UN misinterpretation notwithstanding, Syria, in fact, has declared one small (30-kilowatt) research reactor located near Damascus to the IAEA. [28] The Syrian government has permitted periodic agency inspections of its operations since it became operational in 1996. [29] Syria has also participated in several technical cooperation programs with the IAEA. [30] Most international experts have traditionally believed that Syria lacks the financial and technical resources to undertake a nuclear weapons program. If North Korea provided Syrian technicians with nuclear technologies, fissile materials, or other assistance, some of these economic and technical barriers to entry into the nuclear club would weaken.

When asked about possible nuclear ties with North Korea in his BBC interview, al-Assad responded that, "We have a relation with North Korea and this is not something in secret...we are not interested in any nuclear activity." [31] Mounir Ali, a spokesperson for Syria's Ministry of Information, likewise maintained that, if the Israelis had struck a nuclear site, "there would have been heavy anti-aircraft guns around, soldiers, radiation, scientists.... But they didn't even kill a goat." [32] Some five weeks after the event, Syrian authorities arranged a tour for foreign journalists of one of the suspected target sites to demonstrate that nothing was amiss. [33] The display reminded one U.S. analyst of similar exhibits arranged by the former Iraqi government when Saddam Hussein was seeking to repudiate suspicions about suspect Iraqi WMD sites. [34]

Several Syrian officials claimed that the Israeli action on September 6 was primarily a public relations ploy aimed at rehabilitating Jerusalem's discredited image as a military power following what Syrians described as Israel's embarrassing defeat during the 2006 war in Lebanon. Deputy President Farouk al-Shara claimed that, "Everything reported about this raid is wrong and is part of a psychological warfare that will not fool Syria." [35] In an October 11 interview with Tunisian journalists, Assad said that the U.S. and Israeli news blackout reflected their embarrassment at having acted on erroneous intelligence: "They are trying to cover up their failure by shrouding it with mystery." [36]

Some Syrian sources also implied that Israel was seeking to dictate the terms of Syria's engagement in regional peace initiatives. Syria's UN Ambassador Bashar Ja'afari asserted that the timing of the Israeli attack was not coincidental and that Israel's goal was "to undermine the ongoing international efforts aimed at activating the peace process and giving Syria its legitimate role." [37]

### **The North Korean Dimension**

Some observers of the consequences of the September 6 incident have also perceived the uncharacteristically vehement North Korean condemnation of the attack as suspicious given that the event involved two geographically distant countries. A North Korean Foreign Ministry official stated that, "This is a very dangerous provocation little short of wantonly violating the sovereignty of Syria and seriously harassing the regional peace and security...The Democratic People's Republic of Korea strongly denounces the above-said intrusion and extends full support and solidarity to the Syrian people in their just cause to defend the national security and the regional peace." [38]

A North Korean spokesperson subsequently accused those individuals alleging covert nuclear cooperation between Pyongyang and Damascus of engaging in "a clumsy plot hatched by dishonest forces who do not like to see any progress at the six-party talks and in the DPRK [Democratic People's Republic of Korea]-U.S. relations." [39] According to press reports, when Assistant Secretary for East Asia and Pacific Affairs Christopher Hill, the State Department official in charge of negotiating North Korea's nuclear disarmament, explicitly asked the North Korean delegation to the Six-Party Talks about allegations of North Korean-Syrian nuclear ties, the North Koreans flatly denied them. [40]

Pyongyang's strident response reinforced suspicions of a possible North Korean link to the target. Some observers speculated that to have provoked such a sharp rebuke, the Israelis must have killed a number of North Koreans in the attack, perhaps important nuclear technicians and military experts. [41] This interpretation may be reading too much into the DPRK declaration, however, since the country's government-run media has also condemned Israel in the past for violating Syrian air space, where no North Korean or Syrian fatalities were involved. [42]

Western media commentators also cited the longstanding diplomatic and military exchanges between Syria and North Korea as confirmation of close security relations between the two governments. For over a decade, Syria has worked with North Korea to develop its ballistic missile arsenal. Immediately before and after the September 6 incident, Syria and North Korea held several senior-level meetings. On August 14, the North Korean Minister of Foreign Trade visited Syria to sign the protocol on "cooperation in trade and science and technology," which might encompass military cooperation. [43]

Furthermore, three days before the Israeli attack, a North Korean merchant ship off-loaded cargo at the Syrian port of Tartus. Some commentators suspected the delivery included military material such as conventional weapons or nuclear technologies — perhaps even a nuclear warhead, which would explain why Israeli policy makers concluded they needed to launch an urgent preemptive strike. [44] Two weeks after the alleged Israeli air strike, the second highest official in the North Korean government, Kim Yong-Nam, met a senior Syrian government delegation in Pyongyang. [45] The following month, Choe Thae Bok, North Korea's parliament speaker, visited Damascus. [46]

President George Bush himself has not publicly cited any possible North Korean involvement in a Syrian nuclear weapons program, or repeated earlier warnings that his administration drew a "red line" against the transfer of North Korean nuclear material and technologies to other countries or to terrorist groups. When asked about the North Korean issue at a news conference, President Bush responded ambiguously that, "To the extent that they are proliferating, we expect them to stop that proliferation, if they want the Six-Party talks to be successful." [47] President Bush also refused to confirm any North Korean involvement in the September 6 incident during his October 17 press conference, although he again stressed U.S. opposition to nuclear proliferation. (See side bar) While insisting that the administration was very concerned about any indications of illicit WMD proliferation, Secretary of State Condoleezza Rice stated that "We're handling those in appropriate diplomatic channels." [48]

In a television appearance on Fox News, however, Defense Secretary Robert M. Gates, while refusing to confirm either the Israeli air strike or rumored North Korean-Syrian nuclear collaboration, more bluntly cautioned that, "If such an activity were taking place, it would be a matter of great concern because the president has put down a very strong marker with the North Koreans about further proliferation efforts, and obviously any effort by the Syrians to pursue weapons of mass destruction would be a concern." [49]

The president's refusal to comment publicly on the nature of the Israeli strike might be due to the absence of definitive evidence about a North Korean-Syrian nuclear connection. Critics of the Six-Party Talks, however, claim that the administration does not want to risk disrupting the Korean denuclearization process once again at a time when the North Koreans appeared more cooperative than usual. [50]

### **Western Commentators Speculate About Nuclear Materials, Arms to Hezbollah, or Preparations for an Israeli Attack on Iran**

Despite Israel's silence and Syrian-North Korean denials, many Western media commentators readily speculated that Israel had launched an air strike against an object that the Israelis perceived as presenting a genuine threat. They maintained that Israel would not have risked provoking a war with Syria unless it calculated it had no choice but to destroy such a high-value target. [51]

**Nuclear Target.** The most popular interpretation was that Israel attacked a component associated with a possible Syrian-North Korean joint nuclear weapons program. For example, a September 18 article in the New York Times cited current and former Israeli and U.S. security experts, who had received Israeli briefings on the incident, as describing the target as a part of "a rudimentary Syrian nuclear program." [52]

According to ABC News, in July 2007, the Israeli government presented the Bush administration with satellite imagery showing a nuclear facility in northeast Syria. The Israelis also reportedly presented other intelligence indicating that North Korea had supplied nuclear technology to Syria. [53] ABC and other sources related that some U.S. policy makers found this evidence unconvincing. Reporters from The Sunday Times wrote that these U.S. uncertainties led the Israeli government to order a commando raid into Syria. Supposedly the Special Forces involved collected nuclear material that Israeli technicians confirmed was of North Korean origin. [54] According to The Times, the White House supposedly approved of the Israeli air strike after receiving this information. [55]

ABC News, however, reported that the Israelis feared that their knowledge of the existence of the Syrian nuclear facility would leak to the press. This concern led them to decide to attack the site despite American unease about the quality of the intelligence, the lack of urgency given the incipient nature of the Syrian nuclear program, and the possible adverse regional diplomatic and security consequences that could result from an Israeli preemptive strike. [56] On October 19, ABC News reported that Israel's confidence in the accuracy of its intelligence increased after Mossad managed to place a mole in the suspect Syrian nuclear facility. According to this report, the spy provided detailed photographs of the facility that, while not showing the presence yet of any fissile material at the site, nevertheless confirmed suspicions raised by other intelligence sources that North Korea was helping Syria construct a nuclear reactor complex. [57]

Emily Landau, director of the arms control and regional security program at the Institute for National Security Studies at Tel Aviv University, might have represented Israeli government assessments when she told Western journalists that, "The one lesson that Israel has learned from the Iranian experience is that if you don't take care of something like this at the very initial stages, you're going to have a bigger problem later on." [58]

The New York Times reported that Israeli aircraft destroyed an incipient nuclear reactor that the Syrians were building with North Korean technical assistance. According to this account, the Israelis feared that the Syrians intended to use the graphite-moderated reactor in the same manner as the North Koreans: to produce the plutonium required to build atomic bombs. The New York Times correspondents argued that the Israeli government wanted the attack to show "its determination to snuff out even a nascent project in a neighboring state." [59]

Most recently, on October 23, the Institute for Science and International Security (ISIS) published privately obtained satellite images that show what could have been a nuclear reactor under construction in Syria, just east of the Euphrates River. This location may have been the site Israeli warplanes attacked on September 6. The ISIS analysts also identify several possible similarities between the techniques North Korea used to construct its nuclear reactor at Yongbyon and those suggested by the photographs of the Syrian site. [60] U.S. and international experts and officials shown the pictures by the Washington Post stated that "there was a strong and credible possibility that they depict the remote compound that was attacked." [61] The co-author of the ISIS report, David Albright, told the Post that he was "pretty convinced that Syria was trying to build a nuclear reactor," though one of the prominent nuclear experts interviewed — John E. Pike, director of GlobalSecurity.org — said he found the ISIS imagery inconclusive. [62]

**Practice Strike against Iran.** A less common explanation of the September 6 incident was that Israeli warplanes were attempting to rehearse an attack against nuclear facilities in Iran. International analysts sharing this interpretation note that Syria and Iran both rely on similar air defense systems based on Soviet and Russian technologies. [63] For example, Syria recently purchased Russia's Pantsyr air defense system, which Iran is also currently integrating into its own defense network. Although the Syrian network is currently more elaborate, an attack against it could provide insights into how best to circumvent Iranian air defenses. [64]

Several aviation experts writing in Western journals stated that Israeli fighters relied on recently developed American technologies that allowed the Israeli Air Force to hack into Syria's air defense networks and, once inside, monitor and disable its components. [65] Two detachable fuel tanks normally used by Israel's latest generation long-range bomber, the Raam F151, were found inside Turkey near its border with Syria. Attached to the Raam, the tanks extend the aircraft's range to over 2,000 kilometers (km), sufficient to reach targets in Iran. [66] From the perspective of this interpretation, the operation also allowed Israel to gauge neighboring countries' potential responses to an Israeli air strike against Iran, another isolated Middle Eastern country. [67]

If concerns about Iran determined the Israeli response, the Israelis might have hoped to convince Iranian officials that their nuclear facilities were vulnerable to a comparable Israeli air strike, and thereby ensure Tehran's cooperation in international negotiations seeking to clarify the status of the Iranian nuclear program and curb its expansion. Adherents to this hypothesis maintain that, through their public silence, the United States and Arab governments are signaling their approval of this negotiating stratagem. [68] One Western analyst recalled the Chinese proverb that "sometimes you have to kill the chicken to scare the monkey." [69] (A contrary interpretation would be that an Israeli air strike against Syria might lead the Iranians to take additional steps to strengthen their air defenses, harden potential targets, further conceal and disperse sensitive facilities, and pursue other measures to reduce their vulnerability.)

**Non-Nuclear WMD.** A report in the September 17 issue of Jane's Defence Weekly outlining joint Syrian-Iranian efforts to equip Syrian ballistic missiles with chemical warheads generated some media speculation that Israel conducted an air strike to warn both countries that Tel Aviv would respond vigorously to any possible chemical weapons threat against it. [70] The Syrian armed forces appear to have developed a wide variety of chemical munitions for delivery by missiles, aircraft, and other means. Hundreds of Syrian Scud missiles can attack targets in Israel, including its large population centers, from launch sites anywhere in Syria. [71] According to Jane's, a late July explosion at a Syrian military installation near the city of Aleppo occurred when Syrian and Iranian personnel were attempting to load a warhead containing mustard gas on a Scud-C missile. The New York Times cited a "former intelligence official" as asserting that Syria might have been seeking to develop an "airburst capability for its ballistic missiles" that would considerably increase the destructive capacity of its chemical warheads. [72] Western diplomats also speculate that North Korea has been seeking to compensate for the poor accuracy of the Scud design by helping Syria deploy chemical weapons on the missile. [73]

**Conventional Weapons for Hezbollah.** An alternative hypothesis, widely reported initially but with declining frequency thereafter, is that the Israeli warplanes attacked a consignment of conventional weapons that Iranians were sending via Syria to Hezbollah in Lebanon. This interpretation argues that Israeli policy makers had become so concerned about the unending flow of Iranian arms to Hezbollah that they used the opportunity provided by their transshipment through neighboring Syria to send Damascus and Tehran a powerful warning to end these transfers. [74]

The unusually long and comprehensive Israeli censorship surrounding the incident soon led many commentators to question this interpretation. In particular, they noted that Israeli officials would have logical reasons to publicize the attack in order to underscore Syria's continuing interference in Lebanon's internal affairs in violation of several international agreements. [75]

### **Arab and Iranian Governments Largely Silent**

No Arab government besides Syria has formally commented on the September 6 incident. The Egyptian weekly Al-Ahram accurately commented on the "synchronized silence of the Arab world." [76]

The most prominent declaration by a non-Syrian source occurred after Syrian Vice President al-Shara said that the Israelis had mistakenly bombed the Arab Center for the Studies of Arid Zones and Dry Lands (ACSAD). The center issued a formal statement denying the allegation, though without directly criticizing their host government: "Leaks in the Zionist media concerning this ACSAD station are total inventions and lies." [77] A few nongovernmental Arab media sources also discussed the September 6 incident. For example, the Kuwaiti newspaper Al Watan claimed that a U.S. plane covered the Israeli aircraft from a higher altitude. [78] But for the most part the Arab media has simply avoided the controversial subject.

Western commentators took the position that the lack of official non-Syrian Arab condemnations of Israel's action, threats of retaliation against Israel, or even professions of support for the Syrian government or people must imply that their governments tacitly supported the Israeli action. [79]

Iranian officials also have not formally commented on the Israeli attack or Syria's reactions. At an October 9 meeting of the Interparliamentary Union in Geneva, Iranian parliamentary speaker Hadad Alel told reporters that, "The violation of the airspace of Syria by Israeli planes was not meant to be a signal for Iran" because "Israel is not in a position to have the illusion of attacking Iran." [80] Nevertheless, President Mahmoud Ahmadinejad reportedly sent his nephew, Akbar Mehrabian, to Syria to evaluate the results of the attack first-hand. [81]

### **China and Moscow Treat Incident as Crisis Management Issue**

According to open-source press commentary, the air strike initially led the Chinese government to postpone a forthcoming session of the Six-Party Talks, which seek to secure North Korea's abandonment of its nuclear weapons program in return for various diplomatic and economic benefits. Chinese officials were allegedly concerned that "America might confront the North Koreans over their weapons deals with Syria" and only rescheduled them after they had become convinced the talks would be "constructive." [82]

Russian Deputy Foreign Minister Alexander Sultanov reportedly urged Syria to proceed no further than submitting a letter of protest to the United Nations. [83] The Israeli paper Yediot Ahronot related an unnamed Israeli security official as saying that, after the attack, the Russian government directed Russian merchant ships to beam electronic signals into Israel to assess Israel's information warfare assets and disrupt Israelis' commercial television programs as punishment: "I believe that they sent ships to the region equipped with electronic warfare systems...to try and examine Israel's capabilities in electronic warfare and also to give trouble to those who gave them trouble." [84] Neither the Russian foreign nor defense ministries formally commented on these reports.

### **Conclusion**

Additional information about what actually happened on September 6 would not necessarily clarify the objectives of those involved. Does the Syrian leadership want a nuclear deterrent to induce Israel into negotiations or is it seeking a nuclear shield to hide behind while using Hezbollah as a proxy sword against Israel? Did Israeli leaders attempt to eliminate an incipient Syrian WMD threat or did they primarily aim to send a warning to Iran about presenting Israel with a much more imminent nuclear danger? Is North Korea seeking to circumvent the Six-Party agreement before its implementation or would evidence of nuclear collaboration with Syria simply testify to North Korea's continuing efforts to earn foreign currency even through the sale of WMD technologies to questionable clients? Furthermore, the complexity of these questions increases exponentially when analysts try to discern differences among the various government factions, or the motives of other possible domestic and foreign actors that might influence each government's WMD policies.

The prominence of the allegations regarding various multinational connections among countries of proliferation concern make the incident especially important for those interested in WMD nonproliferation issues. Speculation about North Korean nuclear materials flowing to Syria, North Korean-Syrian collaboration on chemical warheads for ballistic missiles, and possible trilateral cooperation on special weapons that also involves Iran reinforces concerns about the persistence of state-sponsored proliferation networks despite heightened international action against them in recent years and the Bush administration's insistence that such transfers cross various "red lines" defining vital U.S. national security interests.

The incident also highlights a major weakness in the existing nuclear nonproliferation regime. Following the intense media speculation that the target of the Israeli air strike was a nuclear facility in northeastern Syria, the IAEA formally asked Syria and other governments to provide whatever information they might possess about undeclared nuclear activities in Syria. A September 15 statement succinctly summarized the agency's position:

- "The IAEA has no information about any undeclared nuclear facility in Syria and no information about recent reports.
- "We would obviously investigate any relevant information coming our way.
- "The IAEA Secretariat expects any country having information about nuclear-related activities in another country to provide that information to the IAEA.
- "The IAEA is in contact with the Syrian authorities to verify the authenticity of these reports." [85]

In October 2007, a diplomatic source knowledgeable about IAEA activities indicated that the agency had made informal inquiries to Damascus shortly after the incident, but had not received a response from the Syrian government. [86] At present, IAEA experts are reviewing satellite imagery of the site of the alleged attack to determine (after the fact) whether Syria was constructing a nuclear facility at the location.[87] In the meantime, the Syrians are in the process of dismantling the remains of the facility, which will reduce the intelligence value of any possible on-site inspections.[88]

Notwithstanding the IAEA inquiry, the legal status of any possible Syrian nuclear activities is problematic. Although Syria is a signatory of the nuclear Nonproliferation Treaty, as noted the NPT explicitly grants all countries in good standing the right to construct nuclear reactors in order to generate electric power or for other peaceful purposes. In addition, some analysts believe that the NPT does not require governments to declare the existence of reactors during their earliest stages of construction. [89]

Israel's response, if motivated by concerns about a possible Syrian nuclear weapons program, demonstrates that some governments do not consider these safeguards sufficiently strong security guarantees — and will employ controversial unilateral measures, including the use of force, if necessary to address these concerns.

-----*SIDEBAR*-----

## IMPLICATIONS FOR THE SIX-PARTY TALKS

Nonproliferation experts have long worried that North Korea would sell or otherwise transfer its nuclear materials and technologies to foreign countries or non-state actors such as terrorists or criminals. These concerns intensified with the publication of news reports about possible North Korean assistance to a Syrian nuclear weapons program.

Under the terms of the February 13, 2007 agreement that ended the fifth round of the Six-Party Talks, North Korea pledged to shut down and eventually disable its Yongbyon nuclear complex in return for food, economic aid, and the prospect of normalizing relations with the five other countries participating in the talks, China, Japan, Russia, South Korea, and the United States.[1] The terms of the agreement do not formally prohibit North Korea from transferring nuclear weapons-related materials and technologies to third parties, but the follow-on October 6 agreement states that North Korea is

"committed not to transfer nuclear materials, technology, or know-how." [2] In addition, the international community — through various UN resolutions and other measures — has declared such transfers impermissible.

After North Korea's October 2006 nuclear test, President Bush issued the following statement: "The North Korean regime remains one of the world's leading proliferator of missile technology, including transfers to Iran and Syria. The transfer of nuclear weapons or material by North Korea to states or non-state entities would be considered a grave threat to the United States, and we would hold North Korea fully accountable of the consequences of such action." [3]

In commenting on the September 6 incident, former U.S. Ambassador to the United Nations John Bolton speculated that North Korea might have intended to transship nuclear material to Iran through Syria. [4] Bolton also published an op-ed suggesting that Pyongyang might be seeking to conceal its nuclear weapon assets in friendly Middle Eastern countries while it underwent international inspections of its nuclear holdings. [5] Major General Zeevi Farkash, former chief of Israeli military intelligence, told the Western media that North Korea and Syria might have shared a "constellation of interests" in which Syria wanted to strengthen its WMD deterrent and North Korea aimed to disperse its nuclear technologies "to preserve the knowledge it had accumulated and not just throw it away." [6]

Since the September 6 incident, President Bush and other U.S. officials have followed a complex line. On the one hand, while declining to accuse the North Koreans in public of assisting a possible Syrian nuclear weapons program, administration representatives have obliquely warned the North Koreans against transferring WMD-related materials and technologies to third parties. At the same time, they have also maintained that the best method to deal with the North Korean proliferation threat is through continuing the Six-Party Talks. When asked about the alleged transfer at an October 17 news conference, Bush replied: "The best way to solve this issue [of nuclear weapons proliferation] with North Korea peacefully is to put it in — keep it in the context of Six-Party talks. And the reason why is that diplomacy only works if there are consequences when diplomacy breaks down, and it makes sense for there to be other people at the table so that if North Korea were to have said to all of us, we're doing to do x, y, or z, and they don't, that we have other — people other than the United States being consequential." [7]

The governments of China, Japan, Russia, and South Korea have also declined to risk jeopardizing the Six-Party Talks, currently at an extremely delicate stage, by challenging Pyongyang over its possible Syrian connections. South Korean representatives, eager to advance their bilateral and multilateral peace initiatives on the peninsula, have been especially eager to downplay any possible North Korean involvement in the September 6 incident. Senior South Korean nuclear negotiator Chun Yung-woo, besides expressing doubts about the accuracy of Israeli intelligence, cited the clause in the October 3 agreement as a reason why the issue should no longer appear on the agenda of the six-party talks: "After they (North Koreans) pledged they won't do it, what more is there to discuss?" ## **All Still Quiet on the Syria Bombing**

By Jackson Diehl

Monday, November 5, 2007; A19

It was two months ago tomorrow that Israeli warplanes bombed what Israel and the United States believed was a nascent Syrian nuclear complex along the shore of the Euphrates River. But the political shock waves that should have accompanied that remarkable event -- which was both an audacious act of preemption and a revelation of an apparent Syrian bomb program-- have been bottled up by the decisions of the Israeli government and the Bush administration not to speak publicly about the strike.

Now Israeli and U.S. officials are quietly debating whether to go on the record and allow those shock waves to explode across the Middle East and beyond. At stake are not only Israel's tense relations with Syria, which so far has chosen not to retaliate, but a host of other pressure points: Israeli-Palestinian negotiations; the integrity of the International Atomic Energy Agency; Western leverage over Syrian dictator Bashar al-Assad; and -- not least -- the fragile U.S. nuclear bargain with North Korea, which is believed to have aided the secret construction.

For the Israeli government of Ehud Olmert, the decision to suppress news of the strike in September -- including the military censorship of Israel's aggressively free press -- was pretty straightforward. Trumpeting the successful attack not only would have prompted global denunciations of Israel but might have pushed Assad into launching an attack on the Golan Heights or a missile at Tel Aviv. The architect of the attack, Defense Minister Ehud Barak, is a former head of Israel's most elite clandestine commando squad, and he remains convinced that military special operations are best kept secret.

Two months later that calculus hasn't much changed. Barak and Olmert are still worried enough about a Syrian military response to have moved an upcoming military exercise off the Golan; Olmert and other senior officials have been dropping hints about opening political negotiations with Damascus. Olmert knows that full disclosure of the operation would probably blow up the Israeli-Palestinian peace meeting in Annapolis that Secretary of State Condoleezza Rice hopes to convene this month. Among other problems, Arab states that Olmert and Rice hope will attend would surely cancel if they were obliged to react to an event that they have so far pointedly ignored.

Outside Jerusalem and the State Department, however, pressure for an official account of the raid -- or more important, for the intelligence that prompted it -- is growing. The International Atomic Energy Agency and its freelancing director, Mohamed ElBaradei, want to investigate the alleged reactor site. The agency's experts have been studying aerial photographs and asking U.S. officials for information. In theory, at least, an IAEA probe could compound the blow suffered by Assad by forcing him to explain -- on pain of possible sanctions by the U.N. Security Council -- whether and how Syria violated its commitments under the nuclear Non-Proliferation Treaty.

So far the Bush administration has refused to cooperate with ElBaradei, who has all but openly sided with Iran in its attempt to deflect U.N. orders to freeze its uranium enrichment. Having debunked U.S. claims about a reborn Iraqi nuclear program in early 2003, ElBaradei would be certain to seize on any ambiguities in the Israeli and U.S. evidence about the Syrian reactor. If he raised doubts that the project was intended to produce plutonium, both Olmert and the Bush administration would be damaged.

There is, however, a petitioner much tougher to resist than the IAEA director: Republican representatives who are demanding that "every member of Congress be briefed on this incident, and as soon as possible," as Reps. Peter Hoekstra and Ileana Ros-Lehtinen put it in a recent Wall Street Journal op-ed. The two House members were already briefed because of their positions as ranking minority members on the intelligence and Foreign Affairs committees; what they heard evidently convinced them that possible covert collaboration between Syria and North Korea needs to be fully aired and debated before the United States proceeds with negotiations to end North Korea's bomb program.

Here some Bush administration officials are sympathetic. They have been frustrated by what they describe as the stubborn resistance of Rice to connect what was discovered in Syria to the North Korean disarmament talks. Rice's North Korean point man, Assistant Secretary Christopher Hill, told Congress last month that Pyongyang had been asked to disclose any cooperation with Syria as part of a promised full report on its weapons programs.

If it answers the question, North Korea may end up blowing the whistle on Damascus. And if it chooses to lie? Then the pressure on the Bush administration to disclose what it knows about the Israeli raid may become irresistible.

## **Bolton Blasts U.N. at U.N.**

Saturday, November 10, 2007 9:09 AM

By: Newsmax Staff

*[EXCERPTS]*

Former U.S./U.N. ambassador John Bolton returned to U.N. headquarters in NYC on Friday to launch his new book "Surrender Is Not An Option"

Bolton confessed that on many issues he really does not have a current pipeline into the White House, but he did not shy away from commenting on several key issues confronting the Bush administration.

**On Israel's recent strike on a suspected secret Syrian nuclear facility:**

"This was some kind of Syrian-North Korean joint venture in the nuclear field....So, it would not surprise me that to avoid inspection at Yongbyon (North Korea) they decided to recreate (a clone) near the Euphrates River (in Syria)....So, I could even see this as a three-way joint venture with Iran, North Korea and Syria."

**Bolton chastised the White House for maintaining a "gag" order on any comments pertaining to the Israeli strike:**

"The administration, I think, has made a real mistake in not allowing more facts to come out. Because, I think it is undercutting its own argument about North Korea's commitment to giving up its nuclear weapons program."

Neither the office of UN secretary-general Ban Ki-moon, nor the State Department would offer any reaction to the Bolton comments though several officials from the US/UN mission did accompany the former ambassador during his United Nations visit.

## **Bolton: Annapolis will set us back**

Hilary Leila Krieger

THE JERUSALEM POST

Nov. 15, 2007

A former Bush administration stalwart who has become a vocal critic told The Jerusalem Post this week that the planned meeting in Annapolis later this month to push for Israeli-Palestinian peace is "a mistake."

John Bolton, a leading neoconservative who served as the US ambassador to the UN before leaving the administration last winter, spoke to the Post following a lecture Tuesday night on his new book, which takes issue with aspects of American policy toward Iran, North Korea and Lebanon, among others.

"It's a mistake to push ahead with the Annapolis peace conference in November or December," he said, noting that the date hasn't been finalized.

"I just don't see this as the moment to make progress on Israeli-Palestinian matters. And I don't think that a failed conference will simply leave us at the status quo. I think it will set us back, so I think the effort is perhaps well-intentioned but misconceived."

In his talk he referred to an Israeli government with "internal political difficulties" and a Palestinian Authority that's "broken perhaps beyond repair," so any attempt at an "unnatural" reconciliation could leave US influence diminished.

Bolton, who spoke to an audience at the American Enterprise Institute think tank here, where he now holds a position, also strongly attacked the US response to an Israeli attack of an alleged incipient nuclear facility in Syria earlier this fall.

He described "the pall of silence that the administration has caused to fall over Israel's September 6 raid" as "what may be the most disturbing event of recent American history." That's because, in his estimation, the administration was so invested in diplomacy with North Korea that it was willing to make an enormous error by overlooking the proliferation North Korea allegedly engaged in to supply the Syrian site, as well as possible Iranian connections.

"If you're afraid to have this information come out, what does it say about the nature of the diplomacy that's under way?" he asked.

Speaking to the Post, he dismissed concerns that revealing the nature of the attack - which has been shrouded in secrecy in Israel, in part because of military censorship - would increase the likelihood of a Syrian military response.

"I don't think Syria has the military capability and I think they know it," he said.

In his presentation, he called for regime change in Syria and said that the poor Western approach on Iran means that the same option, of regime change or a military attack are the only two remaining alternatives to prevent Iran from acquiring nuclear weapons.

In his book, *Surrender Is Not an Option: Defending America at the United Nations and Abroad*, Bolton attacks the way the US has conducted its Iran policy. Instead of immediately referring signs of illicit Iranian nuclear activity to the UN Security Council for sanctions several years ago, America allowed Britain, France and Germany to undertake negotiations with Iran.

Because of that, he assesses, "Iran gained almost four years of additional time to perfect an indigenous capacity throughout the entire nuclear fuel cycle, leaving us in a far more vulnerable position than when we started." His chilling summation: "This is the road to the nuclear Holocaust."

Bolton also recounts in detail the formulation of the US position at the UN for dealing with Israel's war with Hizbullah last summer, again faulting the Bush administration for backing down from its original demands. Instead of sticking to the insistence that the conflict not end with a mere cease-fire that would maintain the status quo vis-à-vis Hizbullah and Israel, he says, the administration caved in to international demands and the situation got worse.

"Contrary to everything we had said at the outset of the hostilities, the net result, over a year later, appeared yet again to be just another Middle East cease-fire," he writes, "which was, if anything, somewhat less favorable to Israel, and certainly less favorable to democracy in Lebanon, than before."

Bolton, who has been on the receiving end of harsh criticism for his unrepentant neoconservative stances and outspokenness, quit the government after he failed to make his temporary appointment as UN ambassador permanent when the Senate wouldn't confirm him. Since he left office, he has openly criticized the Bush administration for straying from what he considers its original principles.

He has been particularly disparaging of the State Department, a perennial source of frustration for him, and has suggested it be overhauled.

He also doesn't shy from biting put-downs, lambasting former UN secretary-general Kofi Annan for equating himself to a "secular pope" and UN International Atomic Energy Agency head Mohammad El-Baradei for forgetting that "he works for the member governments of the IAEA and not the other way around."

Bolton's section headings take aim at the IAEA ("How Many IAEA Meetings Does It Take to Screw in a Lightbulb?") and the European Union ("Iran in the Security Council: The EU-3 Find New Ways to Give In") among others.

His book, he said, was partly aimed at providing more information to the public ahead of the 2008 elections.

## **Mystery still surrounds Israel's Syria attack**

Published: November 15 2007 23:37

Last updated: November 15 2007 23:37

Rarely does President George W. Bush bite his lip when discussing "axis of evil" states such as Syria and North Korea.

But for more than two months Mr Bush has done just that when asked about a September 6 Israeli strike on a mysterious Syrian site. So has every other US administration official speaking on the record, as well as the Israeli government itself, fuelling a continuing controversy about the incident.

"This is not my first rodeo," Mr Bush said at a press conference last month after being asked about the incident at least six times. "And I know where you're trying to get me to comment. I'm not going to comment on it, one way or the other."

This uncharacteristically taciturn approach has angered some of the president's Republican supporters, amid a series of newspaper reports that the Syrian site was a nuclear reactor built with North Korean help. But as the weeks since the Israeli raid pass, more questions than answers have surfaced about what precisely the Israelis hit.

The Republican anger has been displayed by legislators such as Peter Hoekstra and Ileana Ros-Lehtinen, respectively the senior Republican members of the House of Representatives committees on intelligence and foreign affairs. Among a select handful of congressmen briefed on the incident by Michael McConnell, the US's director of national intelligence, they did not respond to the briefing as intended, calling instead for the administration to come clean publicly about what had occurred.

"Until Congress is fully briefed it would be imprudent for the administration to move forward with agreements with state proliferators," they said in the Wall Street Journal, in reference to the six-party talks on Korea's nuclear programme.

John Bolton, formerly Mr Bush's ambassador to the UN, argues that the administration is unduly preoccupied with reaching a deal in those negotiations and with the forthcoming international conference in Annapolis, Maryland, on the Israel-Palestinian conflict, to which Syria is likely to be invited.

"There's a growing suspicion that the veil of secrecy about Syria doesn't have so much to do with intelligence as with protecting the six-party talks and the Annapolis conference," Mr Bolton says. "Israeli government officials have told me that Secretary [Condoleezza] Rice told them in no uncertain terms that the information [about the attack] better not come from them."

David Albright, a respected former United Nations weapons inspector, has used satellite imagery to argue that the Israelis probably attacked an installation on the Euphrates river at Dawar az Zawr, eastern Syria, which was similar in shape to North Korea's Yongbyon reactor.

"I believe pretty strongly that Israel thinks it attacked a nuclear reactor and that the US didn't say they were wrong," he says, adding that his suspicions were heightened by the recent addition of a pump

house that could supply water for a reactor, and further images that showed Syria razed the site after the Israelis struck.

“The recent photo evidence showing the Syrians clearing the sites indicated that they are clearly trying to hide something,” says Joe Cirincione, a non proliferation expert at the Centre for American Progress. He says that the evidence so far “tilts towards the theory that it was a reactor in Syria but does not establish it”.

But he adds: “There’s no evidence it was an imminent threat,” arguing that if there was a reactor, it was probably years from producing plutonium and that Syria lacks a reprocessing facility to turn its spent reactor fuel into plutonium.

The International Atomic Energy Agency, the UN’s Vienna-based nuclear watchdog, is also not convinced the site was a reactor.

Diplomats in Vienna warn against relying on satellite photos, saying that it is quite possible that the installation was no more than the adjunct of a chemical facility or a shed used to make agricultural equipment. They add that they were surprised that the site lacked a security fence, an unusual omission in a top secret facility.

“I am amazed that people can say they know the function of an installation just because they see its dimensions,” adds Jeffrey Lewis, an arms control expert at the New America Foundation. “It’s a box on a river.” He adds that, far from being in a remote site, the Dawar az Zawr facility is just over a mile from a well-known tourist site in Halabiya, from which rafting trips down the Euphrates can be organised.

Meanwhile, President Bashar al-Assad says the Israeli aircraft hit a disused military building with “nothing in it”.

The mystery may not continue indefinitely: under the talks framework, North Korea is due to give an account of its nuclear activities by the end of the year. And so far, despite Mr Bolton’s concerns, the events in Syria have not interrupted those negotiations.

“The opponents of the six-party talks wanted to use this strike to kill this deal,” said Mr Cirincione. “But the president isn’t having it.”

## **Master gambler Kim Jong-il may finally be ready for his last throw of dice**

Hamish MacDonald

November 17, 2007

*[EXCERPT]*

IN THE longest-running poker game in Asia, the master player is starting to lay some of his cards on the table.

This week in Vienna, officials from North Korea began giving some details to American and other counterparts about the secret acquisition of uranium enrichment know-how from Pakistan at the start of the decade.

If their story is convincing, a crisis that only five years ago had worried US and Chinese military planners studying armed intervention may be winding down.

It will depend on how much Kim Jong-il, the reclusive leader of North Korea for the past 13 years, is prepared to show, and how many cards he tries to keep up his sleeve.

Under the six-nation agreement (involving the US, Japan, China, South Korea and Russia) worked out in Beijing in February-March this year, North Korea is to disable its three key nuclear plants by the end of 2007, provide a list of all nuclear arms activity, account for all its fissile material and address US suspicions about a highly enriched uranium effort.

As a reward, North Korea will receive 1 million tonnes of heavy fuel oil or equivalent aid and the US and Japan will move to open normal diplomatic relations.

Provision of a light-water reactor for electricity generation will be discussed at some point, and Pyongyang included in a new regional security agreement.

The four years of negotiations in Beijing were not without last-minute hold-ups. Washington hawks, suspicious of dealings with a regime they view as "evil" and bound to fail, had treasury officials freeze the North Korea's hard currency holdings in Macau's Bank Delta Asia.

Kim upped the ante by conducting his country's first nuclear weapon test in October 2006. Now he is co-operating, having shut down his only reactor at Yongbyon and started talking about uranium.

But there is still a long way to go, points out Korea expert Peter Beck, director of the US Committee for Human Rights in North Korea, who spoke at Sydney's Lowy Institute this week.

Notably, the North Koreans have to account for about 50 kilograms of plutonium produced since they revved up the Yongbyon reactor in early 2003 after being confronted by President George Bush's Administration about the uranium program.

Nor have the North Koreans been utterly good boys since the Beijing agreement, if they were connected with the mysterious facility in Northern Syria taken out in an Israeli air strike on September 6.

"The imagery was very clear that the Syrians were up to no good," Beck said. "The Israelis are convinced it was a nuclear program and the North Koreans were involved."

The bigger mystery is why Bush and his close neo-con aides have not made more of this breakout. After the 2006 nuclear blast, Bush said the new red line for Kim was any attempt to proliferate nuclear weapons. "Short of firing a weapon at some country, I don't see what red lines they have left to cross," Beck said.

Still, the usual neo-con spoilers of North Korea diplomacy like former arms control director and United Nations ambassador John Bolton, have been pushed out of the picture.

"Obviously Darth Vader [Vice-President Dick Cheney] is still in the background and we don't know when he's going to weigh in," Beck said.

But for more than a year Christopher Hill, the highly active Assistant Secretary of State for East Asia and the Pacific, has been given a relatively free hand to engage with Pyongyang, and the State Department professionals are back in control.

Perhaps Cheney is saving his ammunition for Tehran.

## **Bush says N. Korea talks show 'results'**

By Jon Ward

The Washington Times

November 17, 2007

President Bush defended negotiations over North Korea's nuclear program yesterday, saying they have been effective, but he added that the communist regime must give a full declaration of its nuclear activities before the end of the year.

Some regional analysts said the president's remarks indicate that the Bush administration has decided not to move forward with talks unless North Korea discloses a role in helping Syria build nuclear facilities.

"The six-party talks have delivered measurable results," Mr. Bush said, referring to the negotiations among North Korea, the U.S., South Korea, Japan, Russia and China.

Mr. Bush, speaking from the White House alongside Japanese Prime Minister Yasuo Fukuda during a joint statement, said that although North Korea has begun to shut down its Yongbyon reactor, "hard work remains to be done."

"North Korea has agreed to provide a full declaration of all its nuclear programs and proliferation activities by the end of this year," Mr. Bush said. "Full declaration is one of the next steps North Korea must take to keep the six-party talks moving."

Richard C. Bush, director of the Center for Northeast Asian Studies at the Brookings Institution, said the president appeared to be "laying down a marker."

"I'm not sure that North Korea has agreed to provide a full declaration of its proliferation activities," Richard Bush said. "I suspect that the words 'proliferation activities' are code for the Syria program, and we have decided we need an explanation of what was going on in Syria in order to close any deals."

An Israeli air strike on Sept. 6 in Syria is suspected to have destroyed a partially constructed nuclear reactor of North Korean design, though the U.S. and Israeli governments have pointedly refused to discuss the strike.

The Syrian government has not admitted that it was building nuclear facilities.

An Oct. 3 document that was agreed upon as part of the six-party talks does say that North Korea "committed not to transfer nuclear materials, technology or know-how."

However, when the document discusses the declaration that North Korea will make, it says it "will include all nuclear facilities, materials and programs." There is no mention of documenting proliferation activities.

At an Oct. 17 press conference, Mr. Bush said that "the issue of proliferation has equal importance with the issue of weaponry, and that North Korea has said that they will stop proliferating, just like they have said they will fully disclose and disable any weapons programs."

A State Department official said the U.S. government is "interested in the North Koreans telling us what they have and what they are doing, so we can know what they are telling us they're going to stop."

The Bush administration has been criticized for signing on to the agreement with North Korea in February, clearing the way for the six-party talks to resume after a long standoff. The president's former ambassador to the U.N., John R. Bolton, and others, have said the agreement is ineffectual.

## **Diplomacy With the Devil**

By DANIELLE PLETKA

Washington

NEITHER George W. Bush nor the national security expert who advised him through his first presidential campaign seemed captivated by the prospect of a Nobel Peace Prize or encomiums from the chattering classes. But something has happened over the last seven years. The allure of a place in history has grown. How else to explain the about-face President Bush and Secretary of State Condoleezza Rice have made on key foreign policy issues from North Korea to the Middle East peace process?

Early in his term, President Bush jettisoned the crown jewels of the Clinton administration's foreign policy — the Israeli-Palestinian peace process and the North Korea Agreed Framework. In each case, experts still disagree about whether he was right to do so. But the fact is that Bill Clinton had gone the extra mile in the Middle East and achieved nothing. And revelations that the North Koreans had been cheating on their 1994 commitment to abandon nuclear weapons made manifest the fraud underlying that “breakthrough.”

Seven years into the Bush presidency, however, what was old is new again. The “blackmailing” Pyongyang regime is now one with which the United States can do business. Nevermind that in 2002, American and Spanish warships discovered a North Korean vessel carrying Scud missiles to Yemen or that in 2005 the Treasury Department designated the Macao-based Banco Delta Asia as a “primary money-laundering concern” for its role in North Korea's illegal weapons, counterfeiting and drug businesses.

Now suddenly, Washington eschews comment on North Korean arms sales. And as for Banco Delta Asia, it's back in business and its frozen money has been returned to North Korea. Worse, Ms. Rice has now signed on to a new “Mark II” version of the agreed framework, which has considerably fewer benchmarks for the North Koreans than the Clinton administration deal did.

Ostensibly a commitment by North Korea to disclose and abandon all nuclear programs — including a secret highly enriched uranium program — the deal's vague, open-ended nature promises endless renegotiation. As to why an administration that once insisted upon “complete, verifiable and irreversible dismantlement” is now O.K. with nebulous “abandonment,” the record is silent.

Back in 2001, the newly minted Bush administration was scornful of Bill Clinton's efforts to build a Palestinian state with a terrorist government in place. Mr. Bush refused to allow Yasir Arafat to darken the White House door and said he would “not support the establishment of a Palestinian state until its leaders engage in a sustained fight against the terrorists.” Now Hamas is in control of Gaza, Mahmoud Abbas is the powerless president of a Palestinian Authority and members of his Fatah forces tried to assassinate Israel's prime minister.

Nonetheless, Ms. Rice has been to the region repeatedly and recently sought advice from not just Bill Clinton but, of all people, Jimmy Carter. Next week, she'll be playing host to Prime Minister Ehud Olmert of Israel and his Palestinian antagonists at a cozy chat session in Annapolis, Md. (None seem as committed to the meeting as Ms. Rice — originally expected to last three days, it has reportedly been pared down to one.)

The clearest sign of Ms. Rice's eagerness to make deals with Pyongyang and the Palestinians is her willingness to overlook egregious misbehavior by her negotiating partners. Much like the Clinton administration, which disregarded early warning of a uranium enrichment program in hopes of staging a "historic" presidential visit to Pyongyang in 2000, the United States is now ignoring evidence of North Korean nuclear and missile proliferation to the Middle East.

For example, in September Israeli jets destroyed what Israeli and American intelligence assessed to be a North Korean-built nuclear reactor in Syria. Officials who have seen the intelligence tell me the structure was the result of several years of transfers between North Korean nuclear suppliers and Syrian buyers. Ms. Rice's most revealing comment? An explanation that "issues of proliferation do not affect the Palestinian-Israeli peace efforts we are making."

This bizarre rationalization is oddly divorced from reality: how could Israel possibly be indifferent to its neighbors acquiring nuclear technology from America's partner in the new agreed framework? The statement simply invites America's adversaries to capitalize on the administration's desperation. Why not engage in bad behavior if the Bush administration, like the Clinton administration, will look the other way?

By kowtowing to the conventional wisdom of what a secretary of state should do, Condoleezza Rice is making her legacy dependent on the future behavior of a North Korean tyrant and Palestinian pretenders. Ultimately, that will serve neither selfish nor national interests.

## Syrian signals

JOHN CHERIAN

in Damascus

*[EXCERPTS]*

Syrian Prime Minister Mohammed Naji al-Otari, speaking to the international media in Damascus in the last week of October, said that tremendous pressure was being exerted on Syria to change its domestic and foreign policies. "We will remain steadfast," said Otari. Syrian dissident groups are being nurtured in Western capitals. Washington and Paris are in the forefront of these activities meant to destabilise one of the few remaining secular governments in the region. There have been concerted attempts to link Bashar al-Assad to the assassination of former Lebanese Prime Minister Rafik Hariri.

*[deletia]*

The Israeli air strike in September against a target in northern Syria still generates a lot of comment.

Otari categorically stated that the stories about Israel targeting an alleged Syrian nuclear reactor were part of "Zionist propaganda".

He said that the allegations about North Korean help for Syria's nascent civilian nuclear programme were fabricated by Israel. The International Atomic Energy Agency chief, Mohamed ElBaradei, has also dismissed the Israeli claims. Many intelligence analysts believe that the Israeli war planes targeted a Syrian arms depot in Deir ez-Zor. Bashar al-Assad said that the target was a small military building under construction.

The raid was also obviously part of the continuing U.S.-Israel psychological warfare against Syria and Iran. The message to Damascus and Teheran is that Israel's air force still carries punch even though its army was humiliated in Lebanon. Washington may also be seeking to signal to the international community that on matters relating to proliferation in West Asia, it would prefer to act in concert with Israel as the nuclear policeperson.

Middle East

## **A warning shot for Iran, via Syria**

By Gareth Porter

Nov 21, 2007

WASHINGTON - Until late October, the accepted explanation about the September 6 Israeli air strike in Syria, constructed from a series of press leaks from US officials, was that it was prompted by dramatic satellite intelligence that Syria was building a nuclear facility with help from North Korea.

But new satellite evidence has discredited that narrative, suggesting a more plausible explanation for the strike: that it was a calculated effort by Israel and the United States to convince Iran that its nuclear facilities could be attacked as well.

The narrative promoted by neo-conservatives in the George W Bush administration began to unravel in late October with the release by a private company of a series of satellite images showing that the same square, multi-storey building that was hit by Israeli planes on September 6 had been present on the site four years earlier. Although the building appears to be somewhat more developed in the August 2007 image, it showed that the only major change at the site since September 2003 was what appears to be a pumping station on the Euphrates and a smaller secondary structure.

Media reports based on leaks from administration officials had suggested that the presence of a water pump indicated that the building must have been a nuclear reactor. But Jeffrey Lewis, a specialist on nuclear technology at the New America Foundation, pointed out in an interview with Inter Press Service (IPS) that the existence of a water pump cannot be taken as evidence of the purpose of the building, since other kinds of industrial buildings would also need to pump water.

The campaign of press leaks portraying the strike as related to an alleged nuclear weapons program assisted by North Korea began almost immediately after the Israeli strike. On September 11, a Bush administration official told the New York Times that Israel had obtained intelligence from "reconnaissance flights" over Syria showing "possible nuclear installations that Israeli officials believed might have been supplied with material from North Korea".

The Bush administration officials leaking this account to the press, obviously aligned with Vice President Dick Cheney, were hoping to shoot down the administration's announced policy, pushed by Secretary of State Condoleezza Rice, of going ahead with an agreement to provide food and fuel aid to North Korea in exchange for the dismantling of its nuclear program.

They had lost an earlier battle over that policy and were now seeking to use the Israeli strike story as a new argument against it.

The officials did not want the intelligence community involved in assessing the alleged new evidence, suggesting that they knew it would not withstand expert scrutiny. Glenn Kessler reported in the Washington Post on September 13 that the "dramatic satellite imagery" provided by Israel had been restricted to "a few senior officials" and not disseminated to the intelligence community, on orders from National Security Adviser Stephen Hadley.

The intelligence community had opposed a previous neo-conservative effort in 2002-2003 to claim evidence of a Syrian nuclear program at the same site. A senior US intelligence official confirmed to the New York Times on October 30 that US intelligence analysts had been aware of the Syrian site in question "from the beginning" - meaning from before 2003 - but had not been convinced that it was an indication of an active nuclear program.

In 2002, John Bolton, then under secretary of state for arms control and international security, wanted to go public with an accusation that Syria was seeking a nuclear weapons program, but the intelligence community rejected the claim. A State Department intelligence analyst had called Bolton's assertion that Syria was interested in nuclear weapons technology "a stretch" and other elements of the community also challenged it, according to a Senate Foreign Relations Committee report.

The attack on the site was an obvious demonstration of Israeli military dominance over Syria, generally considered a vital ally of Iran by Israeli and US officials. It was also in line with the general approach of using force against Syria that Cheney and his allies in the administration had urged on Israel before and during the war against Hezbollah in Lebanon in summer 2006.

During the war, Deputy National Security Adviser Elliot Abrams told a senior Israeli official that the Bush administration would not object if Israel "chose to extend the war beyond to its other northern neighbor", leaving no doubt he meant for Israel to attack Syria, IPS reported last December.

David Wurmser's wife Meyrev Wurmser, director of the neo-conservative Hudson Institute's Center for Middle East Policy, told Israel's Ynet News in December 2006 that, "many parts of the American administration believed that Israel should have fought against the real enemy, which is Syria and not Hezbollah". She said such an attack on Syria would have been "such a harsh blow for Iran that it would have weakened it and changed the strategic map in the Middle East".

Both Israeli and US officials dropped hints soon after the Israeli air raid that it was aimed at sending a message to Iran. Ten days after the raid, Israeli's military intelligence chief Amos Yadlin declared to a parliamentary committee, "Israel's deterrence has been rehabilitated since the Lebanon war, and it affects the entire regional system, including Iran and Syria ..."

Although he did not refer explicitly to the strike in Syria, the fact that the Syrian raid was the only event that could possibly have been regarded as restoring Israel's strategic credibility left little doubt as to the meaning of the reference.

That same day, Reuters quoted an unnamed US Defense Department official as saying that the significance of the strike "was not whether Israel hit its targets, but rather that it displayed a willingness to take military action".

On September 18, former United Nations ambassador John Bolton was quoted by JTA, a Jewish news service, as saying, "We're talking about a clear message to Iran. Israel has the right to self-defense - and that includes offensive operations against WMD [weapons of mass destruction] facilities that pose a threat to Israel. The United States would justify such attacks."

On October 7, Washington Post columnist David Ignatius, who enjoys access to top administration officials, quoted an unnamed official as providing the official explanation for the Israeli attack as targeting "nuclear materials supplied to Syria by North Korea".

But then, without quoting the official directly, Ignatius reported the official's description of the raid's implicit message: "[T]he message to Iran is clear: America and Israel can identify nuclear targets and penetrate air defenses to destroy them."

The official's suggestion that the strike was a joint US-Israeli message about a joint policy toward striking Iran's nuclear sites was the clearest indication that the primary objective of the strike was to intimidate Iran at a time when both Israel and the Cheney faction of the Bush administration were finding it increasingly difficult to do so.

Gareth Porter is an investigative historian and journalist specializing in US national security policy. His latest book, *Perils of Dominance: Imbalance of Power and the Road to War in Vietnam*, was published in June 2005.

## **Inside Intel / Not a reactor - something far more vicious**

By Yossi Melman

Ten weeks have passed since the Israel Air Force attacked in Syria, and there is still no reliable information about the precise target that was destroyed, or about the importance and necessity of the attack. Since Israel keeps maintaining its veil of secrecy, Everything that is known comes from leaks by anonymous U.S. administration officials to several of the major American media outlets. What is almost certain, judging from the leaks, are the following facts: A nuclear site built by the Syrians was attacked, and there was some connection to know-how and technology transferred from North Korea. The prevailing assumption is that it was a 5-megawatt nuclear reactor that was in stages of construction, that would have enabled Syria to produce plutonium to manufacture a nuclear bomb.

This assumption relies first and foremost on an analysis by scholar David Albright, director of the Institute for Science and International Security in Washington (ISIS). Albright was part of the United Nations supervisory unit in Iraq that searched for weapons of mass destruction. In recent years, he and his institute have gained a reputation as experts in nuclear proliferation. He is considered close to the U.S. intelligence community and to have connections with the Israeli defense establishment.

A month ago Albright, as well as The Washington Post and The New York Times, published satellite photos of the site attacked in Syria. The photos were taken on August 10, 2007 and reveal a structure built adjacent to a hilly slope, not far from the Euphrates River. Incidentally, it would be interesting to learn who knew already then, about a month before the attack to take photographs of the Syrian structure from the satellite company DigitalGlobe.

A reactor without a dome

Albright compared the structure in Syria to satellite images of a structure located at the Yongbyon nuclear site in North Korea. The dimensions of the two structures are similar - about 48 by 32 meters and lacking a dome. The structure in North Korea is a nuclear research reactor built on the basis of a 1980 Chinese archetype. As opposed to the Western countries, in the Communist bloc countries, reactors commonly have a flat roof and lack a dome. For example, the reactor in Chernobyl, Ukraine, where the radioactive leakage disaster occurred in 1985, had no dome.

The official production capacity of the reaction in Yongbyon, which was fueled with enriched uranium, is 5 megawatts, but the experts estimate that in fact its capacity had been extended. Over the years, particularly during the period when North Korea was not under the supervision of the International Atomic Energy Agency (IAEA), it produced plutonium from the nuclear fuel rods. U.S. intelligence estimates that even after the nuclear test conducted about a year ago (a test which failed), North Korea still has reserves of about 40 kilograms of plutonium, which is sufficient to produce 10 atom bombs. This plutonium is not under supervision, and North Korea could have concealed it in its laboratories or sold it to another country - Syria, for example.

Albright's assessments, which hold that what was attacked in Syria was a nuclear reactor, have become

almost an authoritative voice. They have been unreservedly adopted all over the world, Israeli media included.

But Prof. Uzi Even of Tel Aviv University is challenging them here for the first time. On the basis of an analysis of the same satellite photos, which have been published in the media and on Web sites and are accessible to everyone, he believes that the structure that was attacked and destroyed was not a nuclear reactor. Even, a former Meretz MK, is a chemist who until 1968 worked at the nuclear reactor in Dimona (KAMAG - Hebrew for the Nuclear Research Center). For years he has been keeping track of, and writing about, Israel's nuclear policy and the proliferation of nuclear weapons worldwide.

Even's questions relate to several substantive issues. First, in the reactor in Yongbyon, one can clearly see a chimney, which is necessary for the emission of the radioactive gases (incidentally, based on the emission of the gases experts can determine the capacity of the reactor). In the satellite photos of the structure in Syria there is no chimney. It could be claimed that the Syrians may not have had time to build it. This is a reasonable answer, but it is overshadowed by the fact that there is evidence that the structure was under construction already four years ago. There are satellite photos of the site from 2003. In these photos one can clearly see in one of the building walls openings, which disappeared in the 2007 photos. "We can assume that construction began even before 2003," says Even. "In all those years, five years or even more, a chimney had still not been built? Very strange."

No less strange in his opinion is the fact that the "reactor" did not have cooling towers. The pumping station seen in the photos, 5 kilometers from the site, cannot, according to him, be a substitute for such towers. "A structure without cooling towers cannot be a reactor," he says, pointing to the satellite photo from Yongbyon, in which one can clearly see the cooling tower, with steam rising from it.

Another structure essential for a reactor is missing from the Syrian photos: a plutonium separation facility. As mentioned, the reactor is fueled by enriched uranium of fuel rods, which undergo a process of radiation. In order to turn them into plutonium, they have to be processed chemically in a plutonium separation facility.

And there is an additional question. If this was, in fact, a nuclear reactor, whose construction was not completed, clearly it would have taken the Syrians several years until they were able to operate it and produce plutonium. Why was Israel in a rush to attack a reactor that was under construction, years before it would have become operational? Was it willing to risk an all-out war with Syria because of a reactor in stages of construction? (A war Israel was afraid would erupt last summer, even without any connection to the nuclear issue.) This is very unlikely.

To give an example, the attack on the Iraqi reactor in 1981 was carried out very shortly before it would have become operational. From this, we may conclude that a nuclear reactor under construction, which is far from endangering Israel, should not have been a worthy target for attack.

Even more dangerous

All these explanations and others lead Even to believe that what was destroyed was not a nuclear reactor. If this is the case, what was the purpose of the structure?

"In my estimation this was something very nasty and vicious, and even more dangerous than a reactor,"

says Even. "I have no information, only an assessment, but I suspect that it was a plant for processing plutonium, namely a factory for assembling the bomb."

In other words, Syria already had several kilograms of plutonium, and it was involved in building a bomb factory (the assembling of one bomb requires about four kilograms of fissionable material).

Processing the plutonium and assembling the bomb require utmost caution, because plutonium is one of the most toxic and radioactive materials. One microgram can kill one person, and a gram is capable of killing a million people. Handling it requires special lathes, but because of its lethal nature nobody is allowed to come into direct contact with plutonium or with the lathes. That is why there is a need to build labs containing dozens of glove boxes, which isolate and separate the worker from the material and the equipment.

What reinforces Even's suspicion that the structure attacked in Syria was in fact a bomb assembly plant is the fact that the satellite photos taken after the bombing clearly show that the Syrians made an effort to bury the entire site under piles of earth. "They did so because of the lethal nature of the material that was in the structure, and that can be plutonium," he said. That may also be the reason they refused to allow IAEA inspectors to visit the site and take samples of the earth, which would give away their secret.

Another piece of information crucial for reinforcing Even's assumption is the scant attention paid in the Israeli media to an op-ed published last month in *The Wall Street Journal* by two members of the U.S. Congress, Peter Hoekstra and Ileana Ros-Lehtinen. Hoekstra is the senior Republican member of the House Permanent Select Committee on Intelligence and Ros-Lehtinen is the senior Republican member of the House Foreign Affairs Committee. They expressed their anger at the fact that the Bush administration "has thrown an unprecedented veil of secrecy around the Israeli airstrike. It has briefed only a handful of very senior members of Congress, leaving the vast majority of foreign relations and intelligence committee members in the dark. We are among the very few who were briefed, but we have been sworn to secrecy on this matter."

They write in the article that Syria received "nuclear expertise or material" from North Korea, and in the same breath they mention Iran, without explaining why. They claim that the administration leaks are intentionally vague: to justify the Israeli attack but also to blur North Korea's part in the affair.

The two Congressmen have a clear agenda: They want the administration to remove the cloak of secrecy and tell the members of Congress and the public the truth about what happened, in the belief that such information will lead the majority in Congress to understand that the negotiations with North Korea should be stopped.

North Korea's consent to shut down the Yongbyon reactor and to allow renewed international monitoring of it (although it is not clear what will happen to the fissionable material in its possession - enriched plutonium and uranium), was achieved after exhausting contacts that lasted for about five years, with China, Russia, the U.S., Japan and South Korea. In exchange, North Korea will receive economic assistance and fuel. Hoekstra and Ros-Lehtinen are apparently aware that revealing the truth about North Korea's role will lead to pressure on the U.S. administration to discontinue the contacts with the regime in Pyongyang. But for exactly the same reason, the administration is not interested in doing so, particularly not at this sensitive time when it is trying to prevent Iran's nuclear program.

And what about Israel? Wasn't it in Israel's interest to publicize what was bombed in Syria? Of course it was. Even more so if this was a plant for assembling a nuclear bomb based on information, technology and fissionable material that Syria received from North Korea, perhaps with the knowledge and consent of Iran, or even more than that.

Then why is Israel insisting on continuing to maintain total secrecy? The only logical explanation (except for the embarrassment of Syrian President Bashar Assad, which doesn't particularly bother Israel), is the desire not to make things hard for the U.S. Administration.

## **U.S. to hold N. Korea to nuclear promises**

By Nicholas Kralev

November 29, 2007

The chief U.S. negotiator with North Korea, concerned that Pyongyang might fail to provide a full declaration of its nuclear-related materials and activities by year's end, as it has promised, will return to the North on Monday, U.S. officials said yesterday.

The envoy, Christopher R. Hill, whose visit will be the second in less than six months, warned of a "crisis" if North Korea's list falls short of a "full disclosure."

Mr. Hill intends to tell the North Koreans what the United States expects to see on the list and plans to press them particularly on two main issues: their suspected uranium-enrichment program and the exact number and type of their nuclear weapons, diplomats said.

"Whatever declaration they make needs to be full and complete with respect to their nuclear program," State Department spokesman Sean McCormack told reporters. "It's going to be an important element of what they produce as part of their commitments under the six-party talks."

An incomplete list would stall the six-nation process that envisions the North dismantling its nuclear programs in exchange for political and economic rewards from the United States, South Korea, China, Japan and Russia.

"The data declaration will be a critical test of the North's real willingness to give up its nuclear weapons," said Bruce Klingner, senior research fellow at the Heritage Foundation.

The uranium-enrichment issue appears to be the most challenging, diplomats and analysts said. Washington accused North Korea of pursuing such a program in 2002, based on information from Pakistan that it had sold the North centrifuges and other related materials.

Pyongyang has repeatedly denied the U.S. claim, and the Bush administration has refused to share proof even with its closest Asian allies.

Pakistani President Pervez Musharraf wrote about the North Korean purchases from the shadowy network of A.Q. Khan, the father of the Pakistani atom bomb, in his autobiography "In the Line of Fire," which he promoted last year on U.S. TV talk shows.

Although the North is said to have admitted to acquiring various materials that could be used in a uranium-enrichment program, it is still refusing to acknowledge possessing centrifuges, the core element in such a program.

"If there is even the slightest doubt in the international community that a uranium-enrichment program exists, the North Koreans will play on that doubt," said Michael O'Hanlon, senior fellow in foreign policy studies at the Brookings Institution.

"This will probably be a tactical negotiation, though they would be better off making a clean decision" to disclose everything they have, he said.

Mr. O'Hanlon and other analysts said the North Koreans could be holding on to the centrifuges card to force the United States to take them off its list of state sponsors of terrorism.

The other thorny issue is the number of the North's plutonium-based weapons. The chief North Korean negotiator, Kim Kye-gwan, has said that neither the number nor the exact type will be disclosed, but Mr. Hill has made it clear he expects to see that information in the declaration.

Another matter — the clarity of which is far from certain — is the North's proliferation activities.

Following an Israeli air strike on a suspected nuclear facility in Syria that may have been housing materials from North Korea, President Bush said Pyongyang had agreed in an Oct. 3 six-party statement to provide "a full declaration of any proliferation activities."

The document in question does say that the North is "committed not to transfer nuclear materials, technology or know-how," but when it comes to the declaration, it says it "will include all nuclear facilities, materials and programs." There is no mention of documenting proliferation activities.

Mr. Klingner said Mr. Bush "may have inadvertently raised the bar."

Mr. Hill said during a stop in Japan yesterday that, in addition to Pyongyang, he would visit the North's main nuclear complex in Yongbyon, whose main facilities are currently being disabled as part of the Oct. 3 agreement.

"I think we are making progress and clearly we have more to do, but I think we are on schedule for getting to the end of the year and getting all our commitments done," Mr. Hill told reporters in Tokyo.

## **Mystery still surrounds Israel's attack by the Euphrates**

von Daniel Dombey (Washington)

FTD.de, 29.11.2007

If it was a Syrian nuclear reactor built with North Korean aid, nobody is talking.

Rarely does President George W. Bush bite his lip when discussing "axis of evil" states such as Syria and North Korea.

But for more than two months Mr Bush has done just that when asked about a September 6 Israeli strike on a mysterious Syrian site. So has every other US administration official speaking on the record, as well as the Israeli government itself, fuelling a continuing controversy about the incident.

"This is not my first rodeo," Mr Bush said at a press conference last month after being asked about the incident at least six times. "And I know where you're trying to get me to comment. I'm not going to comment on it, one way or the other."

This uncharacteristically taciturn approach has angered some of the president's Republican supporters, amid a series of newspaper reports that the Syrian site was a nuclear reactor built with North Korean help. But as the weeks since the Israeli raid pass, more questions than answers have surfaced about what precisely the Israelis hit.

The Republican anger has been displayed by legislators such as Peter Hoekstra and Ileana Ros-Lehtinen, respectively the senior Republican members of the House of Representatives committees on intelligence and foreign affairs. Among a select handful of congressmen briefed on the incident by Michael McConnell, the US's director of national intelligence, they did not respond to the briefing as intended, calling instead for the administration to come clean publicly about what had occurred.

"Until Congress is fully briefed it would be imprudent for the administration to move forward with agreements with state proliferators," they said in the Wall Street Journal, in reference to the six-party talks on Korea's nuclear programme.

John Bolton, formerly Mr Bush's ambassador to the UN, argues that the administration is unduly preoccupied with reaching a deal in those negotiations and with the forthcoming international conference in Annapolis, Maryland, on the Israel-Palestinian conflict, to which Syria is likely to be invited.

"There's a growing suspicion that the veil of secrecy about Syria doesn't have so much to do with intelligence as with protecting the six-party talks and the Annapolis conference," Mr Bolton says. "Israeli government officials have told me that Secretary [Condoleezza] Rice told them in no uncertain terms that the information [about the attack] better not come from them."

David Albright, a respected former United Nations weapons inspector, has used satellite imagery to argue that the Israelis probably attacked an installation on the Euphrates river at Dawar az Zawr, eastern Syria, which was similar in shape to North Korea's Yongbyon reactor.

"I believe pretty strongly that Israel thinks it attacked a nuclear reactor and that the US didn't say they were wrong," he says, adding that his suspicions were heightened by the recent addition of a pump house that could supply water for a reactor, and further images that showed Syria razed the site after the Israelis struck.

"The recent photo evidence showing the Syrians clearing the sites indicated that they are clearly trying to hide something," says Joe Cirincione, a non proliferation expert at the Centre for American Progress. He says that the evidence so far "tilts towards the theory that it was a reactor in Syria but does not establish it".

But he adds: "There's no evidence it was an imminent threat," arguing that if there was a reactor, it was probably years from producing plutonium and that Syria lacks a reprocessing facility to turn its spent reactor fuel into plutonium.

The International Atomic Energy Agency, the UN's Vienna-based nuclear watchdog, is also not convinced the site was a reactor.

Diplomats in Vienna warn against relying on satellite photos, saying that it is quite possible that the installation was no more than the adjunct of a chemical facility or a shed used to make agricultural equipment. They add that they were surprised that the site lacked a security fence, an unusual omission in a top secret facility.

"I am amazed that people can say they know the function of an installation just because they see its dimensions," adds Jeffrey Lewis, an arms control expert at the New America Foundation. "It's a box on a river." He adds that, far from being in a remote site, the Dawar az Zawr facility is just over a mile from a well-known tourist site in Halabiya, from which rafting trips down the Euphrates can be organised.

Meanwhile, President Bashar al-Assad says the Israeli aircraft hit a disused military building with "nothing in it".

The mystery may not continue indefinitely: under the talks framework, North Korea is due to give an account of its nuclear activities by the end of the year. And so far, despite Mr Bolton's concerns, the events in Syria have not interrupted those negotiations.

"The opponents of the six-party talks wanted to use this strike to kill this deal," said Mr Cirincione. "But the president isn't having it."

## Syria, Israel peace talks plan

Robin Wright

November 30, 2007

RUSSIA and the US are tentatively planning a second Middle East peace conference, in Moscow in early 2008, with major parties hoping to begin a comprehensive peace effort that would include direct talks between Israel and Syria.

Syria's delegate to this week's talks in Annapolis said that Damascus wanted the Moscow gathering to begin negotiations between Syria and Israel over the Golan Heights, a border region seized by Israel during the 1967 War.

"It is our hope that we can revive the Syrian track in Moscow," Syria's deputy Foreign Minister, Fayssal Mekdad, said.

Israeli Prime Minister Ehud Olmert indicated that he hoped at some point to resume talks with Syria, but cautioned that the time is not yet ripe. He said Syria must change its behaviour, notably its support for Hezbollah.

But the presence of a Syrian delegation in Annapolis "may be the beginning of a reconsideration" on the part of Damascus, he said.

Mr Olmert said US President George Bush indicated privately that he had no objection to an Israeli dialogue with Syria if Israel determined this was in its own interest. Mr Bush's only admonition to the Israelis, he said, was: "Don't surprise us."

After talks at the White House, Mr Bush promised Mr Olmert and Palestinian president Mahmud Abbas his full support to overcome deep doubts on whether new peace talks could yield an accord next year.

Mr Abbas and Mr Olmert were to return home to confront sharp scepticism from friends and foes alike over the peace drive.

Mr Bush, who called Middle East peace "something we all want", did not invite Mr Abbas or Mr Olmert to speak at the event in the White House Rose Garden, and the three leaders did not shake hands. The muted moment was in sharp contrast to the ebullient 1993 handshake on the South Lawn between the then US president, Bill Clinton, the late Israeli prime minister Yitzhak Rabin, and the late Palestinian leader Yasser Arafat.

The new peace push won a cautious show of support from the 22-member Arab League, whose chief, Amr Mussa, cited "misgivings" but warily welcomed the agreement to thaw negotiations that have been frozen during President Bush's seven years in office.

WASHINGTON POST, With AFP

## **The Israeli Attack in Syria and The State Department Response**

**Fri, 2007-11-30 05:37**

By Herbert London

The veil of secrecy surrounding the Israel invasion of what is alleged to be a Syrian nuclear facility on September 6 is understandable. Israel is not willing to disclose its military capabilities and technical advantages.

On the other hand, the secrecy is having and will continue to have a profoundly negative effect on United States' diplomatic credibility. Since North Korea was involved in one way or another with the Syrian facility either by providing enriched uranium, nuclear technology or plutonium, it makes sense to discuss Kim Il Jung's pernicious role in exporting nuclear material.

Yet the State Department, leading a discussion in the Six Party talks over North Korea's nuclear capability, does not want to upset the so-called apple-cart by describing North Korea's malevolent influence. Silence in this case is deadly, but the State Department goal is an agreement, however empty the ultimate result might be.

What hasn't been seriously entertained is the influence of silence on the talks in Annapolis and back channel conversations with the Iranians. If the United States chooses to avert its gaze to North Korea's mischief, the message being conveyed is that you can get away with a great deal if you negotiate with the U.S. and offer the illusion of conciliation.

In fact, diplomacy has become a weapon used against this government by our enemies mindful of our energetic pursuit of treaties. This is the twenty-first century version of the Munich Accord with appeasement the goal for State Department officials who do not know how to say "no."

Moreover, the hidden message at Annapolis is the U.S. wants a deal even if it means giving tacit support to terrorists and selling out our allies. What other conclusion can one reach if we are unwilling to blow the whistle on North Korean nuclear exports.

For some who believe it always pays to talk to adversaries (Obama Barack comes to mind), it should be noted that negotiations can serve as a cover for violent acts. In the haste to produce an "understanding" the U.S. can overlook or rationalize any action that might jeopardize a treaty. Yet as history has demonstrated treaties are worthless if one of the parties chooses to ignore its terms. Think of the Kellogg-Briand pact or the Locarno Treaty.

It should be noted that in addition to the dissemination of nuclear material, the North Koreans have provided every rogue state in the Middle East with missile technology to deliver weapons of mass destruction. The SCUD arsenal in Iran, for example, has its provenance in North Korea.

There are times in foreign affairs when silence is golden. As already noted, I can appreciate Israel's reluctance to discuss details of its September 6 attack. But the U.S. is in a different position vis-à-vis North Korea and its involvement with possible Syrian nuclear material. This disclosure warrants transparency in my judgment.

Unfortunately the State Department wants deals more than disclosure. As a consequence, the full story of North Korea's involvement with Syria won't be known in the short term. But there is something we do know: Israel would not have attacked unless the material in question was a direct threat to its security and Syria would not have cleaned up the site unless the material might prove to be an embarrassment.

What we also know is North Korea's involvement in this imbroglio, since a North Korean vessel carrying sensitive material was monitored by Israeli surveillance satellites days before it arrived in Syria. The key question that remains open is why the State Department maintains secrecy about this matter. But, than again, I think I know the answer to this question.

## Obstacles Loom in NKorea Nuclear Talks

By FOSTER KLUG – Dec 1, 2007

WASHINGTON (AP) — Even as the Bush administration marks unprecedented progress in North Korean nuclear disarmament talks, two looming impediments could undermine years of delicate negotiations.

One is a suspicion, especially among U.S. conservatives, that North Korea has helped Syria pursue a nuclear weapons program. Such cooperation would raise the specter of a country that boasts nuclear weapons providing atomic assistance to a nation Washington considers hostile and a sponsor of terrorism.

The other issue is the U.S. claim the North pursued a secret uranium enrichment program, as well as its known plutonium production. A 1994 nuclear deal collapsed after the United States confronted the North with the uranium claim in 2002; years of acrimony and stalemate followed, culminating in a North Korean nuclear test last year.

North Korea is required to provide a list outlining all its nuclear programs by year-end as part of a six-nation disarmament process, and the United States will be pushing for credible details about these two sensitive issues to allow President Bush to move the accord forward.

Bush is looking to North Korean disarmament as a way to burnish a legacy beleaguered by Iraq. A failure could turn into a political issue ahead of next year's presidential and congressional elections.

The North's nuclear declaration will top the agenda of Christopher Hill, the lead U.S. envoy at the nuclear talks, during his trip this week to the country.

"Chris Hill's credibility is really tied to the North Koreans coming clean on some type of uranium program," said Ralph Cossa, president of the Pacific Forum Center for Strategic and International Studies think tank. "If they don't do that, it's going to be extremely difficult" for the administration to sell the deal.

On Sept. 6, Israeli warplanes struck a target in Syria, which, according to media reports quoting unidentified U.S. officials, was a nuclear facility linked to North Korea. Some congressional staffers caution that the reports have not been supported by any public evidence.

At private talks Nov. 16 in New York, attended by current and former U.S. officials and North Korean government representatives, members of the American delegation pressed the North to provide details about any nuclear ties with Syria.

Former Secretary of State Henry Kissinger, Victor Cha, a former White House adviser on North Korea, and others argued that it would be difficult to take the North off a U.S. list of state sponsors of terror, a crucial North Korean demand in nuclear talks, if there were a lack of clarity about whether the North had provided nuclear cooperation to Syria, according to a person at the meeting. Syria also is on the terror list.

Another participant said the Americans did not appear to have specific information about North Korean-Syrian nuclear dealings, aside from the news reports. The participant described the exchange as people with an interest in the nuclear talks' success trying to share with the North Koreans their anxiety over the reports.

Both people spoke on condition of anonymity because the meeting was private.

U.S. lawmakers wary of the North Korean negotiations have seized on the Syrian issue to urge caution.

Writing in The Wall Street Journal, Republican Reps. Ileana Ros-Lehtinen and Peter Hoekstra urged the Bush administration to provide information about the Israeli attack. The administration, they wrote, has "thrown an unprecedented veil of secrecy around the Israeli airstrike."

Syria has denied repeatedly that it is building a nuclear facility. North Korea denies accusations it has spread its nuclear expertise beyond its borders.

U.S. diplomats are pressing North Korea for a "serious and credible" nuclear declaration, and Hill has said he expects to have intense discussions about the list during his trip to the North.

North Korea has said it does not have a uranium program; the United States says, however, that in 2002 North Korea's government privately acknowledged a program in talks with Hill's predecessor. The United States alleges the North's uranium program was created with help from a nuclear black market run by A.Q. Khan, the founder of Pakistan's atomic weapons program.

Jack Pritchard, the State Department's chief North Korea expert until 2003, said Hill probably will use the North Koreans' desire to be removed from the U.S. terrorism blacklist to push them to outline their uranium efforts.

North Korea already has begun disabling its main nuclear facilities under an agreement with the other countries at the talks — China, Japan, Russia, South Korea and the United States. Washington hopes to use the North's declaration as a guide to nuclear programs to be dismantled by the end of next year.

Robert Gallucci, a former U.S. diplomat who signed the 1994 nuclear deal with the North, said the current accord is unclear about how to "deal with gaps between what we expect they should be declaring and what they may declare."

If North Korea does not offer a serious declaration, he said, "not only will conservatives — who are all geared up to throw mud at this thing — I think even others of us, who really want a deal to work, will say, 'Well, wait a minute, you really have to achieve some reasonable level of transparency.'"

## **Israel's wings clipped by U.S. report on Iran**

By Dan Williams

December 5, 2007

MYT 5:15:47 AM

JERUSALEM (Reuters) - A public difference of opinion between Israel and its U.S. ally about intelligence on Iran's nuclear capability will make it harder for the Jewish state to launch any unilateral preemptive strike on Iran's nuclear sites.

A U.S. National Intelligence Estimates (NIE) report on Monday said Iran had a nuclear arms project but shelved it in 2003, posing an unprecedentedly overt challenge to Israel's assertions that its arch-foe was bent on acquiring a bomb.

Israel's Prime Minister Ehud Olmert attends a ceremony marking the first night of the Hanukkah festival at a military base near West Bank city of Nablus, December 4, 2007. (REUTERS/Oleg Popov) Though the NIE said Iranian uranium enrichment facilities may produce warheads in the next decade, its refusal to perceive an imminent threat sent shockwaves through Israel, which is more used to having Washington endorse its regional strategic vision.

Israeli Prime Minister Ehud Olmert, faced with doubts by some U.N. Security Council powers on the need to press sanctions against Tehran, urged that diplomatic pressure be intensified.

Israeli Defence Minister Ehud Barak suggested that American spies had suffered a "disconnect". He later said Israel would pursue "various options" against Iran, but did not elaborate.

The remarks fell far short of past hints that Israel, which is widely assumed to possess the Middle East's only atomic arsenal, could go it alone and hit Iran if it deemed diplomacy a dead end in removing what it sees as a threat to its existence.

"What this report means is that there will be no preemptive U.S. military action against Iran in the foreseeable future," said a recently retired Israeli government intelligence analyst.

"That means there will be no U.S. 'green light' for Israeli strikes. It looks like a done deal," said the ex-analyst, who declined to be named given the sensitivity of the subject.

The report came amid mounting speculation that President George W. Bush could launch U.S. military action before he leaves office in January 2009, even though Washington says it is committed to resolving the Iranian stand-off diplomatically.

Bush said he read the NIE report as a warning about Iran's latent capabilities: "Iran was dangerous. Iran is dangerous." Israeli media reported that Bush planned to come to Israel in January -- his first visit as president -- to show solidarity.

Whether or not Israel -- which drew brief censure from U.S. President Ronald Reagan by bombing

Iraq's reactor in 1981 -- would set itself a condition of winning Washington's assent to similarly take on Iran is a matter of some debate.

## EXPECTING SURPRISES

Israel, which has peace deals with only two of the surrounding Arab states, depends on the United States for \$2.8 billion in annual defence aid and diplomatic backing at the United Nations, where it is often assailed for its treatment of the Palestinians.

"I don't think the Israelis ever asked us permission to do anything," said one senior U.S. official with knowledge of Israel's military affairs. "If they attack Iran, you can be sure it will be in a way that's hugely surprising for everyone."

A retired Israeli diplomat with defence planning experience said secrecy was key. For high-risk missions like a long-range bombing run, he said, "it would be unwise to check in, even with our closest allies, ahead of time".

But Israel would not want angry allies after the event.

The retired Israeli diplomat allowed that the NIE report complicated any Israeli plan to attack Iran, which has denied seeking nuclear weapons and vowed to retaliate for such strikes with missile salvos on Israel and U.S. targets in the Gulf.

"You resort to force of arms when you feel all other options have been exhausted, and then you explain yourself -- both to your own countrymen, as required in a democracy, and to the world at large," the retired diplomat said.

"This report requires that Israel, which now appears isolated and alarmist, work extra hard to build its case."

Top Israeli officials have been meeting regularly with U.S. counterparts for closed-door discussions on Iran. The former Israeli intelligence analyst said the NIE's conclusions suggested Israel has had a problem winning over the Americans: "Surely if we had hard proof that Iran was about to go nuclear, it would have affected the report's conclusions?"

The retired diplomat pointed to Israel's Sept. 6 air strike on northern Syria as a possible precedent for an attack on Iran.

Israel and the United States have not given details on the Syrian target, which analysts speculated was a nascent nuclear reactor. Syria denied having any such project.

"Look at how muted the world reaction was to whatever happened in Syria. If you don't admit anything, then you can't be held to account," the retired diplomat said.

Israel may not be equipped to repeat its Syria or Iraqi sorties in Iran, whose nuclear facilities are distant, numerous and well-fortified.

## North Korea and Syria

by Victor Cha

Updated Dec.7,2007 09:35 KST

In the coming days, there is an entirely real possibility that the White House will notify the U.S. Congress of its intention to remove North Korea from the list of state sponsors of terrorism, opening a path toward eventual diplomatic normalization with a country that the U.S. has technically been at war with since 1950. This move would reflect a more pragmatically-oriented policy toward the reclusive nuclear state by President George W. Bush in his second term that balanced his strong disapproval of the Pyongyang regime's human rights abuses with practical diplomacy aimed at getting North Korean leader Kim Jong-il out of the nuclear weapons business. His able negotiator Ambassador Christopher Hill has succeeded in utilizing the multilateral six-party talks to leverage U.S. and Chinese diplomatic pressure on the North while also giving Pyongyang ample opportunities for bilateral talks with the U.S. which it so badly seeks. President Bush and Secretary of State Condoleezza Rice have given Hill enough negotiating room to show that Washington is serious about finding a solution to this problem. The policy has garnered unanimous support in Asia and bipartisan support at home. However this policy has not come without cost. Bush's second term flexibility on North Korea has not sat well with the conservative core of the Republican Party and has elicited bold criticism from former senior officials like John Bolton.

The next phase of the negotiations appears to be moving along. North Korea is working methodically through 11 steps to disable the reactor at Yongbyon, and is required to provide a nuclear declaration by Dec. 31. In exchange for this, the U.S., China, Russia, and South Korea would provide energy assistance, and in an apparent side agreement, the U.S. has promised to delist North Korea from the list of state sponsors of terrorism and remove economic sanctions that have been in place since the Korean War. Make no mistake, if the North disables and declares by the end of 2007, the Bush administration will have gone further in denuclearizing North Korea than any previous U.S. administration. Pyongyang would no longer be able to make plutonium for nuclear weapons; it will have fessed up on its secret uranium-based nuclear program which led to the breakdown of the Clinton-era agreement; and American and other inspectors would be on the ground in the closed communist state verifying all of this. This would be an unadulterated success.

So what's the problem? The prospect of delisting North Korea from the terrorism list has elicited some grumbling from Japan. Prime Minister Yasuo Fukuda came to the White House last week to remind President Bush that North Korea needs to come clean on citizens it has abducted from Japan in order to get taken off the list. There is widespread agreement that progress on this issue is needed such that the U.S. does not abandon its most important ally in Asia.

But the real problem is Syria. The silence from all circles has been deafening following the Israeli attack on what is believed to be a Syrian nuclear facility built with cooperation from North Korea. One assumes the silence stems in part from the fact that no one wants to be on record characterizing intelligence, and there are probably debates taking place about the nature of the cooperation and whether it continued after the six-party denuclearization agreements in 2005 and 2007.

Some hardliners within the Bush administration have apparently tried to use the Syria revelations as a deal-breaker for North Korea and move to a containment-type policy. But this neither solves the North Korea nuclear weapons problem, nor the potential proliferation problem. The answer is to stick with the negotiations and to get to the year-end goal of disabling the North's bomb-making capabilities.

The second part of the deal -- the nuclear declaration -- becomes infinitely more crucial, however. If Pyongyang is serious about being removed from the terrorism list, then its declaration must include a full disclosure of any nuclear cooperation with Syria or others. This does not need to be public, for reasons of face, but if and when President Bush notifies Congress of his intention to delist North Korea from the terrorism list, then he needs to be able to assure Congress and the world that Pyongyang is out of any nuclear business with states currently on the list. If he cannot do this, then the U.S. should find a formula short of fully delisting North Korea. The North Koreans, South Koreans, and Chinese might respond that Washington needs to fulfill its end of the bargain and not impose new conditions in order to show political will and commitment. This is a false charge. No party has shown more political commitment to this negotiation than the U.S. to the extent that Bush and Rice may even be overexposed on the policy today. They certainly would be if the North's declaration offered no transparency on Syria.

Victor Cha is Director of Asian Studies and D.S. Song Professor at Georgetown University. From 2004 to 2007 he was Director of Asian Affairs at the White House and deputy head of the U.S. delegation to the six-party talks.

GLOBE EDITORIAL

## **The conversion of George Bush**

**December 9, 2007**

IF THERE was any lingering doubt that President Bush is moving away from his original, imperious style of statecraft, the personal letter he sent last week to North Korean leader Kim Jong Il should dispel that doubt for good. In the past, Bush said he loathed Kim, calling him a tyrant and a pygmy. Yet in the letter that was hand-delivered to Kim by Assistant Secretary of State Christopher Hill, Bush addressed the recipient as “Dear Mr. Chairman” and concluded with the polite farewell formula, “Sincerely, George Bush.”

Such a letter from any of Bush’s recent predecessors would have been unremarkable. Coming from him, however, it heralds a longoverdue and much-needed conversion.

After wasting six years refusing to conduct genuine negotiations with North Korea — years in which that country produced enough plutonium for eight to 10 nuclear weapons — Bush finally rejected the futile policy of administration hardliners and backed Hill’s diplomatic efforts to negotiate an agreement that could lead to the dismantling of North Korea’s nuclear weapons, materials, and facilities.

Bush’s letter to Kim Jong Il was needed at this stage of the process Hill negotiated. North Korea has complied with its initial obligations by disabling its nuclear reactor at Yongbyon. Now it must make a complete declaration not only of all its nuclear materials and weapons, but also of past transfers of nuclear goods or know-how to other countries. This commitment takes on special significance if North Korea was involved with the alleged nuclear site in Syria that Israel destroyed in September.

The declaration is due in the next few weeks, though Kim was not expected to come clean all at once. Past practice suggests he is more likely to parcel out the truth in installments, testing Washington’s adherence to its commitments and eliciting the highest possible price, in economic and political benefits, for each disclosure.

Kim’s goal in striking a deal was to end hostile relations with the United States. So, Bush’s letter was meant to show not only that he stands behind Hill’s promises, but also that Kim can achieve normalized relations with the United States if North Korea’s nuclear declaration is “complete and accurate.”

By engaging with the North Korean dictator, Bush is emulating not only Bill Clinton but also his own father, Ronald Reagan, Jimmy Carter, Richard Nixon, John Kennedy, and Dwight Eisenhower. They negotiated and made deals with Soviet leaders, Mao Zedong, and North Vietnam’s communist regime. From ancient Athens until now, the rules for statecraft have been unalterable. The neoconservative notion that one must never negotiate with evil — but only destroy it — was always a doctrinal delusion. Now that Bush seems to have learned this lesson, he would be well advised to apply it to Iran and Syria.

## 'Sun, Stand Still'

By: Avraham Shmuel Lewin

Wednesday, December 12, 2007

Ze'ev Raz was the leader of the IDF attack force that bombed the Iraqi nuclear reactor in June 1981. Today he works at Elta Systems LTD, one of Israel's leading defense electronics companies and a subdivision of Israel Aerospace Industries.

The Jewish Press met recently with the former IAF pilot to get his thoughts on the Israeli bombing in September of an alleged nuclear facility in Syria; on Israel's options in dealing with what Israeli leaders still consider a very real Iranian nuclear threat; and on what went through his mind as he carried out one of the most daring military actions in Israel's history.

### **The Jewish Press: Do you have any special insight into what exactly Israel did in Syria this past September?**

Raz: We still don't know what actually transpired in Syria. It seems there was nuclear activity there that originated from North Korea. Of course, if we see an enemy country engaged in nuclear activity, it doesn't mean we automatically must rush in and bomb it. To this day Shimon Peres says – and he bases this on what several nuclear experts told him – that even if we hadn't bombed Iraq 26 years ago, the Iraqis still wouldn't be able to produce a nuclear bomb.

But of course, what went on in Syria in cooperation with North Korea smelled so bad that even a dovish Mapainik like the late Moshe Sharett (who opposed the Sinai Campaign in 1956) would have supported bombing the Syrian facility.

**Even before the U.S. released its new intelligence findings stating that Iran allegedly suspended its nuclear program in 2003, Israel seemed undecided about launching a strike a la the 1981 operation in Iraq. What's your view on this?**

Any preemptive Israeli strike against Iran would be potentially beneficial to Israel – but also very risky. Why do you think there was such a heated debate in 1981 about whether to approve the bombing of Iraq?

In hindsight it appears that bombing Iraq was the obvious thing to do because it was successful. But try to look at it through the eyes of Ezer Weizman or Yigal Yadin or Yosef Burg in 1981 when they had to make a decision. They said, "Look, we just signed a peace treaty with Egypt, and in the end the Arabs will have a nuclear bomb anyway, you can't stop it forever, and they know we have one so if they try to do something they'll be wiped off the map. So why bomb Iraq? What do you expect Israel to do, go after every country that has an atomic bomb and bomb it?"

This was the thinking of people like Weizman, Yadin, Burg, Shimon Peres and others. They thought the peace treaty with Egypt would break down because of this action. They were mistaken, but no one could know this in advance.

Begin himself didn't know whether bombing Iraq would break the treaty with Egypt, but he said that Saddam Hussein having an atomic bomb was a greater threat to Israel than the loss of a peace treaty with Egypt. My personal opinion, by the way, is that Begin anyway had started having second thoughts about the treaty he signed with Egypt.

**So in retrospect you have no doubt Israel was right in bombing the Iraqi reactor?**

Now, post factum, it's obvious we had to do it. But again, before we actually did it we really didn't know what the diplomatic fallout would be, nor did we know for sure whether the action would succeed and that all of our planes and pilots would return home safely.

It never dawned on us that the Iraqis would do absolutely nothing to stop us and so many other things would work in our favor.

Considering that in 1981 Israel did not hesitate to tell the world it was responsible for taking out Iraq's reactor, why all the secrecy about what transpired in Syria in September?

That's a very good question. My opinion – I can't prove it but I have no other explanation – is that in 1981 Israel admitted to it because it was right before the elections. I remember distinctly the chief of staff telling us we won't admit to anything and we should keep our mouths shut and act as though we know nothing – just as the government does now with Syria.

Suddenly, the day after the attack, I heard on the radio that Israel said it bombed Iraq. I was in total shock. When I returned from the mission I hadn't even told my family where I'd been.

**Some Israelis actually accused Begin, who was in the midst of a very tough fight for reelection, of ordering the raid to drive up his approval ratings.**

Yes, I recall there were people who said at the time that Begin approved the action because of the upcoming elections, but in my opinion that is not true and just puts those who said it in a bad light. And I say this as someone who did not vote for Begin.

He approved the attack not because of the elections but because of what I heard our Intelligence tell him. They said, Listen, if you're going to wait until 1982 the reactor will be hot and active and there will be a lot of radiation (like what happened in Chernobyl in 1986), so wipe it out now before it has a chance to become active.

I think he did the right thing.

Look, when we received our reactor in Dimona from France, its output was so low that it didn't have what it would take to build a nuclear bomb. So what did we do? We raised its output. We were sure that eventually the Iraqis would do the same thing – raise the output of their reactor and in the end produce a bomb.

**Assuming the Iranians are still, or will soon resume, actively working on developing a nuclear capability, it will be much more difficult for Israel to do in Iran what it did in Iraq in 1981. In light of that, is there any way Israel could deliver the kind of blow that would prevent Iran from building a nuclear bomb?**

Even if we succeed in an attack on Iran, it will not be long before the Iranians are again actively involved in trying to build a nuclear capability. In fact, an Israeli attack will give them even more motivation to do so. So even if we bomb Iran, the effect will be similar to that of a temporary painkiller.

Of course I hope that if we do attack we will be successful and all our pilots will return home safely. It will be much harder than what we did in Iraq. Among other factors, we didn't have to refuel in the air when we attacked Iraq but you can't fly to Iran and back without refueling in the air.

You know, one of the planes that bombed Iraq was manned by Ilan Ramon, who perished in the NASA space shuttle accident several years ago. He was the youngest one among us and the only one not yet married.

He was our navigator, in charge of fuel, etc. When I was told what we were being asked to do in Iraq, I went to Ilan and asked him if it were possible to return to Israel after the strike without refueling. To get there was no problem, but how about getting back? He said that in fact we didn't have enough fuel, and so we'd have to do all kinds of tricks to get back safely.

### **Can you describe the feeling you had when you bombed the reactor?**

I felt I had a big z'chus, or privilege. It was very difficult for me to become a pilot. I was a weak pilot in the beginning. And now here I was, entrusted with carrying out such a mission. I felt a huge responsibility, as if the whole project rested on my shoulders and if I made the slightest mistake everything would be doomed and I wouldn't be able to look at myself in the mirror. That is why the only thing that was on my mind was to find the target.

It's like the story of the old Chinese hunter who is about to die and calls in his three sons to decide who among them would inherit his bow and arrow.

He asks the first son, "What do you see?"

He says, "I see you and everybody around us, a window, and outside the window there is a tree and on it a bird."

The father says, "No, you're not a hunter."

He asks the second son what he sees. "I see a window and outside the window a tree with a bird on it," he tells his father.

The father says, "You're not a hunter either." Then he asks the third son what he sees and the third son simply says, "I see a bird." The father says, "You are a hunter because a hunter only sees his target."

That is what went through my mind the whole time – "Where is the target, where is the target?"

By the way, none of us thought – not even in the IDF General Staff – that we would all come back alive.

**Are you saying that when each of you took off you said goodbye to Israel and goodbye to your life?**

Absolutely. Maybe some of us would come back, but we were sure there was no way that everyone would. So as far as each of us, individually, was concerned, it was our last day on earth.

**Doesn't that thought go through every pilot on this type of mission?**

Yes, but in this case the risk was much greater. And yet things happened there that to this day we have no explanation for. For instance, according to all calculations the Iraqi radar systems were supposed to have spotted us at least 15 minutes before the bombing despite the fact that we flew at very low altitude.

That's why we had eight and not four F-16 fighters, because we thought for sure the Iraqis would spot us and send several MIGs to try to down us. We thought we would encounter heavy resistance.

Don't forget, the Iraqis were threatened by Iran too, so for sure they had their radar system and fighter MIGs on alert. We never thought we would take them by such complete surprise. But they didn't do a thing.

Here is another inexplicable thing: King Hussein was vacationing in Aqaba and saw us on our way toward Iraq. He immediately phoned Amman – our intelligence picked up the whole conversation then – and reported it to them. But those idiots ignored it and didn't do anything.

**The way you are describing it, it sounds like an outright miracle.**

Absolutely. Of course it was a miracle. How is it possible that even after we bombed the reactor not one plane tried to down us?

I'll tell you something else: It takes an hour and a half to get back from Iraq to Israel and we were flying 40,000 feet above the ground. The General Staff originally wanted us to carry out the bombing after sunset so it would be harder for the Iraqis to attack us on the way back. But I was opposed to that. I thought if we did the bombing after sunset there wouldn't be enough light and our planes would miss their target – so I insisted that the bombing take place before sunset.

As a result, we flew back as the sun was setting. But since the planes were traveling at such a fast speed, the sun was out all the time and never set. It was as though it remained standing in the middle of the horizon.

At that time we pilots all radioed each other reciting the same exact biblical verse – Joshua 10:12: "Sun, stand still over Gibeon, and moon, over the Valley of Ayalon."

You know, as I am recalling this now I am getting goose bumps.

## **Ex-US Ambassador to UN John Bolton Speaks on Arutz-7**

9 Tevet 5768, 18 December 07 05:52

by Hillel Fendel

(IsraelNN.com) John Bolton, who served as the United States Permanent Representative to the United Nations from August 2005 to December 2006, spoke with IsraelNationalRadio's Tovia Singer about the recent Bush Administration intelligence report on Iran's nuclear capabilities. The controversial diplomat said the report was more political than intelligence-based, and that it was meant only to undercut President Bush's policies on Iran.

Singer began by asking Bolton, author of a recent book entitled, *Surrender is Not an Option: Defending America at the UN and Abroad*, "How did you manage to maintain your sanity while working in such a hostile environment as the UN?"

Chuckling, Bolton replied, "It was truly a target-rich environment there, and not the most hospitable. But it was important to have someone stand up for American interests, and make sure that we're not turned into a well-bred doormat there at the UN and that our foreign policy options are not constrained."

Singer: "But it certainly got you in an enormous amount of trouble, for you've always been outspoken, and you're not hostile to the Jewish State, and you believe in the war on terrorism - basically, you drive the left crazy! Why do you do it?"

Bolton: "I like to think that Sen. Joe Biden actually tipped his hand a little back in 2001 when he opposed my confirmation for my first job in this administration as Undersecretary for Arms Control; he said that his trouble with me was that over the years, I have been 'too competent.' They were worried that I might actually change things."

### **Not Quite an "Intelligence" Report**

When Singer said he wanted to bring up the recent American intelligence report that downplayed the Iranian nuclear capabilities and brought great joy to Iran and to the left, Bolton said, "I don't think we should call it an intelligence report, but rather a document of the Executive Branch. It was a highly-politicized document, written by some who are not even intelligence community professionals, but rather from the State Department... In theory, they all work for the President, but they don't like his policies and they think that he's too belligerent towards Iran - though my own personal view is that the President was not tough enough - and this paper was intended to undercut the Bush position. This report has put Bush's policy on the bottom of the ocean."

"Let me just take one specific example to show how distorted it was," Bolton said. "The headlines all over the world after the report were that Iran has no nuclear weapons program - but in fact the document refers only to a halt on weaponization - putting a nuclear device on top of a ballistic missile, which is just a sliver of the all-out nuclear program. It's an important piece, yes, but it's just a small

part. Since 2003 Iran has made steady progress towards all the technology it needs for a nuclear weapon, and it can turn its program back on - if it was ever turned off - in a snap. This report will be very harmful to the cause of stopping Iran from getting a nuclear weapon."

Bolton went on to say that the job of the intelligence community is merely to "provide the facts, and what we do not need from the intelligence people is their view on how to put those facts into a political policy; for that, we have government leadership. Unfortunately, this report shows that the intelligence community has gone way beyond its legitimate boundaries."

### **North Korea: A Criminal State**

Singer asked why Iran, with its enormous oil reserves, does not just send ten billion dollars over to cash-strapped North Korea and buy a nuclear weapon?

Bolton: "It's possible; North Korea is a criminal state, and would sell anything to anyone for hard cash. But my judgment is that Iran wants a sustained nuclear capability; they want to master everything so that it doesn't have to be dependent on a place like North Korea."

### **Israeli Censorship on Attack on Syria is Mistake**

"I think we should all be paying more attention to the site that Israel struck in Syria back on September 6. You know, you in Israel are operating under extraordinary censorship about that, but I think this is a mistake - we need to get the facts out about what was going on there at that site near the Euphrates River. We need to know more about the nuclear partnership between Syria and North Korea there."

Singer: "Has this report buried the strategy of imposing sanctions against Iran?"

Bolton: "Yes, certainly for the short term. But I have faith in the Iranians that they will soon do something that will tip their hand again and do something to show that they are working towards nuclear capability. I don't think the report will stand for very long, but let's face it, it's done a lot of damage."

### **Message to Israel**

Singer: "You are now speaking to many Jews and non-Jews throughout the Land of Israel, from the Jordan to the Mediterranean. Your message to them?"

Bolton: "I think it's important to keep your focus on national security and not get diverted by political rhetoric and the demands of people who are out trying to build legacies for themselves. You have to keep the long-term and your national interest in mind and remember who your friends are."

SPIEGEL INTERVIEW WITH FORMER US DIPLOMAT JOHN BOLTON

**'Bush's Foreign Policy Is in Free Fall'**

December 18, 2007

Former US Diplomat John Bolton is no longer in office, but he still has a lot to say about American foreign policy. SPIEGEL spoke to him about Bush's softness abroad, Rice having been taken hostage by the liberal State Department, and why it doesn't matter that the world hates the US.

**SPIEGEL:** Mr. Ambassador, you worked closely with the president and you shared his hawkish views on Iraq. But your new book is fiercely critical of George W. Bush. Why?

**Bolton:** His foreign policy is in free fall. The president is turning against his own best judgment and instincts under the influence of Secretary (of State Condoleezza) Rice. She is the dominant voice, indeed, almost the only voice on foreign policy in this administration.

**SPIEGEL:** The popular reading of her looks a bit different. She is presumed to be weak and not particularly efficient.

**Bolton:** No. Rice is channeling the views of the liberal career bureaucrats in the State Department. The president is focusing all his attention on Iraq and, by doing so, has allowed the secretary to become captured by the State Department. He is not adequately supervising her. It is a mistake.

**SPIEGEL:** Could it be that your pique really comes from the fact that the president doesn't seem to be listening to neoconservatives like you anymore?

**Bolton:** The vice president (Vice President Dick Cheney) is still there. But the idea that somehow the neocons were so powerful is a myth -- I mean, it was five or six people, for God sakes. I am not a neoconservative. I am pro-American.

**SPIEGEL:** You have said that the new moderate foreign policy currently being followed by Bush compromises the security of the United States.

**Bolton:** Well, I think so. North Korea is going to get away with keeping its nuclear weapons. I think the (National Intelligence Estimate) sends Iran a signal they can do whatever they want...

**SPIEGEL:** ...You are talking about the recent report by US intelligence services that Iran stopped its nuclear weapons program in 2003 ...

**Bolton:** Yes. For 12 hours after the NIE announcement, there was not a word from Iran. They were sitting there in Teheran saying: "What devious trick are the Americans playing on us now?" They couldn't believe it and finally declared victory.

**SPIEGEL:** In the past, you argued for a military intervention in Iran. Do you still consider that an option?

**Bolton:** I don't have the same high confidence these intelligence analysts do that, in fact, there was a full suspension of the military program in Iran. This is not like those claims about Cheney pressuring the poor intelligence community to spin intelligence on Iraq. This is politicization from the other side -- people in the intelligence community allowing policy preferences to affect their analysis and judgments about the intelligence.

**SPIEGEL:** And where is the president? Is he merely a puppet?

**Bolton:** Look at the North Korean policy. The North Koreans certainly were involved in that facility in Syria that was raided by the Israelis. The North Koreans renege on their commitments and we still negotiate.

**SPIEGEL:** What do you see as the alternative -- bombing Pyongyang?

**Bolton:** I'm not running around the world looking for ways to create hostilities. The solution to North Korea is the reunification of the Korean Peninsula. China could influence the North; it supplies 80 to 90 percent of North Korea's energy. The United States have to put pressure on China in order for China to pressure North Korea.

**SPIEGEL:** Do you have any second thoughts about the American engagement in Iraq?

**Bolton:** It was right to overthrow Saddam Hussein. It was the regime itself that was a threat. I think in hindsight, what I would have done is turn authority back over to Iraqis much more quickly and say: "Your country, you figure out how to run it."

**SPIEGEL:** Would you say the world is now a safer place than before the Iraq war?

**Bolton:** Yes. There is now no possibility that Iraq is going to have weapons of mass destruction. We had the ancillary strategic victory when (Libyan leader) Moammar Gadhafi gave up his nuclear weapons program as well. When he looked at Saddam, he concluded -- incorrectly -- that he might be next.

**SPIEGEL:** You don't seem to doubt the go-it-alone approach of the United States although anti-Americanism is rising across the world. Doesn't such a negative view of America weaken US power?

**Bolton:** I don't think so. I have looked at public opinion polls in France in the late 1940s and early 1950s during the height of Marshall Plan aid. They had a very negative attitude towards the United States then. There were negative attitudes towards the United States because of Vietnam. There were negative attitudes about the United States when Reagan wanted to deploy intermediate range ballistic missiles. I don't think the president should base his foreign policy on American public opinion polls, let alone foreign public opinion polls.

**SPIEGEL:** What kind of foreign policy will the next president pursue?

**Bolton:** If you get a President (Hillary) Clinton, you might well find, just as after Vietnam, that there is a retraction from Iraq and of American influence in the world. And in a couple of years the Europeans will be complaining about that too. See how long American troops last in Europe under an administration that thinks it is time for America to come home.

**SPIEGEL:** Is that a threat?

**Bolton:** No. The European Union can now act like a major power, at least that is what the European Union tells us. So they should do so -- they can experiment with Russia.

**SPIEGEL:** Mr. Ambassador, thank very much for taking the time to speak with us.

Interview conducted by Cordula Meyer

## **Can Kim Jong Il Implement the Declaration of His Nuclear Programs?**

By Park Hyun Min

[2007-12-19 22:57]

**Wu Dawei, Vice Minister of Foreign Affairs**

With 13 days remaining, North Korea has to disable its Yongbyun nuclear facility and declare nuclear programs by December 31st.

The project to move Yongbyun nuclear reactor's fuel rods to the nearby a cistern for disablement was introduced in the latter half of last week and it will take approximately 100 days for the project to be completed, reported Kyodo New Service.

Nuclear fuel rods amounting to around 8,000 weigh 50 tons total, so it will be difficult to finish the project before March. However, once the project is completed, recharging the reactor will be technologically difficult. Therefore, this can be evaluated as an epochal stage in the disablement process.

The forecast for the delay in the completion of disablement was reiterated by China's top representative Wu Dawei, Vice Minister of Foreign Affairs, at the Six-Party talks on the 6th of this month, "Due to technical issues, it will be difficult for North Korea's nuclear disablement to be completed by the end of the year."

Further, U.S. Secretary of State Condoleeza Rice has said that the U.S. is not concerned about whether or not disablement will be completed by December 31st. Due to essential technical issues, the U.S. cannot rush the process.

Thus, the U.S. has already widened the breadth of understanding regarding the possibility of the postponement in deadline regarding one or two projects as long as disablement has begun.

President Bush already sent an autographed letter, the first letter he has sent to Kim Jong Il, requesting the North's reporting of good faith within the end of the year.

That is, if North Korea accurately declares the amount of abstracted plutonium and suspicions about the Uranium Enrichment Program (UEP), which turned into a second-round nuclear threat in 2002, as well as the presumed nuclear connection with Syria, the removal of North Korea from the list of terrorism-sponsoring nations, the termination of the application of Trading with the Enemy Act, regime safety, and economic support can be ensured.

North Korea has adhered to the position of “groundless rumors” regarding suspicions of its nuclear expansion and the UEP issue, which were previously introduced.

However, it was expressed that North Korea imported high-level aluminum pipes reaching about 150 tons through a former Russian businessman and Pakistan’s President Pervez Musharraf also revealed in last year’s autobiography that he handed over “20 centrifuges” to the North.

In actuality, North Korea is known to have said in passing at an informal meeting regarding the importing of aluminum pipes, which is the crux of the UEP issue, “We used them in missile parts or in airplane manufacturing.”

However, experts have evaluated that these aluminum pipes cannot be used as parts of missiles or airplanes. It will be difficult to jump to the “2nd-phase of denuclearization” without a complete declaration of this issue.

In the midst of this, Tom Casey, Assistant Spokesperson for the State Department, said on the 17th (local time), “I know the Chinese are still working on timing for another envoys level meeting but I don't have any dates to share with you at this point.”

The direction of the Six-Party Talks, which has been steadily continuing after the resolution the BDA issue, depends on completion of the “nuclear program declaration” by the end of the year.

Simultaneously, Vice-Minister Wu Dawei embarked on the path to visiting the North on the 17th. It has not been confirmed whether or not the Vice-Minister visited the North as a special envoy, but through this opportunity, the interest in breakthroughs related to the difficult nuclear declaration issue has been increasing.

In the present, China does not have the leverage to persuade the North, but according to the level of North Korea’s declaration of the nuclear programs, this is a critical period on which hangs whether or not the positive momentum of the Six-Party Talks’ can be sustained.

Satisfaction regarding the declaration of the nuclear programs depends wholly on the U.S. Vice-Minister Wu is expected to play a certain kind of a role to find out common grounds between the two sides.

The issue is whether all nuclear programs in the declaration will become objects of abandonment. Can Kim Jong Il implement a decision regarding denuclearization and abandon its nuclear weapons? This will only be possible when Kim Jong Il has the confidence of sustaining its regime by abandoning its weapons.

## **Subverting Bush at Langley**

By Robert D. Novak

Monday, December 24, 2007; A15

Outrage over the CIA's destruction of interrogation tapes is but one element of the distress Republican intelligence watchdogs in Congress feel about the agency. "It is acting as though it is autonomous, not accountable to anyone," Rep. Peter Hoekstra, ranking Republican on the House intelligence committee, told me. That is his mildest language about the CIA. In carefully selected adjectives, Hoekstra calls it "incompetent, arrogant and political."

Chairman Silvestre Reyes and other Democrats on the intelligence committee join Hoekstra in demanding investigation into the tape destruction in the face of the administration's resistance, but the Republicans stand alone in protesting the CIA's defiant undermining of President Bush. In its clean bill of health for Iran on nuclear weapons development, the agency acted as an independent policymaker rather than an adviser. It has withheld from nearly all members of Congress information on the Israeli bombing of Syria in September. The U.S. intelligence community is deciding on its own what information the public shall learn.

Intelligence agencies, from Nazi Germany to present-day Pakistan, for better or for ill, have tended to break away from their governments. The Office of Strategic Services, the CIA's World War II predecessor, was infiltrated by communists. While CIA tactics were under liberal assault in Congress during the Watergate era, current accusations of a rogue agency come from Republicans who see a conscious undermining of Bush at Langley.

The CIA's contempt for the president was demonstrated during his 2004 reelection campaign when a senior intelligence officer, Paul R. Pillar, made off-the-record speeches around the country criticizing the invasion of Iraq. On Sept. 24, 2004, three days before my column exposed Pillar's activity, former representative Porter Goss arrived at Langley as Bush's handpicked director of central intelligence. Goss had resigned from Congress to accept Bush's mandate to clean up the CIA. But the president eventually buckled under fire from the old boys at Langley and their Democratic supporters in Congress, and Goss was sacked in May 2006.

Goss's successor, Gen. Michael V. Hayden, restored the status quo at the CIA and nurtured relations with congressional Democrats in preparation for their coming majority status. Hayden, an active-duty four-star Air Force general, first antagonized Hoekstra by telling Reyes what the Democrats wanted to hear about the Valerie Plame-CIA leak case.

There is no partisan divide on congressional outrage over the CIA's destruction of tapes showing interrogation of detainees suspected of terrorism. Hoekstra agrees with Reyes that the Bush administration has made a big mistake refusing to let officials testify in the impending investigation.

Republicans also complain that the National Intelligence Estimate concluding that Iran has shut down its nuclear weapons program was a case of the CIA flying solo, not part of the administration team. Donald M. Kerr, principal deputy director of national intelligence, said on Dec. 3 that the intelligence community "took responsibility for what portions of the NIE Key Judgments were to be declassified."

In a Dec. 10 column for the Wall Street Journal, Hoekstra and Democratic Rep. Jane Harman, a senior member of the intelligence committee, wrote that the new NIE "does not explain why the 2005 NIE came to the opposite conclusion or what factors could drive Iran to 'restart' its nuclear-weapons program." (Six days later on "Fox News Sunday," Harman called the NIE "the best work product they've produced.")

Hoekstra is also at odds with Hayden over the CIA's refusal to reveal what it knows about the Sept. 6 Israeli bombing of Syria's nuclear complex. Only chairmen and ranking minority members of the intelligence committees, plus members of the congressional leadership, have been briefed. Other members of Congress, including those on the intelligence committees, were excluded. The intelligence authorization bill, passed by the House and awaiting final action in the Senate, blocks most of the CIA's funding "until each member of the Congressional Intelligence committees has been fully informed with respect to intelligence" about the Syria bombing.

In a June 21 address to the Society for Historians of American Foreign Relations, Hayden unveiled the "CIA's social contract with the American people." Hoekstra's explanation: "The CIA is rejecting accountability to the administration or Congress, saying it can go straight to the people."

## **A Chance to Rein In North Korea**

By Nicholas Eberstadt

Wednesday, December 26, 2007; Page A21

Last week's presidential election in South Korea presages a sea change in that key U.S. ally's policies toward North Korea. The resounding defeat of the candidates who favored more of Seoul's all-carrot, no-stick approach to Kim Jong Il presents Washington with a horizon of new possibilities for reining in Asia's most troublesome dictator. The question now is whether the Bush foreign policy team will be adept enough to seize this opportunity.

The landslide vote, to be sure, was in large measure a rebuke of President Roh Moo-hyun's inept handling of the economy and polarizing domestic policies. Yet, taken together, the candidates who opposed the "Peace and Prosperity" policy (originally dubbed "Sunshine") toward North Korea in last Wednesday's election received more than 63 percent of the vote -- compared with 35 percent for all those who approved of it. Why the widespread discontent with "sunshine"? Because what had started as a policy of reconciliation with the North had degenerated in practice into almost reflexive appeasement of the "Dear Leader," Kim Jong Il. Unsurprisingly, many ordinary Koreans found that kind of "sunshine" too distasteful, too embarrassing and just a bit too dangerous.

South Koreans winced as their government repeatedly abstained from U.N. votes criticizing North Korea for human rights abuses. They grumbled as they saw their tax-funded "economic cooperation" projects with the North devolve into an economic lifeline for a still-hostile government in Pyongyang. And they worried as the undisguised rift with Washington over "the North Korean threat" created unmistakable strains in the vital U.S.-South Korean alliance.

ad\_icon

South Korea, in short, is ready for a new and more critical approach to engagement with North Korea -- and this is just what President-elect Lee Myung-bak has promised. Lee is no Cold Warrior: He styles himself as a pragmatist who judges by results. Since his election, he has signaled that restoring the health of the U.S.-South Korean alliance and achieving a genuine denuclearization of the North Korean regime are to be top foreign policy priorities. He has also served notice to Pyongyang that it can no longer count on Seoul for a "see-no-evil" spin on events in the North -- much less unconditional handouts.

There would seem to be great promise in this new attitude toward "engagement with the North" -- to say nothing of new vistas for genuine cooperation between the United States and South Korea on the multifaceted North Korea problem.

With Seoul finally willing to criticize Kim Jong Il's gulag "paradise," for example, an effective worldwide human rights campaign in the name of the North Korean people comes much closer to reality. With a South Korean government that no longer insists on sitting on the sidelines, the Proliferation Security Initiative to interdict illicit North Korean revenue (from drug-running, counterfeiting, weapons sales and the like) stands to be much more effective -- and that much more costly to Kim Jong Il. No longer a "runaway ally," South Korea could at last join with the United States

and Japan in a common policy to bring real pressure on North Korea for real denuclearization -- and to impose real penalties for noncompliance.

Today, China can depict its support for the North as joining a South Korean bandwagon. Without the cover of a seemingly all-forgiving South Korean government, China would finally be forced to make hard choices about the Kim Jong Il regime -- within the confines of the six-party talks and beyond.

But is the Bush foreign policy team ready to make use of this long-desired diplomatic windfall from South Korea?

For a variety of reasons (among them the Republicans' loss of Congress in 2006 and the situation in Iraq) the Bush team all but abandoned its previous posture toward North Korea at the end of last year. These days it appears intent on producing only "good news" on the North Korean front. "Good news" about North Korea, for its part, seems to have been defined down to meaning a nuclear deal with Kim Jong Il -- irrespective of the fine print.

If this sounds implausible, consider the actual record of U.S. diplomacy with North Korea over the past 12 months.

Early this year, the U.S. government quietly agreed to help "unfreeze" more than \$24 million in suspect North Korean funds from bank accounts in Macau. Why? Because North Korean nuclear negotiators threatened not to return to the table until their Dear Capo got his money back.

After returning to the six-party talks, the North Korean side then inked an "action plan" in February that promised to provide an accounting of its previous nuclear activities within two months. Here we are at the end of the year with no accounting -- and, so far as one can tell, no worries from the White House, either.

In September word emerged that Israeli jets had leveled a facility in Syria that from the air looked a lot like the Yongbyon nuclear reactor. The Syrian site was reputedly being developed with North Korean assistance. Yet under Washington's new rules of engagement with Pyongyang, the Bush team has scarcely whispered a word about this mysterious -- and potentially grave -- international incident.

And by the way: Have you heard from President Bush's special envoy for human rights in North Korea over the past year? Neither has anybody else.

Last week's election in South Korea should serve as a wake-up call to the Bush administration. With willing new partners in the wings in Seoul, President Bush still has the chance to register some real gains for his legacy on North Korea -- and, more important, for the security of the free world.

Nicholas Eberstadt, the Henry Wendt chair in political economy at the American Enterprise Institute, is a member of the U.S. Committee for Human Rights in North Korea.

## **N.Korea Likely to Miss Critical Deadline**

Updated **Dec.26, 2007** 07:04 KST

North Korea is likely to miss an agreed deadline to declare all its nuclear programs and stockpiles and disable nuclear facilities by the end of this year.

A South Korean government official on Tuesday said, "There is no sign yet that North Korea has decided to make an accurate declaration. It's improbable that the North will declare its nuclear programs by the end of the year, with only a week remaining before the New Year."

It is unclear whether the North is positively refusing to make a full declaration of all materials and programs under a Feb. 13 six-nation agreement or whether it is stalling to get a bigger compensation package from the U.S. A positive refusal would derail the entire framework.

Under the Feb. 13 denuclearization deal, the U.S. agreed to strike the North from a blacklist of state sponsors of terrorism and lift sanctions under the Trading with the Enemy Act provided the North disables its nuclear facilities and makes a full declaration to the IAEA.

According to South Korean officials, North Korea is dragging its feet while denying the main U.S. allegations: that it has or had a uranium enrichment program and transferred nuclear materials to Syria. The North's nuclear facilities are, as it happens, being disabled in cooperation with a U.S.-led team. Though the processes will be difficult to complete by the end of the year due to technical problems of extracting spent fuel rods, it will be possible to finish them around February, the South Korean officials added.

A South Korean official said, "We've seen many instances when the North dragged its feet in implementing its promises. An accurate declaration is more important than keeping the deadline." A decision from North Korean leader Kim Jong-il "is needed now more than ever before," he added.

Meanwhile, the North's Workers' Party daily Rodong Shinmun in newly belligerent language on Tuesday accused U.S. "warmongers" of "frenetically preparing behind closed doors for a maneuver to ignite a second Korean War. Such a maneuver makes us suspicious if the U.S. has any real intention to continue the dialogue."

The daily complained about "an aerial war exercise" in the shape of the dispatch of an F-18 hornet strike fighter to South Korea from an overseas base. "Looking at the U.S.' double-dealing attitude, we deeply suspect whether the U.S.' call for dialogue is a disguised tactic." It added, "Nobody knows what kind of shocking incident the U.S. warmongers might ignite to prevent the North Korean-U.S. talks from proceeding further."

The state-run Korean Central News Agency on Sunday quoted Kim Kyok-sik, chief of the general staff of the Korean People's Army, as saying "tensions" remain on the Korean Peninsula due to Washington's persistent "war maneuvers."

According to the KCNA, the North Korean Army chief was addressing a rally to mark the 16th anniversary of Kim Jong-il's inauguration as supreme commander. "The U.S. is still maneuvering

behind the doors to ignite a war of aggression against the North, while clamoring about dialogue and talks in public," Kim Kyok-sik said. Only in July, Kim Jong-il told Chinese Foreign Minister Yang Jiechi, "In recent days, there are signs that the situation on the Korean Peninsula will likely improve to some extent."

## **Editor's Notes: Man of the year, 2007... we hope**

David Horovitz

THE JERUSALEM POST

Dec. 27, 2007

"Unfortunately, despite our yearning for peace as we reach out to our neighbors, the time has not yet come to sheath our sword. It must remain sharpened and honed, prepared to face any enemy..."

"We will be prepared for the challenges posed to us by the terror organizations and by others who have not yet come to terms with the existence of the State of Israel in the Middle East... We will become stronger in order to deter them. And if need be, we will be prepared to overcome them."

From a letter sent to the soldiers and employees of the IDF by Gabi Ashkenazi on February 14, the day he became the 19th IDF chief of the General Staff.

On September 6, Israeli jets raided a target in Syria whose precise nature has neither been officially disclosed nor unofficially proven.

The remarkable strike, evading Syrian radar and other defenses, prompted a flood of rather confused and embarrassed reactions from Damascus, including an assertion from the Syrian vice president that the target was the harmless "Arab Center for the Studies of Arid Zones and Dry Lands" - a claim which was, amusingly, swiftly denied by said Arab Center.

Almost as remarkable as the strike was the relative silence from Jerusalem. Rather than crowing about the intelligence that had established the need for and enabled the raid and highlighting the pinpoint accuracy of the attack, the political echelon, (almost) to a man, kept uncharacteristically mum.

Much less surprisingly, the IDF, under its relatively new chief of General Staff, had no comment either. Lt.-Gen. Gabi Ashkenazi, who had set the tone for his media interactions months earlier by asking his spokesman's department to cancel the interviews it had lined up for him to mark Independence Day, is more of a doer than a talker.

Amid the strict military censorship that still surrounds that September 6 raid, the most that can be said is that it was of critical importance to Israel's well-being; that the Syrians, according to foreign reports, belatedly got found out doing something nuclear in tandem with North Korea that they had thought would remain undiscovered; and that Israel's silence, in turn enabling Damascene denial rather than humiliation, was crucial in preventing the single strike from escalating into a war.

Although the raid represented an impressive display of Israeli air and other prowess, it would be an overstatement to assert that, at a stroke, it revived an Israeli deterrent capability so battered by our demonstrable vulnerability to rudimentary rocket attack - from south Lebanon during the 2006 war with Hizbullah, and from Gaza to this day.

Nonetheless, it likely gave pause to potential enemies, renewing respect for the IDF's capacity to do the unexpected with exemplary professionalism. Sending his forces into rapier-action deep inside hostile

territory, demonstrating the improved readiness to grapple with enemies that he had promised in his introductory letter, Ashkenazi, a member of the Golani infantry force that participated in the 1976 Entebbe hostage rescue, reconnected the IDF to such past glories.

This is the essence of Ashkenazi's goal for the IDF. "We will become stronger in order to deter [our enemies]. And if need be, we will be prepared to overcome them."

IT IS fervently to be hoped that Ashkenazi, chief of the General Staff for 10 and a half of the past 12 calendar months, is Israel's Man of 2007. If so, we may never know it for certain, for much of his success will lie in the degree to which he is indeed making Israel sufficiently strong as to deter its enemies.

It may be that September's surgical strike - and the avoidance of war - marks the first such success. But Ashkenazi is making his quiet impact more widely, too - gradually correcting the damage done to Israel's military image by the Second Lebanon War, rebuilding the IDF's credibility with the US, and bringing his analysis of regional developments, and consequent Israeli imperatives, to a generally receptive political echelon.

He is not universally acclaimed as a deep strategic thinker. Nor is there full consensus behind his emphasis on ground forces, with some critics sniping that he is preparing the IDF for the last war rather than the next one. But the elegant theorizing of his predecessor Dan Halutz about the universal capabilities of an air force proved so misguided in the Second Lebanon War. And the IDF was exposed more as a rusted than a well-oiled fighting machine. The no-nonsense, keenly intelligent and workaholic Ashkenazi is proving a sobering antidote - the ultimate IDF insider reviving the IDF from the inside.

He inherited a shellshocked military whose failure to decisively prevail against Hizbullah constituted an enemy dream come true and an Israeli nightmare. Our loquacious defense chiefs had assured us early in that conflict that Hizbullah would be largely destroyed within days. And yet more than a month later, the sophisticated might of the Israeli Air Force had failed to thwart the salvos of primitive Katyushas, failed to deter the guerrilla army so unexpectedly resilient in firing them.

Ashkenazi's remedy has been a return to basics: An investigation of what had gone wrong and why, and a determination to rectify it. The most obvious and immediate change lies in the attitude to training. Almost from the day he succeeded Halutz, Ashkenazi has reversed norms under which key units could go years without intensive training, a state of affairs that self-evidently left them ill-prepared for the instant resort to war ordered by Prime Minister Ehud Olmert on July 12, 2006.

Frequently out in the field himself, Ashkenazi, who already had the respect of his peers and subordinates, having risen gradually through the ranks to the IDF's top positions, has cemented the reputation of a hands-on, hands-dirty commander.

At the same time, he has credibility among ministers, which helps mightily when defense spending battles are waged. Brought back from the cold to take the post of Defense Ministry director-general by then-minister Amir Peretz, Ashkenazi is now also said to enjoy a good relationship with chief of staff No. 14, Peretz's successor Ehud Barak.

Ashkenazi is still watching Lebanon closely - acutely concerned by the rearming of Hizbullah and by the political shifts that could give it veto power over Lebanese government decisions as critical to Israel as the future deployment of the Lebanese Army and the renewal of UNIFIL's mandate. But other fronts are still more demanding.

LIKE BARAK, Ashkenazi has taken to warning of late that a major IDF incursion into Gaza looks ever more likely so long as the Kassams rain down on Sderot and its environs.

But the chief of the General Staff does not want to invade the Strip. He knows how treacherous it would be for the IDF to fight there, how many lives would be lost, and how rapidly the Kassam crews would reassert themselves the moment the army pulled back.

His recipe would be to ratchet up the constraints on Hamas - to keep border crossings closed, to drastically reduce fuel and electricity supplies, to prevent the Palestinian Authority from sending in funds which wind up in Hamas hands.

He supports any mustering of pressure on Egypt to change its behavior at the border and work seriously to prevent the massive, ongoing smuggling of arms into the Strip and the departure of Hamas activists for terror training. Hence the security establishment's recent dispatch of video footage to the United States documenting Egypt's complicity - a move, as first reported in The Jerusalem Post last week, designed to alert American leaders to Cairo's failures, and thus to condition at least some of the annual American aid package to Egypt on more serious efforts to close down the smuggling tunnels and properly seal the border.

As for the West Bank, Ashkenazi takes seriously the prospect of Hamas replicating its Gaza takeover there. Indeed, like the Shin Bet (Israel Security Agency), the IDF was not surprised by the ease with which Hamas fighters defeated the US-trained Fatah forces in Gaza, recognizing the greater motivation of the Islamists and the weakness and lack of loyalty and accountability in the Fatah hierarchy post-Arafat. When it comes to internal Palestinian conflict, runs the cold IDF assessment, the Fatah gunmen don't know how to kill or be killed.

Ashkenazi's message to the political echelon is that Palestinian Authority President Mahmoud Abbas and his relative moderates in the PA survive only because the IDF maintains full freedom of movement in the West Bank and can thus thwart the threat of the Islamists. Pulling back the IDF, ostensibly to help Abbas, would have the opposite effect.

Aides to Prime Minister Ehud Olmert determinedly talk up the successes in Nablus of the PA's latest small-scale police deployments, express growing satisfaction about improved cooperation with PA security commanders, and thus speak optimistically about the possibilities, in time, for Israel to start to withdraw from the forward positions it has maintained since the outbreak of the second intifada seven years ago and to relinquish territory to PA control. The assessment in Ashkenazi's IDF, by contrast, is that while Israel has every interest in creating the conditions for improved relations with Abbas's PA, a significant IDF pullback in 2008 is plain unthinkable, that the PA forces are anything but capable of imposing security, and that a premature handover of control would render both the PA and Israel vulnerable to an upsurge in Islamic terrorism.

IF ASHKENAZI and Olmert seem a distance apart in weighing PA security capabilities, they may see more eye-to-eye when it comes to Syria. Olmert and his aides have for weeks been highlighting Israel's

readiness for renewed talks. And in notable contrast to US President George W. Bush's recent declaration that he ran out of patience with President Bashar Assad "a long time ago," Olmert took pains to praise Assad for sending a representative to last month's Annapolis conference.

Ashkenazi well recognizes the immense potential benefits of separating Syria from its alliance with Iran - including the consequent isolation of Teheran, the weakening of Hizbullah, the blow to terror groups and the positive repercussions in Iraq - and believes that Assad may be responsive to economic leverage. While the US has been too ready to maintain its huge financial aid to the Egyptians, it may be overly reluctant, in Ashkenazi's thinking, to contemplate drawing in the Syrians via economic leverage. Assad, after all, is waging a constant struggle for survival, and might not be averse to American economic overtures with tremendous potential domestic benefits.

It is worth noting at this point that the idea of Damascus being wooable is far from unanimously accepted. For one thing, it is hard to reconcile the image of a potentially friendly Syria with the fact that the "Arab Center for the Studies of Arid Zones and Dry Lands" constituted so profound and immediate a threat as to have prompted Israel's high-risk bombing raid three-and-a-half months ago.

For another, the critics suggest that there's too much wishful thinking and not enough fact to justify the assessment that Syria might forsake its longstanding alliance with the ever-more powerful Iran in favor of a new, untested partnership with an America that is plainly in Middle East retreat.

NEEDLESS TO say, as Ashkenazi prepares the IDF to defend Israel in a region characterized by growing instability and further potential deterioration, Iran stands out as the key existential threat.

The US National Intelligence Estimate of Iran's nuclear weapons program, with its headline-making assertion that Teheran halted such activities in 2003, is, to put it mildly, not shared in the Israeli military establishment. And it has not impacted Israel's own intelligence estimates.

IDF thinking is that Iran is vulnerable to outside pressures and can be stopped short of military action. But if all else fails, Israel would have to act and could act, though no-one should delude themselves that this would involve a repeat of the single-strike bombing of Saddam Hussein's Osirak facility in 1981. Stopping Iran militarily would require not a one-off action, but a sustained campaign.

Such an action, given Iran's capacity for retaliation and the colossal regional implications, is almost unthinkable. Ashkenazi's ambition is to so revive both Israel's deterrent capability, and its credibility with its allies regarding the nature of the Iranian threat, as to help create the international circumstances in which military intervention against Iran becomes unnecessary.

Of course, if he were able to achieve that, we'd happily laud him as our man of the decade.

## **U.S. Courts North Korea's Army**

New Strategy Recognizes

Military's Pivotal Role

In Nuclear Disarmament

By JAY SOLOMON

December 29, 2007; Page A3

WASHINGTON -- The Bush administration, worried that the North Korean military may block advances in disarmament negotiations, has started an unusual campaign to reach out directly to the communist state's army leaders.

The new strategy comes as Pyongyang is expected to miss an important deadline Monday requiring the North to fully declare its nuclear assets and programs, including the believed pursuit of uranium-enrichment technologies.

But the White House is still expected to provide North Korean dictator Kim Jong Il more time to meet his commitments. And the U.S. continues to support expanding cultural engagement, such as a scheduled February performance in Pyongyang by the New York Philharmonic.

"What is important to us is that when we do get the declaration, whatever day it is, it needs to be full and complete," State Department spokesman Tom Casey said Friday.

Senior-level engagement between the American and North Korean militaries has been significantly limited during the past seven years. Senior U.S. officials say their new outreach to the Korean People's Army, or KPA, stems from their knowledge that Pyongyang's military ultimately controls the majority of North Korea's nuclear assets and installations. These American officials also say their efforts are driven by a lack of certainty over whether North Korea's generals would even honor a request by Mr. Kim for them to turn over nuclear weapons.

"Would the military back Kim Jong Il if he truly wants to give away the program? That's the bottom-line question," said a U.S. official working on disarmament issues. "Maybe [Mr. Kim] doesn't have control of the military."

The official and other North Korea analysts say the KPA has the most to lose if Pyongyang agrees to destroy its nuclear weapons stock. Their development provides the KPA with leverage over the U.S. and Japan, and entrenches the military as the elite power center inside North Korea. Without nuclear weapons, the KPA and North Korea would have only a marginal profile internationally, these officials say, and Washington needs to make clear there are other ways for North Korea to prosper.

The U.S. outreach to the North Korean military has come during a number of recent negotiating sessions between Washington and Pyongyang.

[Kim Jong Il]

American diplomats say they have specifically requested from North Korea's Foreign Ministry the attendance of senior KPA officers at these meetings. And U.S. officials also say they have been

mindful to place American military officers, including a two-star general, on most of their diplomatic missions as a signal to Pyongyang that Washington seeks increased military-to-military engagement.

So far, however, these officials say, North Korean diplomats have rebuked Washington's requests, citing the Foreign Ministry's preeminence in the denuclearization talks. "We need more buy-in from their military," said a senior U.S. official pushing this engagement with the KPA. "The military remains the big question mark for us."

Confidence-building measures are another tool the Bush administration is using to try to soften the North Korean military's hostility to the denuclearization process.

Even as the negotiations continue, North Korea's state-owned media have regularly broadcast propaganda suggesting the Pentagon is using nuclear disarmament as a pretext for a full-scale invasion of the North. Pyongyang's Korean Central News Agency reported this week that the "dialogue advertised by the U.S. while seeking confrontation is, in fact, nothing but a military option to disarm its dialogue partner mentally and mount a surprise preemptive attack."

The planned New York Philharmonic performance in Pyongyang is seen as one way Washington can soften its image inside North Korea, say U.S. diplomats. The orchestra is specifically expected to play the "Star Spangled Banner" and other symbols of American culture traditionally demonized by the North. North Korean diplomats view the coming visit of the large U.S. delegation to Pyongyang as a tool with which it can appeal to hard-liners in the KPA and Korean Workers' Party about Washington's intentions, according to U.S. officials.

Lower-level interaction between the U.S. and North Korean militaries occur regularly along the demilitarized zones that still divide North and South Korea. The Pentagon and KPA have also cooperated on searches for U.S. soldiers missing since the 1950-53 Korean War. But the last senior-level engagement came in October 2000 when Mr. Kim dispatched one of the KPA's top three officers, Vice Marshal Cho Myong Rok, to the White House to hold direct talks with President Bill Clinton.

Vice Marshal Cho carried a personal letter from Mr. Kim to Mr. Clinton inviting him to visit Pyongyang. And the two sides signed a nonaggression statement that many in Pyongyang's military viewed as a prelude to a formal peace treaty ending the Korean War, according to U.S. and South Korean officials. Secretary of State Madeleine Albright visited Pyongyang weeks later, and Mr. Clinton seriously considered going as well before his term expired.

Just months later, however, the detente between Washington and Pyongyang faded with the inauguration of President Bush, who later designated North Korea a member of an "axis of evil," including Iraq and Iran. This diplomatic U-turn made many in the KPA particularly skeptical about Washington's long-term strategic intentions, say U.S. intelligence officials.

Despite Pyongyang's recent negative rhetoric, U.S. officials say North Korea has actually been proactive in disabling the Yongbyon nuclear reactor, another key requirement of the disarmament pace. But North Korea appears to be stalling in declaring all its nuclear assets and programs. Pyongyang has denied in six-party talks that it secretly developed a uranium-enrichment program to produce fissile material alongside the Yongbyon facility, as Washington has charged. And Pyongyang also has denied aiding third countries, such as Syria, in developing nuclear power or weapons programs.

A specific dispute has already emerged between the U.S. and North Korea over the testing of an aluminum tube provided by Pyongyang to international inspectors. According to a U.S. counterproliferation official, the tube tested positive for contamination with a fissile material, suggesting it may have been used in uranium-enrichment work. The official said it was possible the tube was contaminated before being shipped to North Korea but Pyongyang hasn't been forthcoming about the source.

The U.S. is also pushing for clarity on North Korea's suspected cooperation with Syria in developing weapons of mass destruction. Israeli aircraft struck a Syrian facility in September near the Euphrates river, and American officials say intelligence showed a significant number of North Korean personnel working at the site going back years. These U.S. officials say they're not certain that Pyongyang was aiding Damascus in developing a nuclear reactor but that the North Koreans need to account for their activities in the Middle East.

"The North Koreans usually say: Let's just talk about the future not the past," said the U.S. counterproliferation official.

## REVIEW & OUTLOOK

### Off the Terror List

December 29, 2007; Page A10

North Korea promised that by December 31 it would declare its nuclear programs and dismantle its facilities. So dictator Kim Jong Il celebrated the holidays by suggesting Wednesday he might slow down disabling nuclear plants if the world's Santas didn't deliver "promised" economic aid to his doorstep. He may welcome the New Year by stiffing the U.S. yet again.

As part of this deal, the U.S. has agreed to consider removing North Korea from its list of state sponsors of terrorism. Under U.S. law, such removal would be contingent on the President certifying to Congress that North Korea hasn't provided support for international terrorism during the preceding six-month period. Chris Hill, the chief U.S. negotiator, said that "We will follow the letter of the law in that regard."

If so, we hope he takes a close look at a report just out from the Congressional Research Service. Written by Larry Nicksch and Raphael Perl, the report cites "reputable sources" as saying North Korea has provided arms and possibly training to Hezbollah in Lebanon and the Tamil Tigers in Sri Lanka in recent months, both terrorist organizations.

The CRS report cites a French online journal, Paris Intelligence Review, which last year published a detailed account of what it described as an extensive program by Pyongyang to give arms and training to Hezbollah. The aid included instruction by North Korean trainers in the development of underground facilities for storing arms, food and medical installations. This, the French journal said, significantly improved Hezbollah's ability to fight Israel in the 2006 war.

For further evidence of a possible North Korea-Hezbollah link, CRS references an article published last month in the South Korean newspaper, Joon Ang Ilbo. According to Moon Chung-in, a professor at Yonsei University and an expert on security issues, the Israeli intelligence agency, Mossad, believes that North Korea was the source of "vital missile components" for Hezbollah in Lebanon.

The researchers also note reports in September in the Japanese daily Sankei Shimbun of North Korean arms shipments to the Tamil Tigers in Sri Lanka. According to Sankei, North Korea made several attempts this year and last to deliver machine guns, automatic rifles and anti-tank rocket launchers to the Tamil Tigers. The Sri Lankan navy intercepted several North Korean ships carrying the arms, Sankei reported, sinking two of the vessels, capturing North Korean crew members and seizing some arms.

The CRS paper concludes that if the Administration doesn't address the reports of North Korean support of Hezbollah and the Tamil Tigers -- and, we'll add, even more disturbing reports of nuclear aid to Syria -- it could "damage the integrity" of the U.S. list of state sponsors of terror. It could also "limit the ability" of the U.S. to deal with "what appears" to be a "rising level of North Korean support for international terror groups."

It is very worth noting that South Korea's President-elect, Lee Myung-bak, who takes office in February, has pledged to get tough on the North. Mr. Bush might have a talk with this new partner about a world in which we make concessions to North Korea, and they -- still -- do nothing to change their intentions.

## **U.S. intelligence act digs deeper into North Korea's nuclear activities**

**2007/12/31 03:31 KST**

후후 WASHINGTON, Dec. 30 (Yonhap) -- As members of the six-nation talks on denuclearizing North Korea toil to get the country to completely disclose its nuclear stockpile, U.S. Congress plans to dig deeper into exactly what the stockpile contains, and into fresh suspicions of North Korea-Syria nuclear connections.

후후 The Intelligence Authorization Act for fiscal year 2008 limits relevant U.S. fund appropriations until each member of the congressional intelligence committees has been "fully and currently informed" about the Israeli strike of a Syrian facility, allegedly a nuclear-related installation that North Korea was helping to equip.

후후 The legislation also requires the director of national intelligence to submit at least one report within fiscal year 2008 detailing the nuclear programs in North Korea and Iran, followed by two reports in fiscal year 2009.

후후 The House passed the intelligence act on Dec. 13 following a conference committee meeting with the Senate, a process in which the two chambers discuss and agree on any amendments.

후후 North Korea appears most likely to miss the Monday deadline to submit a declaration listing all of its nuclear materials and programs, plus any proliferation activities. The declaration is a key part of a six-nation agreement aimed at denuclearizing the Korean Peninsula, committed to by South and North Korea, the U.S., China, Russia and Japan.

후후 The true extent of Pyongyang's nuclear activities, however, remains hazy, including how much fissile material it produced and how much of it has been converted to atomic weapons. It's also unclear whether the country was able to enrich uranium, an alternative to plutonium in making weapons, and whether it transferred any of its arms or technology to other nations.

후후 The report from the House-Senate conference indicated concerns by Congress over allegations of North Korea's nuclear cooperation with Syria.

후후 Israel on Sept. 6 struck a Syrian site, claiming it was a nuclear facility being built with North Korea's assistance. Both Pyongyang and Damascus have denied any atomic collaboration.

후후 The section on limiting fund appropriations was added at the House-Senate conference. It prohibits expenditure to less than 30 percent of authorized amount until "the full membership of the congressional intelligence committees are fully and currently informed about an important intelligence matter," the conference report says.

후후 The information provided should include whether any agent or citizen from North Korea or other countries was present at the Syrian site, and any intelligence the U.S. obtained on the matter from foreign governments, it says.

후후 The initial version of the act required a quarterly report from the national intelligence director on North Korea and Iran, but this was reduced in frequency in response to a request from the director to lessen the number of reports required by legislators.

후후 The intelligence reports on North Korea and Iran should include assessments of their nuclear weapons programs, evaluation of the sources on which those assessments are based, and discussion of any dissents or caveats that would reduce confidence in the assessments.

후후 Although the frequency of the reports was reduced, the lawmakers "otherwise concur that it is essential that the intelligence community places a high priority on reporting to Congress on nuclear developments in Iran and North Korea," the conference report says.

## **Real test looms for N Korea**

By Aidan Foster-Carter

Korea analyst

Published: 2008/01/01 15:54:37 GMT

### **North Korea has missed another nuclear deadline.**

Under a deal reached in February 2007, the North Korean regime of Kim Jong-il had agreed to do two things by December 31: disable its Yongbyon reactor site, and provide a full declaration of all its nuclear activities.

But the year ended with work still incomplete at Yongbyon - and stony silence from Pyongyang.

The two Ds are different. Yongbyon was already closed down since July, and the US team supervising its disabling reported full local cooperation.

North Korea has evidently decided to sacrifice these ageing facilities - a cause of concern for almost 20 years - now that they have done their job and given Kim the bomb, as seen in October 2006's small nuclear test.

Deja vu is unavoidable. Under the Clinton-era 1994 US-North Korea Agreed Framework, Yongbyon was sealed - but not disabled - until late 2002, when the Bush administration accused North Korea of running a separate covert nuclear programme based on highly enriched uranium (HEU).

In an escalating row, North Korea expelled International Atomic Energy Agency monitors and restarted the site, producing more plutonium and so enabling 2006's nuclear test.

Disabling Yongbyon now - with full dismantlement as a future final stage - is meant to ensure no repetition by putting it beyond use (to borrow a term from Northern Ireland).

The current delay seems mainly technical. To extract and remove some 8,000 fuel rods at this decrepit facility simply could not be done safely by year-end.

However, there are now hints that recently Pyongyang has slowed the process due to reported dissatisfaction with what it is - or is not - getting by way of rewards for its co-operation.

This puzzles the other five nations involved in the six-party process - China, the US, South Korea, Japan and Russia.

Most have sent heavy fuel oil and other energy aid, as an agreed quid pro quo.

Only Tokyo refuses, as it still demands a full account of the fate of Japanese abducted by North Korea in the 1970s and 1980s.

Pyongyang regards that issue as closed, and relations are at rock bottom.

North Korea also wants to come off the US State Department's list of countries accused of supporting terrorism, and an end to long-standing US sanctions.

Both were specified in last February's breakthrough, but the US reckons Mr Kim has not yet done enough.

While Japan opposes any delisting unless the abductions are cleared up, Washington would not let that objection be a deal-breaker if all else were going smoothly. But it is not.

### **Three cruxes**

The real problem is the nuclear declaration. At least three cruxes may be holding this up.

One is the North's alleged enriched uranium programme. Though the US is now unsure how far this had got, it has proof of purchases from Pakistan's rogue nuclear entrepreneur Dr AQ Khan.

Those transactions need explaining.

A new worry is the Syrian connection. In September Israel bombed a mystery facility there, widely rumoured to involve nuclear cooperation with North Korea (though both deny this).

With nuclear proliferation to the Middle East a double red line for the US, Washington has to know the full truth on this - and be absolutely assured there will be no future repetition, anywhere.

Above all, there is the \$64,000 question: how many bombs and how much plutonium does Mr Kim have, where are they, and will he give them up as did Libya's Muammar Gaddafi?

### **Coming clean**

On each of these three issues there is a clash of systems.

North Korea is a pathologically secret state, even on everyday matters.

Coming clean simply does not come naturally.

And nuclear weapons are Mr Kim's sole trump card.

Unlike Mr Gaddafi, he has no oil or other resources to parlay.

The Libyan route is hugely risky for him.

Military hardliners in the Korean People's Army (KPA) would see it as surrender.

With Mr Kim turning 66 in February and no successor in place, any wrong move could cause political turmoil in Pyongyang.

George W Bush's problem is different.

He is desperate to leave office with a foreign policy success to balance Iraq and Afghanistan, hence last year's U-turn to engage North Korea.

But any deal has to be credible to a hostile Congress, and Republican hawks who remain deeply suspicious of a regime which Mr Bush once notoriously called part of an "axis of evil."

### **No more Bart**

Hence heavyweights like Henry Kissinger have been wheeled out to meet North Koreans in New York, reinforcing the message stressed by the tireless chief US negotiator, assistant secretary of state Christopher Hill.

But personal rapport may not be enough.

Mr Bush even sent Mr Kim a direct letter, urging timely fulfilment of obligations already agreed to.

The point they are all emphasising is that what might be called North Korea's stock, Bart Simpson riposte - nobody saw me/didn't do it/can't prove a thing - will not wash this time.

On uranium enrichment, on Syria, on the nuclear stockpile - on all these the US and others need more than some pro forma story.

This has to be the real deal, or the six-party process becomes a charade.

What if Pyongyang stays silent? The process can brook a certain amount of delay.

Yongbyon's closure last year was three months late, owing to the complexities of unwinding a disagreement over a bank.

Similarly, a couple of months' technical hitch in disabling Yongbyon is no problem.

But the nuclear declaration is another matter.

By February or March, silence or recalcitrance from Pyongyang will put the other five on the spot.

By then, too, South Korea will have a new president: Lee Myung-bak, who takes office on 25 February after his landslide win in December's election.

A moderate conservative, Lee plans to strengthen ties with the US.

Unlike his liberal predecessor Roh Moo-hyun, Lee says he will make Seoul's aid to the North conditional on full nuclear compliance.

## **Back to the future**

That could alter the balance in the six-party process. Initially, an "axis of carrot" troika - China, Russia and South Korea - offset a hardline US and Japan, before Mr Bush's switch to engagement left Tokyo isolated.

But if Pyongyang is defiant, the US, Japan and South Korea may all resume their traditional role as sceptical if not hostile, ranged against China and Russia too playing their old Cold War parts as Mr Kim's big brothers and (albeit reluctant) defenders.

A year hence, regime change in Washington will add a further twist.

Mr Kim may procrastinate in hopes of a Democrat victory, as he did in 2004 hoping John Kerry would defeat Mr Bush.

But he is mistaken if he imagines this would bring a softer US line.

As so often before, in theory the ball is in North Korea's court.

But if Mr Kim refuses or tries to fudge his nuclear declaration, that lobs the problem back to his interlocutors.

At the end of the day, none of them - not even a tetchy Japan - is in any mood or position to back up hostile words with deeds.

Unless China finally loses patience, a nuclear North Korea may be here to stay - for as long as Mr Kim and his rebarbative regime survive.

## **What America Must Do: Jessica T. Mathews**

Foreign Policy Passport

Jan 1, 2008

Jessica T. Mathews tells FP why it's time to talk to Syria.

*[EXCERPT]*

FP: What do you make of the news blackout on the Israeli attack on Syria in September? Is it, as recent analysis has suggested, that if there were a connection between North Korea and Syria, the White House wants it buried simply because it wants the North Korean deal to stick?

JTM: I think that's probably true, but there are other reasons why they would want to keep it quiet. The Israeli move is illegal under international law and IAEA [rules], and I think the [Bush] administration probably doesn't want to have that discussed.

What's more extraordinary is the fact that it stayed a secret in Israel, where nothing generally stays a secret among people-in-the-know for longer than about two days. I think that the Israelis did feel a threat and had credible intelligence, but I think their desire to reestablish their existential deterrent, which was badly damaged by their military failings in the war in Lebanon, was very important to them. Israel really depends on a belief in their incredibly potent military force that can do anything. I think that when Gen. [Ehud] Barak came back into the government, his No. 1 assignment was to find a way to repair the damage that the war did to the Israeli Defense Forces' reputation. That had everything to do with this raid.

## EDITORIALS & OPINION

### **Out On A Kim**

INVESTOR'S BUSINESS DAILY

Posted 1/2/2008

North Korea: The communist regime has missed a deadline in the agreed-to process to shut down its nuclear weapons program. Sadly, it's exactly what we've come to expect from Pyongyang.

The Democratic People's Republic of Korea was supposed to have disabled its nuclear complex at Yongbyon and reported the details of its atomic weapons program by Dec. 31. As of Wednesday morning, the second day of the new year, it had done neither.

Less than a month ago, Assistant Secretary of State Christopher Hill, chief U.S. envoy to the six-party talks on North Korea's nuclear arms program, expressed confidence that the Yongbyon facility, shut down in July, would be disabled by the deadline. A U.S. team was on the ground supervising the project and Pyongyang was reportedly cooperating.

It seemed Hill was not as confident, however, regarding North Korea making a full and honest declaration about its program. He telegraphed his concerns by publicly insisting that Pyongyang's disclosures must be "complete and correct" and hold "no surprises."

Apparently he should have been uneasy about both.

It was nearly one year ago, in February 2007, when high-living North Korean dictator Kim Jong Il agreed to the arrangement, which included aid to the DPRK, primarily heavy fuel oil, and improved diplomatic relations with nations that had cut or cooled their ties to Pyongyang.

He can't say he has not had enough time to comply.

Yes, disabling a nuclear facility is complicated and laborious. In particular the safe removal of fuel rods has great potential to cause delays. But Kim's regime has shown that it cannot be trusted; concern that it might be dragging its feet to extract more concessions from the U.S. and other nations involved in the talks is justifiable.

One of the rewards Pyongyang is likely seeking is North Korea's removal from the State Department's list of terrorist-sponsoring nations. But that should have to wait until basic changes have been made in North Korea's government. **There can be no faith put in the word of Kim nor in those at the highest levels of his regime.**

**For instance, even while Kim was supposed to be cleaning up his nuclear weapons mess, it's possible — perhaps even probable — that North Korea was involved with Syria in some sort of nuclear weapons program. Israel did not fly into Syria in September to bomb an aspirin or "baby milk" factory.**

The U.S. response to the missed deadline was right out of the State Department's pantry of milquetoast statements. "We think it's possible for the North Koreans to provide a full and complete declaration, and we hope they will do that as soon as possible," just doesn't have the bite it should have.

There is the frightening possibility that Kim is looking beyond having his regime removed from the State Department list of terrorist-sponsoring states and stalling until he can fill out a potent nuclear arsenal. It would fit his history of failing to keep promises.

With that in mind, the White House needs to engage in tough diplomacy with North Korea, even if the other nations in the talks — South Korea, Japan, China and Russia, none of whom would be comfortable with a nuclear-armed North Korea — seem unwilling to do the same. Decisive U.S. leadership, as it often does, will go a long way in this case.

## **Our view on nuclear diplomacy: N. Korea misses a deadline**

Don't get too tough, too fast on paranoid regime.

Posted at 12:21 AM/ET, January 03, 2008 in Foreign Affairs - Asia - Editorial, Nuclear weapons - Editorial, Politics - Editorial, Politics, Government - Editorial, USA TODAY

Besides the ball dropping in Times Square, something else important was supposed to happen by midnight Dec. 31. The North Korean regime of Kim Jong Il had promised to provide a full accounting of all its nefarious nuclear activities. Kim, being less reliable than the ball, missed the deadline. While that's no cause for celebration, nor is it reason for overreaction.

Kim's nuclear pledge last year was seen as a rare foreign policy breakthrough. In return for coming clean, and as he delivers in dismantling his main nuclear facilities at Yongbyon under U.S. supervision, he is gradually being given a range of rewards. Those include fuel for his impoverished people, nuclear reactors for electricity and less hostility from the United States.

The missed deadline raises the specter of a new crisis and gives ammunition to hawks who say that negotiating with Kim's bizarre regime is pointless. Certainly, if Kim continues to stall, he should be denied the food, fuel, technology and international respect he craves.

For the moment, however, the Bush administration has had an appropriately low-key, skeptical response to the latest delay. Earlier this year, North Korea missed a deadline to start dismantling the Yongbyon facility, but the process eventually went forward.

What is important is that Kim accounts for nuclear weapons and fuel made so far at Yongbyon; whether he has an illicit uranium program, as the United States suspects; and how much help he has given to other rogue regimes, including Libya, Iran and possibly Syria.

To keep North Korea on track requires a mixture of sticks and carrots from the countries involved in "six-party talks" (China, Russia, Japan, South Korea, the United States and North Korea). In the past, Kim has been adept at playing for time and sowing dissension. South Korea has been particularly enabling, but it now has a new president who wants to no longer be soft on North Korea. The role of China, its influential communist neighbor, is particularly important.

Dealing with North Korea can be infuriating. Kim likes to play psychological chicken to wring extra concessions.

Finding the right levers isn't easy. At times, they can be mind-bogglingly petty, given how much is at stake. Kim granted concessions, for example, after his funds of several million dollars for luxury goods were unfrozen. His father warmed up to personal diplomacy from Jimmy Carter, who says they bonded over fly-fishing. So President Bush's recent gambit of sending a letter to Kim holds more promise than earlier bluster about North Korea being part of the "axis of evil."

Threatening North Korea and isolating it even more has a tendency to push this paranoid power to more desperate actions. If Kim continues to flout deadlines, ratcheting up the pressure will become necessary. As the new year begins, however, patience and persistence are the best approaches.

## **Opposing view: A diplomatic charade**

### **Unseemly talks with Kim Jong II pose security threat to U.S., allies.**

By Nicholas Eberstadt

Posted at 12:20 AM/ET, January 03, 2008 in Foreign Affairs - Asia - Editorial, Nuclear weapons - Editorial, Politics - Editorial, Politics, Government - Editorial, USA TODAY

Once and for all: Can we please stop pretending that Kim Jong II is negotiating with us in good faith? The only surprise about North Korea's latest missed deadline — and broken promise — in the ongoing "six-party talks" is Washington's seemingly unending tolerance for this diplomatic masquerade.

Well into the fifth year of negotiations on denuclearizing North Korea, what tangible results do our arms control conferees have to show for their efforts? Only a temporary shutdown of the North's Yongbyon plutonium facility. (State Department happy-talk notwithstanding, that facility has not yet been fully "disabled," much less "dismantled.")

What about the covert uranium enrichment program, whose exposure back in 2002 triggered today's nuclear drama in the first place? Pyongyang still officially denies its very existence. Indeed, breaking pledges signed last February, North Korea has not yet even bothered to offer an accounting of its past nuclear activities to its "negotiating partners" (China, Japan, Russia, South Korea and the United States).

Our response to that violation has been, yes, a request for more talks! In the no-penalty wonderland of conference diplomacy, it would appear Kim Jong II can blow us off whenever he wants — confident we'll always shuffle back to the table. But the unseemly charade of denuclearization negotiations with North Korea is worse than an embarrassment. It is, in fact, compromising the security of America and her allies.

During the six-party talks, the North Korean government continued to amass plutonium for weapons. Over those same years, Pyongyang went from hinting it had nuclear weapons, to explicitly declaring it possessed nukes, to test-blasting a nuclear weapon.

Viewed without illusion, these vaunted denuclearization talks with North Korea have in practice provided diplomatic cover for Pyongyang to achieve its long-desired status as a nuclear weapons state. And, by the way, any American official who thinks Kim Jong II wouldn't dare sell his nuclear wares abroad is off in a dream world.

The Bush team apparently has no benchmarks for failure in its nuke talks with Pyongyang — so the conferencing continues. But it continues at our peril.

Nuclear North Korea

## Eerie silence

Jan 3rd 2008

SEOUL AND TOKYO

From The Economist print edition

Golly: the Dear Leader won't come clean about his bombs

ANOTHER deadline, another disappointment. Last February North Korea agreed with four of its neighbours and the United States to give up its ambitions as a nuclear power in return for lashings of aid and rehabilitation from its standing as an international pariah. Crucial to the deal was North Korea's subsequent promise to declare all its nuclear activities by December 31st. The deadline came. It went. From Pyongyang, not a squeak.

Though hardly out of keeping for such a secretive, recalcitrant regime, the silence has generated unease, even embarrassment, among North Korea's counterparts in the six-party talks hosted by China, which, typically, described the hold-up as “natural”. But the administration of President George Bush reversed a once hostile policy in the past year in an attempt to prove that engagement with North Korea, even after it let off a nuclear bomb, could work. America's patience will have limits.

For now it will not sound the alarm. After all, an earlier part of the deal, the closure of the Soviet-era nuclear reactor at Yongbyon in July, came three months later than promised. Since then American inspectors have moved into Yongbyon to see that it is disabled and eventually dismantled. December 31st was also meant to be the deadline for Yongbyon's disablement, which was missed as well. But this week America was at pains to stress North Korean technical co-operation. If anything, it said, the delay was because of its own insistence that due care be taken in removing the thousands of fuel rods from the ageing reactor.

A few weeks' delay in the declaration of North Korea's nuclear programmes would be tolerable. Any longer and the six-party process would be in trouble. For the nuclear programmes are the crux of the matter. Declaring them was never going to come easily to Kim Jong Il, North Korea's “Dear Leader”. His nuclear weapons, however few and feeble, provide his only leverage against the world. Yet America is unlikely to stand for any bluff—not least because of suspicions that a Syrian site bombed by Israel in September was a nuclear facility that had North Korean help.

The questions now are not only how much plutonium North Korea has extracted and how many warheads it has made. The Bush administration also wants to know the scale of the programme to enrich uranium to which North Korea admitted in 2002. Earlier claims by America about its scale seem exaggerated; still, it has evidence that Pakistan's nuclear racketeer, Abdul Qadeer Khan (see article), sold the North uranium-enriching gear.

Hitherto, those in the six-party talks have given North Korea the benefit of the doubt: only Japan has been openly sceptical about the North's sincerity—at least until it has come clean about the Japanese kidnapped by the regime in the 1970s and 1980s. Now Mr Kim may face a hardening of the ranks.

However badly Mr Bush needs a foreign-policy success, he will not move towards normalising relations with North Korea before nuclear progress. As for South Korea, President Roh Moo-hyun has until now seen no evil; yet even his foreign minister now admits that dealing with a nuclear North Korea is a Sisyphean task. What is more, Mr Roh steps down next month and his conservative successor, Lee Myung-bak, is no fan of “sunshine diplomacy”. He promotes a harder line to the North: aid and investment from Seoul should follow nuclear disablement.

Mr Kim may yet come clean on his programmes, and denuclearisation continue apace. If he doesn't, it is not obvious what the world can do about it.

## **U.S. Should Focus More on N.Korean Plutonium**

**Updated Jan.7,2008 09:28 KST**

In a statement issued by a foreign ministry spokesman, North Korea, which missed the end-2007 deadline to declare all of its nuclear weapons and materials, claims it did prepare a list of items to declare and notified the U.S. in November of last year. Since the U.S. says it has received no such notice from the communist country, the comments sound like North Korea's way of saying it has no intention of declaring its nuclear weapons and materials. Yet North Korea did not harshly criticize the U.S. or present new demands.

The basic reason the North Korean nuclear situation has reached a stalemate is because North Korea has failed to declare its nuclear weapons and materials. The problem has become more complicated with North Korea denying the existence of its uranium-enrichment program and allegations that it transferred nuclear technology to Syria. The Pakistani president and Pakistan's chief nuclear scientist have testified they transferred uranium enrichment technology to North Korea. And a Syrian nuclear facility that was destroyed in a bomb attack by Israeli forces is believed to bear a strong resemblance to North Korea's Yongbyon nuclear facility. These are matters that will not be resolved simply by North Korea denying them.

But from South Korea's perspective, these problems are not at the center of the issue of North Korea's nuclear threat. Judging from various testimonies and North Korea's own admissions, it is very likely true that North Korea did come up with a uranium enrichment program. But it will be realistically impossible for the North to produce a nuclear bomb with enriched uranium because it does not have enough electricity to do so. It is also doubtful that North Korea would feel the need to proceed with the uranium enrichment program since it is believed to have already processed quite a large amount of plutonium and produced nuclear bombs using it. This problem surrounding uranium has come to the surface and has been exaggerated due to differences in opinion between hawks and doves within the U.S. government, and now it seems that the issue may have degenerated into a war of justification between the two countries. Although it is important to find out whether North Korea did in fact transfer nuclear technology to Syria, at this point, such efforts, if true, have been halted.

The central issues of the North Korean nuclear threat are how much plutonium North Korea has processed, how many bombs it has made using that material, how much plutonium it has left and where it is keeping it. This is the core of the problem that South Korea and the international community are facing right now.

If the reports that North Korea notified the U.S. that it processed 30 kg of plutonium are true, then this is a truly serious situation. U.S. intelligence officials believe North Korea has processed at least 50 kg of plutonium. If North Korea has scrapped only 30 kg and has hidden 20 kg somewhere, it can produce several nuclear weapons at any time. If that's true, then we will end up with North Korea as a nuclear power, rather than getting it to fully scrap its nuclear programs and weapons. The U.S. must waste no time in focusing on the real threat of North Korea's plutonium and verify whether the communist country has the will to abandon its nuclear weapons program. The issue of enriched uranium can be addressed later.

## **North Korea: Clouds Block the Sunshine at the Six-Party Talks**

by Bruce Klingner

WebMemo #1771

January 10, 2008

North Korea's failure to meet yet another negotiating deadline raises more doubts about its commitment to get rid of its nuclear weapons. Other events of recent weeks raise disturbing new questions about U.S. policy toward North Korea. The Six-Party Talks have reached an impasse due to conflicting interpretations over the level of detail Pyongyang must provide on its nuclear weapons programs, a shortfall brought on by U.S. acquiescence to vague negotiating text. The most recent joint statement called on North Korea to desist, disable, declare, and dismantle its nuclear weapons programs. It appears that Pyongyang has added deny, deceive, and delay to the mix. And it appears that U.S. negotiators, in an attempt to shield the talks, concealed the fact that North Korea made an inadequate declaration.

The magnitude of the dispute between the U.S. and North Korea over critical aspects of the data declaration will make it more difficult for diplomats to continue papering over differences. Instead, the U.S. and its allies must be resolute on insisting that North Korea declare the number of nuclear weapons and amount of fissile material that it has, as well as provide full transparency of its uranium-based weapons program and proliferation activities. Six-Party Talks participants should withhold additional economic or diplomatic benefits for North Korea until it fully complies with these obligations and allows verification inspections. It would also be prudent to prepare contingency measures, including the sanctions called for under U.N. Resolution 1718 and, in the longer term, returning the nuclear impasse to the U.N. Security Council (UNSC).

### **North Korea's Obligations**

North Korea agreed in the October 2007 Six-Party Talks joint statement to "provide a complete and correct declaration of all its nuclear programs...by 31 December 2007." This requirement followed its February 2007 agreement to "discuss with other parties a list of all its nuclear programs [within 60 days]."

Beyond violating the December 31 deadline, North Korea remains in defiance of U.N. Security Council Resolution 1718 of October 2006. In response to North Korea's nuclear weapons test that month, the U.N. Security Council demanded that North Korea immediately rejoin the Non-Proliferation Treaty and comply with the International Atomic Energy Agency (IAEA) nuclear safeguards. The UNSC also decided that Pyongyang should "abandon all nuclear weapons and existing nuclear programs in a complete, verifiable, and irreversible manner...[and provide] access to individuals, documentation, equipments and facilities."

### **Conflicting Interpretations of Disclosure Requirements**

The Six-Party Talks joint statements were flawed because they failed to delineate the extent of North Korea's data declaration requirements. The Bush Administration has stipulated that Pyongyang must fully disclose its nuclear weapons and fissile material, the extent of its program to covertly develop uranium-based nuclear weapons, and any proliferation activity with other nations.

North Korea claims it provided a complete nuclear declaration to the United States in November 2007, one month before the deadline. Pyongyang's official statement, that it "has done what it should do," matches private statements to visiting officials that it does not intend to provide more information. At that time, the expected deficiencies in North Korea's declaration likely influenced the U.S. delegation to decide against formally presenting the document at the next round of negotiations, which would have taken place in early December 2007. The need to keep sensitive details secret is understandable; but to conceal the fact that a declaration was made, and essentially negotiated, undermines the Administration's credibility.

North Korean non-compliance is not a mere inconvenience or speed bump; it is a brick wall that should halt further progress until completely resolved. The data declaration deals with the core requirements of the Six-Party Talks process; namely, full denuclearization and transparency. Described in further detail below, Pyongyang may have already crossed the red line drawn by the Bush Administration on North Korean nuclear proliferation to other rogue nations.

### **Waiting for the Other Shoe to Drop, or Waiting for Godot?**

It remains unknown whether North Korea's intransigence reflects standard negotiating tactics or an unwillingness to ever denuclearize. If the former is the case, Pyongyang would be expected to raise the price for its compliance by resurrecting previous demands such as light-water reactors or a non-aggression pact. But the latter seems more likely. Throughout the negotiations, North Korean officials have indicated a goal of gaining international recognition as a nuclear weapons state and giving up only the capability of producing nuclear weapons in the future.

North Korea's defiant posture marks a rejection of Washington's efforts to get the regime to come clean on its uranium weapons program. With the ball back in the U.S. court, two developments have constrained Assistant Secretary of State Christopher Hill's negotiating room and increased skepticism about the nuclear agreement: the exposure of possible North Korean nuclear proliferation to Syria, thus crossing the U.S.-drawn red line; and the revelation that North Korean aluminum tube samples contained uranium traces.

The big issue now is how low the U.S. will go to maintain momentum in the Six-Party Talks. The Bush Administration, entering its final year and longing for a foreign policy legacy, will be increasingly tempted to accept Pyongyang's half-hearted compliance as sufficient justification to continue negotiations. The Administration adopted a firmer line on the data declaration only following criticism of its stonewalling about possible North Korean nuclear proliferation to Syria.

The U.S. may even claim sufficient progress to justify providing all economic and diplomatic benefits called for in the joint statement and convening a meeting of the foreign ministers. That course of action, however, risks undermining the potential to finally achieve a full denuclearization of the Korean Peninsula.

### **Verification: The Next Test**

If the two sides are able to resolve the data declaration imbroglio, the next hurdle will be negotiating sufficient verification measures to prevent a recurrence of North Korean cheating. Several months ago, when there was still optimism over the forthcoming data declaration, a Bush Administration official

downplayed the need for strenuous verification: "Most of it should be pretty quick if it meshes with U.S. Intelligence Community estimates." However, subsequent North Korean statements saying that it had produced 30kg of plutonium--significantly less than U.S. Intelligence Community estimates of 50kg--underscores the need for an extensive verification regime.

The Bush Administration, however, is unlikely to demand requisite verification measures without outside pressure.

### **What the U.S. Should Do**

The United States should take the following steps to induce North Korea to comply with its commitments:

- \* Acknowledge the revised declaration when it is offered--however inadequate it may be.
- \* Avoid the past U.S. tendency to offer more benefits in an attempt to break the logjam caused by North Korean intransigence.
- \* Impose a hiatus on providing any additional economic or diplomatic benefits. Six-Party Talks meetings can continue, but they should not be "business as usual" until North Korea completes its obligations.
- \* Do not remove North Korea from the list of state sponsors of terrorism until it has fulfilled all legal requirements as well as admitted to previous terrorist acts. Reducing these issues to a nuclear negotiating chip would trivialize human rights issues, including the fate of Japanese abductees.
- \* Insist on adequate monitoring requirements to verify the data declaration once it is provided. An extensive verification protocol should include a sufficient quota of short-notice, "challenge" inspections of suspect sites.
- \* Request that President-elect Lee Myung-bak delineate and announce the linkages between South Korea's ongoing and future economic incentives and the concrete steps North Korea must take toward nuclear compliance.
- \* Integrate South Korea's unilateral aid to North Korea into the conditionality of multilateral Six-Party Talks process. Also, any deal should include World Food Program monitoring standards to ensure Pyongyang does not divert humanitarian assistance.
- \* Urge South Korea to impose conditionality not only on government-sponsored inter-Korean projects but also on South Korean business ventures, including those proposed during the inter-Korean summit.
- \* Call on China to impose conditionality in its economic engagement with North Korea, which is the latter's primary source of unconstrained financial gains.
- \* Ask South Korea to join the Proliferation Security Initiative.

\* Implement U.N. Resolution 1718 sanctions against Pyongyang's nuclear and missile programs, and require North Korea and Syria to divulge the extent of their nuclear cooperation.

\* Maintain international law enforcement measures against North Korean illicit activities. Sanctions should be maintained until the behavior that triggered them has abated.

\* Closely integrate U.S., South Korean, and Japanese initiatives toward North Korea to enhance negotiating leverage and to secure Pyongyang's full denuclearization.

\* Reject requests to convene a foreign ministers meeting or send a special presidential envoy to resolve the impasse.

\* If North Korea does not comply with its obligations within two months, bring the North Korean nuclear issue back to the U.N. Security Council.

## **Conclusion**

Six-Party Talks participants need an integrated plan to induce North Korea to comply with its commitments. With the cut-off of unconditional aid and business activity, as well as funding from illicit activities, North Korea would face a fundamental choice between isolation and economic stagnation or conditional engagement with benefits. Negotiations cannot be open-ended and stationary, since that would play to Pyongyang's goal of deferring international punishment and isolation.

Like an errant student, North Korea is handing in its research paper late and demands a passing grade. The U.S. should insist that negotiators don't grade on a curve.

## COMMENTARY

### North Korea's True Colors

By JOHN BOLTON

January 11, 2008; Page A11

There's more positive news from the Democratic Peoples Republic of Korea: Its leaders have refused to make any further disclosure concerning its nuclear programs.

How is this umpteenth violation of the Feb. 13, 2006, agreement in the Six-Party Talks positive? Because at a critical moment on a gravely important issue, North Korea has again shown its true colors, thus providing the United States an opportunity to extricate itself from this unwise and dangerous deal.

Troubles in the six-party talks on Korea emerged long before this most recent public manifestation of Pyongyang's unwillingness to give up anything of consequence concerning its nuclear program. Israel's Sept. 6 raid against a likely Syrian-North Korea nuclear project was a fire bell in the night that the regime was up to its old tricks -- at least for anyone willing to listen. The administration's continuing refusal to allow Israel to make public the true nature of this facility will only come back to haunt it, not only on North Korea, but also on its Middle East policy. If no North Koreans were involved, why not shout it out? If the facility was not nuclear, why not do the same? The significance of the Sept. 6 attack has not faded in Congress, nor will the demands for more public disclosure.

In the aftermath of the Feb. 13 agreement, North Korea had to develop a cover story for its uranium-enrichment activities, as well as a way to conceal its stock of plutonium and actual nuclear weapons. And yet -- despite the seemingly active and continuing collaboration by the U.S. State Department in coming up with a convincing line of patter -- Pyongyang still insists it never engaged in uranium enrichment, producing as evidence melted-down tubes. Melting the tubes was curious in and of itself, suggesting that in their original form they appeared much more like centrifuge equipment than artillery barrels. The regime made a fatal mistake, however, because the metal showed unmistakable traces of highly-enriched uranium (HEU).

Perhaps even the State Department's East Asia Bureau was shocked at this evidence of North Korean duplicity. In any event, the "dual use" dodge was now out of play, and Pyongyang had to be persuaded to come up with a more convincing cover story. Even this they have now refused to do.

The timing is important, because elements within the U.S. intelligence community were questioning the community's 2002 assessment that North Korea had launched a production-scope procurement effort for enrichment equipment. This effort, similar in origin and intent to the recent National Intelligence Estimate on Iran's nuclear program, may well have been sidetracked by the findings of HEU, which at least in part reinforced the 2002 conclusions.

Moreover, whatever the North Korean declaration says about its nuclear activities -- assuming just for sport that we actually get a declaration -- it was always only a first step in a long process of verification, and not even the most important one. If North Korea and the State Department, working

together, can come up with something they think will pass the public smile test once it is released, we still need to verify the accuracy and completeness of the declaration. Here is where State has failed most obviously: There has yet to be, 11 months after the Feb. 13 agreement, even a hint of what specific mechanisms will verify a declaration. Unless and until this vacuum is filled, we are going nowhere fast in denuclearizing North Korea.

So, as Kim Jong Il's hero, Lenin, used to say, "what is to be done?"

President Bush can now argue without fear of contradiction that he has done more than anyone could expect to give fantasy a chance, and therefore make a policy course correction. North Korea has dragged out its performance for nearly a year, has less and less incentive to make Mr. Bush look good, and has in sight the possibility of a resumed Clinton administration, or something even weaker. By resuming a tough line on North Korea, Mr. Bush can at least make a future administration's retreat from a tougher, more realistic course, more difficult to explain.

Given the recent South Korean presidential election results, Mr. Bush will soon have a willing ally in Lee Myung-bak, who will be inaugurated on Feb. 25. After 10 years, a realist will once again occupy Seoul's Blue House, one who will support a tougher American line rather than oppose it.

Mr. Bush should meet with Mr. Lee as soon as practicable, and urge South Korea to join the Proliferation Security Initiative, a genuinely important Bush administration legacy. This will help squeeze the North, by adding South Korea's considerable knowledge and capabilities in the waters around the Korean Peninsula.

It will also reinforce Japan's continuing tough line under Prime Minister Yasuo Fukuda -- given president-elect Lee's apparent willingness to confront North Korea on its horrifying oppression of its own citizens and its international record of kidnappings. If South Korea now joins with Japan in pressing the North hard on the kidnappings, Japan is less likely to bend under State Department pressure. This should certainly provide ample reason for the U.S. not to remove North Korea from the list of state sponsors of terrorism for the remainder of the Bush administration.

Aligning Japan and South Korea with the U.S. will allow President Bush to increase the pressure on North Korea internationally by resuming financial sanctions and other "defensive measures." It would also help put the spotlight back on China, which has the real economic leverage to force a change in North Korea's nuclear policy, if it chose to exert it.

We are long past the point of allowing China to cover for Kim Jong Il without any cost in its relations with the U.S. Getting China to take concrete steps against North Korea's nuclear capabilities through increased economic and political pressure would be a true diplomatic success for the Bush administration in its waning days.

## Hiding the evidence

### Reconstruction effort at bombed Syrian site likely aimed at covering up evidence

Ronen Bergman

Published: 01.13.08, 15:01

Israel Opinion

A person who is closely familiar with what happened in Syria back in September 2007 estimated Saturday night that the renewed construction work at the bombed Syrian site is not a joint Syrian-North Korean attempt to reestablish an atomic project – through which Pyongyang aimed to supply Syrian President Bashar Assad with nuclear weapons' production means.

Rather, he estimated that the reconstruction work is part of the effort to hide what was at the site prior to the bombing.

According to assessments, these efforts are being undertaken mostly for fear that the International Atomic Energy Agency would request to visit the site. According to the estimate, it is unlikely that the Syrians will attempt to reconstruct the secret project at the exact same location and in the exact same manner, after it was uncovered in such an embarrassing fashion. If the Syrians would want to reconstruct the project, they will secretly set it up in a completely different location.

Satellite images showed that following the bombing, the Syrians engaged in massive efforts at the site and cleared the ruins of the facility that was targeted by the Air Force. Now they are building something out there that looks very much like the giant structure that was there before.

The objective of this effort, according to estimates, is two-fold: First, reinforce the official Syrian declarations that the building targeted by the Air Force was meaningless, and there we see a copy being built and it is clear that it is not a nuclear facility. Second, this enables more extensive work below the structure in order to remove from there any remnants of what was at the site before, without the sensitive feelers of Israeli and American spy satellites hovering above being able to see and document it.

### Calm may be deceptive

And on the same subject, but from a different angle, sources who are following developments in Syria warn that the danger of an all-out war in the wake of the September bombing has apparently passed – yet the calm may be deceptive. We should not be underestimating Assad's hurt pride.

In the summer of 2001, after the Air Force bombed Syrian targets in Lebanon twice in response to Hizbullah activity, Syria changed its approach to Hizbullah and from being a transfer point for Iranian weapons it turned into being the organization's main arms supplier.

## REVIEW & OUTLOOK

### **Helsinki, Redux?**

January 21, 2008

Listen to the U.S. State Department, and the six-party talks with North Korea are working: Pyongyang has agreed to abandon its nuclear program, China and South Korea are stepping up their diplomatic roles, and all Washington needs is patience.

Enter Jay Lefkowitz, President Bush's Special Envoy for Human Rights in North Korea, with a reality check. In a speech Thursday in Washington, Mr. Lefkowitz said "it is increasingly clear" that the Bush Administration will end with North Korea remaining "in its present nuclear status." In other words, Pyongyang will not honor its promises.

Mr. Lefkowitz offers a few reminders: North Korea has ignored two deadlines to disclose the details of its nuclear program, announced it will strengthen what it calls its "war deterrent," and is suspected of having proliferated some kind of nuclear technology to Syria. He added that China and South Korea have been "unwilling to apply significant pressure on Pyongyang" and have supplied large amounts of aid "even though it is often diverted from those in need to the regime elite and military."

To reorient U.S. policy, Mr. Lefkowitz proposes a Helsinki process for North Korea, echoing Ronald Reagan's successful effort to undermine the Soviet Union almost three decades ago. Under this plan, Washington would tie aid to verifiable progress on human rights and disarmament. "The key is to make the link between human rights and other issues explicit and non-severable, so that it cannot be discarded in any future rush to 'get to yes' in an agreement," Mr. Lefkowitz says.

Mr. Lefkowitz's analogy with the Soviet Union is not perfect. Kim Jong Il has demonstrated that he has more in common with Stalin than Mikhail Gorbachev. Mr. Lefkowitz is correct, however, to say the six-party talks aren't working and that a more "holistic" approach is needed. In addition to linking aid to improvements in human rights, he suggests restricting North Korea's access to the international banking system, a tactic that proved effective until it was rejected by the State Department. He is also right that the newly elected President in South Korea will likely take a tougher line toward Pyongyang -- especially if encouraged to do so by Washington.

Mr. Lefkowitz's words bear special notice because he is close to Mr. Bush, who appointed him, and to whom he reports. A State Department spokesman said Friday that his "comments certainly don't represent the views of the Administration." Then again, maybe they do.

## **Slowly, but Surely, Pyongyang Is Moving**

By David Albright and Jacqueline Shire

Thursday, **January 24, 2008**; A19

The optimism with which the October agreement with North Korea was welcomed has faded amid accusations that the North again is not keeping its commitments. First came word that "disablement" of nuclear facilities was slowing. Then there was the missed Dec. 31 deadline for North Korea to declare the full scope of its nuclear program, including its plutonium stockpile and uranium enrichment activities. And earlier in the fall, North Korea was accused of helping Syria construct a nuclear facility in its desert, reportedly a reactor.

The finger-wagging, told-you-so naysayers in and out of the Bush administration should take a deep breath. There is no indication that North Korea is backing away from its commitments to disable key nuclear facilities and every reason to expect this process to unfold slowly, with North Korea taking small, incremental steps in return for corresponding steps from the United States and others in the six-party discussions.

Disablement of the five-megawatt reactor at Yongbyon slowed in part because the United States decided that unloading the irradiated fuel rods as fast as North Korea proposed could needlessly risk exposing the North Korean workers to excessive radiation. North Korea is unloading the rods and making steady progress on the other aspects of disablement at the Yongbyon site. Could it be happening faster? Probably, and North Korea would point out that promised shipments of heavy fuel oil are also slow in coming.

North Korea's nuclear declaration was to be received by Dec. 31. On Jan. 2, White House spokeswoman Dana Perino said the United States was still "waiting to hear" from the North. Pyongyang responded that the United States had its declaration. After some tail-chasing, it emerged that North Korea had quietly shared an initial declaration with the United States in November. According to media reports, this declaration stated that North Korea had a separated plutonium stockpile of 30 kilograms and denied that it had a uranium enrichment program.

Does this quantity of separated plutonium make sense? Yes. In short, 30 kilograms is at the lower end of the range of plutonium that we have assessed North Korea could have separated. This estimate is based on what we know about how long its reactor operated to build up plutonium in the fuel rods and how much plutonium was chemically extracted from this fuel at the nearby reprocessing plant.

What about any enriched uranium? There is no question that North Korea has committed to providing the other nations in the six-party discussions with information about its uranium enrichment efforts and should be held to that commitment. But we should not lose sight of an uncomfortable fact -- that U.S. policymakers misread (at best) or hyped information that North Korea had a large-scale uranium enrichment program. There is ample evidence that North Korea acquired components for a centrifuge-enrichment program, but few now believe the North produced highly enriched uranium or developed its enrichment capabilities in the manner once claimed by the United States.

The success or failure of this latest agreement with North Korea must not hinge on the uranium issue.

This is an interesting and relevant part of its nuclear program, but it is still a footnote in the context of its plutonium production.

Reports that North Korea has cooperated with Syria on a hidden nuclear program are troubling but must also be kept in context and, until additional information is available, should not be allowed to undermine the agreement. It is possible that North Korea was selling sensitive or dual-use equipment to Syria's nuclear program. The best argument for holding the deal together is that it brings North Korea into the fold, bit by bit, making it harder for it to slip back into the arena of illicit deals and keeping a bright light on its activities. As for the "box in the desert" that Israel bombed in September, it is gone now and whatever has replaced it is almost certainly not a reactor.

Accusations in the Israeli media that North Korea transferred plutonium to Syria, where it was to be placed into bombs, are baseless. The transfer of such material for weapons would be a casus belli with dire consequences for both countries, and this surely is understood by both Kim Jong Il and Syrian President Bashar al-Assad.

North Korea is looking to the United States to keep its promises on delisting it as a terrorist state. Unfortunately, given the climate in Washington and the perception that North Korea is slow-rolling the declaration process, this is unlikely over the near term. Pyongyang should be realistic in its expectations.

For Washington, and the unfairly maligned advocates of the six-party process, the task is to maintain laser-like focus on taking the next step toward fulfillment of the October agreement, with the goal of moving to the disarmament phase, and not allowing these hard-won steps to be drowned out by the noise of detractors.

David Albright, a former U.N. weapons inspector, is president of the Institute for Science and International Security. Jacqueline Shire is a senior analyst at ISIS and a former State Department foreign affairs officer.

## **The door has closed on Syrian-Israeli negotiations**

By Itamar Rabinovich

Commentary by

Tuesday, January 29, 2008

The prospect of a Syrian-Israeli peace settlement looms over the Arab-Israel and larger Middle Eastern arenas as a potentially significant but ever elusive issue. On the eve of the Annapolis conference, the dormant Israeli-Syrian track seemed infused with new life; a few weeks later it appears blocked yet again.

Such fluctuations are not new to this track. At the height of the post-Madrid peace process, when the Clinton administration and four Israeli prime ministers actually gave the Syrian track preference over the Palestinian track, several intense efforts were invested in achieving a Syrian-Israeli deal. They ended in failure and tilted the peace process toward the Palestinians and Jordan.

During the first six years of the current decade, the Israeli-Syrian track seemed to have lost all relevance due to the convergence of several developments: First, President Hafez Assad's death and his son and successor's failure to establish himself as an authoritative figure; second, Ariel Sharon's ascent to power in Israel and his determination to focus on the Palestinian issue and reluctance to withdraw from the Golan; third, the transformation of the Syrian-Iranian alliance and partnership of the 1990s into an unequal relationship between an Iranian senior and a Syrian junior partner; and fourth, the deterioration of Syria's relationship with the Bush administration, initially in 2003 over Iraq and then, in 2005, over Lebanon.

The Bush administration's and the American president's personal animosity toward Syria and President Bashar Assad was such that when Sharon's successor, Prime Minister Ehud Olmert, began to tinker with the idea of renewing negotiations with Syria, he was told in no uncertain terms by Washington that the Bush administration objected to a diplomatic initiative that would help Syria steer its way out of isolation and rebuild its legitimacy in the international arena.

But as noted above, this seemed to change on the eve of the Annapolis conference. It may seem odd that a conference devoted to the Palestinian issue would serve to revive interest in the Syrian track. But in the event, it was precisely the State Department's fear that Syria would sabotage the quest for an Israeli-Palestinian settlement that led to the renewal of a limited American-Syrian dialogue.

An understanding was worked out that consisted of three elements. First, Syria would participate in the Annapolis conference, thus enhancing its legitimacy. Second, Annapolis would still be solely devoted to the Palestinian issue, but clear references would be made to the need for a "comprehensive" settlement and to Syria's own turn farther down the road. And third, Syria tightened control over its border with Iraq and may also have promised to help resolve the political institutional crisis in Lebanon.

This trend was reinforced by parts of the Israeli government, particularly those linked to the security establishment that called for renewal of negotiations with Syria. Some of their arguments echoed the reasoning of the 1990s: It was easier to conclude an agreement with a state like Syria than to resolve

the complex national conflict with the Palestinians. Other arguments were new, shaped by current realities: Beyond resolving the bilateral conflict, a deal with Damascus would detach Syria from Iran and Hizbullah, transform the strategic equation in the region and diminish if not eliminate the challenge faced by Israel in and from Lebanon.

In fact, intermediaries were employed by Israel to explore the prospect of such a deal with Syria, but to no avail. Assad's position is clear and unchanging: Syria is willing to renew negotiations based on the foundation built in the 1990s. Furthermore, it is not satisfied with the hypothetical, conditional "deposit" presented then by Prime Minister Yitzhak Rabin but wants a "commitment" to withdraw from the Golan in return for a "cold peace." Such an agreement must be bilateral, and "preconditions" concerning relations with Iran or other parties are unacceptable.

The narrow opening offered by Annapolis now seems to have closed. The main reason is Lebanon, where Syria continues to meddle, intimidate and even kill in order to preserve and restore its position. This is totally unacceptable to President George W. Bush, who sees the survival and success of the Siniora government as a high priority. With this frame of mind, and in view of the priority the president and his secretary of state assign to completion of Israeli-Palestinian negotiations before the end of 2008, the prospect of American willingness to invest in the revival of a Syrian-Israeli negotiating track is remote.

In Israel, Prime Minister Olmert, bracing for the publication of the Winograd Report and fighting to keep the right-wing parties in his coalition (unhappy as they are with the ongoing negotiations with the Palestinians), is hardly likely to open yet another political front with the powerful (and presently dormant) Golan lobby.

It is important to remember that this discussion of the ups and downs of the Israel-Syria diplomatic option is being conducted in the ominous shadow of potential military escalation. Assad has stated several times that while he is seeking to renew negotiations with Israel he is also building a military option. Israel's destruction of a nuclear reactor in its early stages in northeastern Syria last September 6 served to demonstrate how determined and far-reaching Syria's quest for "strategic parity" with Israel can be.

Itamar Rabinovich, Israel's former ambassador to Washington and chief negotiator with Syria, is the Ettinger professor of contemporary Middle Eastern history at Tel Aviv University. His new book, "The View from Damascus," is due this spring. This commentary first appeared at bitterlemons-international.org, an online newsletter.

## **Don't dump Olmert**

By Uri Dromi

Published: January 31, 2008

JERUSALEM:

Ten months ago, when the Winograd Commission issued its interim report on the handling of the 2006 Lebanon war, there were calls for Prime Minister Ehud Olmert to step down. There are again now that the final report is in: According to polls published Thursday, 57 percent of the Israelis believe Olmert should go.

Though I was never one of Olmert's fans, I thought then that he shouldn't step down, and I still think so now.

Since the interim report came out, two comprehensive books on what we call the Second Lebanon War were published, which left no stone unturned. Therefore this week's report didn't tell the Israeli public anything it had not known before: that in the years preceding the war, there was a complacency with regards to the growing threat of Hezbollah; that years of policing the West Bank and Gaza had weakened the Israeli Army's preparedness for real war; that the military placed too much reliance on the capabilities of air power and technology to achieve victory; that the civilian leaders, Olmert and then-Defense Minister Amir Peretz, were inexperienced, acted hastily and made mistakes that cost the lives of soldiers and civilians. Israelis are perfectly aware of all this, and more.

Israelis, however, differ on the question of whether Olmert should follow the example of his partners in the Lebanon blunder - Peretz and former Chief of Staff General Dan Halutz - and resign. Those wishing to see heads roll argue that war is the ultimate test of national leadership, and once a nonpartisan, serious commission has declared that Olmert failed that test, he should go.

Others believe that while Olmert's performance in the war was poor indeed, the results of the war are far from being a total failure.

The strategy of Hezbollah - taking the north of Israel hostage by the threat of the Katyusha rockets - was challenged and eventually shattered. By taking Israel to war in the summer of 2006, Olmert restored Israel's deterrence, even if he did it in a flawed way. Just look at the calm on the Lebanese-Israeli border for the last 18 months. It seems that Hassan Nasrallah, the head of Hezbollah, is not so keen any more to invoke the wrath of the Israeli Army.

Furthermore, since 2006 there has been a vigorous effort to fix the flaws exposed within the army and Israeli society.

The army is not the same, experts agree. The generals who were there during the war resigned, accumulated rust has been chipped away, training has been doubled, military doctrines reexamined, old equipment replaced.

Olmert himself, bruised by the war, seems to have learned his lessons. If foreign sources are correct, then last September Israel, under his leadership, destroyed a partly constructed nuclear reactor in Syria apparently modeled on a North Korean one. If there is one thing Israelis are concerned about today more than the last Lebanon war, it is the nuclear threat. So Israelis may be wondering whether their prime minister isn't the right man for the job after all.

Then there's the peace process. Forcing Olmert to resign now would throw Israel into political mayhem for a long period. President George W. Bush's commitment to an Israeli-Palestinian accord by the end of 2008, though not highly realistic, will immediately be declared null and void.

The chaotic situation in Gaza, the dependence of Palestinian President Mahmoud Abbas on a stable Israeli partner and the fragile relations between Israel and Egypt all demand a cool-headed Israeli leadership - not a cut-throat election campaign.

Will Ehud Olmert survive his Battle of Winograd?

It depends on how much credit Israelis will be willing to give him and on their assessment of the alternatives. Writing about the interim report on these pages in May 2007, I concluded that the "Israelis, while not happy with their prime minister, prefer for the time being to carry on with him rather than rock the boat even further." I think they still do.

Uri Dromi is the director of the Mishkenot Shaananim conference center in Jerusalem. He was the spokesman of the Rabin and Peres governments between 1992 and 1996.

## **In North Korea, Process Over Progress**

By Michael Gerson

Friday, February 1, 2008; A21

By my count, at least five former high-level Bush administration officials are deeply disillusioned with the current policy on North Korea.

This brewing discontent broke into open revolt two weeks ago when Jay Lefkowitz, the special envoy on North Korean human rights, committed the gaffe of stating the obvious: North Korea is not serious about nuclear disarmament. The current six-party talks will do little to change that fact. And the price we are paying to pursue those talks is silence about the suffering of a brutalized, friendless people.

Afterward, even some of Lefkowitz's supporters complained that he had ventured "out of his lane." Secretary of State Condoleezza Rice slapped the special envoy down hard, noting to reporters that he "doesn't know what's going on in the six-party talks." Lefkowitz's speech was quickly scrubbed from the State Department's Web site.

But Lefkowitz spoke after 2 1/2 years of frustration. The East Asia bureau at the State Department, headed by Assistant Secretary of State Christopher Hill, has consistently viewed the raising of human rights as an impediment to the serious work of negotiating with Kim Jong Il. The Korea desk tried and failed to exclude Lefkowitz from important policy meetings with the president. It attempted unsuccessfully to weaken the North Korea section in the State Department's annual human rights report. Human rights groups generally view Hill with great suspicion.

Some State Department officials working in nonproliferation and intelligence reportedly share Lefkowitz's dissatisfaction. But, as one former Bush official made clear to me, "Rice's treatment of Jay shows that you need to stay quiet if you want to stay in government."

Even critics of the current approach believe that the agreement reached last February was worth a try. After testing a nuclear weapon, North Korea was under serious international pressure. The U.N. Security Council passed a tough resolution that included economic sanctions. So North Korea promised to move away from its nuclear ambitions in stages, beginning with a freeze on work at its plutonium reactor and enrichment complex -- though some experts suspected that the plant was already nearing the end of its useful life. In return, the North Koreans received pledges for 1 million tons of heavy fuel oil.

The problem has come in the months since. Having begun the path of negotiations, the State Department has consistently moved the goal posts closer to keep North Korea at the table. The second stage of compliance was supposed to be the permanent "disablement" of the plutonium complex, which is now interpreted as disablement that is irreversible for a year. Some experts believe it is actually reversible in a few months. To keep the process going, America has returned money that the North Koreans gained from money laundering, drug trafficking and proliferation.

And North Korea's nuclear disclosure, due at the end of 2007, was not even close to adequate. Kim declared 30 kilograms of plutonium but did not even mention uranium enrichment, weapons

**components or proliferation to Syria.** This is a far cry from Libya's full disclosure in 2004, in which that nation sent its most sensitive nuclear program materials to a facility in Tennessee.

North Korea feels little pressure as a result of its noncompliance. China seems relieved that Kim hasn't recently misbehaved and urges patience. The South Korean government continues to hold up its end of a protection racket: To keep the peace, South Korea provides North Korea with aid, which is diverted to strengthen North Korea's military, which threatens South Korea, which gives more aid to keep the peace.

This is the problem of State Department "realism." Negotiations that begin as a means become the end itself -- a kind of blind and dreamy faith in the magic of the process. Any form of criticism or coercion disappears, because "the North Koreans won't negotiate under pressure" -- when, in the past, the North Koreans have negotiated only under pressure.

Kim's goal in the six-party talks is clear: He wants to trade a single, aging nuclear complex for the easing of sanctions. By all accounts, North Korea's supreme leader has the mentality and social skills of a troubled 13-year-old -- but he seems to be doing remarkably well in these negotiations.

The alternative is not to end the talks or impose a blockade. It is, as Lefkowitz pointed out, to pursue a more sophisticated diplomacy familiar from the Cold War. Tie the improvement of relations to both security and human rights. Encourage the new South Korean government to demand more North Korean openness in exchange for resources and cash. Push the United Nations to identify North Korean entities for sanctions. Above all, talk about the rights of North Koreans once again, so the prisoners and the dead are not forgotten.

## **North Korea: We Can Work It Out**

Oxford Analytica 02.01.08, 6:00 AM ET

North Korean leader Kim Jong-il said Wednesday his country would cooperate on implementing agreements reached at multilateral talks.

Kim pledged to renew his government's commitment to the deals when speaking with a visiting senior Chinese Communist Party official yesterday, according to Chinese press reports.

However, until these most recent remarks, progress last year with North Korea--both in multi-party talks and through strengthened ties with South Korea--has stalled. Now, in changing political circumstances, global relations with North Korea may begin to deteriorate once again.

Sung Kim, director of the U.S. State Department's office of Korean affairs, visited Seoul, Beijing and Pyongyang for three days earlier in the week. His aim is to jump-start the six-party negotiations on North Korea's nuclear programs; the talks have stalled since Pyongyang failed to meet a 2007 year-end deadline to disable its Yongbyon nuclear site and declare all its nuclear activities.

### Disabling

Yongbyon closed in July; since then, disablement to put it beyond use has proceeded under U.S. supervision. Safety concerns made the year-end deadline non-feasible, but Pyongyang has recently slowed the removal of fuel rods from the facility from 80 to 30 per day, claiming that other parties are delaying the delivery of promised energy aid, and diplomatic relations have stalled.

### Declaration

The resistance of North Korea to reveal the details of its nuclear programs is even more problematic. North Korea says it has already given the U.S. a list--in November 2007--but **Washington remains far from satisfied on three key issues:**

--HEU: Pyongyang is suspected of pursuing or having pursued a second nuclear program, using highly enriched uranium (HEU), in addition to its known plutonium-based facilities.

--Syria: **Some suspect a link between North Korea and a plant in eastern Syria, bombed by Israel last September, raising nuclear proliferation issues.**

--Bombs: All nuclear weapons and fissile material have to be declared in accordance with commitments Pyongyang has made.

### Clarity

North Korean leader Kim Jong-il can have no doubt about what is required after close liaison between the lead U.S. negotiator, Assistant Secretary of State Christopher Hill, and North Korean Vice Foreign Minister Kim Kye-gwan. As with disablement, a slight delay with the declaration would be tolerable, but worries persist.

Kim Jong-il may be unable to persuade hard-line generals to give up their nuclear deterrent; he may expect the world will have to accept a de facto nuclear North Korea, as it has with India and Pakistan. He may even be holding out for a better deal from the next U.S. president when Bush leaves office a year from now.

#### U.S. Differences

Confusing signals have been coming out of the United States:

On Jan. 17, Jay Lefkowitz, appointed special envoy on human rights in North Korea before the U.S. switch to engaging with Pyongyang last year, called North Korea a "serial proliferator...not serious about disarming in a timely manner."

Lefkowitz said the country would still have nuclear weapons Bush's term ends. He remarked that Seoul and Beijing could do more to influence Pyongyang, and suggested U.S. policy might also be under review.

The U.S. State Department swiftly disavowed these views, but they struck a nerve. If Kim reneges, neo-conservatives--who opposed engagement all along--will claim vindication, and the multilateral talks may unravel as governments ponder how best to handle a defiantly nuclear North Korea.

## **Seymour Hersh on Israel's 'Strike in the Dark'**

National Public Radio

Talk of the Nation: February 4, 2008

**LYNN NEARY, host:**

When Israel launched a seemingly unprovoked attack on Syria last September, the media in Europe and the United States, according to unnamed sources, reported that Israel had destroyed a nuclear reactor which was under construction. But there are still many questions about the attack and its target.

New Yorker staff writer Seymour Hersh spent months talking to U.S., Syrian and Israeli officials and a number of other intelligence authorities. In the latest issue of the New Yorker, he writes that whatever was being instructed at that Syrian facility probably had little to do with nuclear weapons, and that the bombing may have been a warning signal to Iran about its nuclear intentions.

Mr. Hersh joins us now in Studio 3A. Good to have you with us.

**Mr. SEYMOUR HERSH** (Staff Writer, New Yorker): Glad to be here.

**NEARY:** First of all, why was that facility in Syria thought to be a nuclear reactor in the first place?

**Mr. HERSH:** Well, the Israelis will tell you that it was a large building. It was along a river. It had the physical dimensions of a reactor that was similar to the size, length and width of a reactor in North Korea.

And I think their attitude in Israel was they had some other intelligence. They had reason to believe North Koreans were there. They say they have empirical data that they have not made public. And that's the rub of the story. They have data that they have not made public that would prove it, but they're not making it public.

Their best ally in the world, the Americans, our government, is also clearly involved in some of the planning for this raid - that I can establish, I did establish rather easily - and we're not talking about it publicly.

Syria complained quite a bit in the beginning about it and then stayed relatively mute. They didn't do much about it. And so it's become sort of a conundrum. The press went, as you said - look, who am I to be talking about anonymous sources?

**NEARY:** Mm-hmm.

**Mr. HERSH:** I've written, spent much of my career writing about anonymous sources. But the people I talk to, basically, are people inside who are critical of policy. In this case, the policymakers themselves were giving the various newspaper reporters - the correspondents who cover the State Department and the White House - they were giving him their version without saying that this - there's been no official statement by the United States or Israel at all.

**NEARY:** Yeah.

**Mr. HERSH:** And that's the story, it seems to me. We're talking about an act of war.

**NEARY:** Yeah.

**Mr. HERSH:** And we're talking about three major countries that won't talk about it.

**NEARY:** Well, I was really curious about a lot of things that you wrote about. But I was really curious about why Syria has been relatively quiet, as you said, about this, and apparently sort of got rid of any evidence that may have been there as to what actually was in this facility.

**Mr. HERSH:** Well, what they did was this. They said nothing - very little. They complained. They wrote a letter to the U.N. Essentially, what they did find, yes, indeed, there were Koreans there and, yes, indeed, there was a military building being constructed. It wasn't finished. The best I get it was partially done, was slowed up, I think, because of our war in Iraq obviously. They started it before the war and finished it - just went back to it this spring.

I think they were sensitive about the fact there were South Koreans.

(Soundbite of coughing)

**NEARY:** North Koreans.

**Mr. HERSH:** North Koreans. I think, also - I should say think because the only thing we know is that the president, Bashar Assad, publicly said it was an unfinished military building. But beyond that, they've said nothing else.

What I was writing - what I'm reporting in the New Yorker this week is pretty much new. The question is: Is a building that has some military significance with North Koreans there, does that justify a raid across the border, an act of war?

And I can tell you, the amazing thing for me about the way people in the Middle East think about things - and you have to understand we're different. We do think differently. When Hezbollah, the Party of God, the Shiites in Lebanon captured two Israeli prisoners, the response from Israel was 34 days of bombing with America sort of looking on, saying nothing.

Here, Israel goes across the border, bombs something - it's not - you know, a building, whether it was nuclear or not, and nobody in the world says anything.

**NEARY:** Yeah.

**Mr. HERSH:** So there is a double standard at work. I think for Syria also, it's very hard to acknowledge they did nothing. It's a matter of shame for them that they did not respond. They took the hit.

But beyond that, the ultimate bigot - for me, the focus, of course is, as an American, I - what's my country doing in this game? Why are we spinning stories anonymously, not talking publicly? And what I discovered in doing the reporting - I did played border reporter for months on this. Every single fact - I should say that many of the salient facts that were pushed by the various anonymous sources - a boat showed up, called the el-Hamid(ph) three days before it landed in a port in the Mediterranean in Syria with hot stuff in it. That boat, when you check it out, had been into - had been in North Korea in 10 years...

**NEARY:** Mm-hmm.

**Mr. HERSH:** ...was a tramp steamer, essentially not very useful. And it could not possibly have been the boat that the Israeli press and the American press reported it was. And so you find so many other disconnects in the

story. And yet, the story is still there. If you ask anybody to read accounts, it's Syria had a nuclear reactor that was destroyed by Israel; (unintelligible) another day in the world.

And I quote a man, Morton Abramowitz, who is - was an ambassador for the American government and was the head of intelligence in the Bush years. Morton Abramowitz, who was now a director of the international crisis group, said, you know, what's going on with us? An act of war? Violation of a border, a raid, and nobody says anything and no - so that was the motive.

The motive in this - doing this story is just to say, you know, there are standards.

**NEARY:** Yeah.

**Mr. HERSH:** Yeah - excuse me.

**NEARY:** Well, why - you've said the United States was involved in - what was the United States involvement and what was the motivation for the U.S. involvement?

**Mr. HERSH:** What I know from inside - and I have contacts inside. And what I know from inside, in the Pentagon, at the JCS level, and also into the vice president's office, this mission, this raid was being discussed in the summer before it took place. It took place last September 6th.

In the late summer, there was talk and planning of going into Syria with Israeli planes monitored by American intelligence aircraft and taking a sweep - a good look at their radar. The defense intelligence agency reported last year that Syria had upgraded its radar, not to the point where the Iranian - as good as the Iranians - but to a level getting close. So the idea was just to go - as my friends knew it - to go and take a look and knock down their radars, take a look and see how they responded, copy as much as we can, learn as much. And lo and behold, about 10 days afterwards, my guys, who thought it was a radar raid, began to hear this talk about hitting a nuclear reactor.

And in fact, the Israelis had no intention of doing anything but going in and hitting a nuclear reactor. And if you ask me what I really think about this, I think the Israeli government had some very high level contact - off the record if you will, perhaps with the vice president, perhaps even with the president - in which they said what was going on but did not tell the American system.

We have an amazing situation in this country, where we do have the - particularly the vice president, will operate outside the chain of command.

**NEARY:** Mm-hmm.

**Mr. HERSH:** He will move forces, he will make orders, move - make military decisions, and not tell the appropriate generals in the chain of command. He deals directly - Dick Cheney deals directly with our joint special operations command, for example, that the three-star general runs. And he gets in the phone and says go do this and that. And the rest of the officers have to scramble and find out what's going on. We - you know, again, the concept behind the story, really, was to say we have to hold everybody to a high standard here.

**NEARY:** But if it wasn't a nuclear reactor that was under construction, what was this building?

**Mr. HERSH:** Best guess was there was - the Syrians have decided a long time ago that - the trouble with having chemical warfare reactor weapons, if you use it against Israel, the Israeli response is nuke. You're incinerated. So the real issue for them was, years ago, I think they made a decision - I was told this - to go what they call asymmetrical.

If you remember, when Israel invaded Hezbollah in southern Lebanon, they fired rockets. Well, Syria is going to do the same thing. They've been manufacturing low-level, low-yield rockets that can - they're probably going to be better than the ones Hezbollah had. They're going to be able to hit - go deep into Israel perhaps as far as Tel

Aviv, from the Golan Heights and from the areas in the north. And the idea is just to shower Israel in response with rockets.

They can't match Israel man for man, if the Israelis decided to attack. What makes the invasion or the attack last September so interesting, there have been a summer of tension over the Golan Heights. And in the middle of this, Israel makes a strike. I, frankly, I still sit here and I think about it. I say, have we become so unnerved(ph) and so numbed by the seven years of this government that there's no - even not much of a corner for outrage when somebody goes across the border? Yes, Israel is an ally of ours and it always will be. But that doesn't mean we have to countenance a raid across the border.

**NEARY:** We're talking with Seymour Hersh about an article he wrote in the New Yorker about an Israeli attack on a Syrian military facility and the many unanswered questions about that.

If you have any questions from Mr. Hersh, the number is 800-989-8255. Or you can send an e-mail to [talk@npr.org](mailto:talk@npr.org).

What about the role of the IAEA, the International Atomic Energy Agency? And Syria didn't ask them to come in and do any inspection today. And what was their take on whether or not this really was a nuclear facility?

**Mr. HERSH:** They - their opinion based on the satellite imagery, the same imagery that an America was accepted as fait accompli, the IAEA's experts - and you know they use a lot of overhead, they do a lot of analysis because they monitor compliance with the Non-Proliferation Treaty - they didn't see any evidence there was a building. Somebody - I quoted somebody as saying, "a building is a building." They didn't see any evidence of any nuclear reactor there.

On the other hand, I did see some senior officials in Syria. I quoted the vice president: "If I saw people actually higher, not on the record." And a very senior intelligence general did say to me at some point when I asked him about this, why didn't you go and invite the IAEA into? He said, they never asked to come. That's not true. They did ask to come.

**NEARY:** Mm-hmm.

**Mr. HERSH:** And so the Syrians, I must say, to put it mildly, fell all over themselves into response. They didn't - there wasn't a straight answer out of what was going on. Within a few days, they gave...

**NEARY:** That's what's so peculiar to me about this. It contains...

**Mr. HERSH:** Well, you know, those countries are so weird. The New Yorker is an incredible checking department. Almost everything that gets written, even from all my anonymous sources, these sources are contacted and approved and go - we go through the notes. We want to make sure we're totally accurate, not being unfair to anybody - try and check with the Syrian. The foreign minister, the head of intelligence - it's just a - they're just in another planet.

The checking department just couldn't get anybody to respond. They were going to the ambassador here, trying to verify what I was writing. And the - we always kind of end up using my notes, but the idea is not to, to get beyond my notes, do independent verification above and beyond what I produce.

It's very hard. They're just - the foreign minister said one thing. The head of intelligence said another thing. Their press agency said a third thing. Nobody even admitted a building had actually been bombed for almost four weeks after the event inside Syria. It was hapless.

And that does - they are so - I won't say difficult. They're just in a different planet when it comes to what we do in the West with their 24-hour cable television, et cetera.

**NEARY:** We're talking with Seymour Hersh of the New Yorker. And you're listening to TALK OF THE NATION from NPR News.

Now, you - it seems to me, at the end of your article, you came to the conclusion - or you indicated that what this really may have been about was kind of a warning signal to Iran about its - what it's doing with its nuclear capability.

**Mr. HERSH:** I can say this, that one of the selling points inside the White House for doing the exercise just in terms of lighting up the radar was let's show the Iranians that we can - we're going to go study the Syrian radar, and that'll help us understand what could happen to us if we go into Iran. We can't go into Iran and do what we did in Syria, because the Iranians will do something. It's a country of 70 million.

Syria, you can just walk over. They're a small country, small army. The Israelis have been penetrating their airspace, and I will tell you right now American combat soldiers and special operators have been crossing the border all the time. We just sort of - Syria is not - it's just sort of taken as not somebody who's going to stick, you know, a fork in our eye as the Iranians might if we did something like this.

But then, the bottom line came out to be this that for the Israelis, many of them believe there was something there. They did not want to wait around. There's a building, and they didn't like it. There was a building and they saw Koreans there. They had intercepts. They heard the Koreans yakking away. That was enough. And they're not going to wait and see what it is going there. Maybe it's going to be nuclear, maybe it's going to be missile - we're going to take it out. That's their reasoning.

Also, it has other advantages. One, it demoralizes the Syrians. It reminds the president of the Syria not to get too cocky after the victory last summer of his ally, the Lebanese Hezbollah, somewhere a year and a half ago. And Israel believed that Assad got very puffy, full of himself after the Hezbollah took down Israel in that big fight during the summer of '06.

The other factor was, of course, domestically it was terrific. Olmert needed something. This raid, once it became not officially known but unofficially in the chatter class, gave him a lot of publicity, and there was a lot of support for it.

Mention the word, anybody in the Middle East with a nuclear weapon, any Israeli attack is always applauded. And most significantly, in terms of the White House, in terms of the vice president, why he would support something like this, according to my friends, is it's a message for the Iranians: Look out. We're not done. There may have been a very negative National Intelligence Estimate, negative in terms of the Israeli point of view because it said there's no ongoing weapons program, but don't think we're not coming. We're capable of coming.

And that was a message too. I think we're in a real crisis in this country. For those people who want to do something about Iran, they're really flailing now. The NIE has undercut it totally. I don't think America could do it. I think probably half the Joint Chiefs of Staff would resign or do something anyway.

**NEARY:** Let's see if we can take one call in here from Chuck. He's in San Francisco. Hi, Chuck.

**CHUCK (Caller):** Hi. This seems to be an example of a phenomenon that I find very troubling, which is the - what seems like the increasing frequency of proxy fighting proxies, like, if Israel is bombing Syria so the United States can send a message to Iran, it seems like more and more, what was, you know, Hamas and Hezbollah, being a proxy for Iran and, you know, the Pakistani intelligence forces kind of operating through forces in Afghanistan.

If you can kind of separate yourself from accountability for your actions and you empower other parties to act for you, doesn't this kind of open a whole can of worms that could be very dangerous?

**Mr. HERSH:** Well, absolutely. You've just described the reason - I think one of the great underlying reasons that we have so many contract employees, you know, particularly fighting the war for us, like Blackwater did. In Iraq, which has a separation of responsibility, I don't think there's any question. If Israel takes any aggressive action against, let's say Iran or even dramatically against Hezbollah again, that the United States will not be far behind in - just in terms of, as you say, maybe even using the Israelis as a proxy. But certainly, sharing the ideas and pumping up funds in support for the Israeli forces doing the actual military action, you're totally right in my book.

**NEARY:** All right. Thanks for your call, Chuck.

**CHUCK:** Thank you.

**NEARY:** And just one last question. We don't have much time, but you've mentioned the North Koreans - and I'm not sure we explained completely what the North Koreans were doing there at that site.

**Mr. HERSH:** Well, there's certainly were North Koreans intercepted. I learned this from basically, believe it or not, from the Syrians, initially. There - in Syria - when I go to Syria, I'm watched a little bit. I'm taking interviews with - accompanied to people's office. I did see some people - I've been there many times. That's what I do for a living. And I saw a senior officer who just, you know, without anybody knowing I was there, I went to his home. And he said to me, look, they were doing construction. There may have been high-level technicians, too, involved, and if there were rockets involved.

And basically, they were there. They were chattering away on phones back home, sending fax messages and money sent home. They were intercepted, and the Syrians are pretty sure the Israelis intercepted it. I've learned from the Americans they were there. And I think it was embarrassing for the Syrians. That was the fact they didn't want to advertise. And that's maybe another reason they didn't talk.

**NEARY:** All right.

**Mr. HERSH:** It's all mystifying.

**NEARY:** All right.

Seymour Hersh is a staff writer for the New Yorker. His article is in the February double issue, out today. Thanks so much for being with us.

This is TALK OF THE NATION from NPR News.

## **Analysis: Iran's secret Syrian plan**

Posted in: Opinions

Written By: OLIVIER GUITTA

Article Date: Feb 5, 2008 - 3:22:39 AM

Israel has been providing intelligence and satellite images to the U.S. about a secret Syrian nuclear program for several months, according to media reports. Discussions between Israel and the United States took place last summer regarding a possible strike. But when Israel found the matter so pressing that when they realized the U.S. was not ready to act, on September 6 they attacked a Syrian nuclear site. Hence the question: what is Syria really up to or more to the point what is Iran up to?

First, let's start with an underreported explosion that occurred in a Syrian military base outside Aleppo on July 26. Jane's Defense Weekly reported, citing Syrian defense sources, as saying the explosion took place during a test to fit a "Scud C" missile with a mustard-gas warhead. It quoted the sources as saying the explosion occurred when fuel caught fire in the missile production laboratory.

But there might be another explanation. Kuwait's Al Seyassah newspaper recently reported that a Shiite Lebanese religious cleric claimed the Iranians were allegedly supervising a chemical weapons manufacturing program and that tens of Iranian experts and engineers died as a result of that explosion. He also said Israelis attacked the base. He added that Western officials told him they received proof from Israel on the Syrian chemical weapons program. Even if Israel's involvement is not proven, what remains sure is that it must be very happy that a chemical weapons facility in Syria has been partly destroyed.

Now regarding the September 6 strike; while we may never know what really occurred, what remains sure is that the situation is direr than one could imagine and that most likely, Israel did not just bomb a nuclear site in the early stages. Indeed, the silence of the international community and especially the Arab world after the attack is a first, and it shows the gravity of what happened. Even though Syria and its Iranian sponsor are detested, and in the case of Iran feared, in the Muslim world, the fact that there was no condemnation of Israel at the U.N. could be interpreted as a tacit relief that Israel acted.

Another proof of what transpired came from ranking Republicans on the House Intelligence and Foreign Relations committees, Ileana Ros-Lehtinen and Peter Hoekstra, who were briefed on the Israeli strike and sworn to secrecy. They wrote an op-ed in the October 20 Wall Street Journal clearly underlining the seriousness of the situation regarding both the North Korean and Iranian involvement in the Syrian arms program.

Finally, the fact that the Bush administration (including President George W. Bush, Vice President Dick Cheney and most notably Defense Secretary Robert Gates) has been ramping up the rhetoric and taking action against Iran (including the latest sanctions against the Iranian Revolutionary Guards) in the past week, might also be linked to what really happened in Syria.

The Syrian story is far from over: in fact, on October 23, Al Seyassah ran a story about potential new secret nuclear sites in Syria. According to Western sources cited by the paper, it is possible that Syria is developing other nuclear sites with the help of North Korea, Iran and Iraqi experts, the latter who fled

their country at the start of the Iraq war in 2003. In fact, observation satellites have allegedly located in Syria at least two other sites similar to the one destroyed by Israel last month.

Iran's handwriting is all over the wall from the chemical to the nuclear arms program in Syria. Indeed, in research conducted last year as part of an article published in Washington's The Examiner, this reporter delved into Syrian's secret nuclear program, making the point that Syria might actually be "Plan B" for Iran. By helping develop nuclear sites in Syria, strikes on Iran might turn out to be useless. This was a smart strategy until Israel bombed the Syrian nuclear site on September 6 and made the world notice.

## IAEA special inspections after Israel's raid on Syria

By Fiona Simpson |

11 February 2008

"The Israelis are already attacking our allies. It is time to teach them a lesson or else Syria will be next."

-- Statement attributed to Soviet Defense Minister Dimitriy Ustinov at a cabinet meeting immediately following Israel's 1981 attack on Iraq's Osirak nuclear reactor.

Several months have passed since Israel attacked what was rumored to be a partially constructed nuclear facility in Syria. The facility--allegedly undertaken with North Korean assistance--has remained a subject of speculation, its existence officially unconfirmed. Israel, the United States, and Syria (apart from a letter of protest to the U.N. Security Council and U.N. secretary-general) have remained nearly silent on the subject. Save for North Korea, the same holds true for the rest of the international community.

Although unconfirmed, the rumors have started a discussion about the International Atomic Energy Agency (IAEA) and Syria's obligation to the IAEA under its comprehensive safeguards agreement, concluded in accordance with its obligations under Article III of the Nuclear Non-Proliferation Treaty (NPT), to which Syria belongs. Other related questions have been asked regarding whether the IAEA has the authority to dispatch inspectors to Syria on the basis of the allegations.

**Background.** In 1992, in an attempt to respond to the discovery of Iraq's clandestine nuclear weapons program, then-IAEA Director General Hans Blix called for the safeguards system to possess more "teeth." As part of this effort, at a February 1992 meeting, the IAEA Board of Governors reaffirmed the IAEA's right to conduct special inspections under the comprehensive safeguards agreement to be concluded by all non-nuclear weapon states belonging to the NPT. At the same meeting, the board expanded the requirement on the provision of nuclear facility design information beyond that called for under paragraph 42 of INFCIRC/153, which required information to be provided "as early as possible before nuclear material is introduced into a new facility."<sup>1</sup>

Instead, the board called for revisions to existing subsidiary arrangements to be incorporated into both new and old safeguard agreements.<sup>2</sup> These revisions would oblige states with comprehensive safeguard agreements in force to provide preliminary information to the IAEA as soon as a decision has been made to construct, authorize to construct, or modify a facility. Finally, in an interesting coincidence, the February 1992 board session also approved the text of the comprehensive safeguards agreement for Syria, which would enter into force on May 18, 1992.

**Safeguard obligations and the question of special inspections.** The potential implications of the raid--i.e., the possibility that Syria had quietly been constructing a nuclear facility--brought all three of these board decisions into the spotlight. By the end of 1997, Richard Hooper, the then-director of the Division of Concepts and Planning in the IAEA's Department of Safeguards, wrote in the IAEA Bulletin, "The early provision of design information now is incorporated in all new and most existing subsidiary arrangements." Syria, whose safeguards agreement entered into force after the board

decision to revise the subsidiary arrangements, would therefore need to inform the IAEA as soon as it decided to construct a facility, if such construction was underway.<sup>3</sup>

In order to clarify whether the allegations against Syria had any basis, the IAEA secretariat (i.e., the director general) does possess the authority to invoke the special inspections component of INFCIRC/153. According to this document, the IAEA is empowered to make special inspections to either verify the information contained in special reports (not applicable in this case) or "if the agency considers that information made available by the state, including explanations from the state and information obtained from routine inspections, is not adequate for the agency to fulfill its responsibilities under the agreement."<sup>4</sup> Those responsibilities are defined at the document's outset: ". . . to ensure that safeguards will be applied, in accordance with the terms of the agreement, on *all* source and special fissionable material in *all* peaceful nuclear activities within the territory of the state, under its jurisdiction, or carried out under its control anywhere for the exclusive purpose of verifying that such material is not diverted to nuclear weapons or other nuclear explosive devices."<sup>5</sup> [Emphasis added.]

The controversy here lies in the language referring to the IAEA's responsibilities as the application of safeguards to nuclear material only. (Notably, the NPT's language is slightly broader, referring to the goal of safeguards as preventing the diversion of "nuclear energy" from peaceful uses.) However, if evidence was presented to the IAEA indicating that Syria was building a facility and hadn't informed the IAEA of its decision, questions would invariably arise as to whether there could be confidence that safeguards were being applied to all nuclear material within the state. Above all, it's the phrase "if the agency considers" that's most significant, as it gives the IAEA, on paper at least, a reasonable amount of latitude. According to the agreement, the authority to invoke special inspections follows from the IAEA's perception of whether or not it can carry out its safeguards mandate; the justification for special inspections presupposes a relatively flexible interpretation thereof.

But, in practice, the invocation and the implications of special inspections are more complicated, with the IAEA obliged to balance its safeguards mandate against the sovereignty and rights of its member states. The IAEA has only formally invoked special inspections twice--in 1992, at Romania's request to clear up outstanding discrepancies that occurred under Nicolae Ceausescu's regime, and a year later, when the IAEA became aware of inaccuracies in North Korea's initial report, due in part to information provided by the United States. North Korea refused to allow the IAEA to carry out the special inspections, which the board had approved, leading to a report to the U.N. Security Council on North Korean noncompliance.

Against this backdrop, it's not surprising that the IAEA director general stated in the case of the raid against Syria, "If countries have information that the country is working on a nuclear-related program, they should come to us. We have the authority to go out and investigate." As noted, satellite photos appear to show a building similar to North Korea's 5-megawatt nuclear reactor at Yongbyon.<sup>6</sup> But those photographs are subject to interpretation, and others who have examined the images consider them inconsistent with the allegations. In any event, it's highly unlikely that the IAEA would have invoked special inspections on the basis of media reports, allegations, and a quickly razed site (on which new, and likely non-nuclear, construction is now underway)--not simply because its credibility could be damaged if nothing were discovered, but because of the IAEA's sensitivity to antagonizing some member states by dispatching or seeking to dispatch inspectors on the basis of what remain allegations by others.<sup>7</sup>

More to the point, under the safeguards agreement, any disagreement concerning the need for additional access between the IAEA and the state entitles the state in question (in this case, Syria) to request that the board consider it.<sup>8</sup> The board's member states, wary of inspections of the kind indicated above (and many of them historically touchy about the use of outside intelligence by the secretariat), tend to stay conservative on such matters in the best of times, let alone at a time when political sensitivities, such as those that currently exist over the question of Iran's nuclear program, are high.

Moreover, while the board reaffirmed the IAEA's right to conduct special inspections in 1992, it added that such inspections should be invoked "rarely." A rejected request for special inspections would be worse for the IAEA's credibility than special inspections that had never been invoked. In addition, the memories of Israel's 1981 raid on Iraq's nearly completed Osirak reactor and more importantly, its aftermath, shouldn't be overlooked as a factor in the IAEA's somewhat diffident response to recent events.

As opposed to its 2007 raid on Syria, Israel conducted a public campaign to explain why it bombed Osirak. The day after the attack, it presented a letter to the president of the U.N. Security Council, outlining its reasoning--namely, Iraq intended to use its NPT membership as a cover to develop nuclear weapons and that IAEA safeguards weren't adequate to detect such activity. Within months, the Israeli government released a publication that further detailed its thinking.<sup>9</sup> Outside of Israel, an emergency meeting of the Arab League Council was convened in Baghdad, which concluded with a resolution calling upon the United Nations to impose sanctions on Israel. Unlike the 2007 conference, in which the raid on Syria went unmentioned, the 1981 IAEA General Conference became a forum for member states to express their anger with Israel and ended with a successful vote for the IAEA to suspend all technical assistance to Israel and consider suspending Israel's IAEA membership rights unless it placed all its facilities under IAEA safeguards. In an address to the U.N. Security Council on the subject, then-IAEA Director General Sigvard Eklund labeled the attack on Osirak as an attack on the IAEA's safeguards system--a viewpoint Washington directly rebutted during the 1981 General Conference.<sup>10</sup>

A year later at the General Conference, a narrowly approved vote on Israel's credentials took place. In response, the United States, Britain, and several other Western delegations walked out with the U.S. delegation head stating, "This pattern of abusing the U.N. system to carry on political vendettas is corrosively dangerous."<sup>11</sup> Washington then suspended its IAEA membership for five months--a suspension that entailed a freeze on U.S. funding to the IAEA. Two months after the U.S. walkout, Blix, then the new IAEA director general, reportedly said that if the suspension of U.S. participation stretched into the following year, "it could cripple our operations."<sup>12</sup>

Thus, the fact that the reaction to the Syrian raid has been far more cautious isn't simply because the raid remains publicly unclear; the IAEA's reluctance to push the issue onto the board's agenda also reflects an understanding of how costly this could prove to be--both figuratively and literally. Therefore, while the IAEA has the authority to invoke special inspections in the context of the raid on Syria, the chances of it acting upon that authority are slim and will remain so in the absence of concrete evidence. Syria's decision to raze the bombed building hasn't helped matters for the IAEA in this regard.

**Conclusion.** At first glance, it may seem as if the raid on Syria provided an opportunity for the IAEA secretariat to allay concerns by invoking special inspections and, in so doing, testing the board on its

1992 proviso that such inspections were to be rarely used. But in the wake of the international community's silence, the allegations of a partially constructed nuclear facility in Syria remain confined to media reports, which often quote unnamed sources. And the lack of concrete evidence to bring before the board increases the likelihood that such a move would backfire, resulting in the board rejecting the request for inspections and, like the Osirak case, raising the inevitable ire of some member states and increasing the politicization in the board. Therefore, Israel's raid on Syria doesn't represent the best opportunity to test the board on what the 1992 reaffirmation of the IAEA's right to conduct special inspections means in practice.

However, it does raise the question of the IAEA's practical authority in this regard. As of January 22, only 86 states have an Additional Protocol to their NPT safeguards agreement in force. The Additional Protocol, which greatly expands the IAEA's rights of access to information and locations in a state, allows the IAEA to provide credible assurance that there aren't undeclared nuclear materials or activities in a state, and not simply regarding the non-diversion of declared nuclear material. Clearly, special inspections wouldn't be viable, practical, or a politically feasible quasi-substitution for the tools and access granted under the Additional Protocol, particularly since the Board of Governors still formally considers the Additional Protocol a voluntary undertaking.

But without an Additional Protocol, as its director general likes to point out, the IAEA cannot provide credible assurance about undeclared nuclear material or activities within a state. Moreover, although required under the NPT, 30 states (also as of January 22) haven't brought even the basic safeguards agreement into force. As international concerns regarding nuclear black markets and other clandestine nuclear activities increase, and until the Additional Protocol is universal and mandatory--a controversial subject itself--it may be that questions similar to those currently being asked about Syria will arise--whether or not in the wake of some kind preemptive military action. While the vagueness of the allegations about Syria don't provide the best foundation upon which to do so, at some point, the IAEA and some of its member states may eventually need to be prepared to push its board on the interpretation of the IAEA's right to conduct special inspections. The raid on Syria provides them with an opportunity to start thinking carefully about this now.

<sup>1</sup> The text of INFCIRC/153 (corrected) provides the basis for negotiating safeguards agreements between the International Atomic Energy Agency (IAEA) and non-nuclear weapons states parties to the Nuclear Non-Proliferation Treaty (NPT); "The Structure and Content of Agreements Between the Agency and States Required in Connection with the Treaty on the Nonproliferation of Nuclear Weapons," INFCIRC/153 (corrected), Vienna, 1972.

<sup>2</sup> Subsidiary arrangements to safeguards agreements are the "document containing the technical and administrative procedures for specifying how the provisions laid down in a safeguards agreement are to be applied." IAEA Safeguards Glossary, 2001 Edition, Section 1.26, IAEA, 2001, pp. 8-9.

<sup>3</sup> The specifics of safeguards agreements and subsidiary arrangements concluded between the IAEA and the Syria aren't public. However, Syria's comprehensive safeguards agreement is understood to incorporate the revisions called for by the Board to Code 3.1 of its subsidiary arrangements (i.e., the early provision of design information). See also David Albright, Paul Brannan, and Jacqueline Shire, "Syria Update: Suspected Reactor Site Dismantled," (PDF) Institute for Science and International Security (ISIS), October 25, 2007. Syria hasn't concluded an Additional Protocol to its safeguards agreement, which would have allowed the IAEA wider access. Like other states of the region, it has traditionally linked the conclusion of an Additional Protocol with Israel's accession to the NPT and the establishment of a Mideast nuclear-weapon-free zone.

<sup>4</sup> Special reports are made if any unusual incident or circumstances lead the state to believe that there is or may have been a loss of nuclear material in excess of specified limits or if changed circumstances have made the unauthorized removal of nuclear material possible; See INFCIRC/153 (corr.), Part II, paragraph 73(b).

<sup>5</sup> Ibid., Part I, paragraph 2.

## **A New Middle East, After All**

By Reuel Marc Gerecht

Posted: Monday, February 11, 2008

*[EXCERPT]*

America's retreat from democratic Lebanon has been somewhat counterbalanced by Israel's bombing raid against the suspected nuclear site near Dayr az-Zawr, in Syria, which surprised and silenced both Damascus and its key backer, Tehran. But even here, the reaction in Washington is distressing. The Israelis exercised preemption, and the Bush administration--which has made preventive war an official part of America's post-9/11 doctrine--remained silent. The administration seems little inclined to dispute Israeli intelligence, but even if it thought the Israelis were wrong about North Korean involvement in this suspected nuclear site, the signal from the raid is exactly the one the president and the vice president were trying to send the Iranians about their nuclear facilities if they didn't stop uranium enrichment. It's hard to imagine a more helpful event for European and American Iran diplomacy, with its good-cop, bad-cop approach, yet Washington let it fall flat. It appears the administration went easy on Damascus partly for the illusory promise of Syrian participation in the Israeli-Palestinian peace process--which shows how far it has reverted to a pre-9/11 understanding of the Middle East.

## **Hardliners Target Détente with North Korea**

Suzy Kim and John Feffer

February 11, 2008

Editor: Emily Schwartz Greco

The Bush administration's approach to North Korea was once quite consistent with its overall foreign policy. There was name-calling, a preference for regime change, and an emphasis on military solutions. Not surprisingly, then, the relationship between the United States and North Korea, like so many other tense stand-offs, deteriorated over the last seven years. The United States accused the third member of the "axis of evil" of money-laundering, missile sales, and a secret program for the production of nuclear material. For its part, North Korea responded tit for tat at the rhetorical level. And, in October 2006, it upped the ante by exploding a nuclear device. If the United States were not tied up in other military conflicts, and eyeing Iran to boot, a war in Northeast Asia might have been higher on the administration's to-do list.

But all of that appeared to change in 2007. Chastened by military failures in Iraq and Afghanistan, anxious about the vulnerability of the Republican party on foreign policy issues in 2008, and accused of having allowed North Korea to "go nuclear" on its watch, the Bush administration reversed its hard-line policy. Washington agreed to negotiate seriously with Pyongyang, provide it with incentives on the road to denuclearization rather than only at the end of the process, and meet face to face when necessary.

The results of this turnabout were dramatic. The February 13, 2007 agreement in the Six Party Talks – among the United States, the two Koreas, Japan, China, and Russia – not only illuminated a path toward a denuclearized Korean peninsula. It also outlined steps toward the normalization of political relations with Pyongyang, a replacement of the Korean War armistice with a peace treaty, and the building of a regional peace structure for Northeast Asia.

Many conservatives were aghast that the Bush administration, after six years of ABC (Anything But Clinton), was essentially exhuming the Clinton administration's engagement policies toward North Korea. From their perspective, the Six Party Talks were only supposed to be a holding pattern until the regime in Pyongyang finally collapsed through a combination of outside pressure and internal weakness. When the Six Party Talks instead produced a breakthrough agreement, former U.S. ambassador to the United Nations John Bolton denied any achievement and declared, "I think the six-party talks failed." He then recycled his earlier position: "I think the only solution is the enhanced isolation of North Korea, ultimately bringing the regime down and peacefully reuniting the peninsula."

So far in 2008, progress toward implementing last year's February 13 agreement has slowed. North Korea has begun shutting down its Yongbyon plutonium facilities and readmitted inspectors, and the United States has sent about 50,000 tons of heavy fuel oil and 5,000 tons of steel products for its power plants. Nevertheless, disagreements remain. North Korea missed the first deadline for delivering a complete declaration of its nuclear program, and a second one looms at the end of February. Meanwhile, the United States has yet to remove the country from the list of state sponsors of terrorism. Even if these hurdles are cleared, several more remain. It is not yet clear whether North Korea will

entirely give up its nuclear deterrent or whether the United States will remove all economic sanctions and extend diplomatic recognition.

The fragile *détente* between North Korea and the United States might succumb to its internal challenges. But hard-line opponents don't want to leave it to chance, and so are marshalling their arguments to strangle this hopeful development in its cradle.

Criticisms of engagement policy fall into several categories. Some critics, like Bolton, continue to hold onto the old Bush strategy of isolation and regime change because, they argue, North Korea cannot be trusted to abide by any agreement. Other critics focus on North Korea's nuclear program itself, both its internal characteristics and purported external cooperation with countries such as Syria. A third set of criticisms focuses on the February 13 agreement itself and identify flaws, ambiguities, and blind spots, particularly around the question of verification. Another group focuses instead on North Korea's human rights record. And finally there are conservative critics in Japan and South Korea who are attempting to undermine *détente* from the sidelines.

In short, the negotiators trying to implement the agreements reached in the Six Party Talks face a host of internal and external challenges. The hard-line criticisms can be addressed. But it's not certain whether engagement supporters in Washington or in Pyongyang have sufficient political capital to push the process forward in 2008.

## **The Nuclear Challenge**

North Korea's nuclear program has long been a mystery. It's never been clear how much fissionable material the country has produced. Although the country froze its plutonium facilities as part of the 1994 Agreed Framework, it is unclear how much time and resources it devoted to pursuing a second path to a bomb, namely highly enriched uranium (HEU). Even the October 2006 nuclear test remains a puzzle. Some experts have declared it a failure, while others speculate that North Korea succeeded with a low-yield experiment.

For a small and relatively weak country, mystery can be very useful, and North Korea has been reluctant to disarm itself of such a weapon. The current conflict over the country's declaration of the full extent of its nuclear program is a case in point. North Korea claims that it already provided full information in November, in advance of the December 31 deadline. But the United States is not satisfied with the amount of plutonium that North Korea has declared or with the government's contention that it never set up a HEU program.

These points are negotiable. The amount of plutonium that North Korea has reportedly declared – 30 kilograms – is at the low end of U.S. estimates, so this is well within negotiable range. Getting agreement on the amount of reprocessed plutonium in North Korea's hands involves some massaging of the numbers, which is what happened in 1994 as well. The HEU program, meanwhile, is more a matter of saving face than dismantling a viable program. The Bush administration wants to demonstrate that its 2002 accusations, which derailed the 1994 Agreed Framework, had some merit. North Korea, however, wants to demonstrate that it did not violate the spirit of that agreement. Both sides have moved closer to agreement. The U.S. government has already admitted that its initial estimates were exaggerated. And experts suggest that evidence of uranium residue in aluminum tubes that North Korea provided to investigators, which would suggest actual enrichment, is the result of contamination from

Pakistani material. Christopher Hill has all but admitted that North Korea didn't use these tubes for uranium enrichment.

## **Syria Connection**

What might not be negotiable, however, is the Syria connection, which hardliners have seized on to prove that North Korea remains an incorrigibly rogue power.

In early September, the U.S. media reported on Israeli military strikes against Syria that destroyed what might have been a nuclear facility. Some reports suggested that the facility had been built with North Korean assistance and that North Korean engineers had even died in the bombing. If the media reports were correct, North Korea had crossed the critical red line established by the Bush administration (after Pyongyang crossed the earlier red line when it tested a nuclear weapon). And yet, the Bush administration didn't raise a fuss at all. It instead allowed the State Department to go about its business. With hardliners like Bolton and the State Department's senior arms control and security official Robert Joseph no longer on the inside, the State Department has had more maneuvering room to pursue an engagement policy.

But congressional opponents of engagement certainly raised a fuss about the purported Syria connection. "We regret that the administration has ignored numerous letters from Congress asking that all members be briefed on the Israeli airstrike," wrote Peter Hoekstra (R-MI) and Ileana Ros-Lehtinen (R-FL) in *The Wall Street Journal*. "Failing to disclose the details of this incident to the legislative branch, preventing due diligence and oversight -- but talking to the press about it -- is not the way to win support for complex and difficult diplomatic efforts to combat proliferation by rogue nations." The congressional representatives cautioned the administration not to move forward on any agreements with North Korea until this matter was cleared up.

The Syria connection remains sufficiently mysterious that engagement opponents will be able to exploit it at any point when it seems that détente is moving forward. As Bolton has put it, "The idea of North Korea for years engaged in cloning Yongbyon in Syria (or anywhere else -- Burma, for instance) should be a fire bell in the night."

But the notion that any country would be interested in a clone of Yongbyon is quite farfetched. After all, North Korea's facility is itself based on a rather old English model -- the Calder Hall design -- and Syria could just as easily have skipped North Korea and gone back to the original. That is, if Syria were in fact building a nuclear plant, which is still not verified. As Seymour Hersh reports in *The New Yorker*, a former senior U.S. intelligence official with access to the current intelligence says that "We don't have any proof of a reactor -- no signals intelligence, no human intelligence, no satellite intelligence."

Bolton slips in a sly suggestion that North Korea is cloning Yongbyon elsewhere. In briefings with its Asian allies in early 2005, the United States similarly accused North Korea of providing Libya with uranium hexafluoride. But it turned out that the U.S. government had misled its allies. North Korea had provided the material to Pakistan, which already has a nuclear program, a business transaction that the United States had known about for years.

As such, there still remains no evidence that North Korea is engaged in nuclear proliferation, whether in Syria or elsewhere. North Korea is certainly short of cash, and nuclear know-how and materials are

valuable commodities. But no one knows the true marketability of North Korea's program, and certainly it would pale in comparison to what North Korea could earn from giving up its nuclear program wholesale.

## **Trust, Then Verify?**

If North Korea provides a declaration of its nuclear programs that U.S. negotiators can live with, and the United States then proceeds to remove the country from the state sponsors of terrorism list, the process moves on to the next level. At that point, North Korea is supposed to submit to a more intrusive inspection regime and begin to give over all of its nuclear material.

Opponents of engagement are readying their arguments, and they largely focus on the question of verification. The Heritage Foundation's Bruce Klingner, for instance, compares the verification protocols from the Cold War with what is being proposed in the Six Party Talks and finds them wanting.

“To verify the extent of North Korean plutonium production, inspectors must be allowed to conduct short-notice challenge inspections of suspect sites as well as to take samples of fissile material,” he writes. “North Korea's refusal in 1992–1993 to allow the International Atomic Energy Agency to access two suspect nuclear sites precipitated the first nuclear crisis. The agency has never gained access to the sites.”

In fact, during the lead-up to the first nuclear crisis in the early 1990s, North Korea allowed an initial inspection by Hans Blix of the International Atomic Energy Agency and produced a 150-page document detailing its uranium mining sites and nuclear power plants. “It turned out that the North Korean list closely matched Western estimates of the scope of its nuclear program,” writes Michael Mazarr in his study, *North Korea and the Bomb*. True, North Korea refused to allow the IAEA to visit the two suspect sites, claiming that they were conventional military facilities. But the real problem was that after allowing six IAEA inspections and providing the detailed list of its programs, North Korea hadn't gotten anything out of the deal: “no economic aid or investment, no broader political contacts with Washington or Seoul or Tokyo, not even the ability to verify that U.S. nuclear weapons had been withdrawn from the South,” Mazarr concludes.

The current demand that North Korea submit to an intrusive inspection regime as a precondition for moving forward with engagement recapitulates this earlier conflict.

Before it throws open its mostly highly secretive sites, North Korea wants some sign that its longstanding enemies – the United States, Japan, and South Korea – have changed their adversarial policies. South Korea has largely done so. But the United States has only sent over some heavy fuel and rescued a few North Korean sailors who were attacked in the Red Sea by pirates. Japan, still obsessed with the abduction issue, has shown no sign of changing tack.

The verification procedures that the Agreed Framework established are still applicable to the dismantlement of the Yongbyon facility. They worked during the 1990s, and there is no reason to doubt that they will work again. Expanding verification to short-notice inspections of all suspect sites throughout the country can only be achieved through give-and-take negotiations and the building of trust, not through fiat.

## Human Rights

If negotiators manage to settle all the outstanding disputes over the nuclear issue, other stumbling blocks loom. Perhaps the most vexing is the issue of human rights. The debate over human rights in North Korea as it intersects with policy discussions over engagement inevitably focuses on the prudence of linking human rights concerns with political issues such as nuclear negotiations and normalization of relations. Central to this debate is not whether there are human rights violations in North Korea. No doubt North Koreans endure major human rights violations. As economic migrants or political refugees who have crossed into China, North Koreans face dire living conditions. They are in danger of being discovered not only by the authorities but also by anyone wanting a reward for turning in undocumented immigrants. For those remaining in North Korea, the list of human rights concerns is long, ranging from the full spectrum of civil and political rights to social and economic rights.

The heart of the matter is: how should these rights be protected and by whom? The answer largely revolves around the issue of regime change. Some, like Bolton, argue that North Korean human rights can best be protected if the regime is toppled. Others, like the German doctor Norbert Vollertsen, go so far as to encourage large refugee outflows to foster the collapse of the regime.

But human rights organizations such as Amnesty International have been leery of linking human rights to such political agendas throughout its long history of human rights activism precisely because such strategies only serve to detract from the issue in several ways. Political agendas take the focus away from human rights and play into geopolitical power struggles. In the short term, they provoke harsher measures that directly affect the most vulnerable. In the North Korean case, this was seen in the crackdowns by Chinese authorities after high profile bids for asylum in the scaling of embassy compound walls. Such strategies foster distrust rather than cooperation. Proponents of regime change seem oblivious to the even greater potential threat to human rights in the chaotic aftermath of regime collapse. In short, most human rights organizations believe that human rights should not be used as a political tool.

A negative example of what happens when human rights are linked to political agendas is the North Korea Human Rights Act of 2004. This legislation authorizes \$24 million for each of the fiscal years between 2005 and 2008 for assistance to North Korean refugees, promoting human rights, democracy, and freedom of information inside North Korea. In addition, the bill mandated the appointment of a special envoy for human rights in North Korea, a position subsequently filled by lawyer Jay Lefkowitz.

On the surface, it seems that the legislation stands up for human rights, alleviating a major humanitarian crisis. However, it has another objective. During a speech given to the Heritage Foundation on April 19, 2007, Lefkowitz emphasized the need for increasing flows of information into and out of North Korea by smuggling in radios so that North Koreans might listen to programs like the Voice of America and Radio Free Asia. "While all of these are crimes in North Korea, and getting caught could subject the offender to extreme forms of punishment, the long-term trend has been a steady increase in the porosity of the country," he casually stated. "In the struggle for human rights in North Korea, we not only can help try to save the lives of the North Korean people, most immediately, but we can also try to help make the region and the world safer by helping to bring about a similar transformation [as in the Soviet Union]. In this way, human rights can be a means to a greater end." Lefkowitz leaves little room for doubt that this "greater end" is the collapse of the North Korean regime.

More recently on January 17, Lefkowitz seemed to consign the Six Party Talks to premature death in a speech at the American Enterprise Institute. He declared that North Korea, despite four years of nuclear disarmament talks, will likely still have its nuclear weapons when the next U.S. president takes office in 2009. He accused Pyongyang of not being “serious about disarming in a timely manner,” pronouncing that “North Korea has not kept its word.” Revealing the longstanding split within the administration on how to deal with North Korea, his statement was hurriedly taken off from the State Department’s website, and its author quickly put in line by Secretary of State Condoleezza Rice. “[Lefkowitz] doesn’t know what’s going on in the six-party talks, and he certainly has no say on what American policy will be in the six-party talks,” she said sternly. “I know where the president stands, and I know where I stand, and those are the people who speak for American policy.”

Lefkowitz deliberately overstepped his bounds to undermine the nuclear talks by linking them to human rights. “Security issues and human rights issues are linked inextricably,” he has said. “They both derive from the nature of the regime, and any long-term effort by the international community to alleviate security concerns in northeast Asia will have to seek to modify the nature of the [North Korean] regime.” Although his job is to press for human rights, Lefkowitz views his role through the prism of national security and regime change. His apparent misunderstanding of his own job presents one of the strongest cases against linking human rights with political agendas.

## **Japan**

Opposition to détente with North Korea isn’t confined to the United States. In both South Korea and Japan, hard-line conservatives have adopted many of the arguments concerning North Korea’s weapons program, verification procedures, and human rights. But they also have other agendas.

The outrage in Japan over North Korea’s admission that its agents had been responsible for kidnapping 13 Japanese citizens during the 1970s and early 1980s hardened into a conservative movement in Japan that opposes engagement with North Korea. North Korea returned five of the 13 abductees to Japan soon after the announcement and pronounced the rest dead. However, conservatives in Japan insist that no progress can be made in normalizing relations between the two countries until the return of the remaining eight along with an unknown number of others, claiming that they are still alive. The confusion over the status of the eight abductees revolves around DNA tests performed on the alleged remains, which came back as those of unrelated people.

However, in February 2005, a world-renowned scientific journal, *Nature*, concluded that such analyses of cremated specimens are highly inconclusive and easily contaminated by those coming into contact with them. More to the point for Koreans of both the North and South, however, is that the issue of abduction cannot bypass the history of hundreds of thousands of Koreans forcibly conscripted by Japan during its colonization of Korea to serve Japan’s imperial interests as forced laborers, soldiers, and most notoriously as “comfort women,” many of whom were abducted. Japan’s call for justice for Japanese abductees rings hollow next to its stubborn resistance in dealing with its own past.

## **South Korea**

Although Lee Myung-bak, South Korea’s new president-elect, asserts continuity with previous policies, he’s also quick to point out his pragmatic approach toward North Korea. His foreign policy, dubbed the “MB Doctrine,” focuses on a for-profit version of engagement that promises bold economic support to

help increase North Korea's per-capita income to \$3,000 within 10 years if it abandons its nuclear weapons program. Tapping into frustrations expressed by many South Koreans at what appears to be stalled progress in North Korea's opening, Lee has pledged to "move away from the unilateral policy of appeasement that has been implemented without principle and embrace a strategy of reciprocity as a means to induce North Korea's genuine opening."

Of course, the quid pro quo is the complete dismantlement of North Korea's nuclear program. One sign of Lee's more hard-line approach is his plan to eliminate the Unification Ministry, which has been the locus of South Korea's engagement policy during the last decade.

On the other hand, capitalizing on his victory at the polls, Lee has come out more strongly than outgoing President Roh Moo-hyun in agreeing to unconditional meetings with North Korean leader, Kim Jong-il. "If a summit between the leaders of South and North Korea will help persuade the North to give up its nuclear programs and benefit both the South and North, I can do it anytime," Lee has said.

As a former chief executive at the Hyundai conglomerate, Lee has pledged to run his administration more like a business. With an eye to investing in China and the former Communist bloc, Lee may be hedging his bet that economic incentives will be the key to enticing North Korea out of its hermit status. On January 17, Lee confidently announced that his administration will "exert all-out efforts to promote dialogue and exchanges with North Korea. If the North abandons its nuclear program, the South will take the initiative in raising an international cooperation fund amounting to about \$40 billion and provide a comprehensive aid package to upgrade five sectors in the North—the economy, finance, education, the infrastructure and living conditions."

There are similarities among hard-liners in the United States, Japan, and South Korea. They all see human rights as the thin edge of the wedge to open up North Korea and transform, if not eliminate, the regime. They are skeptical that North Korea intends to denuclearize or abide by any international agreements. They are critical of engagement policies for being asymmetrical. Nevertheless, South Korean hardliners are different because, unlike their counterparts in other countries, they must continue to live on the Korean peninsula with North Korea. As such, they generally recognize that the alternative to engagement is economic stagnation at best and at worst the outbreak of hostilities devastating the lives of millions – all of which will have direct impact on the lives of South Koreans. Whatever his pedigree as a conservative, Lee Myung-bak understands that there is no viable alternative to engagement.

In 2006, People's Solidarity for Participatory Democracy (PSPD), one of South Korea's largest NGOs, issued a statement on behalf of a coalition of human rights organizations in the country. PSPD criticized the politicization of the North Korean human rights issue within the UN, calling for mutual cooperation rather than the imposition of political pressures. Most importantly, it emphasized the need to establish peace on the Korean peninsula by resolving the relationship between the U.S. and North Korea as a precondition to improving the human rights situation in North Korea. "In approaching the human rights issue in the DPRK," the statement reads, "the right to peaceful survival on the Korean peninsula is essential to the promotion of all other rights." Engagement is a prerequisite for peace and human rights.

## Pushing Engagement Forward

Over the last year, hard-line opponents to engagement with North Korea have largely been quiet. Special Envoy Lefkowitz has made a couple of speeches, but he has been slapped down by, of all people, Rice. John Bolton and other former administration officials have done what they can from outside the tent, but the louder they criticize the Six Party Talks, the more they underscore their own lack of influence. The hard-line Japanese politician Shinzo Abe, who made his reputation on the abductee issue, has been replaced by Prime Minister Yasuo Fukuda, who is much less willing to use the abductee issue to win support at home. President-elect Lee Myung-Bak in South Korea, his conservative bona fides notwithstanding, embraces some kind of engagement policy with the North.

The ineffectuality of the hard-line faction, however, might have less to do with a lack of political influence than a perceived lack of need. The hardliners have not strenuously exerted themselves to bring down the Six Party Talks perhaps because they believe that if they wait long enough the negotiations will, like North Korea itself, eventually collapse from within. Although the State Department is committed to reaching agreement with North Korea – and rebutting its critics on the right – it is also peculiarly blind to its own intransigencies. Although North Korea meets all the requirements for removal from the state sponsors of terrorism list, by the State Department's own criteria, the administration refuses to take this first step – even though it is a revocable decision compared to North Korea's full declaration of its nuclear programs. The State Department continues to hold firm on its HEU allegations, even though the only tangible proof rests with Pakistan – the claims of President Pervez Musharraf and the proliferation czar A. Q. Khan. The Bush administration has been unable or unwilling to extract documentary proof from its putative ally. With the State Department so ambivalent in its commitments, hardliners don't need to expend their own political capital to wreck engagement.

The State Department also faces the difficult legacy of the Bush administration's overall foreign policy. In the last seven years, U.S. foreign policy throughout much of the world has failed to garner the trust necessary to enable negotiations with North Korea to proceed in good faith. What Washington needs is a step-by-step process of building trust. Otherwise, American diplomacy will ring hollow. Engagement is a prerequisite for fruitful progress not only on human rights, but much more.

What's at stake is an end to more than half a century of hostilities in U.S.-North Korea relations, 20 million North Korean lives, and a peaceful and prosperous East Asia. The United States has to commit to the long haul. It's time to give engaged diplomacy a chance.

## Six Parties, Zero Progress

By Dan Blumenthal

Posted: Tuesday, February 19, 2008

### ARTICLES

The Weekly Standard

Publication Date: February 25, 2008

The State Department is engaged in heavy-duty spin to keep alive the clearly failing Six Party Talks on North Korean disarmament. But no amount of spin can hide the fact that whoever becomes president in 2009 will face a North Korean problem worse than that which Bill Clinton bequeathed to George W. Bush.

Last week, before the Senate Foreign Relations Committee, Christopher Hill, State's top Asia diplomat, had to explain away the fact that Pyongyang has missed its deadline for fully declaring all of its nuclear weapons programs. Even more difficult was fudging the very open question of continuing North Korean proliferation.

Just the day before, Director of National Intelligence Mike McConnell testified that the intelligence community has "moderate confidence"--intelligence speak for "we have evidence"--that North Korea has an ongoing uranium enrichment program. McConnell further assessed that Pyongyang has produced enough plutonium for up to half a dozen nuclear weapons, and has the ballistic missile capability to hit the continental United States with those weapons. In short, notwithstanding State Department spin, North Korea has nuclear weapons and the ability to use them against the United States and her allies. There is little prospect that current U.S. policy will change North Korea's nuclear status.

Then there is the subject of proliferation. U.N. Security Council resolutions, Six Party Talk agreements, and U.S. warnings are supposed to prevent Pyongyang from proliferating any weapons of mass destruction or ballistic missile technology. But it seems pretty clear that when Israel struck a site in Syria in September 2007, it was because North Korea was helping ramp up a Syrian WMD program of some sort. All Hill had to say to Congress on this matter was that the State Department takes the issue of North Korean proliferation seriously--diplomatic talk meaning we're not planning to do anything about it.

The real state of play, then, is that North Korea will not fully declare, much less disable or dismantle, its nuclear weapons programs, and it has continued to proliferate. To mask this noncompliance, the State Department will talk optimistically of the next phases of diplomacy, continuing to provide North Korea with heavy fuel oil, removing it from the list of state sponsors of terror, even negotiating a peace treaty and full normalization. In short, no amount of evidence of North Korea's bad intentions will deter the Bush administration from declaring diplomatic victory.

This policy collapse on North Korea has happened at a rapid clip. It was just a year and a half ago that Bush told an audience in Singapore that we would "hold North Korea fully accountable for the consequences of such actions" if it shared WMD technology. If Pyongyang was not helping Syria with a WMD program, then the administration should say so forthrightly to help save its faltering policy.

After North Korea's ballistic missile and nuclear tests in 2006, the administration got tough, with two strong U.N. resolutions and financial sanctions that hurt Kim and his cronies directly. President Bush then decided to give the regime he loathes one last chance to come clean, after decades of lying and cheating. Assistant Secretary Hill got it exactly backwards when he told senators on February 6 that "we" have much work to do in getting

Pyongyang to rid itself of its nuclear programs. The burden is on Pyongyang to come clean. "We," meaning Washington (plus Tokyo, Seoul, Beijing, and Moscow), must verify that they have done so and punish them if they have not.

Besides creating a more dangerous Korean peninsula, the Six Party process has caused a breach with our most important ally, Japan, which wanted to take a tougher line. What's more, China is making its own plans and arrangements to deal with an unstable and nuclear North Korea. Beijing, too, has little faith in the talks and has drawn up military plans to intervene in North Korea to protect its own interests. All parties are concerned about China's intentions, which they are keeping to themselves. If North Korea does collapse, American, Japanese, and South Korean war planners will have to consider the possibility of dealing with a unilateral Chinese intervention. China's trade with the North tripled between 2000 and 2005--with an eye toward gaining more influence over the future disposition of the peninsula.

The Six Party Talks, supposedly a model of multilateral diplomacy, have thus caused each party to act more unilaterally. Washington is essentially conducting its own negotiations with Pyongyang. Japan, a little less confident of U.S. protection, is showing a keener interest in having its own military capabilities to defend against North Korean missiles. And China is taking military and economic measures of its own to live with or perhaps even control an unstable, nuclear regime on its borders. The situation is, in short, more precarious than when this new round of diplomacy began.

President Bush, who has shown a remarkable steadfastness on Iraq, keen not to bequeath a Middle East disaster to his successor, still has an opportunity to change course in Korea. South Korea's new president, Lee Myung-bak, seems willing to be less conciliatory to Kim Jong Il and repair relations with Japan and Washington. South Korea has little interest in seeing a Chinese satellite state to its north. But Lee is getting mixed messages from Washington. He can't take a tougher line if Washington sticks to its "agreement at any price" course.

Rather than tying the hands of the next president, President Bush could start taking a more realistic approach to North Korea. First, Washington can halt its economic largesse until North Korea makes a full, and verifiable, declaration of its nuclear programs. Any talk of de-listing North Korea as a terrorist state or of normalizing relations is inappropriate given North Korea's continued bad behavior. **Second, the Bush administration should tell the truth about North Korea's proliferation. If Pyongyang proliferated, it is time to once again sanction, squeeze, isolate, and perhaps even quarantine it.** Third, the administration should focus its time and energy on building a common approach with South Korea and Japan. Washington shares with its democratic allies an interest in a democratic, unified peninsula. All three parties should ramp up efforts to take in the refugees still pouring out of North Korea.

The prospect of real change in North Korea under Kim is next to zero. All three countries should thus reestablish a strong deterrent posture that will be necessary as they work toward the only real, albeit long term, solution: a unified Korea free of Kim Jong Il and his ilk.

## **A Little Nuke Music**

February 28, 2008

The New York Philharmonic's concert in Pyongyang was a tantalizing taste of what might be in America's relationship with North Korea. It was also a reminder of the missteps and dangerously wrongheaded judgments that have kept the two countries apart and at saber-point for more than a half century.

The Philharmonic drew sustained applause and even some tears, playing Gershwin, a beloved Korean folk song and the two countries' national anthems. The concert would have had even more significance if it could have celebrated continuing progress toward shuttering North Korea's nuclear weapons program.

That effort unfortunately has stalled, and the fault — at least this time — is undeniably Pyongyang's. It would take a serious diplomatic push by the Bush administration and the leaders of China, Russia, Japan and South Korea to ensure that it does not fall apart.

North Korea agreed last year to disable its Yongbyon nuclear reactor and produce a "complete and correct" accounting of all its nuclear activities, facilities and weapons-usable material by the end of last year. In exchange, it was to get 950,000 tons of heavy fuel oil and start down the road toward normalizing diplomatic and economic relations with the United States and others.

While North Korea is disabling the reactor, it has not turned over the promised list. That has revived serious doubts about whether it would ever abandon a program that has already tested a nuclear device and produced fuel for 10 or more weapons. Russia's delay in delivering some of the promised fuel oil may be a factor, but there are more serious disputes as well.

North Korea has said it would produce the accounting, but first it wants Washington to remove it from the list of state sponsors of terrorism and lift certain sanctions. Washington says the sequencing can be worked out if Pyongyang is prepared for full disclosure.

The Bush administration has a long history of using any excuse to scuttle any diplomatic deal, but in this case it is right. Pyongyang clearly agreed to full disclosure and the deadline. Since then serious questions have also arisen about Pyongyang's nuclear cooperation with Syria. That must also be disclosed.

President Bush wasted years refusing to deal with North Korea, and that expanded stockpile of weapons-grade plutonium is the result. Having belatedly embraced diplomacy, the president deserves credit for not overreacting — for continuing negotiations and fuel deliveries — despite fierce criticism from members of his party, including former members of his administration.

The United States and its partners should continue to explore creative solutions to the impasse and stand ready to lift sanctions and quickly take North Korea off the terrorism list if it fulfills its obligations. China, North Korea's chief benefactor (and frequent enabler), must press Pyongyang to

keep its commitments. Plans by South Korea's new president to link economic integration to nuclear progress could be important leverage.

If the stalemate drags on, the United States and its partners may have to get tougher and implement United Nations sanctions that they are now choosing to ignore. North Korea needs to know that the international community has patience — but that such patience has limits.

<http://media.www.jhunewsletter.com/media/storage/paper932/news/2008/02/28/NewsFeatures/Bolton.Condemns.Handling.Of.Nuclear.Proliferation.Issue-3243071.shtml>

## **Bolton condemns handling of nuclear proliferation issue**

By: Kate Kelberg

Posted: 2/28/08

John Bolton, former United States ambassador to the United Nations, addressed a very small audience in Shriver Hall yesterday.

Bolton, a Baltimore native, spoke on the effects of nuclear proliferation on national security and safety around the world. His speech was part of this spring's Foreign Affairs Symposium.

Bolton began his speech immediately condemning the Bush administration's handling of the proliferation issue. North Korea, which he called "a fundamentally criminal regime" is particularly dangerous as a nuclear regime because it "would sell anything to anyone ... I believe if Al-Qaeda came up with the money to pay for [a nuclear ballistic weapon] they would sell it to them."

North Korea, aware of the fear this possibility inspires in western powers, has exploited their position of power since the late '90s, continually promising to cease nuclear programs in exchange for economic and political gains, and then never following through on their commitments.

This has set up a pattern in which "first [North Korea] negotiates, then it renegotiates to get what it wants. The trouble is that North Korea is lying about its programming [and getting away with it] because its negotiating partners are so eager to keep negotiations alive," Bolton said.

"Any other country in the world would have long ago been shut down" for the threat North Korea poses to international safety, Bolton said.

Bolton blamed the problem on "lazy journalists" who reported that North Korea is conceding when all evidence suggests otherwise.

**Bolton discussed the recent Israeli discovery of a North Korean nuclear facility in the Syrian desert.**

**Although little has been released publicly about the discovery, Bolton found reason to believe Syria and North Korea were working together to build this factory.**

**Syria has remained silent on the issue.**

**"Syria knows how to fill a security council chamber with agitated people," Bolton said, adding that for some reason they didn't.**

**Bolton suggested the only explanation for their silence is that they were working with the North.**

That silence of other countries in the region also suggests that the Sunni-Arab region is becoming a satellite of an Iranian nuclear revolution, Bolton warned.

Yet world powers continue to disregard the threat, Bolton believes this Iranian nuclear revolution deserves. He angrily referred to the 2007 National Intelligence Estimates, the United States' authoritative assessments of national security. The 2007 NIE misrepresented the information American Intelligence had gathered.

"It was written in a very politicized way and had an intended policy outcome," he said.

In terms of substance the report was not very different from previous NIEs. There was one key difference however - the first sentence of the document stated, "In 2003, Iran halted its nuclear weapons program."

This sentence, Bolton argued, was the only thing that got any attention from the press, however the foot note explaining the incredibly narrow definition of "nuclear weapons program" did not.

Bolton found it irrational to disbelieve that Iran is actively pursuing nuclear proliferation. In the past, the Iranian government has claimed they are only experimenting with nuclear materials for benign purposes.

Iranian leaders said they wanted nuclear power as an alternative energy source for the fear that they were running out of oil and natural gases.

Bolton cited a recent study that concluded if Iran continued to both consume and export oil and natural gases at its current rate, they would run out of these energy sources in the next 300 to 400 years - making their fear unbelievable.

"I could go on and on with examples like this. There's very little doubt Iran is producing nuclear weapons and there's very little doubt that Syria would have engaged in North Korea's [program] without Iranian support," Bolton said.

And Iran and North Korea working in tandem would be a very dangerous combination. Two things are required to build weapons of mass destruction: the technical capabilities, which North Korea possesses, and the financial resources Iran has from its oil reserves.

The two countries share "the same interest in hiding nuclear activity from international inspectors."

Bolton reiterated his desperate claim that this was a dire situation that our administration and administrations across the world were failing to address properly.

We either must immediately put a stop to this activity or, "get used to the idea of an Iran and North Korea with nuclear weapons," he said.

Bolton also warned of a "chain reaction" in the middle east should the western powers let Iran get away with building nuclear weapons.

"Each country [that develops nuclear weapons] inspires more than one country to do the same," he said. It is a very scary situation that can only be prevented by "a more robust program against proliferation."

## Is Syria a Candidate for Nuclear Proliferation?

Author: Tariq Khaitous, Postdoctoral Fellow

James Martin Center for Nonproliferation Studies  
March 2008

### Syria's Nuclear Ambitions-Cause for Concern

Over the past decade, there has been concern in the international community that Syria would develop a secret nuclear program. These concerns were heightened after allegations of a Syria-North Korea nuclear collaboration, which was followed by an Israeli air incursion in September 2007. Israeli officials allege that North Korea was secretly assisting Syria in the development of a military nuclear program.[1] Syria and North Korea both denied these reports. Syrian officials accused Israel of using the claim as a pretext for violating Syria's airspace. Syrian newspapers reported, "[The allegations] recall those false claims that the Americans and the British circulated about Iraq's nuclear programs." [2] The North Korean foreign ministry condemned the accusations as "unskillful conspiracy" and "groundless." [3]

So far, there is inadequate evidence to conclusively prove that Syria is pursuing a secret nuclear program, with or without Pyongyang's assistance. The International Atomic Energy Agency (IAEA) addressed the lack of evidence in a January 2008 interview in the newspaper Al Hayat, where IAEA Director Dr. Mohammed El Baradei stated, "So far, we have not received any information about any nuclear programs in Syria." [4]

Syria has been a member of the International Agency Energy Atomic (IAEA) since 1963. In 1969, it ratified the Nuclear Nonproliferation Treaty (NPT) as a non-nuclear state. Syria has one nuclear research reactor at Deir el-Hajjar not far from Damascus. It is a 30kW miniature neutron source reactor that was built by China in 1991 [5]. Since it became operational in 1996, the International Atomic Energy Agency (IAEA) has periodically inspected the reactor. [6] Syria has never conducted uranium enrichment activities. Since 2003, Damascus has been seeking nuclear partnerships, particularly with Russia, to acquire research reactors and desalination plants. However, no official agreement has been reached.

Even if Syria's nuclear capabilities are limited and restricted to civilian use, Syria's ability to pursue a military nuclear program remains within reach. The West considers Syria's nuclear activities a cause for significant concern, especially taking into account the fact that for some time Syria has had the expertise and capacity to develop a chemical weapons program. [7] A recent satellite image shows that Syria is undertaking new construction on the site bombed by Israel. Press reports state that the new building is similar in design to the suspected nuclear reactor that was destroyed by Israel. [8] Syrian officials denied these interpretations of the satellite image and insisted that the site is a military base. [9] When asked whether the site contained a nuclear reactor or not, Dr. El Baradei said, "The IAEA wanted to inspect the site but the Syrian brothers refused." [10]

The Syrian attitudes towards nuclear weapons and possible motivations for pursuing nuclear weapons must be understood in terms of the broader security situation in the Middle East. Due to Syria's close

ties to with Iran and North Korea, and its historically adversarial relationship with Israel, it is viewed as a potential candidate for nuclear proliferation. Its military relationships with Iran and North Korea could play a part in its decision to pursue a nuclear weapons program that would counter perceived threats from Israel and the United States.

### **Syria's Potential Motivations for Developing Nuclear Weapons**

There are several reasons why Syria would develop nuclear weapons. Its primary reason is its perception that Israel poses a military threat. The main motivation for Syria to develop nuclear weapons is the Israeli nuclear arsenal. Syria insists that Israel's nuclear program is a security threat.[11] The inability of the United Nations (UN) to force Israel to join the Nonproliferation Treaty (NPT) as a non-nuclear state only increases Syria's frustration. The Syrian government has consistently denounced Israel, as its nuclear facilities are the only ones in the region that are not under IAEA control. Syrian Chief of Staff General Hihmet Al-Siabi expressed his concerns over Israel's nuclear weapons stating, "Syria would strive to achieve strategic equality with Israel including nuclear parity." [12] Damascus, like other Arab capitals, believes that Israel's nuclear program is instigating an arms race that undermines peace and security in the region.

This adds to Syria's view of Israel as a threat that is the result of Israel's occupation of the Golan Heights since the War of 1967. This is one of the most persistent disputes between Syria and Israel. The negotiations between the two countries remain deadlocked. Syria wants Israel to withdraw completely from the Golan Heights without any conditions. At best, Israel would accept a partial withdrawal. The two parties also disagree on how to achieve the withdrawal due to a disagreement over territorial borders defined in the past.[13] Moreover, the countries diverge on how to restart the negotiations. Israel suggested beginning a new set of negotiations without pre-conditions. Syria has insisted that negotiations restart based on negotiations in 2000. These were the last Israeli-Syrian discussions and were followed by the collapse of the peace talks led by the United States. During the November 2007 Israeli-Arab summit in Annapolis, Maryland, Syria wanted to raise the issue again. It was able to pressure the participating states to put the Golan Heights on the table for negotiations. However, it did not achieve the collective support it was expecting, and it failed to re-open negotiations with Israel.

On a broader regional strategic level, Syria is also concerned over the current security environment in the Middle East. Since the invasion of Iraq by U.S. forces, Damascus has felt itself in a vulnerable position, as U.S. troops are now at Syria's doorstep, in Iraq and Turkey. Syrian officials fear that their country could be a future target of U.S. aggression, and are concerned about the regime change agenda of the United States being applied to the Assad regime. On March 1, 2003, a few days before the U.S. invasion of Iraq, President Assad expressed his concerns over the increasing U.S presence in the region. In an emergency speech addressed to the members of the Arab League, the Syrian leader said, "We are all targeted [...]. We are all in danger." [14]

Friction with the United States over Lebanon has also increased Syria's threat perceptions. Since the February 2005 assassination of former Lebanese Prime Minister Rafik Al Hariri, Syria has been under pressure from the United States to be transparent and cooperate fully with the UN investigation into the assassination. Washington is working closely with the other members of the Security Council to set up a tribunal to try the suspected killers.[15] Washington is also concerned over Syria's passive role in allowing foreign fighters to infiltrate Iraq via Syria's borders. These foreign fighters then join extremist

groups in Iraq. In addition, United States has long denounced the support that Syria provides to Hezbollah and Hamas.

Finally, there is deterioration of the relationships between Syria and Arab states in the region due to Syria's alliance with Iran, its involvement in Lebanon, and its support for Hezbollah. These factors have weakened ties between Syria and the other Sunni Arab regimes. If the major Arab states of the region, particularly Egypt and Saudi Arabia, pursue nuclear programs in order to counter a future nuclear Iran, it is possible that Syria would seek to do the same, not necessarily to support its strategic ally Iran, but to strengthen its own defense capacities in a volatile region.

### **Allegations of Nuclear Weapons Activity**

In recent years there have been numerous revelations regarding the nuclear smuggling network run by Dr. A.Q. Khan, but questions remain over the extent of his dealings with various recipient states. Press releases in 2004 reported that Khan's network might be involved in sensitive nuclear activities in Syria, Iran, Libya, and North Korea. Former United States Undersecretary of State John Bolton referred to Syria when he said that the Khan Network had "several other" customers who may want the bomb.[16] In the summer of 2004, Middle East newspapers reported that U.S. intelligence agencies had proof that the Khan network sold Syria nuclear technology and components of Pakistani centrifuges that could be used for military programs.[17] However, IAEA Director Dr. Mohamed El Baradei dismissed the allegations. He reported that there were no connections between Khan's network and Syria. Dr. El Baradei said, "No country had provided any hard evidence that would implicate Syria as a customer in the black market set up by Abdul Qadeer Khan, the father of Pakistan's atomic weapons program [...]. This is something I read in the paper. Nobody came to us with any information [about Syria]."[18]

Although Syria is party to the NPT, and has called several times for a WMD-free zone in the Middle East, it has long been cited as a potential candidate for nuclear proliferation.[19] In 1979, Syria was accused of developing a secret nuclear program for military purposes and of not being transparent with the IAEA regarding the extent of its nuclear activities. Syria denied the accusations and declared that its nuclear policy was oriented for peaceful research rather than military purposes. Nevertheless the United States and Israel have consistently expressed skepticism over such assertions by Damascus, and the two countries have opposed all sales of nuclear technology to Syria that might be used in the development of a nuclear weapons program.[20]

### **North Korean Ties**

The most recent incident surrounding Syria's suspected nuclear program was the reported Israeli air incursion into Syria in September 2007. Neither Syria nor Israel has been forthcoming about the exact nature of the incident. Some media sources claim that the target was actually a military stockpile of weapons that was supposed to be delivered to Hezbollah. Others described it as a training base for Palestinian militants. However, the report causing the most concern was that the target was a nuclear reactor that Syria was using to develop a secret nuclear program with the support of North Korea. North Korea has called the allegation "preposterous misinformation." [21] Nonetheless, Syria has had a long military relationship with North Korea, and has cooperated with it on its ballistic missile program and purchased launchers and components. Immediately after the Israeli attack, the Syrian regime attempted to mitigate rumors about its nuclear activities. It invited international journalists to observe that there was neither a military base at Deir ez-Zor nor presence of nuclear materials. Mehdi Ahmed,

director of the Deir ez Zor Center, who was guiding the tour of the journalists said, "You see, around us are farmers, corn, produce, nothing else [...]. The allegations are completely groundless, and I don't really understand where all this WMD (weapons of mass destruction) talk came from,"[22] However, no one was allowed to access the bombed site. The journalists reported that the area was a sleepy Bedouin city but no real evidence proved that the target was a nuclear reactor.

## **Israeli Concerns**

Israel realizes that Syria is not a nuclear threat for now, since its nuclear capacity is not sufficient to build a nuclear weapon. However, the goal of the air incursion was most likely related to the Iranian crisis, given Israel's deep concern over Iran's nuclear intentions. Despite the recent U.S. National Intelligence Estimate (NIE) that declared that Iran gave up its nuclear weapons program in 2003, it appears that Israel may launch a pre-emptive attack if Iran refuses to halt its nuclear program. During a parliamentary meeting on January 18, 2008, Israeli Prime Minister, Ehud Olmert said that, "Israel clearly will not reconcile itself to a nuclear Iran [...]. All options that prevent Iran from gaining nuclear capabilities are legitimate within the context of how to grapple with this matter."[23] Therefore, the attack was a message not only to Syria, but also to Iran, that if Israel could attack Syria's nuclear site, Iran's nuclear facilities could also be targeted. Israel thus wants to show other Middle Eastern states that it is able to take unilateral measures to strike any other suspicious nuclear installations in the region.[24] However, Iranian officials demonstrated that they do not consider the raid as an indicator of Israeli capacity and willingness to strike Iran. During the annual meeting of the Inter-parliamentary Union (IPU) in Geneva, Iranian Parliamentary Speaker Hadad Alel said, "The violation of the airspace of Syria by Israeli planes was not meant to be a signal for Iran, because Israel is not in a position to have the illusion of attacking Iran."[25]

At the same time IAEA Director, Dr. Mohammed El Baradei denounced the Israeli attack as undermining the Agency's global atomic work. He said, "Israel took the law into her own hands and that, neither the U.S. nor Israel provided evidence that the site was a secret nuclear installation." He regretted the Israeli action and added, "If a country has information that another country is developing a secret nuclear program, the IAEA should be contacted because we have the power to investigate the issue."[26]

The Israeli aggression was also aimed to reinforce Israel's military deterrence in the region. After the Israeli-Lebanon war of 2006, Syria and Iran welcomed the harsh resistance of Hezbollah against the Israeli army and claimed that Israel was defeated. Hezbollah had shown that its militants were able to penetrate Israeli territories when it killed eight soldiers and kidnapped two others. They also prove themselves to be a strong force when faced with the most well equipped army in the region. Iran and Syria view Israel's 2007 air strike as an attempt to restore the credibility of its conventional forces after the stalemate with Hezbollah. Syrian foreign minister Farouq Al Shara said, "The raid was aimed at boosting the morale of the Israel Defense Forces in the wake of the Second Lebanon War."[27]

Syrian news sources also voiced opinions on the goal of the raid. One newspaper, Al Asr, said "[The aim was] to frighten Syria, make it feel the sentiment of war, push it to break its alliance with Iran, stop its support to Hezbollah and the Palestinian resistance, force it to sign a 'free' peace agreement with Israel without full withdraw from the Golan Heights and to prevent the voluntary militants to cross its borders to join the resistance in Iraq."[28]

However, Israel's officials denied the comments in the press and media. They insisted that the incursion aimed to destroy a Syrian nuclear reactor that was secretly assembled with the assistance of North Korea, without giving any proof of existence of a reactor.[29]

### **The Iranian Connection**

Concerns have also been expressed in the West over any Iranian involvement in Syrian nuclear activities. According to London-based Jane's Defense Weekly, Iran and Syria "signed a strategic accord meant to protect either country from international pressure regarding their weapons programs." [30] It added that some Syrian diplomatic sources said that Syria agreed to hide Iranian weapons materials in the event that Iran was subject to military aggression or UN sanctions. Under the accord, Syria would continue to support the Lebanese Hezbollah with weapons and logistics. Iran had always provided military support to the Shiite movement. About 15,000 Iranian missiles were delivered by Syria to Hezbollah. During its war against Israel in July 2006, Hezbollah militants launched more than 3,000 rockets into Northern Israel. The intension of the accord is also to strengthen the Iranian-Syrian alliance and challenge economic sanctions that may eventually be imposed by the West. Jane's also reported that Iran would help Syria financially to resist UN sanctions imposed after the assassination of Hariri.

Furthermore, Iran also admitted to supporting the Syrian military with the technology needed to develop WMD, as well as conventional arms, training, and logistics. Iran will also help Syria develop its ballistic missiles and chemical weapons capabilities. Jane's reported that under the same accord, Iran will take the opportunity to test "advanced weapon systems in Syria during a military confrontation."

At the same time, in June 2007, the official Iranian state news agency (IRNA) reported that President Assad called Tehran to establish "better cooperation" in "the confrontation with the Zionist regime and the USA." [31] During the most recent visit of President Mahmoud Ahmadenijad to Damascus in January 2008, President Assad renewed his support for Iran's nuclear program. When asked of his opinion towards Iran's ambitions, he said, "Those countries which oppose Iran's right to gain peaceful nuclear technology have no convincing and logical reason... Clearing the region from mass destruction weapons should first start from Israel because it is the only country in the Middle East which owns nuclear weapons." [32]

With this strategic alliance that seems to have acquired a nuclear dimension, the Iranian regime appears to be including Syria in its nuclear plans to bolster Tehran's position in the Middle East. In turn, Syria would gain from Iranian nuclear expertise. This alliance will also help Iran divert international attention away from its nuclear aims and gain more time to proceed with its nuclear program. It would also put the United States in a difficult situation given the multiple fronts of violence in Iraq, Afghanistan, Lebanon, and Palestine.

### **Conclusion**

Even if Damascus is considered a potential candidate for nuclear proliferation in the Middle East, Syria's current nuclear capacity indicates that it is focusing its nuclear energy primarily on civilian research. At present Syria does not seem to have the capability for clandestine nuclear activities. It has neither the financial capacity nor the required infrastructure to develop a nuclear device. Furthermore, the Assad regime's most immediate concerns are UN investigations and Resolution 1757 of the Security Council that established a Special Tribunal to investigate the murder of former Lebanese

Prime Minister Hariri. Embarking on any sort of suspicious nuclear activities would have a major impact on non proliferation efforts in the Middle East. It would also be a great rationale for the United States to seek regime change in Syria.

Thus, calculations of the broader security environment in the Middle East are an integral part of nuclear decision-making of the leadership in Damascus. Several factors impact the direction Syria takes with respect to its nuclear ambitions. These include maintaining good relations with other major regional powers such as Egypt and Saudi Arabia. Finally, it is unclear whether Iranian-Syrian cooperation will actually extend to Iran defending Syria militarily in the event of an attack. The role of Iran's relations with Syria will continue to be a major contributing factor should Syria ever decide to pursue a nuclear weapons capability.

## **U.S. Hard-line Policy toward DPRK Slammed**

Pyongyang, **March 5 [2008]**(KCNA) -- These days the U.S. conservative hardliners are talking nonsense that the points agreed at the six-party talks have not been properly implemented due to the "delaying tactics" of the DPRK and, accordingly, the Bush administration should stick to its hard-line policy toward the DPRK, not appeasing it. They are even blustering that it is seriously "mistaken" if it calculates it can produce a better agreement with the next U.S. Administration.

Commenting on this, Rodong Sinmun today terms this a provocative move to scuttle the six-party talks and lay an obstacle in the way of settling the nuclear issue on the Korean Peninsula in a bid to deteriorate the existing hostile relations between the DPRK and the U.S. and bring the situation on the peninsula to an extreme pitch of tension.

The U.S. conservative hardliners are not seeking the negotiated settlement of the nuclear issue on the peninsula but working hard to attain their sinister aim with a strong-arm policy by shifting onto the DPRK all the responsibilities for the delayed implementation of the points agreed at the six-party talks, the commentary says, and goes on:

They are blustering that the new U.S. regime would never pardon the DPRK while talking nonsense that it is delaying the implementation of the above-said points. This is a short-sighted and foolish ruse to frighten and stifle it with pressure and blackmail.

It is preposterous and ridiculous for them to float rumor that the DPRK pins any hope on the next U.S. president. It is a very wrong way of thinking for them to regard their one-sided hard-line policy toward the DPRK as a cure-all.

They had better clearly understand that if the U.S. opts for the one-sided hard-line policy toward the DPRK, the bilateral relations will reach an extreme phase and everything go up in smoke.

The DPRK does what it should do and refrains from what it should not do no matter what others may say. The U.S. conservative hardliners are sadly mistaken if they calculate they can wrest any concession from the DPRK with a strong-arm policy.

They would be well advised to discard a foolish delusion and behave with reason in the realistic way of thinking.

## **U.S. Rivals Overseas Now Bide Their Time**

### **Thorniest Issues Will Face A New Administration; Seeking Better Deals?**

By JAY SOLOMON

March 13, 2008; Page A8

WASHINGTON -- As fall elections grow closer, many of President Bush's fiercest overseas foes appear to be adjusting their foreign-policy strategies for the next administration.

The dynamic could undercut some of the White House's most pressing foreign-policy initiatives, including campaigns to disarm North Korea and to stabilize Lebanon and the Palestinian territories.

Even American efforts to reach deals with friendly nations -- such as an agreement to share nuclear technologies with India -- risk running out of time. The fallout could leave the next president with immediate foreign-policy dilemmas, in addition to the war in Iraq.

The Republicans' presumptive candidate, Sen. John McCain, has pledged to maintain a hard line on regimes such as those in Iran and North Korea, but there is a perception internationally that his foreign-policy agenda will be much more nuanced than Mr. Bush's. Both Democratic candidates still seeking their party's nomination, Sens. Hillary Clinton and Barack Obama, have campaigned on the platform of aggressively engaging some of the world's most hostile regimes, such as Iran and Syria, in order to stabilize the Middle East.

Officials in Tehran and Damascus already have made public statements saying they are going to wait for new U.S. leadership before deciding whether to try to improve ties with Washington. "The conditions of the U.S. government are such now that it is harmful for us to resume relations," Iran Supreme Leader Ali Khamenei told Iranian students in a speech earlier this year. "We have never said that they will be cut forever."

Last month, the Bush administration successfully lobbied the United Nations Security Council to pass a new round of economic sanctions aimed at pressuring Tehran into negotiations over the future of its nuclear program. Many diplomats, say the sanctions are likely to be too weak to force Iran to the negotiating table, and few expect the White House to be able to pass a fourth round of sanctions against Iran in its remaining 10 months in office.

In Geneva today, Assistant Secretary of State Christopher Hill is scheduled to meet with North Korean negotiators to push forward a tentative denuclearization pact agreed to by Washington and Pyongyang more than a year ago. Mr. Hill's mission follows a successful trip by the New York Philharmonic to North Korea last month, which has fueled hopes of a greater willingness by the communist state to open to the West. Pyongyang has largely dismantled its Yongbyon nuclear reactor, which has been used to produce bomb-making fuel.

There remains mounting concern inside the Bush administration that North Korean leader Kim Jong Il may seek to draw out the current negotiations in a bid to extract more concessions from a future U.S.

administration. These diplomats note that Pyongyang has already missed by 10 weeks its initial deadline for declaring all its current and past nuclear activities, as called for by the agreement. And North Korea's lead negotiator, Kim Kye Gwan, didn't show up for a scheduled meeting with Mr. Hill in Beijing last month.

State Department officials express optimism that Mr. Hill can successfully press Pyongyang this week to clarify two key parts of its nuclear program: its alleged assistance to Syria and its attempts to develop highly enriched uranium. These officials say the U.S. is seeking to offer Pyongyang a face-saving alternative through which to declare its programs. But should Mr. Hill fail, they acknowledge the next administration could immediately be faced with the challenge of a North Korean leadership possibly unwilling to give up its nuclear arsenal for any price. "My fear is that the North Koreans are trying to get what they can and then delay things," said a U.S. official working on counter-proliferation issues. "They may think they can get a better deal" down the line.

In the Middle East, the Bush administration's efforts to pressure and woo Syria into helping stabilize the region also risk foundering. In November, the White House invited Damascus to a peace summit in Annapolis, Md., calculating that Syrian President Bashar Assad may assist Washington's efforts to promote deals in Lebanon and the Palestinian territories in return for U.S. support of direct dialogue between Syria and Israel over the disputed Golan Heights region. But increased instability inside Lebanon and the Palestinian territories in recent months has led many Western diplomats to conclude the overture failed.

The Bush administration has responded in recent weeks by placing sanctions on some of President Assad's closest confidants while working with Arab states to try to curtail investment into Syria. But Damascus is still expected to weather the storm while seeking direct dialogue with whichever candidate replaces Mr. Bush. "There's likely to be another year in Lebanon without a president as the Syrians continue to block a political settlement," says an Arab diplomat involved in the Syrian diplomacy.

Even Washington's much touted efforts to promote nuclear cooperation with India seem to be running out of time. More than two years ago, President Bush and Indian Prime Minister Manmohan Singh agreed to a tentative deal in which the U.S. would supply nuclear fuels and technologies to New Delhi in return for greater international oversight of India's nuclear programs. Indian communist parties, however, have subsequently sought to block ratification in India's parliament.

U.S. congressional leaders say they must begin debate on the deal's final authorization by June in order to complete the process in Washington's political calendar. But U.S. officials say there remains opposition in India and New Delhi needs to conclude agreements with the International Atomic Energy Agency on safeguards.

## OPINION

### Salvaging Our North Korea Policy

By JOHN R. BOLTON

March 17, 2008

There are signs, albeit small ones, that the Bush administration may be reaching the end of its patience with the Six-Party Talks on North Korea's nuclear weapons program. These signs could prove illusory. But as it nears its end, the administration has a serious responsibility: It must not leave its successor with an ongoing, failed policy. At a minimum, President Bush should not bequeath to the next president only the burned-out hulk of the Six-Party Talks, and countless failed and violated North Korean commitments.

Since they were conceived in spring 2003, the Six-Party Talks have stumbled around inconclusively. And for the last 13 months, Pyongyang has ignored, stalled, renegotiated and violated the Feb. 13, 2007 agreement.

Throughout all this "negotiation," which has mostly consisted of our government negotiating with itself, North Korea has benefited enormously. It's been spared the truly punishing sanctions that concerted international effort might have produced. In large part because of the appeasement policies of the two previous South Korean governments, Pyongyang has not felt the full impact of the Proliferation Security Initiative (PSI) on its outward proliferation efforts. The U.S. has muzzled its criticism of North Korea's atrocious oppression of its own citizens. And, perhaps most humiliatingly of all, the U.S., in a vain effort at chasing the mirage, gave up its most effective pressure point -- the financial squeeze -- allowing Pyongyang renewed access to international markets through institutions like Banco Delta Asia.

In fact, the protracted Six-Party Talks have provided Kim Jong-il with the most precious resource of all: the time to enhance, conceal and even disperse his nuclear weapons programs. Time is nearly always on the side of the would-be proliferator, and so it has proven here. In exchange for five years of grace to North Korea, the U.S. has received precious little in return.

Pyongyang is now stonewalling yet again on its promise to disclose fully the details of its nuclear programs, including its uranium enrichment efforts and its outward proliferation. The successful Israeli military strike against a Syrian-North Korean facility on the Euphrates River last September highlighted the gravity of the regime's unwillingness to do anything serious that might restrict its nuclear option.

President Bush should spend the next 10 months rectifying the Six-Party concessions and put North Korea back under international pressure -- efforts that would be welcomed by Japan, and South Korea's new, far more realistic President Lee Myung-bak. Here are the steps to take:

- Declare North Korea's repeated refusal to honor its commitments, especially but not exclusively concerning full disclosure of its nuclear programs, unacceptable. This is the easiest step, and the most obvious. It can happen immediately. Accept no further partial "compliance," as the State Department

continuously tries to do. **Make public what we know about the North's Syria project,** and its uranium enrichment and missile programs, so our 2008 presidential candidates can have a fully-informed debate.

- Suspend the Six-Party Talks, and reconvene talks without North Korea. Although the talks could be jettisoned altogether, continuing them without the North allows Japan, South Korea and the U.S. to begin applying real pressure to China, the one nation with the capacity to bring Pyongyang's nuclear program to a halt. China has feared to apply such pressure, worried that it could collapse Kim Jong-il's regime altogether -- an accurate assessment of the regime's limited staying power. Nonetheless, the effect of Chinese reticence has been to preserve Kim and his nuclear program. It is vital that China know this policy is no longer viable.

- Strengthen international pressure on North Korea's nuclear and missile programs. Ramp up PSI cooperation with South Korea. Remind Russia of its own voluntarily-assumed obligations as a PSI core member. Remind China as well to comply with the sanctions imposed on North Korea by U.N. Security Council Resolutions 1695 and 1718 (which followed the North's 2006 ballistic missile and nuclear tests), and honor its other counterproliferation obligations. Tell them we will be watching with particular care, and that Chinese failure to increase pressure on North Korea will have implications in Sino-American bilateral relations. We can make this point privately to China rather than trumpet it publicly, but it should be made without ambiguity.

- Squeeze North Korea economically. Return the regime to limbo outside the international financial system, and step up action against its other illicit activities, such as trafficking in illicit narcotics and counterfeiting U.S. money. These and other "defensive measures" are nothing more than what any self-respecting nation does to protect itself, and the U.S. should never have eased up on them. Even now they can have a measurable impact on Kim Jong-il's weak and unsteady regime.

- Prepare contingency plans for humanitarian relief in the event of increased North Korean refugee flows or a regime collapse. Both China and South Korea have legitimate concerns about the burdens they would face if the North collapsed, or if increased internal economic deprivation spread instability. America and Japan should make it plain that they will fully shoulder their share of providing humanitarian supplies and assistance if either happened. Moreover, President Lee should increase pressure on Pyongyang -- by reiterating that South Korea will fully comply with its own constitution and grant full citizenship to any refugees from the North, however they make their way to the South.

Doubtless there are other steps. President Bush will not likely be able to solve the threat posed by North Korea's nuclear weapons program. Nonetheless, he still has time to implement policies that will allow him to leave office with the nation back on offense -- thereby affording his successor the chance to vindicate a return to the original Bush administration national security strategy.

## **North Korea and Syria: The US wants to know more**

By David Ignatius

Daily Star staff

Saturday, March 22, 2008

For many months, Bush administration officials have been imagining a valedictory conclusion to their long-running negotiations with North Korea: Pyongyang would make a "complete and correct declaration" about its nuclear program, and Secretary of State Condoleezza Rice would travel to North Korea to celebrate normalization of relations with a former member of the "axis of evil."

But the North Korea breakthrough isn't happening, and administration officials know they are running out of time before Bush leaves office. The New York Philharmonic has come and gone from its February 26 concert in Pyongyang - without Rice there to add a nimble-fingered piano accompaniment, as some US officials had hoped.

An agreement remains tantalizingly close: The North Koreans are currently disabling their reactor at Yongbyon, which was a key part of the denuclearization agreement announced last October. And there are hopes that if Pyongyang will finally deliver the promised nuclear declaration, then negotiations can move to a final (and even more difficult) phase of bargaining over destruction of North Korea's handful of nuclear weapons and an estimated 30 to 40 kilograms of plutonium.

**What is blocking this breakthrough is North Korea's refusal to explain its nuclear relationship with Syria.** This remains one of the murkiest foreign-policy issues of the past year, but administration policymakers, intelligence officials and other analysts recently shed some new light on what happened.

**The mystery centers on Israel's bombing on September 6, 2007, of a facility in Syria. This was to be the site of a nuclear reactor, US officials believe.** North Korea had made a secret agreement to provide technical knowhow and some materials for the reactor, although not fissile material. The Israelis destroyed the reactor site - but neither they nor the US made any public statement about the attack.

The silence in the United States and Israel led some analysts to think that the Bush administration was afraid of blowing up the six-party talks with North Korea - by disclosing the evidence of Pyongyang's role as a proliferator. That may have been a small factor, but I'm told that the larger issue was a fear in Israel - especially, it is said, with Defense Minister Ehud Barak - that disclosure would wreck the chances for serious peace negotiations with Syria, which the Israelis were exploring through back channels.

For Israel and Syria, it appears, last September was a classic Middle East moment of talking and fighting simultaneously. Since then, hopes in Israel for a breakthrough with Syria appear to have faded.

Back to the North Korea negotiations: Christopher Hill, the US assistant secretary of state for East Asia who has deftly managed the six-party talks, began demanding an accounting of the Syria connection last fall. The North Korean response, as recently as Hill's March 13 meeting in Geneva with North Korean negotiator Kim Gye Gwan, has essentially been: "We never did it, and we won't do it again." That is, the North Koreans have promised that they have no current nuclear cooperation with Damascus

and won't have any in the future, but they won't discuss what may have happened in the past. That's not enough, Hill has insisted.

American officials have begun to confirm publicly that they have hard intelligence about North Korean proliferation. Mike McConnell, the director of national intelligence, said in February 7 testimony to the House Intelligence Committee: "While Pyongyang denies a program for uranium enrichment and also denies its proliferation activities, we know North Korea continues to engage in both." In a telephone interview this week, a senior intelligence official confirmed the Syria nuclear connection, saying: "Our suspicions are justified and valid. A lot of due diligence was done on this. People are confident."

Hill expressed the administration's frustration over North Korea's foot-dragging in comments to reporters last week. "We are at a point where we really do need to make progress soon to wrap up" the current phase of negotiations, he said. He complained that the North Koreans "seem to think I have nothing better to do in my time or in my life than to keep asking them questions." Hill has privately rebuffed Pyongyang's request for another round after the Geneva session, saying that there's no point in meeting if the stalemate continues.

A full peace agreement with North Korea remains a worthy prize. It would stabilize a dangerous region and cement the cooperation between China and the US that made the six-party talks possible. But as with so many of its foreign-policy goals, the Bush administration is nearly out of time. It doesn't make sense to break off the talks when they are so close to success, but then, it doesn't make sense to continue with a charade, either.

## **Israel Fears New Korean Nuclear Factor But Remains Silent**

Written by David Harris

Published Monday, April 07, 2008

[Analysis] It is no secret that Israel believes North Korean scientists were working in Syria to help develop a nuclear program – a project Israel destroyed when it launched an aerial attack on an installation in northern Syria on September 6 last year.

Right now, there is a debate in Israel as to whether to go public concerning that airstrike. So far no official information has been published by Jerusalem, with foreign media coverage being the main vehicle for knowing what happened. For the record, Syria vehemently denies the “factory” in question was a fledgling nuclear facility.

If one believes the latest reports in the Hebrew media, Israeli Intelligence believes the North Koreans have now turned their attention to Iran, with the level of aid, if anything, considerably greater than that given to Damascus. Washington is pressuring Pyongyang behind the scenes to end its association with Tehran.

However, in public, neither the Bush administration nor the Olmert government is openly criticizing North Korea. And that has absolutely nothing to do with United States Mideast policy or with Israel’s relations with its Arab and Muslim neighbors.

The lack of frankness about the Korean involvement in Syria and Iran is all about the Bush legacy and the U.S. approach to Southeast Asia. The deal brokered by Washington with North Korea is arguably the key success story of the Bush administration (some would say its only success). President George W. Bush, his team of negotiators led by Christopher Hill and the State Department do not want to see that deal collapse. Any public attack on Pyongyang could lead to a u-turn by the Koreans and a return to a potential arms race involving China, Japan and South Korea.

So, while some in Israel, led by the Defense Ministry, are pushing for more openness about Israel’s recent operation in Syria, the diplomatic wonks in Washington are urging Prime Minister Ehud Olmert to ensure the gag order on his cabinet members remains in place.

## **A Mystery in the Middle East**

**April 8, 2008**

By George Friedman

The Arab-Israeli region of the Middle East is filled with rumors of war. That is about as unusual as the rising of the sun, so normally it would not be worth mentioning. But like the proverbial broken clock that is right twice a day, such rumors occasionally will be true. In this case, we don't know that they are true, and certainly it's not the rumors that are driving us. But other things — minor and readily explicable individually — have drawn our attention to the possibility that something is happening.

The first thing that drew our attention was a minor, routine matter. Back in February, the United States started purchasing oil for its Strategic Petroleum Reserve (SPR). The SPR is a reserve of crude oil stored in underground salt domes. Back in February, it stood at 96.2 percent of capacity, which is pretty full as far as we are concerned. But the U.S. Department of Energy decided to increase its capacity. This move came in spite of record-high oil prices and the fact that the purchase would not help matters. It also came despite potential political fallout, since during times like these there is generally pressure to release reserves. Part of the step could have been the bureaucracy cranking away, and part of it could have been the feeling that the step didn't make much difference. But part of it could have been based on real fears of a disruption in oil supplies. By itself, the move meant nothing. But it did cause us to become thoughtful.

Also in February, someone assassinated Imad Mughniyah, a leader of Hezbollah, in a car bomb explosion in Syria. It was assumed the Israelis had killed him, although there were some suspicions the Syrians might have had him killed for their own arcane reasons. In any case, Hezbollah publicly claimed the Israelis killed Mughniyah, and therefore it was expected the militant Shiite group would take revenge. In the past, Hezbollah responded not by attacking Israel but by attacking Jewish targets elsewhere, as in the Buenos Aires attacks of 1992 and 1994.

In March, the United States decided to dispatch the USS Cole, then under Sixth Fleet command, to Lebanese coastal waters. Washington later replaced it with two escorts from the Nassau (LHA-4) Expeditionary Strike Group (ESG), reportedly maintaining a minor naval presence in the area. (Most of the ESG, on a regularly scheduled deployment, is no more than a few days sail from the coast, as it remains in the Mediterranean Sea.) The reason given for the American naval presence was to serve as a warning to the Syrians not to involve themselves in Lebanese affairs. The exact mission of the naval presence off the Levantine coast — and the exact deterrent function it served — was not clear, but there they were. The Sixth Fleet has gone out of its way to park and maintain U.S. warships off the Lebanese coast.

Hezbollah leaders being killed by the Israelis and the presence of American ships off the shores of Mediterranean countries are not news in and of themselves. These things happen. The killing of Mughniyah is notable only to point out that as much as Israel might have wanted him dead, the Israelis

knew this fight would escalate. But anyone would have known this. So all we know is that whoever killed Mughniyah wanted to trigger a conflict. The U.S. naval presence off the Levantine coast is notable in that Washington, rather busy with matters elsewhere, found the bandwidth to get involved here as well.

With the situation becoming tense, the Israelis announced in March that they would carry out an exercise in April called Turning Point 2. Once again, an Israeli military exercise is hardly interesting news. But the Syrians apparently got quite interested. After the announcement, the Syrians deployed three divisions — two armored, one mechanized — to the Lebanese-Syrian border in the Bekaa Valley, the western part of which is Hezbollah's stronghold. The Syrians didn't appear to be aggressive. Rather, they deployed these forces in a defensive posture, in a way walling off their part of the valley.

The Syrians are well aware that in the event of a conventional war with Israel, they would experience a short but exciting life, as they say. They thus are hardly going to attack Israel. The deployment therefore seemed intended to keep the Israelis on the Lebanese side of the border — on the apparent assumption the Israelis were going into the Bekaa Valley. Despite Israeli and Syrian denials of the Syrian troop buildup along the border, Stratfor sources maintain that the buildup in fact happened. Normally, Israel would be jumping at the chance to trumpet Syrian aggression in response to these troop movements, but, instead, the Israelis downplayed the buildup.

When the Israelis kicked off Turning Point 2, which we regard as a pretty interesting name, it turned out to be the largest exercise in Israeli history. It involved the entire country, and was designed to test civil defenses and the ability of the national command authority to continue to function in the event of an attack with unconventional weapons — chemical and nuclear, we would assume. This was a costly exercise. It also involved calling up reserves, some of them for the exercise, and, by some reports, others for deployment to the north against Syria. Israel does not call up reserves casually. Reserve call-ups are expensive and disrupt the civilian economy. These appear small, but in the environment of Turning Point 2, it would not be difficult to mobilize larger forces without being noticed.

The Syrians already were deeply concerned by the Israeli exercise. Eventually, the Lebanese government got worried, too, and started to evacuate some civilians from the South. Hezbollah, which still hadn't retaliated for the Mughniyah assassination, also claimed the Israelis were about to attack it, and reportedly went on alert and mobilized its forces. The Americans, who normally issue warnings and cautions to everyone, said nothing to try to calm the situation. They just sat offshore on their ships.

It is noteworthy that Israeli Defense Minister Ehud Barak canceled a scheduled visit to Germany this week. The cancellation came immediately after the reports of the Syrian military redeployment were released. Obviously, Barak needed to be in Israel for Turning Point 2, but then he had known about the exercise for at least a month. Why cancel at the last minute? While we are discussing diplomacy, we note that U.S. Vice President Dick Cheney visited Oman — a country with close relations with Iran — and then was followed by U.S. Secretary of Defense Robert Gates. By itself not interesting, but why the high-level interest in Oman at this point?

Now let's swing back to September 2007, when the Israelis bombed something in Syria near the Turkish border. As we discussed at the time, for some reason the Israelis refused to say what they had attacked. It made no sense for them not to trumpet what they carefully leaked — namely, that they had attacked a nuclear facility. Proving that Syria had a secret nuclear program would have been a public

relations coup for Israel. Nevertheless, no public charges were leveled. And the Syrians remained awfully calm about the bombing.

Rumors now are swirling that the Israelis are about to reveal publicly that they in fact bombed a nuclear reactor provided to Syria by North Korea. But this news isn't all that big. Also rumored is that the Israelis will claim Iranian complicity in building the reactor. And one Israeli TV station reported April 8 that Israel really had discovered Saddam Hussein's weapons of mass destruction, which it said had been smuggled to Syria.

Now why the Bush administration wouldn't have trumpeted news of the Syrian reactor worldwide in September 2007 is beyond us, but there obviously were some reasons — assuming the TV report is true, which we have no way of establishing. In fact, we have no idea why the Israelis are choosing this moment to rehash the bombing of this site. But whatever their reason, it certainly raises a critical question. If the Syrians are developing a nuclear capability, what are the Israelis planning to do about it?

No one of these things, by itself, is of very great interest. And taken together they do not provide the means for a clear forecast. Nevertheless, a series of rather ordinary events, taken together, can constitute something significant. Tensions in the Middle East are moving well beyond the normal point, and given everything that is happening, events are moving to a point where someone is likely to take military action. Whether Hezbollah will carry out a retaliatory strike or Israel a pre-emptive strike in Lebanon, or whether the Israelis' real target is Iran, tensions systematically have been ratcheted up to the point where we, in our simple way, are beginning to wonder whether something has to give.

All together, these events are fairly extraordinary. Ignoring all rhetoric — and the Israelis have gone out of their way to say that they are not looking for a fight — it would seem that each side, but particularly the Americans and Israelis, have gone out of their way to signal that they are expecting conflict. The Syrians have also signaled that they expect conflict, and Hezbollah always claims there is about to be conflict.

What is missing is this: who will fight whom, and why, and why now. The simple explanation is that Israel wants a second round with Hezbollah. But while that might be true, it doesn't explain everything else that has happened. Most important, it doesn't explain the simultaneous revelations about the bombing of Syria. It also doesn't explain the U.S. naval deployment. Is the United States about to get involved in a war with Hezbollah, a war that the Israelis should handle themselves? Are the Israelis going to topple Syrian President Bashar al Assad — and then wind up with a Sunni government, or worse, an Israeli occupation of Syria? None of that makes a lot of sense.

In truth, all of this may dissolve into nothing much. In intelligence analysis, however, sometimes a set of not-fully-coherent facts must be reported, and that is what we are doing now. There is no clear pattern; there is no obvious direction this is taking. Nevertheless, when we string together events from February until now, we see a persistently escalating pattern of behavior. In fact, what we can say most clearly is that there is escalation, without being able to say what is the clear direction of the escalation or the purpose.

We would like to wrap this up with a crystal clear explanation and forecast. But we can't. The motives of the various actors are opaque; and taken separately, the individual events all have quite innocent explanations. We are not prepared to say war is imminent, nor even what sort of war there would be.

We are simply prepared to say that the course of events since February — and really since the September 2007 attack on Syria — have been startling, and they appear to be reaching some sort of hard-to-understand crescendo.

The bombing of Syria symbolizes our confusion. Why would Syria want a nuclear reactor and why put it on the border of Turkey, a country the Syrians aren't particularly friendly with? If the Syrians had a nuclear reactor, why would the Israelis be coy about it? Why would the Americans? Having said nothing for months apart from careful leaks, why are the Israelis going to speak publicly now? And if what they are going to say is simply that the North Koreans provided the equipment, what's the big deal? That was leaked months ago.

The events of September 2007 make no sense and have never made any sense. The events we have seen since February make no sense either. That is noteworthy, and we bring it to your attention. We are not saying that the events are meaningless. We are saying that we do not know their meaning. But we can't help but regard them as ominous.

**OPINION**

**Bush's North Korea Capitulation**

By JOHN R. BOLTON

April 15, 2008; Page A19

President George W. Bush is fond of comparing himself to Ronald Reagan. But as he meets with South Korean President Lee Myung-bak in Washington this week, his policy regarding North Korea's nuclear weapons program looks more like something out of Bill Clinton's or Jimmy Carter's playbook.

In dealing with the Soviet Union on arms control, Reagan was famous for repeating the Russian phrase, "Doveryai, no proveryai" (trust, but verify). Soviet President Mikhail Gorbachev reportedly once complained to Reagan, "You use that phrase every time we meet." To which Reagan smilingly replied, "That's because I like it so much."

This administration appears to have forgotten that concept altogether. Although the Six-Party Talks have been sliding into dangerous territory for some time, the Bush administration has repeatedly said that North Korea's complete, verifiable disclosure of its nuclear program was a sine qua non of any deal. No longer.

Last week in Singapore, U.S. chief negotiator Christopher Hill and his North Korean counterpart Kim Kye Gwan reached a deal that rests on trust and not verification. According to numerous press reports and Mr. Hill's April 10 congressional briefing, the U.S. will be expected to accept on faith, literally, North Korean assertions that it has not engaged in significant uranium enrichment, and that it has not proliferated nuclear technology or materials to countries like Syria and Iran.

Indeed, the North will not even make the declaration it earlier agreed to, but merely "acknowledge" that we are concerned about reports of such activities – which the United States itself will actually list. By some accounts, the North Korean statement will not even be public. In exchange for this utter nonperformance, the North will be rewarded with political "compensation" (its word): Concurrent with its "declaration," it will be removed from the U.S. list of state sponsors of terrorism and freed from the Trading With the Enemy Act.

President Bush has repeatedly told Secretary of State Condoleezza Rice and National Security Adviser Stephen Hadley not to make him look weak on North Korea. If the president accepts the deal now on the table, things will be far worse than that.

Although the U.S. public is not yet fully aware of every detail of this agreement, the administration's public and private comments effectively admit the substance. While briefing Congress, Mr. Hill said he expects the North's release from the long-standing U.S. constraints to be "simultaneous" with its "acknowledgment," which he described as a "win-win" concept.

The generals in Pyongyang must love that assessment. They can also relax, since they won't have to worry about concealing their ongoing nuclear work from any verification follow-up.

Our chief negotiator conceded, without blushing, that North Korea "won't allow snap inspections," which apparently justifies the Bush administration's immediate surrender. Indeed, Mr. Hill derided concerns about the North's enrichment effort by saying, according to an attendee, "Some people imagine there is a building somewhere with a secret door they can open and find a group of scantily clad women enriching uranium."

So much for legitimate concerns about U.S. security and the equally legitimate concerns of our allies. Despite cryptic comments by Secretary of State Rice to the contrary, there is no verification mechanism whatever to explore and monitor the truth of what North Korea will say. We will be taking their word.

Ironically, the only hang-up is that North Korea is still lying about how much plutonium it has accumulated, proffering an amount well below what U.S. intelligence believes to be the case. In short, the Bush administration is focusing on what it thinks it knows (plutonium), ignoring what could be the far more dangerous activities (uranium enrichment) it has reason to suspect.

This is the same mistake as the drunk searching for his car keys near a lamppost, even though he admits to a passerby they are not there. Why keep looking near the lamp post? "Because the light is better," the drunk replies.

One can only imagine what Ronald Reagan would have said in his 1980 campaign, if Jimmy Carter had fallen so low. Similarly, in 1999, former Secretary of State James Baker called Clinton administration policy on North Korea "appeasement," writing in the New York Times: "Once again, we have been played for fools. . . . [I]t is hard to fathom how anyone could put credence in any agreement by North Korea."

Perhaps President Bush could at least read Secretary Baker's Times's op-ed before he signs off on this deal. Even Jack Pritchard, the Bush administration's former chief North Korea negotiator – who resigned five years ago because he believed our policy was too harsh – is critical of the current approach.

Our allies South Korea and Japan will long remember this impending act of American fecklessness. South Korea's President Lee, who was voted into office last December, campaigned extensively on requiring the North to meet its commitments. As he meets with President Bush this week, his countrymen must be wondering why the North's commitments mean something in Seoul but not in Washington.

Japan emphatically wants Pyongyang to account for the Japanese citizens kidnapped over the decades. On April 12, Japan extended its own economic sanctions against the North. Nonetheless, despite the absence of any resolution of these repeated acts of North Korean terrorism, the U.S., until now Japan's closest ally, is poised to remove the North from the terrorism list.

Pyongyang's escape from accountability could break down international counter-proliferation efforts. What possible reason will Iran now have to be transparent about its nuclear activities? If North Korea can get away with deception and be rewarded, why should Iran not do the same? In Libya, Moammar Gadhafi will kick himself for giving up his nuclear weapons program in 2003. This deal with North Korea is troubling enough, but the worst news is still to come.

Last fall, President Bush rejected the idea of giving North Korea a pass on uranium enrichment and proliferation. Now, in the waning days of his term, he seems poised to accept it. If he does, and if this deal proceeds, we can well and truly say: "President Bush, you are no Ronald Reagan."

Mr. Bolton, a senior fellow at the American Enterprise Institute, is the author of "Surrender Is Not an Option: Defending America at the United Nations" (Simon & Schuster/Threshold Editions, 2007).

## REVIEW & OUTLOOK

### **Six-Party Giveaway**

April 16, 2008; Page A18

Kim Jong Il has done it again. The North Korean dictator rarely makes a promise he doesn't break, and sure enough, that includes his latest nuclear disarmament pledge. He can thank his enablers in Washington for letting him get away with it.

Kim's strategy was entirely predictable on February 13, 2007, when North Korea pledged to give up its nuclear ambitions in exchange for diplomatic recognition and foreign aid. After years of broken promises, missile launches and nuclear tests, there was little reason to think Kim would treat this promise any differently than he had previous ones. At the time, we called it faith-based nonproliferation, and now that's turning out literally to be the case.

After months of demanding that the North live up to its promise to provide a "complete declaration of its nuclear programs" – as specified in the document Pyongyang signed – the U.S. is now backtracking. Last week in Singapore, U.S. negotiator Christopher Hill and his North Korean counterpart reached a compromise that media reports say will take the North's assurances on faith.

Washington appears ready to accept a declaration that refers only to the North's plutonium program. It would exclude any mention of its clandestine uranium enrichment program – which it bragged about in 2002 but now claims never existed. Nor would it explain the North's proliferation of nuclear technology or materials to Syria, Iran or elsewhere.

A Financial Times report quotes an anonymous U.S. official, almost certainly Mr. Hill, as saying a "full admission" isn't necessary. "This is a regime that is incapable of certain things, and it is incapable of doing that." This is diplomacy as psychotherapy. In other words, the U.S. will give a pass to Pyongyang for lying about Syria and uranium while assuming that the North is now telling us the truth about its plutonium stockpile. This turns Ronald Reagan's slogan on its head: Trust but don't verify.

The revised nuclear deal hasn't been formally announced, and President Bush could still nix it. South Korea's new President, Lee Myung-bak, who will be in Washington later this week, has the moral standing to persuade Mr. Bush of the dangers here. Since taking office at the end of February, Mr. Lee has talked tough on the subject of North Korean accountability. Pyongyang has responded by testing short-range missiles that could reach the South and threatening to reduce Seoul to "ashes."

Allowing the North to renege on its pledge to account fully for its nuclear programs is also a slap at Japan, another U.S. ally in range of Pyongyang's missiles. Tokyo has been pushing North Korea for information about the Japanese citizens it abducted in the 1970s and '80s. If Pyongyang doesn't have to account for its nuclear weapons or its uranium program, why would it feel inclined to account for a few Japanese nationals?

In the waning days of the Bush Administration, there seems to be an attitude that any deal with Pyongyang is better than no deal. But a "disarmament" accord that gives the North a pass on

proliferation and uranium is more than worthless. In addition to propping up Kim's regime, the Administration is setting a standard for nonproliferation that is so low that it may well allow rogue regimes to keep their weapons while getting credit for giving them up. This is dangerous.

## A Deal With Pyongyang?

Once again, North Korea may gain concessions from the Bush administration while evading its own commitments.

Friday, April 18, 2008; A26

FOR MONTHS, the Bush administration has insisted that North Korea would have to fulfill its year-old commitment to disclose all of its nuclear programs in order to receive further economic and political concessions from the United States. The disclosure is important because Pyongyang has until now denied that it pursued uranium enrichment or helped Syria with a nuclear reactor, even though there is strong evidence that it did both. A truthful statement would indicate that the regime of Kim Jong Il was serious about giving up its weapons and not just trying to extort aid from the West as it has in the past.

Yet the Bush administration appears to be close to a deal under which North Korea would be excused from disclosing its work with uranium and proliferation activity. Instead, The Post's Glenn Kessler reported, it would merely "acknowledge" -- possibly in private -- a U.S. statement of concern about those activities. According to a package crafted by Assistant Secretary of State Christopher R. Hill, the North would disclose only its plutonium stockpile, by far the most dangerous part of its nuclear program. In return the United States would make two major concessions: North Korea would be removed from the State Department's list of state sponsors of terrorism and be exempted from the Trading With the Enemy Act.

Secretary of State Condoleezza Rice was still saying yesterday that "the outcome we and our partners require is a full account from North Korea of all its nuclear programs, including any uranium and nuclear proliferation activities." But the reality is that the Bush administration is letting an intransigent regime off the hook. Administration officials explain Ms. Rice's statement by saying that the North Koreans would eventually "account" for their uranium and proliferation by accepting a process of verification. But that process will be prolonged, if it succeeds at all. In the meantime Mr. Kim will pocket the latest U.S. concessions without making the "full and complete declaration" of nuclear programs that Ms. Rice previously said would be required.

In a meeting with members of Congress and in statements to reporters, Mr. Hill has argued that the first priority must be the plutonium stockpile, since it can be used to make weapons. In contrast, U.S. officials believe that while North Korea obtained equipment for uranium enrichment, it does not now have such a program. Yet there are also problems with North Korea's preliminary declaration on plutonium, which is well below U.S. intelligence estimates. Ms. Rice suggested that the amount of plutonium, too, will have to be confirmed by the verification process.

If the United States were able to reach its goal of having North Korea surrender its plutonium, substantial concessions would be justified. But senior administration officials say they don't expect that the Kim regime will turn over its plutonium in the coming nine months. That raises the question of why President Bush would allow North Korea to evade full disclosure. Mr. Hill's deal would preserve the negotiating process -- but what does the Bush administration stand to gain from it? All along the risk has been that North Korea would repeatedly extract economic and political favors from the United States without giving up its nuclear arsenal. The latest deal would seem to greatly increase the chance that that will be the legacy of Mr. Bush's diplomacy.

## **Detering the Undeterrable**

By Charles Krauthammer

Friday, April 18, 2008; A27

The era of nonproliferation is over. During the first half-century of the nuclear age, safety lay in restricting the weaponry to major powers and keeping it out of the hands of rogue states. This strategy was inevitably going to break down. The inevitable has arrived.

The six-party talks on North Korea have failed miserably. They did not prevent Pyongyang from testing a nuclear weapon and entering the club. Now North Korea has broken yet again its agreement to reveal all its nuclear facilities.

The other test case was Iran. The EU-3 negotiations (Britain, France and Germany) went nowhere. Each U.N. Security Council resolution enacting what passed for sanctions was more useless than the last. Uranium enrichment continues.

When Iran's latest announcement that it was tripling its number of centrifuges to 9,000 elicited no discernible response from the Bush administration, the game was over. Everyone says Iran must be prevented from going nuclear. No one will bell the cat.

The "international community" is prepared to do nothing of consequence to halt nuclear proliferation. No one wants to admit that. Nor does anyone want to contemplate the prospect of nuclear weapons in the hands of one, two, many rogue states.

We must. The day is coming, and quickly. We must face reality and begin thinking how we live with the unthinkable.

There are four ways to deal with rogue states going nuclear: preemption, deterrence, missile defense and regime change.

Preemption works but, as a remedy, it is spent. Iraq was defanged by the 1981 Israeli airstrike, by the 1991 Persian Gulf War (which uncovered Saddam Hussein's clandestine nuclear programs) and finally by the 2003 invasion, which ended the Hussein dynasty, père et deux fils.

A collateral effect of the Iraq war was Libya's nuclear disarmament. Seeing Hussein's fate, Moammar Gaddafi declared and dismantled his nuclear program. And if November's National Intelligence Estimate is to be believed, the Iraq invasion even induced Iran to temporarily suspend weaponization and enrichment.

But the cost of preemption is simply too high. No one is going to renew the Korean War with an attack on Pyongyang. And the prospects of an attack on Iran's facilities are now vanishingly small. What to do?

Deterrence. It worked in the two-player Cold War. Will it work against multiple rogues? It seems quite suitable for North Korea, whose regime, far from being suicidal, is obsessed with survival.

Iran is a different proposition. With its current millenarian leadership, deterrence is indeed a feeble gamble, as I wrote in 2006 in making the case for considering preemption. But if preemption is off the table, deterrence is all you've got. Our task is to make deterrence in this context less feeble.

Two ways: Begin by making the retaliatory threat in response to Iranian nuclear aggression so unmistakable and so overwhelming that the non-millenarians in leadership would stay the hand or even remove those taking their country to the point of extinction.

But there is an adjunct to deterrence: missile defense. Against a huge Soviet arsenal, this was useless. Against small powers with small arsenals, i.e., North Korea and Iran, it becomes extremely effective in conjunction with deterrence.

For the sake of argument, imagine a two-layered anti-missile system in which each layer is imperfect, with, say, a 90 percent shoot-down accuracy. That means one in 100 missiles gets through both layers. That infinitely strengthens deterrence by radically degrading the possibility of a successful first strike. Even Mahmoud Ahmadinejad might refrain from launching an arsenal of, say, 20 nukes if his scientific advisers showed him that there was only an 18.2 percent chance of any getting through-- and a 100 percent chance that a retaliatory counterattack of hundreds of Israeli (and/or American) nukes would reduce the world's first Islamic republic to a cinder.

Of course, one can get around missile defense by using terrorists. But anything short of a hermetically secret, perfectly executed, multiple-site attack would cause terrible, but not existential, destruction. The retaliatory destruction, on the other hand, would be existential.

We are, of course, dealing here with probabilities. Total safety comes only from regime change. During the Cold War, we worried about Soviet nukes, but never French or British nukes. Weapons don't kill people; people kill people. Regime change will surely come to both North Korea and Iran. That is the ultimate salvation.

But between now and then lies danger. How to safely navigate the interval? Deterrence plus missile defense renders a first strike so unlikely to succeed and yet so certain to bring on self-destruction that it might -- just might -- get us through from the day the rogues go nuclear to the day they are deposed.

We have entered the post-nonproliferation age. It's time to take our heads out of the sand and deal with it.

Editorial

## **Now He's Ready to Deal**

**April 19, 2008**

President Bush's latest compromise for ending North Korea's nuclear program is agitating critics — outside his administration and in. It is an imperfect solution. But imperfect may be all one can expect after Mr. Bush wasted so much time refusing to consider any compromise at all.

For six years, Mr. Bush rejected any meaningful negotiations. The result? Pyongyang kept adding to its plutonium stockpile — it now has enough for eight or more bombs — and tested a nuclear device.

When Mr. Bush finally agreed to try diplomacy — and gave a serious diplomat, Christopher Hill, the room to negotiate — Washington correctly insisted on a “complete and correct” accounting of all North Korea's nuclear activities as an important step toward dismantling the program. Now Mr. Bush is willing to accept less.

The North Koreans won't have to come clean — at least for now — on their fledgling uranium-based weapons program, which American officials believe has been shut down. **Nor will they be required to publicly admit to selling Syria the technology and know-how to build a nuclear reactor. Israel destroyed that project last September.** Instead, officials say, the United States will stipulate what it knows about these programs, and Pyongyang only has to “acknowledge” these “concerns.”

Of course, if a Democratic president had made similar compromises, hard-line Republicans probably would have called for impeachment. That said, Mr. Hill may be right that this is the only chance to push the process to the next step: getting North Korea to dismantle its plutonium-based reactor at Yongbyon and eventually surrender all its nuclear fuel and weapons.

That is the clear and present danger. The North Koreans have already shut down Yongbyon — an important but insufficient accomplishment.

Presuming the current compromise comes together — the two sides remain divided over the size of North Korea's plutonium fuel stocks — North Korea would be removed from America's list of terrorist states and from sanctions under the Trading With the Enemy Act and receive a large shipment of heavy fuel oil.

All of this is especially frustrating when one considers how much safer the world would be if Mr. Bush had picked up where President Bill Clinton left off in 2001. In those days, the North Koreans only had enough plutonium for one or two bombs. Activities at Yongbyon were frozen under a 1994 agreement. Mr. Bush and his aides detested that agreement, and as soon as they discovered Pyongyang was trying to build a uranium-based weapons program, they declared that diplomacy pointless.

The hard-liners are right on one thing: No commitment from North Korea should ever be taken at face value. We're not convinced it will ever trade its nuclear capability, even for vastly better diplomatic and economic ties with the world.

That is why the emerging deal will require the most transparency and verification possible, including full access to its plutonium production records. The Bush administration must push harder on this. And if North Korea is found cheating, the world will have to impose even tougher sanctions.

As we said, it is an imperfect solution. But, presuming the deal isn't weakened even more, it may be the only choice.

## **Samore: More Fluid U.S. Stance on N. Korea Nuclear Weapons**

Interviewee:

Gary Samore, Vice President, Director of Studies, and Maurice R. Greenberg Chair

Interviewer:

Bernard Gwertzman, Consulting Editor

**April 23, 2008**

Gary Samore Gary Samore, vice president of the Council on Foreign Relations, says the Bush administration has agreed to a compromise on demands for North Korea to confess the extent of its uranium-enrichment activities. Samore, a senior arms control negotiator in the Clinton administration, says the compromise is to allow the United States “to get into what it considers to be the most important element of the deal, the negotiation over the actual elimination of North Korea’s nuclear weapons.”

**What’s the status of negotiations with North Korea? A year ago, it looked like we had an agreement. Now critics are saying the Bush administration is giving away the store and selling out.**

For over a year the talks have been stuck over the issue of North Korea making a declaration of all of its nuclear activities. The main question there is North Korea’s refusal to acknowledge a secret uranium-enrichment program and then more recently, its nuclear assistance to Syria. So the administration has made a compromise with North Korea. In the compromise the North Koreans will declare how much plutonium they’ve produced over the years and instead of North Korea having to directly acknowledge the uranium-enrichment program and their assistance to Syria, the United States will make a statement expressing its belief that these activities have taken place and the North Koreans will not refute or challenge that U.S. statement.

In exchange for that, the United States will take North Korea off the list of state sponsors of terrorism and remove some of the Trading with the Enemy Act sanctions. Most importantly, once the declaration issue has been resolved, the two sides will begin the serious negotiations over the so-called third phase, which is the plan to dismantle North Korea’s nuclear facilities and eventually eliminate its nuclear weapons. Basically the Bush administration has made a concession or compromise on the North Korean declaration in order to get into what it considers to be the most important element of the deal, the negotiation over the actual elimination of North Korea’s nuclear weapons.

**Now, there is a State Department delegation on its way to Pyongyang as we talk. What is it supposed to accomplish?**

My understanding is that they are talking about the verification provisions, especially for North Korea’s plutonium declaration. North Korea, as I understand it, has declared or will declare that it’s produced about thirty kilograms of plutonium. That’s at the low end of U.S. estimates for how much plutonium they have produced over the last twenty years. It will be absolutely essential to have some confidence that’s an accurate number, because the natural suspicion is that North Korea will under

declare what they have so that can keep some in secret for possible nuclear weapons. The team that is going to Pyongyang, headed by Sung Kim, who is the director of the Korea office at the State Department, will be to talk about what kinds of measures the North Koreans will allow to verify that their statement of thirty kilograms is accurate. That's going to be very tricky.

In the past North Korea has rejected intrusive inspection methods designed to try to determine how much plutonium it had actually produced. In fact that was the cause of the original nuclear crisis in 1992. The International Atomic Energy Agency (IAEA) wanted to visit some suspected nuclear waste sites, which would have shown evidence of North Korean reprocessing, and the North Koreans refused to let the IAEA go to those sites. Then they left the Nonproliferation Treaty [NPT] and that's what led to the whole crisis during the Clinton administration [which led to the signing of the Agreed Framework in 1994].

**Now I've read that the United States has estimated North Korea has produced as much as fifty kilograms.**

We don't know. These are estimates based on how long the reactor is operated. You have to take into consideration that when you reprocess you don't get all the plutonium out of the spent fuel. Some of it is lost. If the reprocessing facility is sloppy, which I wouldn't be at all surprised in this case, you could lose 20 or 25 percent of the plutonium in the waste stream. Nobody really knows how much plutonium the North Koreans actually produced.

**To get some sense of plutonium, it takes about eight kilograms to make a bomb?**

It really depends on the design. Again, we don't know how efficient the North Korean design is, but something on the order of six to eight kilograms per bomb is probably a pretty conservative estimate for the kind of design we think North Korea is most likely to utilize.

**So we're talking about the possibility that they might be secretly keeping enough plutonium to make a couple of bombs.**

That's the natural suspicion—that the North Koreans have lied about their nuclear program over the decade. The natural suspicion is that they would underreport the amount of plutonium; they would falsify records; they would coax their scientists to give us a false story. So unless we have an independent means of verifying, which means sampling from the reactor the waste that was produced in the reprocessing plant. Unless you get those kinds of physical samples to carry out a real forensic investigation, the verification is not going to be very strong.

**What do you think is going on in North Korea? You would think they would have a lot to gain from joining the world of nations, by getting trade and everything else that would help their economy.**

Especially now. They've had a very bad harvest so they are looking at the likelihood of serious food shortages, maybe as bad as they experienced in the mid-1990s. At the same time the North Korean regime wants to hang on to their nuclear weapons, so they are playing the same game they have always been playing, which is to make concessions to limit their nuclear capabilities in exchange for political and economic compensation, while at the same time hold off and resist pressure to actually give up their nuclear weapons.

I expect that if these third-phase negotiations begin you will see a similar kind of process, where the North Koreans agree in principle to give up their nuclear weapons once peace and prosperity has been established on the Korean peninsula and U.S-North Korea relations are fully normalized. So in other words, they will set conditions which are not likely to be met anytime in the near future.

**Let's come back to this compromise that U.S. negotiator Chris Hill reached with the North Koreans. This is one that is getting criticized by former U.N. Ambassador John Bolton and other conservatives. Did the Bush administration cause its own problem by taking such a tough line back in 2002 and 2003?**

The Bush administration was correct when it reached the conclusion that North Korea was cheating on the Agreed Framework by pursuing a secret uranium-enrichment program, but the way it handled the confrontation with North Korea was very clumsy. North Korea took advantage on our focus on Iraq to leave the NPT and to produce more plutonium and to basically walk away from the Agreed Framework. Then the Bush administration realized that it needed to negotiate but unfortunately it was too late to roll back what the North Koreans had already done.

Now the Bush administration has frozen any further North Korean plutonium production and it has created a good diplomatic framework for the next U.S. administration to pick up the talks. It's unlikely that you'll see a deal reached on the third phase during the rest of this administration because North Korea is likely to demand things, like the light-water nuclear-reactor project, that so far the Bush administration has not been willing to give. But at least the talks will get started and will put the next administration in a better position to pick them up and hopefully bring them to a conclusion.

**I haven't seen much said by any of the candidates about North Korea in particular; am I missing something?**

No, that's right. As long as the situation seems to be under control, as long as the negotiations are proceeding, it's really not a major foreign-policy challenge, especially given all the big problems in the Middle East, Iraq being the first.

**If you were in the new administration would you recommend that they do anything different?**

The Bush administration has provided a good diplomatic framework for trying to work out an agreement with the North Koreans to eventually give up their nuclear weapons, even though I am skeptical that the North Koreans will actually carry out that commitment. The next administration just has to pick up where this administration leaves off. The big issue, which is sort of out there for these third-phase negotiations, is whether we agree to resume the light-water reactor project. You will remember that in the original Agreed Framework, the North Koreans were to get nuclear power in exchange for giving up nuclear weapons.

**We were supposed to supply a light-water reactor?**

It was mainly funded by the South Koreans and Japanese but the United States also had to support it because the design was a U.S. design. That project of course was suspended when we found out that North Korea was cheating. The North Koreans are saying they still want that light-water reactor because they need the electrical power.

**But for them to get a light water reactor we have to be absolutely certain about what their nuclear situation is?**

That's why the verification is so important. The declaration that the North Koreans have made was always intended to be an initial declaration and the understanding was that unless you verified it, the initial declaration wouldn't be worth very much. So these talks that are going on in Pyongyang are critically important for the plutonium question; even more difficult will be how to verify eventually the status of the uranium-enrichment program because we know so little about that. At least in the case of the plutonium program we know where the facilities are, so we can go visit the facilities and take physical measurements. In the case of the enrichment program, we don't even know where it is.

**And they've denied it all?**

Well, yes, they've sort of denied it. Apparently they acknowledged it during the 2002 meetings with [James] Kelly [assistant secretary of state for Asian affairs], or at least that's what our side claims. But the official position of the North Koreans is that they deny it. The evidence that they had or still have a secret enrichment program is very strong. We just don't know how advanced it is.

**Are we worse off now regarding North Korea? They've had a nuclear test and built a couple of bombs. Who's at fault here? The Bush administration, or the North Koreans?**

The fundamental fault rests with Pyongyang. They are the ones that decided to renege on the Agreed Framework, although the way the Bush administration handled the discovery of their cheating was not the most effective way to go about it. Taking on Iraq and North Korea at the same time created an opening for the North Koreans to walk away from the Agreed Framework with impunity.

## **Caving in to Pyongyang**

April 24, 2008

THE WASHINGTON TIMES EDITORIAL - The more details that come out about the Bush administration's approach to negotiations with North Korea, the more disturbing the deal looks. Last week, administration officials indicated that they were backing away from their insistence that North Korea fully admit its nuclear activities. The White House said that its requirements for a full declaration from North Korea about its past actions would no longer include proliferation matters. Since North Korea signed an agreement last year agreeing to come clean about its nuclear activities, the White House had been saying that these would include proliferation — or the transfer of knowledge about uranium enrichment or nuclear materials to other countries. North Korea is suspected of helping Syria build a plutonium-processing facility for nuclear weapons which was destroyed by Israel in a Sept. 6 airstrike.

Dennis Wilder, the senior White House official on East Asia, said April 17 that Washington is handling the North Korea proliferation issue in a "different" (i.e., more conciliatory) way from other requirements that North Korea declare its past nuclear activities. The Bush administration's latest approach to Pyongyang, supported by Secretary of State Condoleezza Rice and Assistant Secretary of State Christopher Hill, would enable North Korea to avoid coming clean about its earlier nuclear activities. North Korea will make a formal declaration about its plutonium-based weapons program and then "acknowledge" in a confidential side agreement U.S. statements regarding the communist's regime program to build nuclear weapons using highly enriched uranium and its proliferation activities with Syria.

The Bush administration yesterday said publicly that North Korea was helping Syria build a plutonium-based nuclear reactor, but that Pyongyang has ceased all assistance and promised not to resume providing it. How the United States verifies this in dealing with a totalitarian police state like North Korea is anyone's guess.

But State Department spokesman Sean McCormack claims that the emerging agreement with North Korea does not represent a U.S. concession. For example, he maintains that even if North Korea did not fully account for its uranium enrichment efforts, the agreement would still permit inspectors access to all of Pyongyang's nuclear facilities in order to verify that it had stopped its weapons programs. "We don't know where the facilities are. That's totally untrue," former Undersecretary of State for Arms Control John Bolton told us yesterday when we read him Mr. McCormack's statement. "All it gives us is [access to] Yongbyon," he said, referring to North Korea's main plutonium processing facility.

But North Korea's decision to jettison Yongbyon is not much of a concession because that facility is probably at the end of useful life anyway, Mr. Bolton said. One major flaw of the agreement is that it lacks a mechanism permitting snap inspections of suspected covert facilities. In essence, Washington will be reduced to taking North Korea's word, Mr. Bolton added, likening the Bush administration's North Korean deal to something Jimmy Carter would put together.

Meanwhile, on Capitol Hill, Rep. Ileana Ros-Lehtinen, Florida Republican, has sent a detailed letter to congressional appropriators challenging a panoply of U.S. concessions to North Korea, among them

steps to relax economic sanctions against Pyongyang despite the fact that it continues to threaten South Korea and apparently remains engaged in counterfeiting U.S. currency. It's time for more members of Congress to join Mrs. Ros-Lehtinen in doing some serious oversight work regarding the concessions being made to North Korea.

## **Analysts Mull N. Korea's Link to Syrian Nuclear Site**

RAY SUAREZ: Finally tonight, the evidence of North Korean nuclear cooperation with Syria. Judy Woodruff has the story.

JUDY WOODRUFF: Top U.S. intelligence officials briefed members of Congress and reporters yesterday about North Korea helping Syria build a nuclear reactor.

A key piece of evidence: an 11-minute video showing the Syrian facility. Here's a brief excerpt.

VIDEO NARRATOR: This photograph shows the top of the reactor vessel in the reactor hall before concrete was poured around the vertical control rod and refueling tubes.

Note the similar arrangement of vertical tube openings in the top of the Syrian reactor on the left and North Korea's Yongbyon plutonium production reactor on the right.

We assessed the Syrian reactor was similar in size and capacity to this North Korean reactor. Only North Korea has built such gas-cooled graphite-moderated reactors in the past 35 years.

### **Uncertainty over weaponization**

JUDY WOODRUFF: This latest intelligence comes at a sensitive time, as the U.S. and other nations are in talks with North Korea over Pyongyang's nuclear program.

For an assessment of this intelligence and its significance, we get two views. David Albright is president of the Institute for Science and International Security, which studies nuclear programs worldwide.

Henry Sokolski is executive director of the Nonproliferation Policy Education Center, which is a Washington research organization.

Gentlemen, thank you both for being with us. And I'm going to start with you, David Albright.

Now that you've had a day to look over this evidence put forward by the administration and by intelligence officials, how persuasive is it?

DAVID ALBRIGHT, Institute for Science and International Security: I think the information is very persuasive that Syria was secretly building a nuclear reactor, and it was taking great steps to hide it from visual observation, it was getting help from North Korea, and it appeared quite determined to get it to operate.

Where I think the information is lacking is certain key things that would conclusively show Syria was engaged in trying to make nuclear weapons, things like you have to have a facility to separate plutonium in order to make a nuclear weapon.

There is no information about how Syria was going to actually get the uranium fuel to run the reactor, which is a little bit like finishing a car but not having any gasoline to run it.

And so there remain several questions where you have to be careful before you accuse Syria of having an active nuclear weapons program.

JUDY WOODRUFF: Henry Sokolski, how do you size up the evidence?

HENRY SOKOLSKI, Nonproliferation Policy Education Center: Well, I agree with all the comments made, but it's perhaps a different take, which is it certainly looked like a duck and it walked like a duck. And I think what you can't find is always a problem. We tend not to find fuel-making facilities all the time.

How far along the project was is, perhaps, a matter of open dispute, but, boy, they were definitely gunning for plutonium production. There's no question of that. And you wait long enough, you'd have another Iran crisis for sure.

JUDY WOODRUFF: When you say "we often," I think you said we often don't find uranium fuel facilities, what are you referring to?

HENRY SOKOLSKI: Well, or processing facilities. I remember being in the Pentagon, and we debated for nearly a year as to what a photographed reprocessing plant at Yongbyon in North Korea was, whether it was a textile plant or not.

So even when it's in plain sight, we have disputes as to what's going on. And frequently it's not in plain sight.

You can hide some of these facilities, as we've found in the case of Natanz, which is the Iranian enrichment program, and it being out of sight for quite a while until it's fairly far along.

So I think even this plant took a long time to find. That's one of the most remarkable things about this story is we didn't picture it ourselves until late in the game.

JUDY WOODRUFF: David Albright, what about this argument that if it walks, quacks like a duck, it must be?

DAVID ALBRIGHT: That's the kind of argument, unfortunately, that got us into a lot of trouble in Iraq and also in Iran. So I think you have to be very careful and find the evidence.

And particularly, if Syria is accused of having an active nuclear weapons program, that is different than accusing them of having a secret reactor, and particularly in a region where there's lots of tension...

JUDY WOODRUFF: What's the difference?

DAVID ALBRIGHT: Well, the difference is, is that it's a much greater violation of the nonproliferation treaty if you can show that they were actively trying to build nuclear weapons, and particularly if it was further along.

Right now, Syria wasn't loading fuel into that reactor, because then the bombing showed that and the work after the bombing. And so they hadn't violated major international treaties.

But if they were -- if you can prove they were engaged in making nuclear weapons and you can have evidence of that, then it's a very serious issue. And in a region where -- or particularly with Syria bordering Israel, you have to always worry in these cases that it could escalate into a military confrontation.

JUDY WOODRUFF: But very quickly, why would they have been building a facility to make plutonium if they weren't going to do something lethal with it?

DAVID ALBRIGHT: Well, one is we don't know the purpose. I mean, it looks like they were building it to get plutonium. And you would think that it's probably for nuclear weapons.

But the point I'm making is that things can change and they can fail. For example, maybe they were going to depend on North Korea to provide the uranium, but North Korea was no longer going to provide that uranium, and they would have ended up with a machine that could never operate.

### **Role of North Korea under debate**

JUDY WOODRUFF: Let me move to the question, Henry Sokolski, of why North Korea, if North Korea -- and the evidence seems, I guess, you're both saying it's pretty clear to you that North Korea was involved in this -- why were they helping the Syrians? What were they getting out of it?

HENRY SOKOLSKI: Well, you know, lots of speculation. The intelligence officers said cash. There are any number of other possibilities, including everything from, well, maybe they hoped to continue to produce material there.

I mean, we don't know. This is one of the reasons why we don't try to gauge our policies or our verification system to intent, but rather to capabilities.

It's one of the things that the international inspectors, who were totally caught flat-footed on this, as well -- they just look for undeclared activity that's out of sorts. And this clearly was in that category.

JUDY WOODRUFF: Why do you think, Henry Sokolski, the administration is just now saying -- because this happened last September in 2007.

HENRY SOKOLSKI: Yes.

JUDY WOODRUFF: The administration was aware activity...

HENRY SOKOLSKI: Yes.

JUDY WOODRUFF: ... were underway. Why are they putting it out now? And what does it is about U.S. policy going forward toward North Korea?

HENRY SOKOLSKI: Really good question. I think the folks that want to push the further discussions and perhaps even dropping North Korea from the list of terrorist countries for U.S. trade purposes figure, well, maybe we need to just get this out of the way so that we can move ahead.

Hawks and critics of this approach point to this transgression, because actually North Korea was supposed to fess up to all of its export of nuclear activities last December. And they point to this and say, well, maybe we should kill the talks.

I'm not sure we really know who's winning this debate in the administration. My guess is that it'll end up with the talks continuing, but the focus of the talks being on getting the North Koreans to fess up to a lot more than they have.

### **More pressure to be put on DPRK**

JUDY WOODRUFF: Well, we know that Christopher Hill, who's the chief administration negotiator with the North Koreans, he was quoted yesterday as saying that any cooperation that did exist no longer exists.

HENRY SOKOLSKI: Yes, there you go.

JUDY WOODRUFF: Does that say anything to you, David Albright?

DAVID ALBRIGHT: I think the evidence points in that direction. I mean, even the CIA, when it was talking about this to the journalist, was talking about any assistance after the bombing was on damage assessment.

I mean, we know the North Koreans were near the site, probably at the reactor, and so they were looking at what happened, for sure. But I think what is important, though, is that, in engaging North Korea, negotiating with them, and being tough about it is that you want to get North Korea to stop this kind of activities.

We have no guarantee they're not selling something to another country. And so it's very important to try to draw North Korea in, into the negotiations, and insist in a verifiable manner that they stop this kind of illicit nuclear trade.

JUDY WOODRUFF: And very quickly, Henry Sokolski, by making this public, is that likely to have that effect on -- is this likely to have that effect on the North Koreans?

HENRY SOKOLSKI: Well, temporarily. I don't think any pledge from these folks amounts to much because we can't really verify until very late in the game after they cheat. And they have a record of seeing things very differently with regard to their obligations to anything they sign.

So I wouldn't get your hopes up on this one. And that's the reason why fessing up will be the focus from here on out for a while.

JUDY WOODRUFF: Final word here?

DAVID ALBRIGHT: Yes, I think they've said many things that have been verified to be true. I mean, they have shut down their plutonium production...

JUDY WOODRUFF: The North Koreans?

DAVID ALBRIGHT: The North Koreans have shut down their plutonium production capability and they're not making plutonium for nuclear weapons anymore, and that's verified, and that's true.

So on illicit trade, they are caught, and that can be verified. And more scrutiny internationally is very important to thwart and deter the North Koreans.

HENRY SOKOLSKI: You don't need a deal to do that. And I think we're going to have to start thinking bigger than whether or not we can prevent things by getting pledges from the North Koreans.

This is the 11th *[sic]* bombing of a nuclear reactor in the Middle East. Where we head it in general is a much bigger, more important question.

JUDY WOODRUFF: Well, certainly an interesting story, and we thank both of you for helping shed some more light on it. David Albright with me, Henry Sokolski, thank you both. We appreciate it.

HENRY SOKOLSKI: Thank you.

DAVID ALBRIGHT: Thank you.

## **The curious Syrian nuclear affair**

Published: April 25 2008 21:50 | Last updated: April 25 2008 21:50

Just over five years ago, a US secretary of state, Colin Powell, made more than two dozen claims to the United Nations Security Council about Iraq's alleged possession of weapons of mass destruction. In the build-up to war, many found it a compelling performance. But all Mr Powell's assertions were subsequently shown to be without foundation. He might as well have shown the world a video game.

Not long after that, Israel started hawking "evidence" uncovered by its spies that Saddam Hussein had moved his WMD to Syria. It got some takers – but nothing more has been heard of this chimera.

Thursday's Central Intelligence Agency presentation to the US Congress – making the case that North Korea supplied Syria with a nuclear reactor able to produce plutonium for nuclear weapons – was also compelling. It would also appear to justify retroactively the Israeli air strike on the site in Syria's eastern desert last September. But given the US and Israel's recent record in these matters, it could also be just another dog and pony show.

Taken purely on its own terms, the US claim raises many questions. Where was Damascus going to get the fissile fuel for this alleged reactor? Where was the plutonium separator, or reprocessing facility for spent fuel? Where is the evidence for a weaponisation programme? Why, moreover, did the US (and Israeli air force) bypass the IAEA, the UN's nuclear watchdog?

None of this means we should believe the Syrians. They have said little more than Israel – which refuses to comment – beyond claiming the site was a military depot. Bashar al-Assad's regime is not trustworthy. Damascus has a long history of pursuing its aims through violent surrogates such as Hizbollah and Hamas, and of murdering its opponents, especially in Lebanon.

Its usual defence – "do you think we would be that stupid?" – can only be answered in the affirmative after the government sanctioned a recruiting station for volunteer fighters in Iraq just yards away from the US embassy in Damascus in 2003. But that does not mean these specific allegations are true.

This affair is very odd. The CIA's decision to go public now backs Pyongyang into a corner at a critical moment in the six-power talks on North Korea's nuclear disarmament – leading some to detect the hand of Bush administration hawks such as Dick Cheney.

But it also follows the assassination in Damascus of top Hizbollah (and Iranian) operative Imad Mughniyeh. The air strike and the hit could also be interpreted as warnings to Iran to cease its regional meddling and nuclear ambitions – and maybe scare Damascus off its alliance with Tehran. One video show in Washington does not shine a light through the regional murk. But it should remind us there is too much dry tinder out there for anyone to be careless with matches.

William M. Arkin on National and Homeland Security

## **Syria's Nuclear Weapon: What to Do**

By William M. Arkin

April 25, 2008; 11:40 AM ET

The "news" that North Korea and Syria were cooperating in the development of nuclear weapons, a "charge" the Bush administration made yesterday, is not news to anyone who has been closely following the September incident in which Israel mysteriously attacked a remote facility in Syria. It may not even be true.

I say may not be true because it is important to understand that the intelligence -- both American and Israeli -- is limited and even elliptical, and though I don't doubt that the two countries cooperate on weapons of mass destruction -- Hezbollah's main long-range missile used against Israel in the 2006 war was a Syrian/North Korean hybrid -- getting the goods regarding clandestine nuclear developments, and then proving that the intent is to develop nuclear weapons, is incredibly difficult.

In fact, the whole question of nuclear weapons is so prone to hyperbole that if the actual intent is to dissuade nations from developing nuclear weapons, the best road is transparency and accountability -- not bombing, exaggeration and mystery.

On Sept. 6, Israel mounted a secret raid on a facility deep inside Syria, a bombing attack that the country has still barely even acknowledged and one that Israeli and U.S. officials, until yesterday, have been practically silent about.

Anyone who has been following the story knows of the North Korean connection. Syria of course has denied everything; North Korea has denounced the preemptive strike. Iran has protested. Et cetera.

Because of the exaggeration and intelligence failures relating to Iraq, these countries almost get away with their denials. Yes, the International Atomic Energy Agency (which administers the non-proliferation regime) and the United Nations oppose the illegal development of nuclear weapons. But because of the intelligence failures in the past -- and because of the exaggeration that accompanies the atom -- the goal of non-proliferation is undermined and a lot of people are confused about the truth.

The question regarding Syria, North Korea, Iran and (at least retrospectively) Iraq is this: What to do?

Yesterday the Bush administration made the claim that Syria was "within weeks or months" of completion of a nuclear reactor -- which of course is not nuclear weapon. Part of the problem here is the exaggeration that goes into describing (and understanding) a nuclear weapons program. Even if Syria managed to complete a plutonium production reactor, and then managed to operate it for the months would be needed to manufacture the materials it needed, and then managed to machine that plutonium, and then design and fabricate a nuclear weapon, many months if not years would go by. Such a program would be detected, proven and probably thwarted by the international community.

In other words, to bomb a single unfinished possible reactor last September was a panicked and flawed response. It did not further the ultimate goal of non-proliferation. In the war of persuasion, in the

international battle to improve the rule of law, the actual goal is undermined, for the "illegality" of Syria developing nuclear weapons in the first place is based upon law, actual or societally accepted. Turning to preemption and just taking the law into one's own hands achieves nothing.

Editorial

## **North Korea Redux**

**April 25, 2008**

It is more than a little suspicious that the ever-secretive Bush administration has suddenly decided to go public with what it knows about North Korea's nuclear connection with Syria. After seven months of refusing to acknowledge Israel's air strike last Sept. 6 on a suspected Syrian nuclear reactor, the intelligence community has now provided Congress with video images showing North Koreans inside the secret facility.

It is another example of this administration insisting that information be withheld for national security reasons — until there is a political reason to release it.

So why now? It is no secret that Republican hard-liners are outraged over a State Department-negotiated deal intended to eventually shut down North Korea's nuclear weapons program. They are desperate to stop it, either by getting President Bush to pull back or provoking the easily provoked North Koreans into doing something stupid, like walking out of the talks.

Thursday's presentation to certain Congressional committees will also make it harder to win approval for aid to dismantle North Korean nuclear facilities — an essential part of the agreement.

As we said recently on this page, the deal is imperfect, not least because it does not require Pyongyang to come clean on the Syria deal. But at this point it is probably the best chance of moving North Korea toward a much more important goal: fully accounting for and eventually giving up its plutonium stocks and weapons. The North Koreans have already shut down their reactor at Yongbyon — the source of their plutonium — but there is a lot more work to be done.

North Korea's willingness to sell nuclear technology and know-how to Syria is extremely worrisome. Israel's attack has at least ensured that the Syrian reactor will not be a threat. As for Pyongyang's promises to forsake any future sales, that must be vigilantly monitored and verified along with all of its nuclear activities. Scuttling the agreement now will guarantee less transparency, not more, and will only increase Pyongyang's nuclear appetites and its incentive to sell more of its wares.

For six years, President Bush and Vice President Dick Cheney refused to seriously negotiate with North Korea. The result? North Korea tested a nuclear device and went from having enough plutonium for one or two weapons to eight or more. We've seen that movie. The world can't afford a sequel.

## **Geopolitical Diary: The Syrian Nuclear Mystery Evolves**

**April 25, 2008 | 0223 GMT**

The Bush administration briefed the U.S. Congress on Thursday about the reasons behind the Sept. 6, 2007, Israeli raid on Syria. According to the secret briefing — the content of which, of course, not only was leaked immediately (as was intended) but was essentially confirmed by a White House spokeswoman — the target was a nuclear reactor, able to produce plutonium, that had been built with the assistance of North Korea. The administration showed a videotape, apparently produced by Israeli intelligence, showing faces that were said to be in the facility and to be clearly Korean.

What is important to note is this information is not new. It is a confirmation of the story leaked by the administration shortly after the attack and also leaked by the Israelis a bit later. The explanation for the attack was that it was designed to take out a reactor in Syria that had been built with North Korean help. There are therefore three questions. First, why did the United States go to such lengths to reveal what it has been saying privately for months? Second, why did the administration do it now? Third, why is the United States explaining an Israeli raid using, at least in part, material provided by Israel? Why isn't Israel making the revelation?

It has never been clear to us why the Israelis and Americans didn't immediately announce that the Syrians were building a nuclear reactor. Given American hostility toward Syria over support for jihadists in Iraq, we would have thought that they would have announced it instantly. The explanation we thought most plausible at the time was that the intelligence came from the North Koreans in the course of discussions of their nuclear technology, and since the North Koreans were cooperating, the United States didn't want to publicly embarrass them. It was the best we could come up with.

The announcement on Thursday seems to debunk that theory, at least to the extent that the primary material displayed was U.S. satellite information and the Israeli video, which was said to have been used to convince the United States of the existence of the reactor and of North Korean involvement. So why didn't the administration condemn Syria and North Korea on Sept. 7? It still seems to us that part of the explanation is in the state of talks with North Korea over its own program. The North Koreans had said that they would provide technical information on their program — which they haven't done. Either the United States lost its motivation to protect North Korean feelings because of this or the Bush administration felt that Thursday's briefings would somehow bring pressure to bear on North Korea. Unless the United States is planning to use these revelations as justification for attacks on the North Koreans, we find it difficult to see how this increases pressure on them.

More interesting is the question of why the United States — and not Israel — is briefing on an Israeli raid. Israeli media reported April 23 that the Israelis had asked the Americans not to brief Congress. The reason given was that the Israelis did not want the United States to embarrass Syria at this point. As we noted on April 23, there appeared to have been some interesting diplomatic moves between Syria and Israel, and it made sense that revealing this information now might increase friction.

If this read is true, then it would appear that the United States briefed deliberately against Israeli wishes. Certainly, the Israelis didn't participate in the process. One answer could be that the United States is unhappy about Israeli Prime Minister Ehud Olmert's moves on Syria and wants to derail them.

The United States wanted Syria out of Lebanon. The Israelis have a more complex view of their presence. In some ways, they see the Syrians as a stabilizing force. And they certainly aren't eager to see Bashar al Assad's government fall, since whatever might replace the al Assad government would probably be worse from the Israeli point of view. That would mean that the Israelis would want to take out the reactor, but not necessarily rub the Syrians' nose in it.

So there are two plausible answers to Thursday's show. One is to increase pressure on North Korea. The second is to derail any Israeli-Syrian peace process. The problem is that it's hard to see why North Korea is going to be moved by the official declaration of what Washington has been saying from the beginning. The second would assume that U.S.-Israeli relations had deteriorated to the point that the United States had to use this as a lever. That's tough to believe.

The senior Republican on the House Intelligence Committee, Peter Hoekstra, said after the briefing, "This administration has no credibility on North Korea. A lot of us are beginning to become concerned that the administration is moving away from getting a solid policy solution to 'let's make a deal.'"

So that seems to undermine the prep for strike theory. That leaves tension between the United States and Israel as the last standing theory. Not a good theory, but the last standing one.

## North Korea's Syrian Connection

By Bill Powell

Friday, Apr. 25, 2008

Throughout his entire first term and most of his second, U.S. President George W. Bush has tried pretty much everything to get North Korean dictator Kim Jong Il to come out of his cage. He has tried to coerce him with economic sanctions and schoolboy bluster—a policy course that ended on in the autumn of 2006, when Kim tested a nuclear weapon, precisely the opposite of the result Bush intended. Since then, the Administration has tried bribery, offering blandishments like food and free fuel oil in hopes that in return North Korea would stand down its nuclear program. Kim has responded a bit—his nuclear reactor at Yongbyon, which produced the fissile material for the North's estimated 8 to 10 nuclear bombs—is slowly being shut down. But Kim has refused to detail all the other components of his nuclear program, including an alleged uranium enrichment effort, and he has continued to sell North Korean nuclear expertise into a buyer's market of rogue states.

Exasperated, the Administration yesterday unveiled North Korea policy version 3.0. Bush is now trying to shame North Korea into complying with what it had agreed to do in talks with the U.S. and four other negotiating partners (China, Russia, Japan and South Korea). In a convincing presentation to reporters in Washington, the Administration produced damning photographic evidence of what has been whispered about for seven months now: North Korea was intimately involved in helping Syria build a plutonium-fueled nuclear reactor, "basically a copy of Yongbyon," one Administration official told TIME.

Last year, on Sept. 6, Israel put an end to that project, bombing it out of existence. Ever since, there has been a cone of official silence placed around what had happened, with neither Jerusalem nor Washington nor anyone else confirming the operation. Two months ago, in Seoul, I pressed a senior South Korean negotiator in the six-party talks for information about the Syrian-North Korean connection. He squirmed a little and said it was his impression that the so-called al Kibar site was just a "missile factory," not a nuclear facility. That, we learned yesterday, was false.

There were reasons for the seven months of silence. Bush Administration officials say they were worried that Syria might start a new war in the Middle East if they were publicly fingered after the attack. In other words, it was one thing for Israel to send bombers into Syrian airspace and obliterate a massively expensive nuclear reactor that had been under construction for years. Syrian President Basahr Assad could apparently accept that. But talking about it in public? Now that was really going to hack the Syrians off — so much so they might start a war against Israel that they would almost surely lose.

No. The major reason for the silence, say former Administration officials and Asian diplomats, was an ongoing struggle over the Bush Administration's North Korea policy. The State Department, led by Secretary of State Condoleezza Rice and Assistant Secretary of State Christopher Hill, the U.S. point man for North Korea talks, still believe the only sensible path is the one they have been on for the last two years: trying, oh so patiently, to come to a deal with Kim that will at least eliminate his regime's plutonium program and the weapons it produced. Everything else, they believe, is secondary, a "sideshow," says a South Korean diplomat.

Set against them are the North Korea skeptics, led by Vice President Dick Cheney, who believe North Korea has no intention of giving up its nukes, no matter what diplomatic agreements it signs. The most vocal of this group is Bush's former UN representative John Bolton, who likens the State Department to a drunk searching for car keys near a lamppost, even though he knows the keys were lost in the bar. Asked by a passerby why he keeps looking near the lamppost, the drunk replies: "Because the light is better."

The hawks were delighted with yesterday's presentation about the Syrian connection, hoping that the North will be so angered by it that Kim will abandon the six-party talks, bringing down the curtain on what Bolton and others believe has been a feckless effort by the State Department. But Administration officials insist they don't expect that to happen. They believe North Korea 3.0 — the "shame on you" policy — may pay off. "I doubt they're walking away," says one diplomat involved in the talks. Yes, they say, North Korea's obvious and serial proliferation is a huge problem. That's why getting Pyongyang to mothball its plutonium program has already been a significant accomplishment. Convincing Kim to surrender his stash of weapons, and whatever plutonium it has left over, would be another big step forward, and should remain the focus of the Administration's policy.

Consider the reason given at yesterday's briefing in Washington for the North's motivation in helping Syria build a reactor: "Cash," said a CIA official. The North is a gangster state. It earns hard currency anyway it can— including selling weapons and its expertise in producing them. The point of the diplomacy is give Kim sufficient incentives—both economic and diplomatic—to get to a point where he and his regime don't need to do that anymore to survive. A return to what used to be called, in the early years of the Bush Administration, a "strangulation" strategy, only increases the incentive for Kim to behave badly, with very little hope that the Pyongyang government will disappear anytime soon, not so long as China, the North's only real ally, is doing what it can to forestall collapse.

Dealing with Kim's regime is an arduous, sometimes humiliating process. Christopher Hill privately has let it be known that it drives him nuts to be portrayed as aiding and abetting such an odious crowd. But bribing Kim is the only realistic strategy. When the next Administration takes over in January, with its own North Korea policy, it's going to come to the same conclusion, whether the President is named Obama, Clinton or McCain.

## **Yielding To N. Korea Too Often**

By Winston Lord and Leslie H. Gelb

Saturday, April 26, 2008; A17

The Bush administration gives plausible reasons for a bad nuclear deal with North Korea.

The proposed deal would lift key U.S. legal sanctions against the North while Pyongyang shelve many of the commitments it made in a prior agreement.

The United States would stomach North Korea's latest evasions because, for all of its risks, the deal at hand offers some movement on the most immediate problem, reducing North Korea's plutonium capabilities, and it keeps the door open to diplomatic solutions to eliminate Pyongyang's nuclear weapons.

But these reasons are not enough. If the administration accepts North Korea's hedging and renegeing once again, it will increase, not decrease, the likelihood of confrontation down the line.

Yes, sometimes Washington must hold its nose, make concessions and tolerate ambiguity. But not now. Not when it waters down compliance with a painfully reached prior agreement. If President Bush allows Pyongyang to brush away its pledges, he will reinforce its instinct for bluster and blackmail.

This latest tug of war began promisingly, with a joint statement agreed on in six-party talks in September 2005. In essence, it stipulated easing some American economic sanctions in return for Pyongyang's disabling its nuclear facilities and accounting for past activities.

The most recent U.S. statement of the North's primary obligations, made last Oct. 3, gave this update on Pyongyang's performance: North Korea was committed to "a complete and correct declaration of all its nuclear programs -- including clarification regarding the uranium issue -- by the end of the year." On plutonium, North Korea reportedly has stated levels at the low end of U.S. intelligence estimates. On uranium, Pyongyang has provided nothing. It merely "acknowledges" American assertions.

In diplomatic parlance, "acknowledge" rarely means "accept"; usually, it means "we hear what you say."

North Korea pledged to disable all its existing nuclear facilities. By most reports, progress did occur but is slowing. The Dec. 31 deadline for disabling the facilities at the Yongbyon plutonium plant was missed.

North Korea had committed "not to transfer nuclear materials, technology or know-how." The issue today is Pyongyang's evident role in a Syrian nuclear reactor that was bombed by Israel last September. Washington has until now correctly demanded a full explanation of this and other nuclear activities. Once again, Pyongyang has provided no information and merely proposes to "acknowledge" American assertions.

Despite these failures, the Bush administration seems ready to make a bilateral deal by which it would accept these "acknowledgments" and fulfill the U.S. commitments to cease applying the Trading With the Enemy Act and -- over the vociferous objections of our closest Asian ally, Japan -- remove North Korea from our list of state sponsors of terrorism. (While this would make Pyongyang eligible for economic benefits, the practical effects remain unclear.)

American officials rationalize this cave-in by asserting that the plutonium issue, which remains unresolved, is paramount. They count on correcting deficiencies on all issues in the next phase of negotiations and through verification. The latter, by the administration's own admission, will be extraordinarily difficult. Such an approach is slippery with any negotiating partner; with North Korea, it is perilous.

It is one thing to compromise in order to craft an agreement, keep difficult negotiations going and not let the best be the enemy of the good. It is another thing to let the other side breach compromises already reached.

President Bush's remarks at his meeting with South Korean President Lee Myung-bak last weekend suggest that he still may stiffen his stance. We hope so. Our fear, however, is that Bush, feeling the glow of a rare foreign policy accomplishment, may proceed to cement a legacy. He should consider the criticism he would heap upon his successor if he or she were to ink such a deal.

The two of us can hardly be counted as conservative die-hards opposing deals with Pyongyang. We believe that Washington and its allies are rightly committed to exploring even the remotest chance that Pyongyang might give up its nuclear weapons. While reaching for that larger goal, our negotiators can seek to cap North Korea's nuclear inventory and head off proliferation.

We oppose both abandoning the September 2005 agreement and allowing Pyongyang to eviscerate it. Better to let the talks continue than to make one-sided concessions. Better to sharpen North Korean compliance or -- failing that -- to string out our own.

Bush can sustain international unity by making clear that his goal is to hold Pyongyang to its 2005 commitments. This is the only way to preserve American credibility and bargaining leverage. It is also the only way to maintain political support in Washington for these difficult negotiations.

This is the legacy Bush should bequeath to his successor.

## **Belated Disclosure**

The Bush administration releases evidence regarding Syria's nuclear reactor, eight months after it was destroyed.

Sunday, April 27, 2008; B06

THE FACT that Israel bombed a secret Syrian nuclear reactor built with the help of North Korea was widely if unofficially reported within days of the strike last September. But the Bush administration's decision to go public with the considerable evidence it had about the reactor has placed that extraordinary event in a new political context. The disclosure, which administration officials said they initially withheld because of fears of triggering hostilities between Israel and Syria, was nevertheless overdue. As a member of the U.N. Security Council, the United States is obligated to report evidence that other states are violating international law against nuclear proliferation.

Experts pointed out that the U.S. disclosures, including pictures from inside the reactor, did not include evidence that Syria had obtained fuel or built the reprocessing facility that would be needed to convert plutonium from the reactor into bomb material. But Syria's failure to report the reactor's existence to the International Atomic Energy Agency, as required by the nuclear Non-Proliferation Treaty, and its quick demolition and burial of the reactor's remains after the attack require explanation -- and in its absence, sanction. IAEA chief Mohamed ElBaradei will be tested by the investigation he announced on Friday. Already he has politicized his position by trying to thwart Western pressure on Iran about its illegal nuclear program. Will Mr. ElBaradei hold Damascus accountable for its blatant violation of international law, or will he simply blame Israel and the United States? So far he has chosen the latter course -- and thereby given cover to the many governments who will want to do the same.

That answers are needed, too, from North Korea is an immense understatement. The regime of Kim Jong Il pledged to disclose all of its nuclear programs as one of the opening steps of a disarmament process. Now we know that North Korean technicians were continuing to work on the Syrian reactor after Pyongyang made its commitment in February 2007. Yet the Kim regime still refuses to report on its help to Syria. According to a deal under discussion with the Bush administration, it would merely "acknowledge" -- and then only in private -- U.S. "concerns" about proliferation.

Bush administration officials say they hope the disclosure of evidence about the reactor will prompt North Korea to be more forthcoming. They also acknowledge that they were under pressure from Congress to act before removing sanctions on Pyongyang as part of the new agreement. The question for the administration remains why it would grant further concessions to North Korea before Pyongyang comes clean about its proliferation to Syria as well as any other deals it may have made. The State Department argues that such an "accounting" will come through a verification process.

Officials also say that by sustaining the "six-party" diplomacy, they are gradually opening a totalitarian state to change. Still, the process won't work unless North Korea truly intends to disarm, rather than merely extort aid and political favors from the West. What's needed is a diplomatic strategy that forces Mr. Kim to choose between his weapons and engagement with the outside world. That's why dropping the requirement for a full disclosure by Pyongyang is risky -- it encourages the regime to believe it can avoid that decision.

## **More on Syrian Reactor Bombing; From an Informed Reader**

*An informed reader writes:*

What little information provided in the CIA videotape concerning the destruction of the purported Syrian reactor only provokes more questions.

The alleged reactor is described, because of its dimensions and shape, as a duplicate of the North Korean reactor at Yongbyon. The reactor at Yongbyon is a rough copy of an old British design. It is graphite-moderated and cooled with gaseous carbon dioxide. Its core is composed of a large number of highly-purified graphite blocks. For example, each of the first two Magnox reactors at Windscale in the UK used 2,000 tons of graphite. Even if this purported Syrian reactor vessel were half the size of one of the original UK reactors, it would require roughly 1,000 tons of graphite. That's 14,400 cubic feet of highly-purified graphite. Would all official entities fail to notice the production and transfer of that amount of highly-refined graphite to Syria?

The voice-over on the CIA videotape asserts that the reactor in Syria was "nearly completed." If the plant were "nearly completed," those graphite blocks would have been substantially in place. Bombing and fire would have spread bits of carbon all over the site, or scattered whole blocks of graphite around the site. The "after" photos didn't seem to indicate that this happened.

If the reactor were substantially complete, neutron-absorbing boron-10 carbide (or possibly cadmium alloy) control rods would have been installed. Had those been burned or exploded in the bombing, those, too, would have left a chemical signature on the hills surrounding the site and in the prevailing winds. As far as I know, this hasn't been discussed.

Then, too, there is the matter of fuel rods. Syria is reported not to have uranium yellowcake stocks in appreciable quantities. (One particularly large phosphorite field, the Charkiet formation, is known to contain uranium, but the phosphate fertilizer plant built to process that ore was done by a Swedish company which would certainly alert the IAEA if there were non-compliant diversion. Moreover, Syria has cooperated with the IAEA in the past to develop its commercial uranium extraction processes, but those have not progressed, according to SIPRI.) There's no evidence presented that Syria has built fuel processing and fuel rod assembly facilities. That would suggest production elsewhere, and such production can be tracked. So, if it was almost complete, where are the fuel rods?

The primary weapons benefit of such a reactor is its ability to be refueled on the fly, so to speak (it's necessary to get the fuel rods out of the reactor before the optimum quantity of plutonium-239 is degraded by neutron capture to less suitable isotopes), so, why does U.S. intelligence say they have "low confidence" that the plutonium that might be produced is for nuclear weapons? It must be that

Syria does not have the necessary fuel processing, fuel rod assembly and spent fuel reprocessing plants, and there's no evidence of bomb-manufacturing facilities (all this infrastructure should ideally go forward concurrent with fuel production to produce a bomb in the shortest period of time); does this suggest that the purpose of the facility might not be nuclear in nature, or that it was nuclear, but would have had a non-weapons purpose? If there's no evidence for the existence of the rest of a weapons-making complex, how credible is the claim of "near completion" of a reactor which is well-suited for producing plutonium?

So far, the government's primary evidence seems to be a photo of a North Korean who is reputed to be NK nuclear scientist Chon Chibu, standing next to someone "believed to be his Syrian counterpart" (quote from the London Times). That photo, as well as others, likely was provided by the Mossad, so its provenance is in question. Given that the Israelis bombed the site, one can't evade the reality that they're an interested party in the matter.

What is shocking in this assertion is the lack of physical evidence available for independent inspection, and the apparent complete failure of U.S. authorities to seek international inspection via the IAEA before the Israelis bombed the site in question, despite the fact that the U.S. was apparently aware of Israeli intentions well ahead of time. Syria has been a ratified signatory of the NPT since 1969, making it obligated to accept inspections. If, as the CIA asserts, the Syrian facility has been under construction since 2001, there was more than ample time to inform the IAEA of a signatory's possible failure to abide by the treaty. Repeated unannounced overflights of Syrian territory by Israeli jets in recent years indicates long-term planning of this mission.

Possibilities? The Bush administration might prefer to use this event to imply nuclear weapons production on Iran's part, because it is an ally of Syria, or the claims of North Korean assistance might provide cover for eventually abandoning the six-nation talks involving North Korea and provoking them in some way. Suggestions that the Israelis wanted to use the bombing raid to penetrate and compromise Syria's Russian-built air defenses preparatory to a future attack on Iran are not wholly out of the realm of possibility.

It's possible that the Syrians were building a bomb-fuel reactor with North Korean assistance, and imagined, wrongly, that they could escape detection. Certainly, North Korea's economy is so awful that they would be desperate for revenues. But, there's no physical evidence of such activity which has been independently verified, and the Bush administration's record on this sort of thing is, well, dubious, at best. Nor can one discount Syria's previous cooperation with the IAEA, and the necessary evidence would have come from an IAEA inspection. It's also possible that the Syrians were building something military in nature that they wanted kept secret, and which had nothing to do with a nuclear program, but which alarmed the Israelis, anyway, such as an early warning facility, ground-based laser, something along those lines.

The CIA video depends heavily upon computer models, and those models add substantial pieces of equipment not shown in the photos of the "nearly completed" facility. Remember that Colin Powell depended upon artists' renderings of "mobile bioweapons labs" instead of physical evidence, and that Rumsfeld used cartoonish illustrations to show lavish al-Qaeda complexes, replete with living quarters, office space, truck parking and ventilating systems, like the Islamist equivalent of Cheyenne Mountain, buried inside Tora Bora. Those, too, were never found.

One more final consideration: the Yongbyon reactor, from the descriptions by inspectors in 1994, is a real hunk of junk, by contemporary standards. The inspectors could tell from the condition of the spent fuel rods that there were many operating problems and shutdowns because of problems. Nuclear safety at the site was marginal to non-existent. The bomb test using plutonium from it was very likely a fizzle yield. If the Syrians got a duplicate copy of the Yongbyon reactor, as the CIA claims, they were very likely wasting their money.

The real question is: If any suspicion surrounding the nuclear reactor's state of construction, purpose and provenence existed, WHY NOT JUST VISIT IT???

At least give Syria the chance to obfuscate and dissemble before lobbing bombs.

At 5:19 PM, Anonymous cobaltbob said...

Why, if Syria is so innocent, did they not lodge a complaint after the bombing?

Why did they instead just silently and very speedily clean up the mess?

Why no real howl of protest of Israel's actions by it's Arab neighbors?

The bombing may have been premature. Doesn't mean it wasn't necessary.

At 5:30 PM, Anonymous Anonymous said...

Let me start by saying I am not one to believe much of what comes from the Bush Administration. I have a degree in chemical engineering and know just a bit about reactor design. If that wasn't a nuclear reactor, then what was it?

If the images are to be believed, then the reactor vessel took up a rather large percentage of that building leaving little room for other processing equipment. If the facility was to generate a product other than heated water and plutonium enriched spent reactor fuel, one would expect to see more processing equipment.

It should be noted that if it was a reactor, it would take more than a year to fully react the reactor fuel leaving time to build a reprocessing plant.

At 9:57 PM, Anonymous Andy said...

Your "informed reader" is, I'm afraid, not so informed. Here are only the most blatant and obvious errors:

The alleged reactor is described, because of its dimensions and shape, as a duplicate of the North Korean reactor at Yongbyon. The reactor at Yongbyon is a rough copy of an old British design. It is graphite-moderated and cooled with gaseous carbon dioxide. Its core is composed of a large number of highly-purified graphite blocks. For example, each of the first two Magnox reactors at Windscale in the UK used 2,000 tons of graphite.

First, the Syrian reactor is not a "duplicate" of Yongbyon but it is the same basic design. Secondly, the British reactors "informed reader" refers to are actually not the British MAGNOX reactors, but the older Windscale piles. Piles are the simplest reactor design and don't use any sort of containment and so are more prone to fires. Then there is the rhetorical question: Would all official entities fail to notice the production and transfer of that amount of highly-refined graphite to Syria? Sure that's possible. Iran, for example, secretly imported 500 tons of uranium yellowcake in 1991 and uranium is much more controlled than graphite. Even still, one might ask in response, "Why would Syria, at great expense, build a graphite moderated reactor if it did not have a secure source of graphite?" The same question can be asked with regard to the reactor's uranium supply. Why would a relatively poor country like Syria go to the great expense of building a reactor it could not use?

"Informed Reader" continues:

If the plant were "nearly completed," those graphite blocks would have been substantially in place. Bombing and fire would have spread bits of carbon all over the site, or scattered whole blocks of graphite around the site. The "after" photos didn't seem to indicate that this happened.

If this were a pile-type of reactor, then the above comment would be true. But in MAGNOX-type reactors, the graphite is contained in a steel pressure vessel, which is in turn contained in a thick reinforced concrete bioshield. We can see from the post-strike satellite pictures that the round outer bioshield was probably damaged, but was not significantly breached much less blown apart and was later buried after the rest of the building was dismantled. The pressure vessel inside that bioshield (containing the graphite) likely was damaged as well, but not enough to cause graphite to fly about outside the facility nor cause it to catch fire.

"Informed Reader" continues:

The primary weapons benefit of such a reactor is its ability to be refueled on the fly, so to speak (it's necessary to get the fuel rods out of the reactor before the optimum quantity of plutonium-239 is degraded by neutron capture to less suitable isotopes), so, why does U.S. intelligence say they have "low confidence" that the plutonium that might be produced is for nuclear weapons?

The "low confidence" statement is a bit confusing at first. There are two basic judgments the intelligence community (IC) uses - what the IC **knows** and **what** the IC judges. The "low confidence" assessment is based on the former - IOW, the IC doesn't have much evidence of activities like

reprocessing and specific work on nuclear weapons. At the same time, however, the IC judges that this reactor is most likely part of a nuclear weapons program because of its design and Syrian activities and secrecy both before and after the strike. IOW, building this particular type of reactor, and building it covertly is at least strongly indicative of a nuclear weapon's program, even if little real evidence of weaponization work yet exists. As an analogy, suppose you saw your spouse enter a hotel room hand-in-hand with someone else when he/she was supposed to be at the store. You would naturally and rightly conclude your spouse was having an affair, even though you did not look in the room for confirmation that illicit sex was indeed occurring. IOW, you would have "low confidence" on a pure evidentiary standard that sex took place, even though the circumstances (entering a hotel room with another person, and lying about it) are quite convincing by themselves. Similarly, the mere existence this reactor and the Syrian actions before and after the strike to cover up any evidence is equivalent to seeing your spouse enter a hotel room with another stranger.

"Informed Reader" continues:

If, as the CIA asserts, the Syrian facility has been under construction since 2001, there was more than ample time to inform the IAEA of a signatory's possible failure to abide by the treaty.

As the text of the DNI briefing indicates, the IC knew of this structure for some time but didn't get the first indications that it was a reactor until the Spring of 2007. So, at most, the US had a couple of months and much of that time was undoubtedly spent confirming and verifying the information along with reanalysis of old information in light of the new.

That said, I would have much preferred informing the IAEA at the time even though the Agency's authority to demand access to the site was limited because Syria is not a party to the NPT's additional protocol.

At 7:07 PM, Blogger Rowan Berkeley said...

let me just caution that "the U.S. was apparently aware of Israeli intentions well ahead of time" was itself, initially, only an Israeli claim. CIA may be pretending it is true, or at least not denying it, without its actually being true at all. I personally don't believe they told the US before the attack. There is no evidence they did, and I think it's implausible. There is an extraordinary strand in the current hasbara of exhibitionistic arrogance, which amounts in some cases to saying "The US told us not to do it but we went ahead anyway" - an absurd, truly absurd, claim. Here it is, in fact - Yossi Melman:

<http://www.haaretz.com/hasen/spages/978107.html>

Last update - 22:55 27/04/2008

## **Getting carried away**

By Yossi Melman

Even though briefing Congress and the press kept Central Intelligence Agency Director, General Michael Hayden, busy last week, he still found time last Thursday to meet with senior officers in the agency and to praise them.

He told them that they could be proud of the team effort and cooperation that exposed Syria's secret construction of a nuclear reactor, and complimented them for their skillful intelligence gathering and its careful analysis. Even though it is obvious the CIA only revealed a smidgen of all it knows, it seems that the director got a little carried away with his praise.

The CIA had intelligence about the construction of the suspicious structure in Syria from the onset, most likely since 2001. It seems that most of the information was based on spy satellite photos. This intelligence was bolstered by information received following the investigation into the activities of Dr. A.Q. Khan, the father of Pakistan's nuclear program, who was exposed as a major proliferator of nuclear technology.

Khan confirmed he had visited Syria in the past and offered his knowledge and wares.

All this should have raised an alarm with the CIA that something nuclear was taking place in Syria. But according to U.S. media reports late last week, the Americans caught on only in Spring 2007, after receiving photographs of the reactor and its environs, which were taken by Israeli agents.

The photographs, according to the reports, confirmed without a doubt that the site was a nuclear reactor.

However, even then Bush administration officials - first and foremost Secretary of State Condoleezza Rice - sought to dissuade Israel from attacking the reactor. According to reports, the administration tried to convince Israel that it could use the information to pressure Syria into concessions in Lebanon, to stop its support for Hamas and to stem its involvement in rebel activities in Iraq.

However, Israel - according to reports that are based on senior administration sources - refused.

The reports state that for Israel the construction of the reactor constituted an "existential threat"; therefore, Israel demanded that it be allowed to take the only action possible: to destroy the reactor in a military operation, prior to the introduction of nuclear fuel that would enable the Syrians to produce plutonium.

## **Syriana**

By: Professor Foland

Sunday April 27, 2008 1:02 pm

(While I have been trying to find a resolution to MI's DNC delegation in the last few days, the Admin put on their nukes in Syria dog and pony show. Partly because I didn't have the time to do the Syria presentation justice, and partly because Professor Foland--whom you know from his great comments--has a lot more expertise on this area than I, I asked him to do a post assessing the presentation. Thanks for the really informative post, Prof! -ew)

If there's one thing I've learned over the course of this Administration, it's that if Dana Perino one day announces that the sky is blue, I will be forced to assume that an alien invasion has commenced with the total ionization of Earth's upper atmosphere.

With that in mind, there's an awful lot of cognitive dissonance for me in analyzing the evidence on the raid (apparently named "Operation Orchard" by the Israelis) on a Syrian desert site (apparently named "Al-Kibar"). Having started my own blog motivated by "the incredible amount of lies & hyperbole on the Iran situation of early 2006", I don't find it easy to accept anything this Administration puts forth as evidence. I'm having all this difficulty because the pictures they showed last Thursday are clearly pictures of a nuclear reactor.

In what follows, I will lay out the history of what we've known about Operation Orchard and al-Kibar, what the latest photographs show, and what questions we should probably be asking.

A little bit about what I know. My training is in the experimental science of particle and nuclear physics; post-moniker-choice I left academia for more recent experience in applied device engineering in the field. This means I am not a detailed expert on the engineering design of nuclear reactors or weapons, but I do have basic familiarity with the field. I'm not an image analyst, so I'm not going to comment very much on whether the shadows in the pictures all line up the way they should. (Of course, if something very technically wrong appeared in the pictures, I'd certainly be posting "zOMG those aren't dilithium crystals!".)

It should also be said that any sort of technical look at the images and videos presupposes that the images are what they are purported to be--taken on the ground at the site in Syria. I'll return to the question towards the end; but in the meantime, for the sake of argument the provenance is granted.

Finally, I'm trying to be careful to distinguish evidence that is conclusive from evidence or reasoning that is suggestive or even powerful. I do have an opinion on whether this was part of a weapons program; but I don't feel my opinion was compelled by the available evidence.

### **What We Knew Before Thursday**

1. Israeli jets flew over Syria on Sept. 6 ("Operation Orchard")
2. Syria lodged no particularly strong protests

3. No radioactivity was released as a result of the overflight (I could find no news stories to this effect--but that's precisely the point. Within a few hours of Chernobyl, radioactivity readings were going nuts in Europe.)

4. There was a 47 meter x 47 meter x 24 meter structure ("Box on the Euphrates") erected a few hundred meters from the Euphrates River at 35d42m28s(N), 39d49m59s(E).

5. This structure was destroyed between August and October

6. A new building, 60 meters x60 meters x 15 meters was erected on top of the old site between October and January

7. An apparent water-treatment facility 5 km to the northeast was built prior to August, and connected by pipe to the rebuilt site after October

8. American intelligence had noticed the buildup at the site in 2003 but did not conclude it was threatening.

9. American officials were exchanging intelligence with Israel in advance of the Sept. 6 strike

Note I'm trying here to be as precise as possible about what was known. For instance, it's pretty clear that 1,4, and 5, taken together, add up to "Israeli jets destroyed the structure." But the site coordinates given here were (highly informed and ultimately correct) speculation on the part of the folks at the independent institute ISIS, who spent many hours in the yeoman's work of poring over 2000 square kilometers of satellite images to find the likely site of (4). Neither the US, Israel, nor Syria ever provided or confirmed the location of the site before Thursday.

I'm being careful about this because for a while there was considerable confusion about the location of the strike. There are two other largish buildings and an airfield in the vicinity; and there have been reports that the Israeli jets also overflew Turkish airspace. (According to Defensetech, the Turkish border is where Syrian air defenses were weaker, and Israeli jets chose to enter Syrian airspace there.) There were early reports of a strike on an agricultural phosphorus facility or even a port facility; and even speculation that the raid had strick nothing or had failed in its mission.

### **What The Video Shows**

The CIA briefing video now clearly confirms the ISIS location; the imagery there is of the same canyon. The "Box on the Euphrates" is in fact "Al-Kibar". The animated video segments are virtual reality; they are relatively accurate concerning the local geography (a canyon off of the Euphrates) and size of the building, but they are a model and should not be taken as primary evidence in any way.

Here was the question posed in the comments at armscontrolwonk back on October 26, 2007:

Finally, let's assume for a minute that there was a large, round, reinforced concrete cylinder inside that building. Are there any alternatives for such a facility besides a reactor?

Nobody produced an alternative. Note that the pressures on the interior of the reactor vessel are equivalent to a water depth of about 400 m.

There are four significant stills, all purported to be taken at the Syrian site:

1. A degraded satellite photo taken soon after the raid showing a large circular structure in the center of the building
2. A still taken during construction, outside and under tarps, of components of what appear to be a steel reactor pressure vessel for a reactor
3. A still taken from inside the main building, showing the rebar structure of a large cylindrical tank. nb swimming pools are made with a single layer of rebar, and even diving wells are only 5 m deep
4. A still taken from inside the main building, showing the rod heads. (Note: the height of the facility must include sufficient headroom for removal of fuel rods and control rods).

Taken together and granting provenance, to me these stills are conclusory: that's what a nuclear reactor looks like. Alternatives must provide a good engineering reason to have a cylindrical multiply-ported steel-lined concrete vessel, at least 16" thick and 5m deep, quadruply reinforced with rebar, topped by a geometrically regular pattern of rod ports.

### **Some Other Notables from the Video**

- \* A satellite picture showing early structure stages which were later covered by a "curtain wall" that gave rise to the final Box-on-the-Euphrates shape
- \* A ground-level photo showing the "inside building" under the curtain wall, looking much like Yongbyon
- \* A picture showing two people standing for a picture, one of whom also attended US-North Korean Nuclear Talks. Did you hear Mohammed Atta met Czech intelligence?

### **What We Can Reasonably Assume**

If the provenance is granted, then it is safe to assume that the Syrians were building, but not yet operating, a nuclear reactor capable of plutonium production at the site of the Box on the Euphrates, and that they have rebuilt a second structure atop the destroyed remains of that reactor. It is safe to assume no radiological traces will be present to damn the Syrians. One may safely assume that absent extremely intrusive IAEA inspections (which I suspect are unlikely), the reactor core components will never be physically recovered. The reactor components are broadly consistent with being a magnox reactor similar to such reactors built by the UK, France, and North Korea. One may also assume that US officials made no substantial attempt to dissuade the Israelis from the strike.

### **Is It A Weapons Program?**

So, with the provenance caveat, this was a nuclear program. Was it a research program, an energy program, or a weapons program? The evidence we have to date is that the reactor could have served any of the purposes--remember, it may not have been complete. Magnox designs have in the past been used to produce weaponizable plutonium. They have also been used for research, and for power. Nothing in the presented evidence is conclusive to me, one way or another.

There does not seem to be any hint so far of a plutonium reprocessing facility. If the intent is to produce plutonium, the uranium fuel rods, after being in the reactor for some time, must be removed. Some of the uranium will have transmuted into plutonium. The rods need to be dissolved, the

plutonium removed, then the untransmuted uranium recovered for reinstallation into the reactor. No building has been identified that might serve as a reprocessing center. Magnox reactors in particular have some special problems, so that reprocessing facilities tend to be located nearby.

### **The CIA's Three Conclusions**

The CIA video begins and ends with three "key conclusions." The conclusions are in italics, followed by my take.

*Syria was building a gas-cooled, graphite-moderated reactor that was nearing operational capability in August 2007. The reactor would have been capable of producing plutonium for nuclear weapons, was not configured to produce electricity, and was ill-suited for research.*

If you grant the photo provenance, the construction of a nuclear facility is very well attested by the evidence presented, and certainly consistent with magnox. Magnox designs are gas-cooled and graphite-moderated. I don't know enough to say conclusively that it is consistent solely with a magnox design. The operational capability in August 2007 is a reasonable inference if the only purpose was for plutonium production, but is not specifically attested to by any presented evidence. The facility would have been capable of producing plutonium for a weapon. No evidence presented leapt out to me as "ill-suited for research". The electrical-configuration question is attested by an apparent lack of local power lines, but logically this may be related to the operational capability question. (i.e. perhaps it was an unfinished facility.) Note that the briefing does not present a conclusion that this was for a weapons program--because there's no evidence on that question one way or the other.

*The reactor was destroyed in early September 2007 before it was loaded with nuclear fuel or operated*

That the site was destroyed before nuclear reactions were initiated is well-attested in the public evidence.

*We are convinced, based on a variety of information, that North Korea assisted Syria's covert nuclear activities, both before and after the reactor was destroyed. Only North Korea has built this type of reactor in the past 35 years.*

I find this conclusion very weak; nothing presented made this seem any stronger than a simple assertion. It was asserted that there is considerable evidence; none was presented. The North Korean Yongbyon complex is said to be the precursor design for the Syrian al-Kibar reactor. The statement "only North Korea has built this type of reactor in the last 35 years" is a little bit misleading; the time period of 35 years was chosen because 40 years ago the UK built them. In fact the North Korean Yongbyon design is actually copied in turn from a British design (specifically, Calder Hall). The UK still operates several of this magnox design even today. A country with little technical ability and scant resources will find much to like in the magnox design: it requires unenriched uranium, low input power, modest technical requirements (mainly in graphite purification), and relative ease of operation. The design is also very thoroughly described in the literature, being relatively obsolete. Finally, as Cheryl Rofer has noted, the detailed design of the control rod and fuel rod ports is actually different in the photos of al-Kibar than in existing photos of the 25 MWt reactor at Yongbyon.

## Provenance

If the pictures are of the site, then Syria was building an undeclared nuclear facility. So--were they of the site?

Now we're in the world of shadows, angles, oblique transformations, Photoshop, etc. I can't tell you the answer.

I'll just make a few observations on the subject:

- \* A number of colleagues have expressed a surprising level of skepticism concerning the provenance. Not specific "for reasons X and Y I think these photos were taken somewhere else", but basic variants of "you've seen how these people operate, why should we believe these photos are real?" This was surprising even to yours truly, who thinks Dana Perino would lie about meteorology.
- \* A scientific experiment that is gunning for a big result generally leaves a trail of less remarkable results first, which establish that the experiment is capable of measuring other things that it ought to be able to measure and which have been previously established. That's because scientists expect others to be very skeptical--so they build in a reinforcing chain, back to what's already known, in their arguments from the beginning. In the case at hand, knowing there would be skepticism about the provenance (especially given the history), if I'd been the briefing officer, what would I have done? I would have found and presented a series of photographs that put together a traceable chain of features from the local terrain down into the reactor core. That's because the local terrain is easily independently verified, by commercial satellites and even Russian/Chinese satellites. One way (but not the only way) would be to have a series of photographs from outside, in the door, along the halls, into the main hall. They claim to have a very large volume of photographs of which only a few are shown. It troubles me nobody thought it important to put together that chain, because it would have reduced the space of skepticism to "it's a photoshop world". Instead, there are only a few photos, all tightly cropped. (Source protection seems inane here. The steel liner image, and the interior rebar image, can already likely be dated to within a week or so by the relevant Syrian authorities.)
- \* To me, the difference wrt the Powell Iraq presentation, is that in that case, a lot of inconclusive images were shown as "illustrations" to go along with bald assertions about what unshown intelligence concluded. Here, the conclusions can be drawn directly from the photos--to the extent they are genuine.
- \* The satellite still photo, described as still photo #1 in "What the Video Shows", is particularly key to the provenance. I'm willing to bet that airspace (space?) over the al-Kabir sight was crowded with reconnaissance satellites for several weeks after the strike. If the satellite image were flatly inconsistent with, say, Russian images, I imagine the Russians would take great joy in exposing an American forgery.
- \* The use of a forgery in making a case for WMD's is not unknown in this administration.

And with those, pass along an observation from a colleague:

We're outsourcing our intelligence-gathering to agencies (e.g., the Israeli government) that clearly have an institutional bias, so we cannot be certain of whether the raw intelligence can be trusted or not. It's bad enough that we

cherry-picked intelligence to go to war in Iraq, but we're at risk here of having those cherries picked by others and delivered to us...

There are some convincing satellite images of the cylindrical vessel, and there is generally wide availability of third-party satellite images that could likely falsify what's shown. So given the lack of specific contrary evidence, and despite significant reservations, if you put a gun to my head and said I had to pick, on "preponderance of evidence" I'd go with a genuine provenance. It's not even close to "beyond a reasonable doubt".

### **IAEA, NPT, and the UN**

One of the many tragedies of the Iraq war is that the formation of UNMOVIC in the run-up seemed like a possible model for a more intrusive anti-proliferation regime. Could it have provided a path to a more effective set of additional protocols to the Nuclear Non-Proliferation Treaty (NPT)? We'll never know.

Mohammed El-Baradei has censured the US and Israel for providing their information only now at such a late date. (Please note, he has not censured them for the truth or falsity of the information.) The IAEA can only barely demand access now to the site; Syria is not going to grant access; and even with access, the relevant evidence has been demolished and buried under a building. Had IAEA been notified instead of scrambling the F-16's, the IAEA might have had a chance to prove its relevance. And a successful proof of relevance would have been good for the world, thought perhaps not for UN-haters centered in Washington, DC. (In fairness, one should also weight that with the possibility of an unsuccessful proof of relevance...)

In the comments on Friday, klynn provided a nice timeline of UN and IAEA related actions since the strike.

The US administration, having been pre-warned by the Israelis, made a policy choice not to notify the IAEA. One can speculate why, but really it's incumbent upon the administration to explain to Americans why they made that choice.

### **Rhetorical Links to Iran**

I feel confident that we are going to be hearing a lot more of this sort of thing (Adm. Mike Mullen):

It should serve as a reminder to us all of the very real dangers of proliferation and need to rededicate ourselves to prevent the spread of weapons of mass destruction, particularly into the hands of a state or a group with terrorist connections.

In case that was too subtle for you, the SAO at the CIA press briefing was a little less coy in spelling it out:

SENIOR ADMINISTRATION OFFICIAL: **With respect to Iran**, the Syrian episode reminds us of the ability of states to obtain nuclear capability covertly and how destabilizing the proliferation of nuclear weapons in the Middle East would be.

(Emphasis mine.) Iran was also mentioned in this briefing as "potentially interrelated", "the same kind of cooperation between North Korea and Iran", and "But is there something going on there that resembles this program that we we're talking about in Syrian, in Iran?" It would be irresponsible not to speculate, don't you think?

In the same Syria briefing, Iran also was mentioned in the context of the declassified NIE:

**But our unfortunate choice of words in our NIE caused you all in the press to misrepresent what we were trying to explain. Three parts of the program; they halted one narrow piece of it, which was a secret program – weapons-head design. They continue with fissile material; they continue with ballistic missile systems for delivery. So we don't know where it is at the moment.**

(Emphasis mine.) This made me nearly choke on my breakfast. Are they really using this Syria episode to retract the crystal-clear statements in the Iran NIE?

Steinn Sigurdsson at Catdynamics has some thoughts on what the Israeli willingness to strike al-Kibar might signal for the upcoming planned turn-on of the Iranian Arak facility.

## **Learning More**

The original source for much of the information about the al-Kibar site has been the Institute for Science and International Security. There has also been very credible analysis by the posters and commenters at armscontrolwonk, and in a series of posts by Cheryl Rofer at whirledview. There have also been some very interesting threads at moonofalabama, but I simply have not followed the commentary there long enough to have any idea how reliable it is relative to the others I know well. The Federation of American Scientists has a 735-page tome of pretty much every press report, image, satellite photo, or commentary that has related to the al-Kibar site. The FAS is an outstanding site in general for technical security information. Globalsecurity provided a very complete and credible analysis back in November. And I provide occasional commentary on matters nuclear at my own place, nuclearmangos.

## **Summing Up**

The CIA has published pictures that clearly show interior, unplaceable shots of the steel and reinforced concrete components of a nuclear reactor pressure vessel, an interior and unplaceable shot of a nearly completed reactor core, and a placeable satellite image of the damaged al-Kibar structure showing a large round structure in the center of the building. To me it is not conclusive, but more likely than not, that the provenance is genuine and the images indeed show an undeclared nuclear facility at the Syrian site of al-Kibar.

## **Questions We Need To Be Asking**

The nuclear situation in the Middle East is going to get more complicated as a result of actions on all sides of this--Syrian, American, and Israeli. American servicemen and women most of all, but all of us ultimately, will surely in the coming months be bearing greater risks than we did before.

\* We deserve an answer to why American policy makers made the policy choice to pursue this through means other than the IAEA.

\* We deserve an answer to the question what impact bypassing and undermining the IAEA was expected to have in our difficult situation with respect to Iran.

\* Reporters need to be asking "pull on the thread" type questions, even where there's no specific reason for doubt. Some of this went on in the CIA briefing (i.e. "were American capabilities involved in the Sept. 6 raid?") but reading the transcript you can practically hear the reporters turning to one another and saying, "These are not the droids we are looking for."

\* We deserve an answer to the question of what national technical means of verification the US can make available to the IAEA to settle the question once and for all should access to the site be gained.

\* We deserve to know how, why, and when the first agnostic American assessment of the nature of the site was changed to an assessment that it was a nuclear reactor.

\* And finally, we deserve better than having to guess whether these images have an indisputable provenance. Given what's at stake, and the history of our village with wolves, this administration owes it to us to prove it.

## REVIEW & OUTLOOK

### Plutonium on the Euphrates -- II

April 29, 2008; Page A12

We finally know what Israel bombed in the Syrian desert on September 6 last year, and it isn't pretty. After seven months of silence, the Bush Administration confirmed last week that the target was a nuclear reactor being built with the aid of North Korea.

The prospect of nuclear technology in the hands of another terrorism-sponsoring state is scary enough. Worse is the notion that Syria's reactor is no big deal. That's the interpretation being shopped in Washington by anonymous Administration officials, presumably at State, who have been quoted as saying the CIA has "little confidence" that the goal was to build a bomb.

The no-big-deal thesis expounded by the President's men directly contradicts their boss. After briefing Congress behind closed doors, the White House put out a statement expressing "confidence" that "this reactor was not intended for peaceful activities." CIA Director Michael Hayden said yesterday an operational reactor could have produced enough plutonium to make one or two nuclear bombs.

No one disputes that the Syrians were cooperating with the North Koreans on a nuclear facility like the one currently being shut down at Yongbyon as part of the six-party denuclearization process. The previously classified intelligence shows striking similarities between the Syrian facility, going up at a desert site called Al Kibar, and Yongbyon. Other evidence includes photos of a man identified as a North Korean nuclear expert in Syria.

Nor does anyone – other than the Syrians – deny that Damascus was disguising Al Kibar from the world. The secret reactor is also a violation of Syria's obligation as a signatory of the Nuclear Non-Proliferation Treaty. Given this background, it would be folly for anyone concerned about the national security of the U.S. to conclude that Syria's intention wasn't some sort of nuclear program, or capacity.

It is also disturbing that the Administration first tried to persuade the Israelis that Syria's outlaw actions could be settled with diplomacy, and then sat on its conclusions for seven months after Israel bombed the site.

This kind of behavior is typical of the "arms control process" that Mr. Bush has embarked on with North Korea, where violations get explained away or ignored if the violator merely promises not to do it again. Pyongyang's nuclear aid to Syria was still going on after its February 2007 pledge to give up all its nuclear programs and stop proliferating.

Meanwhile in Tehran, it's easy to imagine what the mullahs are making of all this. Washington may be talking tough again about Iran, but its leadership can see what North Korea is getting away with. If Pyongyang can pursue a nuclear program with impunity – and in violation of its promises – why not Tehran?

The same goes for Iran's support of the insurgencies in Iraq and Afghanistan. The Chairman of the Joint Chiefs of Staff, Admiral Mike Mullen, accused Iran on Friday of stepping up arms transfers and training support to insurgents fighting American troops in both countries. But Iran has been killing American soldiers, directly or indirectly, for years and suffered no consequences. Why should it believe it's any different now?

As the news of North Korea's violations in Syria became public, Chris Hill, chief U.S. negotiator with Pyongyang, kept up his happy talk about the nuclear deal, calling the latest talks "productive." The Administration has already agreed to let North Korea renege on its promise to provide a full accounting of its nuclear program. It is widely expected soon to start the process of removing the North from the U.S. list of state sponsors of terrorism and the Trading With the Enemy Act.

By insisting that the nuclear accord proceed even as the latest information of Pyongyang's proliferation becomes public, Mr. Hill and his boss, Condoleezza Rice, are making the President look foolish. The intelligence about the Syrian reactor came out largely because of pressure from Congress, which demanded to know what happened on September 6 before it would consider whether to allow the sanctions on North Korea to be lifted.

This affair was not well handled from day one. Now Mr. Bush is allowing his diplomats to put about the belief that he values any deal over no deal. That leaves it to Congress to blow the whistle.

## Operation Orchard

Late last week, two senior US intelligence officials and a senior administration official provided background briefings to Congressional committees and the media on what they said was the evidence of North Korean involvement in a covert Syrian nuclear reactor. The facility was destroyed by Israeli air strikes last September, in an operation dubbed "Operation Orchard" that was subject to an Israeli news blackout.

“What we’re going to discuss is a nuclear reactor,” one senior US intelligence official told (.pdf) the media. “It was constructed by the Syrians in the eastern desert of Syria along the Euphrates River on the east side. The Syrians constructed this reactor for the production of plutonium with the assistance of the North Koreans.”

“Our evidence goes back an extended period of time,” he continued. “In the spring of last year, we were able to obtain some additional information that made it conclusive. And so, we engaged in this policy process of now that we have the evidence, what do we do about it? The evidence concluded a nuclear reactor, as I mentioned, constructed by the Syrians, started probably in 2001, completed in the summer of 2007. And it was nearing operational capability.”

(You can read the transcript of the intelligence officials' full remarks here (.pdf), and see the video the officials presented here.)

The briefing had been much anticipated. Since the Israeli air strikes last September, hawks opposed to US negotiations with North Korea over its nuclear program had argued that if Israel or the US revealed what Israel had hit in Syria, North Korea would be exposed as proliferating nuclear technology abroad and in violation of the spirit of the negotiations.

Calling the State Department’s diplomatic efforts with Pyongyang "feckless," noted hawk, former US ambassador to the UN John Bolton, wrote in a Wall Street Journal oped August 31, 2007 – intriguingly precisely one week before the Israeli Air Force operation: “We know that both Iran and Syria have long cooperated with North Korea on ballistic missile programs, and the prospect of cooperation on nuclear matters is not far-fetched. Whether and to what extent Iran, Syria or others might be ‘safe havens’ for North Korea's nuclear weapons development, or may have already participated with or benefited from it, must be made clear.”

But though skeptics of US-North Korea diplomacy such as Bolton had long pushed for the information on what had been struck in Syria to be disclosed, when the briefing came late last week, some media reports suggested the timing of the briefing was intended not to scuttle the US-North Korea deal, but rather, to push Pyongyang to finally come clean on its alleged proliferation activities as a way to accelerate a peace settlement. And what's more, the briefing came as Israel and Syria had both spent weeks signaling their interest in pursuing possible engagement and their anxiety to avoid an escalation of hostilities.

“Based on my own ‘uninformed’ perspective, the big question is not whether the Syrians were building a nuclear reactor, but whether it was actually close to becoming operational (which raises questions

about the timing of the strike) and the almost total absence of any evidence of what kind of plans the Syrians may have had for any plutonium that might have been produced at the plant if and when it went into operation,” said former US National Security Council official Gary Sick. “Although some will fix on the anomalies to cast doubt on the very existence of such a project, the real debate in policy circles (including the Congress) is likely to focus on whether it was really as far along as claimed and whether the same thing could have been accomplished by publicizing the photographic evidence and insisting that the IAEA be permitted to inspect the site.”

“The other big question is why the Syrians decided to do this,” Sick added. “It is easy to explain North Korean motives -- money, money, money. But did the Syrians intend to follow their covert reactor project with a covert plutonium reprocessing facility and then a covert bomb design and testing program? And they didn't expect to get caught?”

In the wake of the US briefing on the Syria strike, Israeli defense minister Ehud Barak has postponed a trip to Washington, Israeli media report. "The postponement is aimed at avoiding the impression that his meetings were in any way connected to the U.S. decision to disclosure information on the Syrian facility," Ha'aretz reported, noting that Barak had been slated to meet with his counterpart Defense Secretary Robert Gates as well as Vice President Dick Cheney.

## **The Syrian Nuclear Puzzle**

May 1, 2008

Author:

Greg Bruno

On matters of nonproliferation, policymakers and weapons inspectors share a disdain for secrets. So perhaps it was inevitable that a seven-month delay (NYT) in disclosing details of an Israeli air raid on a Syrian nuclear reactor—built, allegedly, with North Korean assistance—would spark outrage from Capitol Hill and the UN’s nuclear agency. Members of the House and Senate intelligence committees scolded (AFP) the Bush administration for its delay in briefing Congress on the September 2007 strike. Mohamed ElBaradei, chief of the Vienna-based International Atomic Energy Agency, said he “deplores the fact” information was not provided to his agency in a timely fashion, as required under the Nuclear Nonproliferation Treaty. President Bush, meanwhile, defended the late disclosure as necessary to avoid sparking a larger regional conflict.

Beyond the dispute over timing is the broader question of motivation. At a news conference on April 29, Bush said the release was aimed as a warning to nations pondering the spread of nuclear weapons; he singled out Syria, North Korea, and Iran. A senior administration official, detailing the sequence of events in a background briefing for reporters on April 24, went further. The official said the disclosure was intended “to advance a number of policy objectives,” from serving as a potential trump card in negotiations with Pyongyang over its own nuclear program (AP), to compelling the international community to take action against Iran for its suspected nuclear-weapons development.

But some observers see other motives in pulling back Syria’s nuclear curtain. Andrew Semmel, the former top State Department official for nonproliferation, tells Voice of America the release may have been aimed at “putting a positive spin” on intelligence that was bound to leak. Dar Al-Hayat columnist Elias Harfoush sees the disclosure as an attempt by Washington to interrupt talks between Syria and Israel over the disputed Golan Heights. The intelligence briefing came amid reports of a potential breakthrough (Reuters) between the two sides. Still others question the veracity of the nuclear plant claim. The allegations were equated in some quarters (al-Jazeera) to intelligence presented to the UN Security Council by then Secretary of State Colin Powell in the run-up to the Iraq war. Nuclear weapons experts David Albright and Paul Brannan don’t doubt the photos’ veracity but question whether the plant was part of an “active nuclear weapons program” (PDF).

The situation puts a new spotlight on the troubled U.S.-Syria relationship. In recent years Damascus and Washington have sparred over the Arab-Israeli conflict; Syria’s support for Hezbollah in Lebanon; and claims that foreign fighters in Iraq have entered the war zone via Syria. The Bush administration has raised concern about Syrian weapons development in the recent past. Damascus has rejected such charges before and denies (AFP) the targeted complex in the most recent case was nuclear in nature.

But U.S. claims of Syrian support for terrorists are decades old; the U.S. government first listed Syria as a state sponsor of terrorism in 1979. The State Department’s most recent annual report on global terrorism accuses Syria of providing material and political support to Palestinian terrorist groups, and suggests official involvement in the February 2005 assassination of former Lebanese Prime Minister Rafik Hariri. Secretary of State Condoleezza Rice recalled the U.S. ambassador to Syria following the

murder, although Syria maintains a diplomatic mission in Washington. The United States has also sought to use economic leverage to compel Syria to cut ties with terrorist groups.

It is uncertain how stepped up U.S. pressure will influence Syrian behavior. The American Enterprise Institute's David Frum says reckless regimes can't always be reasoned with (National Post). Jeremy M. Sharp, a Middle East analyst for the Congressional Research Service, estimates economic sanctions would be futile. Trade with Syria is already minimal, Sharp writes (PDF). And the United States Institute of Peace (USIP), which has published a series of reports on Syrian politics and regional relations, has found that sanctions could embolden the ruling party. The most direct route to change, two USIP scholars say, lies with Syria's oppositionists.

## **North Korea and the Incident in the Syrian Desert**

Daryl G. Kimball  
Arms Control Today  
May 2008

Seven months after Israeli Air Force jets bombed a remote facility near al-Kibar in Syria, the United States released intelligence information April 24 suggesting that the site housed a nuclear reactor for a military program being built with assistance from North Korea. The assessment comes as Pyongyang and Washington have reached a tentative agreement on a declaration of North Korea's nuclear program, an issue which has stalled talks aimed at verifiably denuclearizing North Korea.

The charges of a Syrian-North Korean nuclear connection raise new and troubling questions about Pyongyang's past proliferation behavior and Damascus' intentions, which must be fully investigated by the International Atomic Energy Agency (IAEA). Yet, it would be a grave mistake to allow it to derail the ongoing diplomatic process that has led to the dismantling of North Korea's nuclear weapons program and still provides important, if limited, leverage to halt further North Korean proliferation activities.

In the past year, the six-party negotiations have finally yielded significant results. In July 2007, the IAEA confirmed that North Korea shut down its Yongbyon reactor and plutonium-separation plant. Since October, U.S. officials have been on the ground with North Korean scientists to disable those facilities.

Now, under a tentative deal, North Korea has agreed to produce a declaration on its weapons program and acknowledge U.S. concerns about its proliferation activities and alleged uranium-enrichment program. Within weeks, U.S. experts may begin the process of verifying North Korea's declaration. In exchange, the Bush administration has pledged to seek to remove Pyongyang from the state sponsors of terrorism list and lift certain sanctions.

Some fear the Syria revelations make it appear as if Washington is rewarding bad behavior. Instead, the United States should remain focused on the priority task of taking out of circulation whatever nuclear bombs, bomb material, and uranium-enrichment items North Korea has and redirecting its scientists to nonlethal pursuits.

When confronted with a similar situation in 2002, the Bush team miscalculated. On the basis of preliminary intelligence, Washington accused North Korea of pursuing a uranium-enrichment program in violation of previous denuclearization commitments. To show his displeasure, President George W. Bush cut off delivery of heavy fuel oil shipments to North Korea, even though it was clear this might lead Pyongyang to kick out IAEA inspectors and restart plutonium production, which had been frozen eight years earlier.

Pyongyang's plutonium supply grew from one to two bombs worth to about 10. Then, after delays in the six-party talks and U.S. financial sanctions in 2006, Pyongyang engaged in a fit of missile tests and set off a nuclear test explosion. Only after a February 2007 agreement outlining an "action-for-action" series of steps to achieve denuclearization and the normalization of relations has the situation somewhat eased.

The six-party process is imperfect but invaluable because it also provides much needed leverage to snuff out North Korea's nuclear proliferation activities. In the wake of the Sept. 6, 2007, Israeli strike on Syria's facility, the United States demanded and got North Korea to reaffirm "its commitment not to transfer nuclear materials, technology, or know-how" in an October 2007 six-party statement.

As Bush said Sept. 20 when he was asked a question about reports of North Korean-Syrian ties, "[T]o the extent that they are proliferating, we expect them to stop that proliferation if they want the six-party talks to be successful." Now, U.S. leaders and allies need to back up this demand with tough diplomacy.

Indeed, any North Korean-Syrian nuclear or missile cooperation would be a violation of UN Security Council Resolution 1718 of October 2006, which requires states to cease trade of these items with North Korea. If Syria was in fact building a reactor, it would also have been a clear violation of its safeguards obligations because it failed to inform the IAEA of the project.

Following Israel's September raid, any such assistance would appear to have ended, along with the facility. Israel's action, however, will make it far more difficult for the IAEA to find any hard physical evidence of the existence of a reactor, which Syria denies. It also increases the risk of a possible future attack on Israel's secret military reactor at Dimona.

Israeli concern about Syrian nuclear activities is understandable. But rather than launching a risky and illegal airstrike, Israel or the United States should have used their information about the al-Kibar reactor to call on the IAEA or the Security Council to demand an inspection and the dismantlement of the facility, as well as other potential secret nuclear sites in Syria.

Policymakers should use the release of the intelligence on the Syrian facility to increase pressure on North Korea to accept measures that help verify it has ceased its proliferation activities, rather than use it as a pretext to delay or derail the process of verifiably denuclearizing North Korea.

## **Cloak and stagger**

After overestimating the Iraq threat, U.S. intelligence agencies are now dangerously underestimating Syria and Iran.

By Leonard S. Spector and Avner Cohen

May 4, 2008

Last month's unclassified congressional briefing on Syria's clandestine nuclear reactor, which was destroyed by Israel on Sept. 6, 2007, was yet another reminder of the challenges confronting the U.S. intelligence community. Still smarting from its gross overestimation of Iraq's weapons of mass destruction, the community bent over backward to avoid overstating its case against Syria -- and in doing so, it stumbled badly.

In the Syrian case (as with the release last year of part of the National Intelligence Estimate on Iran's nuclear program) the intelligence community was unnecessarily cautious, and thereby underestimated the threats posed by Syria and Iran. Its efforts to improve precision have only created new confusion and uncertainty.

The key problem has been the intelligence community's astonishing awkwardness in making clear what's a fact and what's an inference. In the case of Iraq, there were few facts on which to build a convincing case that Saddam Hussein was arming himself with weapons of mass destruction. But Hussein's past pursuit of them, coupled with the anxieties unleashed by 9/11, led U.S. intelligence analysts and many policymakers to infer the worst and leap to conclusions unsupported by the facts.

The intelligence community has now jumped to the opposite extreme with respect to Iran's and Syria's nuclear ambitions, where there are more than a few facts. Yet it has virtually refused to draw any conclusions, no matter how obvious, about the two countries' nuclear programs. The effect has been to seriously understate the dangers Iran and Syria pose and to distort the policy options available to the U.S. to manage them.

When the unclassified summary of the NIE on Iran's nuclear program was released Dec. 3, many observers were shocked by its most prominent "key finding" -- that the intelligence community believed with "high confidence" that Iran had halted its "nuclear weapon program" in late 2003. A footnote defined "nuclear weapon program" as Iran's efforts to design a nuclear weapon and to enrich uranium in secret. That definition is extremely narrow because most proliferation experts view designing the bomb as relatively easy compared with producing the necessary fissile materials for its core and developing a delivery system.

As a result, the summary paid scant attention to those two nuclear-weapon-related -- and extremely dangerous -- activities in Iran. In fact, the summary doesn't even mention the missiles, and Iran's uranium enrichment activities, the focal point of U.S. and U.N. Security Council diplomacy and pressure, are described in the blandest of terms.

Why? Based on comments at a recent roundtable of U.S. officials and outside proliferation experts that we co-chaired, those responsible for the NIE on Iran knew that the heads of the 16 U.S. intelligence agencies had agreed that its key findings would not be declassified. But the White House, fearful that the findings might leak to the media without any official explanation of their significance, overruled the agencies.

By the time the White House decided to release an unclassified summary, the classified version had been produced and was about to be handed over to the congressional intelligence committees. That created a problem. Even though the estimate's "key findings" were originally intended to be understood in the context of the whole classified report, the intelligence community and the White House felt that they needed to repeat them almost verbatim in the unclassified summary. They worried that any rephrasing of the findings would open them up to accusations of playing politics with the estimate.

That still leaves the question of why the intelligence community spotlighted the finding on Iran's nuclear weapons program. We know that important new evidence on Iran's nuclear activities in 2003 had been obtained and that it had required changing a 2005 estimate that the country was pursuing a nuclear weapon. In highlighting the new data, the authors of the 2007 unclassified summary unfortunately left out the context of the previous estimate -- that a rogue Iran remained well on course to developing a nuclear capability.

Ever since Dec. 3, the intelligence community has been trying to restore context to its key finding. On Feb. 27, Director of National Intelligence Michael McConnell said the release of the unclassified version was rushed and that it was "an error of judgment on my part." Days later, Defense Intelligence Agency Director Lt. Gen. Michael D. Maples said that "although Iran claims its program is focused on producing commercial electric power, [we assess] with high confidence Iran remains determined to develop nuclear weapons." Then in March, CIA chief Michael Hayden, asked on NBC's "Meet the Press" whether he thought Iran was trying to develop a nuclear weapon, replied "Yes," adding this was not based on "court-of-law stuff. ... This is Mike Hayden looking at the body of evidence."

These statements were a move in the right direction, but the CIA's linguistic fumbling during last month's congressional briefing on Syria's reactor indicates that the snafu over the Iran estimate is not a one-time blunder.

After going to considerable lengths to show that Syria's reactor was built with North Korea's help, that it was modeled on the reactor that the North Koreans used to produce plutonium for their nuclear weapons and that it had been carefully disguised by the Syrians to avoid detection, senior intelligence officials declared they had only "low confidence" that Syria has a nuclear weapons program.

The justification for this bizarre conclusion? Although it has "a rich level of information" about the destroyed reactor and North Korea's involvement in building it, the intelligence community said it has no specific information on Syrian facilities for the manufacture of fuel for the reactor or for processing the fuel after it is irradiated to extract plutonium. Nor has it any information showing that Syria is working on a design for a nuclear warhead.

While well-intentioned, the intelligence community's efforts at clarity have now twice gone astray. If it wants to right the balance between facts and inference, a starting point might be to stop redefining commonly used phrases -- such as "nuclear weapon program" -- in order to give them new, counterintuitive meanings that obscure a more simple and dangerous reality.

When the intelligence community has real evidence, it should not be afraid to draw the obvious inference and call a spade a spade.

[Leonard S. Spector directs the Washington office of the Monterey Institute's James Martin Center for Nonproliferation Studies. Avner Cohen is a senior fellow at the United States Institute of Peace in Washington and the author of "Israel and the Bomb."](#)

## **The Elusive Smoking Gun**

Assessing Nuclear Activity in Syria and Iran

By INSS: Emily Landau

Sunday, May 4, 2008

Posted 05/4 at 09:54 AM

On April 24, US officials briefed lawmakers on Syria's covert nuclear reactor. They explained their "high confidence" that what was destroyed last September in Syria was in fact a nuclear reactor for the production of plutonium, and that it was built with the long-term and sustained assistance of North Korea. In contrast to this certainty, a central aspect of their estimate regarding Syria's nuclear plans adopted a vaguer tone: when asked whether the material to be produced by the reactor would be used in a nuclear weapons program, the Intelligence officials accorded this only a "low confidence" level.

Interestingly and rather surprisingly, the officials acknowledged that a low confidence estimate did not concur with what they actually believed to be the case. In fact, on the basis of their overall analysis of the situation, it was their belief that the reactor was intended to produce nuclear weapons. Indeed, they found no other reasonable explanation for the reactor: it was clearly not for producing electricity, and it was ill-suited to be a research reactor. Moreover, Syria had acted suspiciously in other regards, such as rushing to destroy the remains of the reactor after the attack. But due to the lack of "additional clinical evidence of other activities" – most importantly, the absence of a reprocessing facility – they could not accord this assessment the level of confidence that they actually believed to be the case. As one of the Intelligence officials at the briefing tried to explain: "there's a difference between evidence and an assessment."

This episode underscores the problematics involved when decisions regarding nuclear proliferation activities are expected to be grounded in clear-cut evidence of a "smoking gun" – namely, in some physical or clinical evidence that proves beyond a doubt the illegal and dangerous nature of the nuclear activity in question.

Generally speaking, smoking guns – although packaged by those who seek them as the epitome of proof based on hard evidence – are actually subject to interpretation, and can prove to be quite elusive. In reality, there are no clear-cut criteria for smoking guns. Short of producing evidence of a nuclear bomb, is any piece of evidence truly iron-clad? If someone is not interested in finding a state guilty of illegal nuclear activity, then with regard to most evidence – again, short of a nuclear bomb – a more benign interpretation can generally be manufactured. In the final analysis, much depends on the ability of the presenter to convince others that the facts exposed do or do not constitute incriminating evidence.

Moreover, the history of the past five and a half years of dealing with Iran's nuclear activities demonstrates that the ongoing search for a smoking gun can result in the loss of valuable time in confronting a determined proliferator. Throughout 2003 the search was on for a smoking gun in Iran, which was never found. But in late 2007, the US National Intelligence Estimate (NIE) concluded that for most of that same year – as well as for close to 20 years before that time – Iran had actually been engaged in an active nuclear weapons program. If in 2003 states had acted upon what they sensed and

believed to be the case in light of Iran's long history of deception in the nuclear realm – rather than focusing on finding a smoking gun – things might have evolved differently.

This leads to another problem with smoking guns: determined proliferators are well aware of the fact that states are looking for this kind of evidence, and they put tremendous efforts into hiding it. Therefore, the difficulties that are encountered in finding a smoking gun should come as no surprise, and the inability to find one due to states' concealment efforts should be factored into assessments. According to the NIE, Iran stopped one aspect of its nuclear program in the fall of 2003: weaponization. It continued with the other two activities that are essential for nuclear weapons: production of fissile material (uranium enrichment), and development of long-range ballistic missiles. The decision to stop the weaponization program had a double logic for Iran: first, this was the part of its program that could be achieved in the least amount of time, and thus it was the easiest to suspend temporarily while Iran continued to work on the other two prongs. Second, this was the only part of the program that Iran believed it would be hard pressed to account for, if discovered. Uranium enrichment in Iran has been conducted openly for the past several years and Iran steadfastly continues to insist that it is for civilian purposes, and long-range missiles can be explained as intended for conventional warheads. But designs for a nuclear warhead suggest a different narrative that would be more difficult to explain.

All of this leads to the conclusion that connecting the dots of weapons-related nuclear activity should be carried out in the realm of strategic analysis, where hard evidence of so-called smoking guns is but one important component (but not a sine qua non) in an overall, intricate picture. Something is amiss when Intelligence officials have to bend over backwards to explain an estimate that doesn't concur with what they believe to be the actual nature of a state's nuclear activity based on their overall analysis and powers of deduction. Moreover, there is the real risk that media articles will pick up the line that there is "low confidence" that nuclear activity is intended for weapons, and forget the broader, more complex message that was presented. The sound bytes that appeared in the media following publication of the NIE – and the damage that they caused to efforts to confront Iran – are a case in point.

Comprehensive and logical assessments with regard to nuclear proliferation obviously need to include as much hard evidence as possible, but in the interest of non-proliferation, they should not be held hostage to the absence of a smoking gun.

## EDITORIAL

### **N Korea's long nuclear reach**

Tuesday May 06, 2008

The disclosure that Syria has been caught in the secret construction of a high-class nuclear facility bears special attention for our part of the world.

That is because the fingerprints of North Korea appear at each stage of the largely mysterious Syrian facility destroyed last year by Israel. The facts of the Syrian facility are murky at best. Damascus appears determined to try to deny the whole problem away by claiming there was nothing there.

The United Nations nuclear watchdog has spent far more energy and urgency denouncing the Israeli airstrike and withholding of evidence by the United States, than in investigating the secret Syrian project and \_ most ominous of all actors in the story \_ the Pyongyang link.

The first time most of the world heard of the possible Syrian nuclear project was last September, when the Israeli air force and commandos destroyed the facility. Damascus, in a most unusual reaction to the act of war, waffled over what had been hit and what reaction it planned. After months of pressure and vacillation, the United States finally coughed up the information it had gathered on the site in northern Syria.

The evidence appears overwhelming that Syria had secretly and thus illegally almost finished constructing a nuclear facility, virtually identical to that of the North Korean nuclear programme headquartered at Yongbyon, which has made nuclear bombs. It credibly indicates a continuing, strong effort by North Korea to proliferate nuclear sites, quite possibly for its own purposes.

And that is the rub. Recent photographs show the head of the North Korean nuclear project in Syria. Pyongyang is known to have peddled missiles and weapons technology to Syria. The evidence is almost entirely circumstantial but thus far it points to a single conclusion: North Korea has tried to build a nuclear plant in Syria capable of supplying plutonium and related material which would fit perfectly in the North Korean weapons programme.

There may be another explanation, but the initial claim by Syria that Israel had bombed an abandoned building was clearly a lie, since dated satellite photos from several sources prove the site was active.

Shortly after Israel destroyed the Syrian facility, North Korea renewed diplomatic relations with Burma. The Burmese junta kicked out the North Koreans in 1983, after Pyongyang staged a terrorist attack in Rangoon which killed many South Koreans and almost assassinated then-president Chun Doo-Hwan during a state visit.

The timing of the renewal of diplomatic relations between the two Asian hermits raised eyebrows because they have so little in common. Their biggest common interest is that Rangoon wants a nuclear facility and Pyongyang has the technology and, perhaps, a burning ambition to help the generals get one.

The International Atomic Energy Agency has already proved too lackadaisical in taking up evidence in the Syrian case. Indeed, it appears Syria is in serious violation of its responsibility under the Nuclear Non-Proliferation Treaty to report all nuclear construction. Not only is the IAEA qualified to investigate, it must do so. More troubling is the North Korean link. If Pyongyang really was attempting to set up a back-up source of plutonium in Syria, it probably is doing the same elsewhere.

The IAEA also must delve urgently into all aspects of the inscrutable nuclear projects by Burma. If Rangoon is trying to construct a medical-type nuclear reactor, fine. But the world, and more importantly this region, deserves to know if North Korea is playing any role.

## Review & Outlook

### Vetoing the Verifiers

May 8, 2008; Page A14

The State Department is justifying its decision to let North Korea renege on its pledge to give a "complete declaration of its nuclear programs" by promising a strict verification regime. So why is Foggy Bottom cutting its own verification experts out of the loop?

The State Department's systematic exclusion of its own Bureau of Verification, Compliance and Implementation has gone unreported as the North Korean diplomacy proceeds. But it is causing concern on Capitol Hill and has already led to a proposal to require State to submit a report to Congress describing how the U.S. will verify any nuclear deal. Sponsored by Florida Republican Ileana Ros-Lehtinen, the legislation passed the House Foreign Affairs Committee last week with the support of Democratic Chairman Howard Berman.

The mandate of the verification bureau, as described on the State Department's Web site, is to provide oversight "on all matters relating to verification or compliance with international arms control, nonproliferation and disarmament agreements and commitments." It "supports the Secretary" in "developing and implementing robust and rigorous verification and compliance policies."

The verification bureau was created by a Republican Congress in 1999 over the objections of the Clinton Administration and State Department careerists who didn't want agreements subject to additional oversight. The bureau's biggest success to date is Libya, where it played a central role in dismantling the country's WMD programs in 2003. There the bureau worked closely with experts from the Departments of Defense and Energy as well as with Britain and the International Atomic Energy Agency.

North Korea is a different story. The verifiers "have no voice so far," one person close to the process told us. They aren't part of the negotiating teams talking to the North Koreans and they've been excluded from key internal meetings. No one from the verification bureau participated in a recent State Department trip to Pyongyang intended to work out verification issues.

Nor is the verification bureau in charge of monitoring the disabling of the North's nuclear reactor at Yongbyon. One bureau professional took part, but he was invited for his technical expertise; he was not there as a verifier. Paula DeSutter, the assistant secretary who heads the bureau, declined to comment.

Incredibly, the Bureau of East Asian and Pacific Affairs is calling the shots – talking to the North Koreans, hand picking experts to work at Yongbyon, and overseeing disablement. Call it the Chris Hill Show. Mr. Hill – the assistant secretary for East Asia – has also made a mockery of the interagency process. The verification bureau's Pentagon counterparts, who were closely involved in the six-party Korean diplomacy until mid-2005, have also been kept in exile.

Now there's talk that the East Asia bureau – not the verification bureau – will also end up monitoring any final six-party agreement. Not only does East Asia lack the technical expertise to verify a nuclear

agreement, its staffers would hardly be eager to find violations in an accord negotiated by their superiors. There's even talk State may outsource some of the inspection work to China, which will be chairing a verification group within the six-party group. But China would have no incentive to blow the whistle on its client state.

The fact that Mr. Hill and his boss, Secretary Condoleezza Rice, are marginalizing their own verifiers is further reason to doubt their North Korea deal. The diplomats want to deliver a "success" and are afraid that if the verifiers get a close look, they will expose it as a fraud. Among the uncomfortable questions: Where is all of the plutonium North Korea has produced over the years? What happened to the uranium program that Pyongyang once boasted about but now says does not exist? What exactly did the North proliferate to Syria?

No verification can deliver 100% certainty, and North Korea, with its history of cheating and lying, would be a difficult case under even the most stringent inspection regimes. The disarmament of Libya succeeded because Moammar Gadhafi decided to cooperate. There's zero indication that Kim Jong Il shares that frame of mind.

North Korea's geography offers special challenges too. It's a mountainous country, with caves hiding mobile missile launchers aimed at Seoul. The military has vast underground facilities built with the help of its former Soviet patrons. Will these be open to inspectors? Even assuming that Kim will allow unimpeded and unannounced access – a leap of diplomatic faith – special expertise is needed to decide where to inspect and what to look for.

The State Department's verification bureau was created in the spirit of Ronald Reagan's slogan, "trust but verify." The Gipper was referring to the disarmament of the Soviet Union in the 1980s, but his principle applies equally to North Korea today. If Foggy Bottom won't trust its own verifiers enough to make them part of any disarmament deal, then the rest of us shouldn't trust any deal struck by the Bush State Department.

## OPINION

### **Bush's North Korea Nuclear Abdication**

By JOHN R. BOLTON

May 8, 2008; Page A15

Despite rising Capitol Hill opposition to its North Korea policy, the Bush administration continues to find new and imaginative ways to accommodate Pyongyang's sensitivities. Meanwhile, the administration's Democratic congressional allies are urgently pushing to waive the Glenn Amendment, which bars essentially all U.S. economic and military aid to the North.

The strategic folly here is rooted in the administration's decision to focus on North Korea's plutonium supplies and stop caring what Pyongyang once did or is doing on the enriched-uranium route to nuclear weapons. That could be a fatal mistake.

In 2002, our intelligence community definitively judged that the regime was working on an industrial-scale enrichment program. Since then we have little new information, reducing the confidence level, but not changing the substantive conclusion, that the North Koreans "have and continue to operate a uranium enrichment program" – as Director of National Intelligence Mike McConnell testified in February.

For the Bush administration, however, the lack of new data is an excuse to ignore the entire issue of uranium.

On plutonium, the administration seems content to seek vague statements from the North that "account" for the amount of this fissile material we think it has extracted from its Yongbyon reactor's spent fuel rods over the years. Administration briefings reveal little or no interest in how many plutonium weapons exist; whether there are other plutonium-related facilities hidden in North Korea's vast complex of underground facilities; and what the North's weapons-manufacturing capabilities are.

Proliferation? Perhaps the Bush administration's most wondrous act of magic is to make that problem disappear. The State Department argues that North Korea may have proliferated in the past, but that's all behind us. How do we know? The North Koreans have told us.

Since the reactor it helped Syria build on the Euphrates River was pulverized by the Israeli Air Force last September 6, Pyongyang's efforts at and interest in nuclear proliferation may have ceased. Even if true, that should not give us comfort: It took an act of brute military force to bring this about. One need hardly point out that this tactic is not congruent with the administration's current approach to North Korea's nuclear behavior.

More troubling is the administration's apparent treatment of the Syrian reactor as if it were the only proliferation threat in the Middle East. It is not. Iran should be top of mind as well.

It is inconceivable that Syria could work for five years or more building the clone of North Korea's Yongbyon reactor on the Euphrates without, at a minimum, Iranian acquiescence. Quite likely, Iran

was involved. Tehran could well be financing Syria's purchase of reactor technology from North Korea. It could also have expected to benefit from the reactor's production of plutonium.

Indeed, Iran had much the same incentive as North Korea to hide its nuclear activities from international scrutiny. What better way to conceal proscribed work from inspectors in North Korea or Iran than to build facilities in Syria?

Iran and North Korea already have a history of cooperation in ballistic missiles – the delivery system which, if perfected, could give their weapons global reach. After the North declared a moratorium on launch testing from the Korean Peninsula in 1999, it simply ramped up cooperation with Iran's aggressive missile research and development program.

The North thus continued to benefit from launch-testing data, prior to breaking its moratorium on July 4, 2006, while also scoring a propaganda victory among the clueless for its apparent renunciation of provocative behavior in Northeast Asia. Outsourcing weapons programs is nothing new for Pyongyang.

Although our intelligence community stated publicly that the Syrian reactor was a cash transaction, its congressional briefings contained little or no supporting evidence that this was so. This is unsurprising. The Israeli raid was based on the hard physical evidence seen on the banks of the Euphrates River, not on scrutiny of documents embodying the deal.

Some friendly advice to our intelligence services: Think joint venture. Think asset diversification.

Hypothetically, what if the deal had North Korea getting a third of the plutonium produced by the Euphrates reactor, Iran a third, and Syria a third? The North benefits by maintaining open access to a plutonium supply even if Yongbyon remains frozen. Iran gets experience in reactor technologies immune from IAEA scrutiny. And Syria takes a major step toward undisclosed nuclear capabilities. Win-win-win, as that entrepreneurial proliferator A.Q. Khan might have said.

Here is the real problem. North Korean nuclear proliferation is quite likely more than a series of one-time transactions that create problems elsewhere in the world. It may very well be integral to its own nuclear weapons program.

The Bush administration can wish away these possibilities and still achieve its deal. But it cannot wish away the underlying reality, the full scope of which we simply do not know. That reality, whatever its reach, will still be there to haunt President Bush's successor and threaten international peace.

## **Commentary**

### **CIA credibility suffers**

By HAVILAND SMITH

May 8, 2008

Credibility is the lifeblood of any intelligence organization serving a democracy. If the public, or any given administration, doesn't believe it is getting told the truth, then the organization has lost its purpose and effectiveness. It is the public perception of credibility that matters most, and thanks to current White House tasking of the agency, the CIA appears to be losing that battle today.

The role of any intelligence organization is to provide intelligence information and estimates to policymakers in support of security and foreign policy issues, based on known facts.

During the Cold War, the CIA did its best to do just that. It was not always as effective as it might have been, but it was a principled organization staffed by motivated, reputable people who did their best to do their job and do it right. The Cold War CIA did not lie or fabricate intelligence for policymakers or for public consumption.

CIA management occasionally suffered from poor judgment and did some really stupid things, like providing disguises to a former employee who was a member of the Watergate break-in team. However, with the possible exception of Iran/Contra — who knows if Reagan knew and approved? — the CIA never undertook covert activities without White House direction. It was never the "rogue elephant" that its fiercest critics persistently alleged it to have been.

Unfortunately, concerns about CIA credibility have grown since 9/11. The role of the CIA in enabling the Iraq invasion is probably still not fully understood, muddled as it is by the machinations of the Bush administration. The persistent, unprecedented visits by Vice President Cheney to CIA headquarters during the run-up to the invasion, reportedly to seek changes in CIA estimates on Iraq that would support such an invasion, have never been fully explained.

The "slam dunk" moment on Iraqi WMD; allegations of CIA waterboarding, renditions, a gulag of prisons around the world and, most recently, the question of why the waterboarding tapes were destroyed have all added fuel to the credibility fire.

Structural changes have weakened CIA credibility, as well. The post-9/11 creation of a new Office of the Director of National Intelligence at the expense of the CIA was senseless and bureaucratic. The persistent efforts of the Pentagon under Secretary of Defense Donald Rumsfeld to usurp CIA functions and to denigrate the CIA, its processes and its products have added further to an atmosphere in which CIA credibility is routinely publicly questioned.

In early September 2007, Israeli jets flattened a structure in the Syrian desert. Israel, Syria and America all acknowledged the act, but none gave any explanation for it, that is, until recently. Now we see pre-raid photos of the inside of the Syrian structure with virtually identical companion pictures of North Korean nuclear sites. The Syria photos presumably were obtained from the Israelis.

In the meantime, the Syrian ambassador in Washington, who can hardly be viewed as impartial, claims the photos are CIA fabrications. This claim has then become the object of speculation in the American media.

What's going on here? Why was this information held so tightly and only released now, seven months later? Is the CIA lying about this issue? Has the CIA fabricated these photos? Have the Israelis done the fabrications and passed them on to us? All of these questions and more are now under examination.

Ultimately what is true and what is false about this Syria incident is of secondary importance to what the effect of a media examination of the subject has already brought and will continue to bring. What will matter is that further doubt will arise in Americans' minds about CIA credibility.

The U.S. involvement in the "war on terror" and in Iraq has put tremendous pressure from the White House on the CIA to undertake activities which, even if not illegal, create in the public mind an aura of mistrust. In today's world, no one is quite sure if the CIA is on the "right" side of anything.

That may suit the needs of today's White House, but it creates a legacy of mistrust in and lack of credibility for the CIA that will continue for years after they are gone. This legacy may serve this White House well, but it will disastrously serve its successors. The U.S. can ill afford to have an intelligence service whose credibility is publicly questioned.

Haviland Smith is a retired CIA station chief who served abroad in Europe and the Middle East, as executive assistant in the director's office and as chief of the counterterrorism staff. He lives in Williston.

## **The Right Path With N. Korea**

By Siegfried S. Hecker and William J. Perry

Tuesday, May 13, 2008; A15

The Bush administration's North Korea strategy is being criticized from the right and the left for letting Pyongyang off the hook. Some advocate scuttling the six-party talks. Others suggest slowing our own compliance with the agreement to get North Korea to make a full declaration of its nuclear program first. We disagree with both positions. Our mantra should be: It's the plutonium, stupid.

North Korea does have the bomb -- but a limited nuclear arsenal and supply of plutonium to fuel its weapons. The Yongbyon plutonium production facilities are closed and partially disabled.

In separate visits to North Korea in February, we concluded that the disablement was extensive and thorough. We also learned that Pyongyang is prepared to move to the next crucial step of dismantling Yongbyon, eliminating plutonium production. This would mean no more bombs, no better bombs and less likelihood of export. After this success, we can concentrate on getting full declarations and on rolling back Pyongyang's supply of weapons and plutonium.

We must not miss this opportunity, because we have the chance to contain the risk posed by North Korea's arsenal while we work to eliminate it. As dismantlement proceeds, negotiations should focus concurrently on the plutonium declaration, the extent of the uranium enrichment effort and Pyongyang's nuclear exports.

Pyongyang's declaration of 30 kilograms of plutonium (sufficient for roughly four to five bombs) falls short of the estimate of 40 to 50 kilograms, based on our past visits. We believe that North Korea is prepared to produce operating records and permit access to facilities, equipment and waste sites for verification. Obtaining and verifying its declaration of plutonium production and inventories is imperative. Let's proceed.

Pyongyang continues to claim that it has made no efforts to enrich uranium, despite strong evidence to the contrary. Although it appears unlikely that these efforts reached a scale that constitutes a weapons threat, a complete accounting is required. Dismantlement of the Yongbyon facilities should not, however, be postponed to resolve this issue. In October 2002, the Bush administration accused North Korea of covert uranium enrichment, only to have Pyongyang withdraw from the nuclear Non-Proliferation Treaty and produce plutonium to fuel the arsenal that we are now attempting to eliminate.

Nuclear exports are of greater concern. As recently revealed evidence demonstrates, North Korea sold nuclear technology to Syria, much as it sold missile technology. North Korea must cooperate if we are to get to the bottom of the Syrian incident and ensure that it is not repeated elsewhere. Israel eliminated the Syrian threat, for now, by bombing the reactor at Al Kibar. But it is imperative that Pyongyang reveal the nature and extent of its export operations and, most important, whether it has similar deals underway with Iran.

We do not advocate letting Pyongyang off the hook, but a "confession" regarding Syria is not the critical issue. We have good knowledge of what the North Koreans supplied to Syria. What we really

need is information from North Korea that will help us deal with potential threats. For example, was North Korea acting alone, or was it part of a more sophisticated proliferation ring involving Pyongyang's trading partners and suppliers? North Korea's leadership must resolve all three declaration issues fully, and these will take time to verify.

To ultimately succeed in the peaceful elimination of nuclear weapons, we must understand why North Korea devoted its limited resources to going nuclear. The September 2005 six-party joint statement addresses many of these concerns, promising mutual respect for national sovereignty, peaceful coexistence, and a commitment to stability and lasting peace in Northeast Asia, as well as normalization of relations. Given the acrimonious history of our relations, such steps require a transformation in the relationship between North Korea and the United States, a change that will first require building trust -- step by step.

The six-party negotiations have put us on that path, and there is much evidence of winds of change blowing in North Korea that will make navigating that path easier (the recent New York Philharmonic concert in Pyongyang is one such symbol of change; the joint industrial facility at Kaesong is another). But North Korea's reluctance to provide full declarations and the Syria revelations have moved us in the wrong direction.

Nevertheless, walking away from the talks or slowing them at this point would be counterproductive. Instead, in its remaining months, the Bush administration should focus on limiting North Korea's nuclear capabilities by concluding the elimination of plutonium production. If it can also get answers on the Syrian operation and resolve the question of uranium enrichment, it will put the next administration in a stronger position to finally end the nuclear threat from North Korea.

[Siegfried S. Hecker and William J. Perry](#) are with the Center for International Security and Cooperation at Stanford University. Hecker was director of the Los Alamos National Laboratory from 1986 through 1997. Perry was secretary of defense from 1994 through 1997.

## **The failed theology of arms control**

**So-called experts are frequently certain about what they know about nuclear material -- and they're frequently wrong.**

By Gabriel Schoenfeld

May 24, 2008

ONE OF THE least noticed and most peculiar campaign promises made by Barack Obama is his pledge, if elected president, to "secure all loose nuclear materials in the world within four years." Without doubt that is a laudable goal, but one is left wondering how exactly he expects to accomplish it in four years, or even, for that matter, in 40.

One of many obstacles is that our intelligence agencies seldom know where loose nuclear materials are, especially when they are hidden on the territory of hostile states. An even bigger problem is that when we they do locate them, there always will be some expert or another telling us that, despite all the evidence, they are not really there. Obama, of all people, should know this.

He has one such expert advising his campaign.

On Sept. 6, 2007, Israeli jets destroyed a large box-shaped structure built in Syria at Al Kibar, not far from the Euphrates River. Although Israel maintained a discreet silence about the raid, and Syria confined itself to denouncing Israel for violating its airspace, suspicion immediately began to mount that the target was a nuclear reactor. In the weeks that followed, satellite photos and other data buttressing that suspicion rapidly began to emerge.

But not everyone was convinced. Among the skeptics was Joseph Cirincione, formerly a staff member for Rep. John Conyers Jr. (D-Mich.) on the House Armed Services Committee and more recently a denizen of the Washington think-tank world, who has been an informal advisor on nuclear affairs for Obama and has written a series of memos for the campaign.

Interviewed by Seymour Hersh of the New Yorker after the Israeli raid, Cirincione was emphatic: "Syria does not have the technical, industrial or financial ability to support a nuclear weapons program. I've been following this issue for 15 years, and every once in awhile a suspicion arises and we investigate and there's nothing. There was and is no nuclear weapons threat from Syria."

Thanks to materials made public by the U.S. on April 24, we now know that the facility at Al Kibar was a nuclear reactor and that it had been built with North Korean assistance. Indeed, it was a close copy of the North Korean plutonium producing reactor at Yongbyon that the U.S. has been trying, via negotiations, to shut down. Cirincione has admitted that he got it wrong, explaining that the evidence "seems strong" that Syria was building a reactor and that no one can bat 1,000.

Cirincione is correct about the difficulty of attaining a perfect batting average. But still, why did he miss this particular ball?

One obvious explanation is that he fell victim to Syrian deception. As a report by the Institute for Science and International Security makes plain, Syrian engineers and architects went to "astonishing

lengths" to erase the "signature" of the reactor at Al Kibar and to camouflage and/or bury "commonly expected attributes and conceal the building's true purpose." So successful was the Syrian concealment effort that even after 2005, when U.S. intelligence officials first became aware of the structure and a North Korean presence at it, they labeled it an "enigma facility."

Yet secrecy and camouflage are par for the course. No country with a covert nuclear program has failed to use such means to keep its effort hidden from the world. And no nuclear nonproliferation expert worth his boron would be unaware of this. What else must have been at work here?

Experts, like generals, have a tendency to fight the last war. In this instance, the last war was the Iraq war, in which the U.S. invaded in no small part to dismantle a nuclear weapons program that turned out not to exist. A good many nuclear specialists within and outside the intelligence world appear to have become so fearful of repeating that sorry experience that they are afraid even to acknowledge things that do exist. Last year's National Intelligence Estimate on Iran that declared, misleadingly, that Iran's nuclear weapons program ended in 2003 is a prominent case in point.

Cirincione seems to have been snared by precisely the same trap. Reports of a Syrian nuclear reactor, he wrote a week after the Israeli strike, were "nonsense," the handiwork "of a small group of officials leaking cherry-picked, unvetted 'intelligence' to key reporters in order to promote a preexisting political agenda. If this sounds like the run-up to the war in Iraq, it should."

It "is all political," he insisted to Hersh. Those peddling the story of the nonexistent reactor appear to have been aiming "at derailing the U.S.-North Korean agreement that administration hard-liners think is appeasement."

In his solicitude for the U.S.-North Korean agreement -- itself a deeply flawed document and one repeatedly violated by Pyongyang -- the solution to the riddle becomes clear. Cirincione is now the president of an outfit called the Ploughshares Fund, a foundation dedicated to funding advocates of arms control negotiations around the world. To him and his fellow members of the arms control creed, the admission that North Korea was illicitly shipping nuclear technology abroad -- and that a country such as Syria, a signatory to the Nuclear Nonproliferation Treaty, had been caught in a brazen violation of its commitments -- might be taken as an acknowledgment that the arms control regime on which they have staked their reputations and dedicated their lives has failed utterly.

But it is as irrational to suggest that weapons never exist as it would be to suggest that they always exist. As the Syrian episode demonstrates, there may not be weapons of mass destruction under every dictator's bed, but sometimes there will be, and it is not something about which we -- or, in this instance, the Israelis -- can afford to be wrong.

In short, when the Israelis obliterated the reactor at Al Kibar, the reverberations of the blast also shattered a theology. If Obama is to make any headway at all on his quixotic pledge to secure all loose nuclear materials in the world in four years, he might begin by securing some more realistic nuclear advisors.

[Gabriel Schoenfeld is senior editor of Commentary magazine.](#)

## **Going Their Own Way in The Mideast**

By David Ignatius

Sunday, June 1, 2008; Page B07 [Accessed 2008-05-31T11:55Z]

*[EXCERPTS]*

What happens when a superpower becomes preoccupied by a costly war and loses some of its ability to coerce friends and enemies toward the outcomes it favors? We're seeing a demonstration of that change now in the Middle East, as Arabs and even Israel reckon with the limits of American power -- and begin to cut their own deals.

*[deletia]*

The American-Israeli split on Syria has been widening for the past several years. One point of difference was what to do about the nuclear reactor the Syrians were secretly building at Al Kibar, in the northeastern desert, with help from North Korea. The Bush administration wanted to confront the Syrians last year with the intelligence and use the issue to pressure them to dismantle the facility. The Israelis decided they couldn't wait -- and bombed the suspected reactor site on Sept. 6.

The United States feared the Israeli attack might trigger a wider war and insisted on American-Israeli silence to avoid humiliating Syrian President Bashar al-Assad. In the end, the Israelis were right in their prediction that Syria wouldn't retaliate. Instead, according to U.S. intelligence, the Syrians scrambled to hide traces of the reactor they had secretly been building.

## **A visit to the Levant - Kieran**

**03 June 2008**

Kieran sent me this letter account of his travels in the Levant some days ago and has today allowed me to post it. pl

Johnharvardstatue7\_4

"Recently I had the opportunity to travel as part of a student-organized delegation of 30 Harvard graduate students (mostly from the Kennedy School, though I'm at the Center for Middle East Studies) to Lebanon and Syria. We met with most of the major players, with whom we engaged in generally quite freewheeling debate. I imagine that the kind of discussions we had were quite rare simply because students have a certain freedom (and allow a certain freedom to the other party) that politicians, diplomats, journalists, and certainly citizens of the countries concerned do not. We were also there at a very historic time for Lebanon (May 19 - June 1), just after the Doha agreement. I thought you might be interested in hearing a few of my impressions.

*[deletia]*

A couple of days later we travelled to Damascus to meet Bashar al-Assad and his wife Asma in the visitors' palace on a mountain overlooking Damascus. Bashar spoke with us for three hours, all Q&A. He impressed the whole group with his willingness to actually answer the questions asked, his ability to provide logical defenses of his positions, his command of English, and his forward-looking mindset. A number of anti-Syrian Lebanese in the group walked away shaken by the experience. We were furthermore surprised that, in contrast to almost every other politician we met, we were not searched or put through any kind of physical screening. Only one (massive) bodyguard attended him and he seemed to be present more to pass the microphone around.

I asked him why he had not allowed the IAEA in to inspect the 'nuclear facility' in order to disprove US-Israeli allegations. He responded that there was no use - Saddam opened his sites up to inspectors but the US attacked anyway. He indicated that he does not believe in dignifying these kinds of allegations, or in setting the precedent of allowing weapons inspectors to run around his country. I told him I thought he underestimated the value of public relations - he was standing on a point of principle, but this would have real costs in terms of Syria's image in the media. He replied that he did not think so: the Western media would paint him as a bad guy in any case, and moreover in his view the key strategic decisions are taken without regard to public opinion (he again used the invasion of Iraq as an example).

Someone else asked him about his worst and best case scenarios for the region during the next 5 years. He said that the worst case scenario was a US or Israeli attack on Iran, which would have repercussions everywhere. The best case scenario was a US president committed to seeking peace accords with Syria and the Palestinians ("a genuine commitment, not like Annapolis"). I got the impression from this (and later from a sly 'yes we can' from his wife) that they saw a significant difference between Obama and McCain. Nonetheless, when explicitly asked about this, he replied that his country had learned to be skeptical of US campaign rhetoric.

As to the Syria-Israeli talks Assad said that the intention was genuine but that he doubted Olmert's ability to actually reach an agreement.

On Lebanon he was reluctant to discuss the details of Lebanese politics, though he was clearly pleased by the Doha agreement. He was ready to establish normal ties in principle (embassies and border demarcation) but sounded reluctant to do so with the government of Fuad al-Siniora. We (especially the Lebanese among us) pushed him hard on this issue, but it was not clear whether or not he appreciated the importance of Syria making a symbolic gesture of reconciliation. He considers Walid Jumblatt an enemy of the state.

The only point at which he became emotional was in discussing the regime's fight against Islamists during the early 80s, responding to a question about Hama. He talked about the various atrocities committed by the Islamists, then saying "what would you do with these people?"

When asked about Alawi dominance of key levers of power and the impact of that on political reform, he responded obliquely, talking about the new party law designed to end the Ba'ath Party's dominance of political life. When we pointed out that the problem was not just in the Party but in the military-security apparatus, his response became vaguer still. It was clear we were not getting anywhere on this issue.

Overall, Assad performed extremely well. Still, he could get off easy as the darker side of Syrian involvement in Lebanon is (somewhat) plausibly deniable. It struck me that one reason he may have consented to such an extended discussion in such a freewheeling format is practice for him in the hope of eventually making the transition to a more conventional or at least Western-style politician, giving press conferences and such.

After three hours his wife Asma showed up. If they were not in love it was a hell of a good act. After chatting informally for a bit and taking photos he left, and she sat in his place. She is beautiful, charming, and thoroughly English. She is also extremely intelligent and had a remarkable grasp of the minutiae of domestic social and economic policy that he himself did not exhibit. It occurred to me that a woman in her position may be in effect a second president. She discussed the importance of education as the key strategic domestic issue. She also mentioned that she was personally key in shaping the new companies law, which aims to shift the emphasis from the development of existing large enterprises to small and medium businesses, including startups.

## **“Nothing to Hide” From Nuclear Inspectors**

**(12-Jun-08)**

Analysts in Syria insist the reason Damascus is allowing the United Nation’s atomic watchdog in for an inspection is that it has nothing to hide.

After several months’ delay, a delegation from the International Atomic Energy Agency, IAEA, is to inspect a site at al-Kibar in northeastern Syria on June 22-24.

The Israeli air force bombed the al-Kibar site last September. In April, the United States said it believed al-Kibar was the site of a reactor plant that North Korea was helping to build for Syria.

Damascus insisted that the facility was an abandoned military building.

Most Syrians appear to believe their government’s assertion that it has no ambition to develop nuclear weapons, with analysts noting that Damascus is a signatory to the Nuclear Non-Proliferation Treaty and has worked with the IAEA in the past.

The Syrian government argues that the US lacks credibility on nuclear issues since the claim that former Iraqi leader Saddam Hussein had weapons of mass destruction proved untrue.

Many Syrians agree, and support their government’s argument that the international community should view Israel rather than Syria with suspicion.

“Syrians are not afraid of the IAEA’s inspections,” said an assistant professor at Damascus University.

“Israel hasn’t signed any non-proliferation international agreement or protocol for nuclear weapons. It has never allowed inspection of its nuclear institutions. Where is the logic in that? Syria is inspected on the basis of suspicions, whereas Israel has nuclear weapons but isn’t subject to inspection.”

Radwan Ziyadeh, an opposition member and a scholar at the US Institute of Peace, said while America may views Syria’s nuclear intentions with suspicion, this is not a matter of concern for the opposition.

“I don’t think any Syrian believe that Syria has a nuclear programme,” he said. “And secondly, I don’t believe that Syria has the capacity to build a nuclear programme.”

Some interviewees expressed fears that the United States was raising a red flag about Syria’s nuclear activities as a pretext for launching an attack.

A local activist who works on anti-globalisation issues claimed the US was “creating problems” in an effort to gain greater leverage over Damascus – perhaps to make it more cooperative on Iraq, or to compromise in the ongoing negotiations with Israel.

“If Syria was secretly hiding something from the IAEA, it wouldn’t have agreed to allow its sites to be inspected,” said the activist.

“I am afraid that the Iraqi scenario will be repeated and this [nuclear issue] will be used as a pretext to launch a war against the country. Yesterday, it was Iraq. Now it’s Syria and Iran. The US is trying to fabricate pretexts for controlling Middle Eastern countries. It won’t stop at inspecting suspected nuclear facilities; it goes much farther than that.”

Syria initially ignored IAEA requests to visit the site, raising suspicions that it was concealing illegal nuclear activities.

According to Ziyadeh, “It’s better for the Syrian government to deal with this issue with more transparency, because it builds its credibility domestically and externally.”

A western diplomat in Damascus, who did not want to be named, said, “Syria has to fully cooperate with the IAEA in order to refute international accusations that it has non-peaceful nuclear programmes, otherwise it will face problems with the international community.”

“Syria has the right to have peaceful nuclear programmes,” added the diplomat. “But they must be observed by the IAEA permanently and continually.”

IAEA chief Mohammed ElBaradei told the German magazine Der Spiegel that he expected "absolute transparency" from Syria, and that the IAEA delegation would demand visits to several other sites that might have supplied to al-Kibar. However, the Associated Press last week cited Arab diplomats as saying Damascus planned to give the inspectors access only to the destroyed facility.

In the interview, ElBaradei was critical of the Israeli attack on al-Kibar, saying,

"With unilateral military actions, countries are undermining international agreements, and we are at a historic turning point."

## **Coverage of Syria Airstrike**

By Peter Hart

When an apparent airstrike by Israel against Syria on September 6 was eventually linked to accusations of a secret Syrian nuclear program, the striking thing about the often muddled reporting was how much the credulous reaction to unsubstantiated claims resembled the similarly uncritical reporting about Iraq's non-existent weapons of mass destruction.

When the airstrike was first disclosed, the New York Times (9/12/07) quoted an unnamed U.S. military official saying "it was still unclear exactly what the jets hit." The best guess from other unnamed officials was that the building housed "weapons caches" of arms from Iran, ultimately destined for Hezbollah fighters in Lebanon. Yet another U.S. official--who, like others, "spoke on condition of anonymity because they were discussing a military action by another government"--drew North Korea into the plot, suggesting it "might be unloading some of its nuclear material on Syria."

The following day's Washington Post (9/13/07) had a piece that further attempted to connect the alleged Syrian nuclear program to North Korea. Details on the air raid were still hard to come by; the Post could only point to one source who had heard the site was "capable of making unconventional weapons."

On September 15, the Post reported that "a prominent U.S. expert on the Middle East" had heard from Israeli officials "that the attack appears to have been linked to the arrival three days earlier of a ship carrying material from North Korea labeled as cement." The Post noted that the "emerging consensus in Israel was that it delivered nuclear equipment"--which was the emerging consensus in the media as well.

Soon these sketchy accounts began to take on a more definitive tone. The Post's editorial page noted (9/20/07) that "it's not clear whether U.S. intelligence agencies concur with Israel's conclusion, and independent experts have said that Syria lacks the resources for a credible nuclear weapons program." But the paper went on to conclude, "It nevertheless is beginning to look as if Israel may have carried out the boldest act of nuclear preemption since its own 1981 raid against Iraq's Osirak nuclear complex."

The next day the Post (9/21/07) was still more confident, leading a news piece with the declaration that Israel had attacked "a suspected nuclear site set up in apparent collaboration with North Korea." The main basis for the paper's increasing certainty seemed to be the growing assurance being expressed by anonymous U.S. officials.

An October 14 New York Times account that led with the conclusions of "American and foreign officials with access to the intelligence reports" gave readers a vital cue much further down: Dick

Cheney's office, we were told, was lobbying to use the Israeli strike as a pretext to abandon negotiating with North Korea. Indeed, many reports noted the push from hardliners inside and outside the Bush administration, but failed to connect the dots between their anonymous leaks and their pre-Iraq War strategy of hyping intelligence to bolster their political goals.

The New York Times (9/21/07) quoted an (of course) anonymous U.S. official saying that "the enormous secrecy around the findings, both here and in Israel, suggests that the activity that prompted the Israeli attack involved 'more than a run-of-the-mill missile transaction'"--as if not providing a rationale for your actions was somehow itself a rationale. NBC correspondent Martin Fletcher seemed to agree (9/21/07), saying that "Israel's keeping completely mum on the subject. Another example showing that it actually must be a much more serious issue this time than in the past."

Then came dramatic new visual evidence. On the October 19 broadcast of ABC World News, anchor Charles Gibson dubbed it "a story that could come right out of a Tom Clancy novel," with correspondent Martha Raddatz relying on an unnamed "senior U.S. official" who said that "based on the photographs and additional intelligence...the facility was a North Korean design because of its construction and the technology used." Raddatz relayed her source's supreme confidence: "The official I spoke to said, quote, 'It was unmistakable what it was going to be. There is no doubt in my mind.'" Seconds later, however, when Gibson asked why the administration has been so reluctant to speak on the record "if the intelligence was so clear," Raddatz responded: "Well, I think some in the administration felt it wasn't absolutely clear." The same could be said for such reporting.

More evidence came on October 24, when the Washington Post reported on satellite photos of the Syrian site analyzed by the Institute for Science and International Security (ISIS). The Post declared that "satellite imagery of the area shows buildings under construction roughly similar in design to a North Korean reactor capable of producing nuclear material for one bomb a year," and quoted ISIS analyst David Albright as saying he was "pretty convinced that Syria was trying to build a nuclear reactor."

The Post article did include some skeptics, but the situation was reminiscent of a similar attempt to prove via satellite photos that Iraq had an unconventional weapons program. Most media outlets took Colin Powell's February 2003 case against Iraq at face value; indeed, the very same David Albright declared on CNN (2/9/03) that Powell's presentation of satellite photos and the like was "compelling.... Based on looking at other things Iraq has done, you get the sense that Iraq never intended to comply." The fact that Albright had been so wrong about Iraq's weapons programs hardly seemed to factor into whether reporters should trust his analysis of Syria. (Albright would later say of the White House's chemical and biological weapons claims, "I just figured they were telling the truth"-- L.A. Times, 4/20/03)

Other parallels to the run-up to the Iraq War were still to come. On October 26, the New York Times noted that Syria had suspiciously cleaned up after the airstrike: "New commercial satellite photos show that a Syrian site that Israel bombed last month no longer bears any obvious traces of what analysts said appeared to have been a partly built nuclear reactor." While it's not hard to imagine various reasons why a country would clear away the debris left by a humiliating foreign airstrike, the clean-up was taken by some (including Albright) as an attempt by Syria to cover its tracks. The same reasoning was used by Powell to argue that any discernible activity near suspect buildings was evidence that Iraq was concealing its weapons programs.

The consensus was then more or less well-established: Syria was up to something suspicious, and thus Israel was wise to act. The legality of attacking another country on the basis of a hunch without even offering an explanation hardly factored into any of the media discussion of the attack.

But the next day's New York Times (10/27/07) would raise some doubts: Other satellite images showed the Syrian facility in question had been clearly visible as of September 2003, seemingly undercutting the notion that this was a new project of any sort. At this point, the story seemed to curiously fall off the media radar. A more aggressive and skeptical press--one that would want to show it had learned lessons from being burned by faulty intelligence before the Iraq invasion--would take this new evidence and run with it. Instead, they ran from it.

## **Nuclear or not, the damage has been done**

Phil Sands, Foreign Correspondent

Last Updated: June 24. 2008 11:28PM UAE / June 24. 2008 7:28PM GMT

DAMASCUS // UN nuclear experts are due to leave Syria this evening after a three-day search for proof that Damascus has been running a secret nuclear programme. Did the International Atomic Energy Agency team find that evidence?

A cloak of silence has surrounded the matter in official circles. The IAEA made no comment while on the ground in Syria – in fact it has not even confirmed its presence in the country. Those details have come from other sources.

For their part, the Syrians have imposed a heavy media blackout. SANA, the state news agency, has not so much as hinted that UN inspections are under way, nor have any other government-run media organisations. Only one Syria-based newspaper has referred to the inspections at all – the privately owned al Watan, an Arabic daily.

The issue is so sensitive here that the authorities are taking no chances; best to publicly ignore it and hope it all quietly fades away.

Whether that actually happens depends on what the inspectors actually saw and what they will conclude in their September report.

There are three scenarios: the UN inspectors found conclusive evidence of a hidden nuclear programme; they found some inconclusive suggestions of a programme; or they found no evidence at all.

Syria insists vehemently it has no nuclear ambitions, no nuclear project and therefore that no legitimate evidence can possibly be found. If the IAEA agrees, Damascus will have renewed justification for believing it is unfairly persecuted by the United States, Israel and the international community.

Israeli bombers attacked the site of the alleged nuclear reactor last September, a unilateral pre-emptive strike on its neighbour. If Syria had launched a similar assault on Israel's up-and-running nuclear facilities – something that is politically unthinkable and probably physically impossible – the international uproar would have been huge, and the Middle East thrown into another, hotter-than-ever firestorm.

But Israel attacked Syria and so nothing much was said. If cleared by the UN team, Damascus will be able to claim the moral high ground and will doubtless mention – accurately – that it allowed the IAEA inspectors in, something that Israel, which neither denies nor admits it is armed with nuclear weapons, has never done.

The intelligence services and governments of the United States and Israel, both of which claim to have photographic evidence of a Syrian nuclear programme, would be unlikely to accept a finding of

innocence. The UN team was only given a few days on the ground, under tight Syrian supervision, and was refused access to some of the sites it wanted to inspect. Syria's enemies will say that is proof of a cover-up, that the failure to find fresh evidence is not the same as saying the evidence does not exist – just that the UN team was obstructed and unable to find it.

Those against Syria will also note that the UN atomic agency was not able to stop North Korea from developing and testing a nuclear bomb.

If the UN inspectors do say they have uncovered hard evidence of a nuclear programme, it will be devastating for Syria and its friends, and a gift to its enemies. It would in all likelihood trigger intense international pressure and harsh economic sanctions, as well as a wider probe into possible links between Syria, Iran and North Korea, the latter two having declared nuclear programmes.

The United States and Israel would claim conclusive justification that Syria was part of an “axis of evil” and Damascus would become further isolated from the West, moving into an ever-tighter alliance with Tehran. Prospects for peace with Israel would wither, as would prospects for gradual political reforms in Syria.

In the event of the IAEA saying it did find proof, Syria would continue to deny it had a nuclear programme and had fallen victim to set-up, would be able to say the Israeli bombers had dropped nuclear material during the attack – a smoking gun pushed into an innocent's hands. Or that the UN team was in the hands of foreign agents and was itself guilty of planting evidence.

Perhaps the most likely scenario is that the IAEA's September report will offer no conclusive, final proof of guilt or innocence. Inspectors may find things that do not add up to a nuclear reactor but which may imply one; perhaps traces of graphite of the type that is used in a nuclear plant. They would say they want to return to Syria to visit other sites to carry out more tests, that they need more time on the ground.

That will ensure the Syrian nuclear affair drags on. There will be more media discussion and speculation, more unnamed intelligence officials having their say, more late-night meetings in Vienna, Damascus, Washington, Jerusalem and Brussels about what to do and how to do it.

Syria can well do without this kind of drawn-out wrangle. Damascus already has a death-by-a-thousand cuts legal probe on its plate, the UN inquiry into the assassination of Rafik Hariri, the former Lebanese prime minister. Syria has been implicated in the murder – allegations hotly denied by the Syrian authorities.

A basic principle of justice is the presumption of innocence. The burden of proof is on the prosecution to prove its allegations, not on the defendant to prove those allegations are unfounded.

On that basis Syria must be considered innocent until such time as the IAEA says that, beyond all reasonable doubt, it did have an undeclared nuclear programme. The head of the IAEA, Mohamed ElBaradei, has already said it is unlikely such evidence can be found.

But under the US “war on terrorism”, such a legal principle has been eroded, even in legal systems such as those of the United States and United Kingdom, which supposedly pride themselves on being

dispassionate and scrupulously fair. If the presumption of innocence scarcely applies these days in the western judicial establishment, it certainly does not in the ugly world of geopolitics, intelligence agencies and trial by media.

The nuclear claims have put Syria in a difficult position and it is hard to see Damascus coming out of this matter in better shape than it went in. The Syrian authorities are canny political operators and they might come out on top. It will be a difficult struggle.

Nuclear mud has been thrown at Syria and some will have stuck. Rightly or wrongly, the innuendo will linger. Whatever the IAEA inspectors' findings, this week's inspection will not be the end of the affair.

## **A Surprise From Syria And Israel?**

By David Ignatius

Wednesday, June 25, 2008; A13

*[EXCERPTS]*

What's going on between Syria and Israel? Are the indirect peace negotiations through Turkish mediators that were announced last month for real? I've been talking with sources on all sides, and they present an upbeat view of a peace process that has taken many people (including top Bush administration officials) by surprise.

As with any secret diplomatic initiative, this one is surrounded by mysteries and riddles. So I'll examine the Syria-Israel dialogue as a series of puzzles and offer my best guesses about what's happening:

*[deletia]*

(5) What about Syria's secret nuclear reactor, which was destroyed by the Israelis on Sept. 6, 2007?

Oddly enough, that attack on what CIA analysts called the "Enigma Building" may have helped the peace talks. The Israelis felt that their decisive action helped restore the credibility of their deterrence policy. The Syrians appreciated that Israeli and American silence allowed them time to cover their tracks. Finally, the fact that Assad kept the nuclear effort a secret, and that he managed the post-attack pressures, showed Israelis that he was truly master of his own house, and thus a plausible negotiating partner.

110th CONGRESS  
2d Session

## **H. R. 6420**

**To toll the congressional notification period for removing North Korea from the state sponsors of terrorism list.**

IN THE HOUSE OF REPRESENTATIVES

June 26, 2008

Mr. SHERMAN (for himself and Ms. ROS-LEHTINEN) introduced the following bill; which was referred to the Committee on Foreign Affairs, and in addition to the Committee on Rules, for a period to be subsequently determined by the Speaker, in each case for consideration of such provisions as fall within the jurisdiction of the committee concerned

A BILL

To toll the congressional notification period for removing North Korea from the state sponsors of terrorism list.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

**SECTION 1. REQUIREMENT TO TOLL CONGRESSIONAL NOTIFICATION PERIOD FOR REMOVING NORTH KOREA FROM THE STATE SPONSORS OF TERRORISM LIST.**

(a) Requirement-

(1) **IN GENERAL-** Beginning on the date of the enactment of this Act, the 45-day period referred to in the provisions of law described in paragraph (2) shall be tolled with respect to any rescission of the determination of the Secretary of State that the Government of North Korea has repeatedly provision support for acts of international terrorism pursuant to such provisions of law until the President certifies to Congress that North Korea meets the conditions described in subsection (b).

(2) **PROVISIONS OF LAW DESCRIBED-** The provisions of law referred to in paragraph (1) are section 620A of the Foreign Assistance Act of 1961 (22 U.S.C. 2371), section 40 of the Arms Export Control Act (22 U.S.C. 2780), and section 6(j) of the Export Administration Act of 1979 (50 U.S.C. App. 2405(j)).

(b) **Conditions Described-** The conditions referred to in subsection (a) are the following:

(1) The Government of North Korea has made a complete and verifiable declaration regarding the existence, number, and disposition of any assembled or partially assembled nuclear explosive devices.

(2) The Government of North Korea has made a complete and verifiable declaration regarding attempts to enrich uranium or develop the capability to do so.

(3) The Government of North Korea has made a complete and verifiable declaration regarding nuclear assistance provided to any other countries.

## Cooling Tower Crumbles

That doesn't mean North Korea has decided to give up nuclear weapons.

Saturday, June 28, 2008; A14

THE 60-FOOT-HIGH cooling tower at North Korea's Yongbyon nuclear reactor came tumbling down in a cloud of dust yesterday, producing a television picture that U.S. officials have been seeking for more than two years. The dramatic image was meant to convey the tangible results of a protracted and torturous diplomatic campaign to eliminate North Korea's nuclear weapons program and signal its irreversibility. In that sense there is less than met the eye. Yongbyon's shutdown is indisputably a positive development, and one that a U.S.-led coalition achieved at relatively modest cost. No longer will the facility add to a North Korean plutonium stockpile that already contained the raw material for at least eight bombs -- though the plant has not yet been dismantled beyond repair. Still, the goal of disarming North Korea, far from becoming inevitable, remains distant -- and the regime's repeated evasions, lies and failures to fulfill its promises strongly suggest that it has no intention of giving up its arms.

By the terms of the agreements it signed, North Korea should have supplied a full declaration of all its nuclear programs by the end of last year. Instead, the disclosure it handed over Thursday, six months late, does not acknowledge the uranium enrichment work it is known to have done -- the latest evidence for which turned up, in the form of radioactive traces, on some of the documents it handed over. It does not explain its export of a nuclear reactor to Syria, a clandestine crime that continued after President Bush declared proliferation activity by the North to be a "red line." It does not say how many bombs have been fabricated from the available plutonium, though the Bush administration originally demanded that that be part of the disclosure.

In exchange for its partial compliance, Kim Jong Il's regime will get everything promised it by the international coalition, including the equivalent of 1 million tons of fuel oil and removal from the U.S. list of terrorism sponsors. Though U.S. officials said the effect is largely symbolic, it is, at least, galling to public opinion in Japan, which is still seeking answers from Pyongyang about citizens who were kidnapped and forced to live in North Korea.

With only months left in office, Bush administration officials now intend to press ahead with a new phase of negotiations that would seek to establish a plan for North Korea to turn over its weapons and plutonium in exchange for far larger U.S. concessions. The talks will go forward despite the still-outstanding questions about the uranium program and proliferation to Syria. U.S. officials say they will seek answers as part of the verification of the recent declaration. But it's safe to predict that North Korea's refusal to cooperate will continue, since there has been no consequence for it so far. Rather than lunge for a last-minute deal, the Bush administration should focus on laying a foundation for the next administration. That means establishing a principle: North Korea will receive no further concessions until it discloses its nuclear activities -- including uranium enrichment, proliferation and bomb fabrication -- and those disclosures are verified.

Remarks With South Korean Foreign Minister Yu Myung-hwan  
Secretary Condoleezza Rice  
Seoul, Korea  
June 28, 2008

*[EXCERPT]*

First of all, Mr. Lee Woo-tak, please go ahead with your question.

QUESTION: (Via interpreter.) Yes, I am from Yonhap News. My name is Lee

Woo-tak. Welcome for your – this – the current visit to Korea. I have some questions for you, Secretary of State Rice.

North Korea has made the submission of declaration and within this declaration, we have a list of the plutonium extraction-related information. However, we don't have any information concerning the nuclear weapons and materials. There are also some suspicions about the spread of nuclear proliferation to Syria as well, as well as the UEP issue. So for those issues and verifying those issues, how do you plan to proceed with that? That's my first question.

And when we go into the third phase, then the nuclear weapons or materials that are possessed by North Korea, how it is going to be sent out of the country will be an issue. So from that perspective, does the U.S. have any plans to, for example, purchase those materials and weapons and take them out of North Korea?

And lastly, I think there are many people who are expecting you to visit North Korea. You have already mentioned that this is not the time yet. However, what do you believe will be the appropriate conditions for you to visit North Korea?

My last question is for Foreign Minister Yu. Currently, concerning the submission of declaration by North Korea as well as the destruction of the cooling tower, I think that there are some who criticize about how the verification process may lack the participation of Korea. So how will Korea be able to activate a participation in that verification process? There are some cost issues involved as well as the need to acquire the specialists and experts. And is the Korean Government willing to pay for that?

SECRETARY RICE: Let me begin by saying that we consider the verification process that is about to begin to be one that is a six-party verification process and in which all parties need to be actively engaged. And in fact, the Foreign Minister and I had an extensive discussion about moving forward on verification. We are looking forward to the discussions about how the verification protocol will be carried out.

In fact, on the weapons and other related nuclear programs and materials, it is fully understood that in order to have abandonment of weapons and materials, one also has to have an accounting of them. Now the phase that we've just gone through in which the North Koreans have made a declaration about the amount of plutonium produced and in which they have given representations of a willingness to have that number verified through access to the reactor, through documents that we do have in hand, it is a natural step to know how much plutonium was made as one moves to understanding what has happened with weaponization. But I want to assure everyone that in this next phase, we do have to move on abandonment. That is the purpose of the six-party talks and that is what was agreed in the September 2005 statement.

As to the other elements, the proliferation and the HEU program, it is – there are documents that are referred to in the declaration concerning those two issues, HEU and proliferation. I have said before and I will say again that thus far, we don't have the answers that we need about either. But I expect that the North will live up to the obligation that it's undertaken to take those concerns seriously and to address them. And so at the end of this – let me just emphasize, again, at the end of this, we have to have the abandonment of all programs, weapons, and materials.

## **Dick Cheney 'tried to block North Korea nuclear deal'**

By Philip Sherwell in New York

Last updated: 6:51 PM BST 28/06/2008

*[EXCERPT]*

Vice President Dick Cheney fought furiously to block efforts by Secretary of State Condoleezza Rice to strike a controversial US compromise deal with North Korea over the communist state's nuclear programme, the Telegraph has learned.

"The exchanges between Cheney's office and Rice's people at State got very testy. But ultimately Condi had the President's ear and persuaded him that his legacy would be stronger if they reached a deal with Pyongyang," said a Pentagon adviser who was briefed on the battle.

Mr Cheney's office is believed to have played a key role in the release two months ago of documents and photographs linking North Korea to a suspected nuclear site in Syria that was bombed by Israeli jets last year.

Six months later than promised, Pyongyang last week handed over details to China of its plutonium stocks and invited US officials to witness the symbolic destruction of an already disabled cooling tower at its Yongbyon plutonium plant.

But the declaration gave no information about its programme to enrich uranium or its sharing of nuclear technology with other rogue states - two demands that Washington had previously insisted were non-negotiable if a deal was to be reached.

*[deletia]*

## **North Korea nuclear deal with US 'like police truce with Mafia'**

By John Bolton

Last Updated: 12:01am BST **30/06/2008**

For most Europeans, President Bush's second-term North Korea policy is a welcome relief from his earlier unilateralist cowboy-ism. Recent photos of the Yongbyon reactor's cooling tower collapsing are soothing evidence that Washington's foreign-policy establishment has reasserted itself. Can direct US negotiations with Iran be far behind? In fact, what is collapsing is not the North's nuclear program but President Bush's foreign policy. North Korea has violated every significant agreement ever reached with the United States, and all indications are that the North is again following its traditional game plan. It is quite adept at pledging to give up its nuclear programme, having done so several times in the past fifteen years. Not once, however, has it actually taken decisive steps to do so. Indeed, quite the opposite.

Almost from the moment the North signed the 1994 Agreed Framework, it set about violating it, seeking to offset the loss of plutonium produced in Yongbyon's spent fuel by pursuing uranium enrichment, the alternate route to nuclear weapons. Only when America uncovered decisive proof that North Korea had embarked on a production-scope procurement effort for an enrichment program was that ruse broken. The North initially admitted to the enrichment program, but now firmly denies it. In fact, the evidence suggests the enrichment programme is still underway.

Much fanfare heralded the North's handover of 18,000 pages of documents on Yongbyon's operation, but those very documents are contaminated by particles of highly enriched uranium, probably from that enrichment program the North never had. Equally telling is that these records are incomplete and, given the North's economy in the truthfulness department, quite possibly fraudulent. Gaps in the records preclude determining how much plutonium Yongbyon has produced during its lifetime, a critical issue in estimating how many nuclear weapons the North has.

The only real progress in de-nuclearising North Korea came via Israel's air force last September 6, when it pulverized a nearly-completed clone of Yongbyon on the banks of the Euphrates River in Syria. While the reactor is history, we still lack its vital details, most notably its likely customers. Was this a straight sale to Syria from the North, or was it in fact a North Korean reactor sitting on leased Syrian territory? Or was it a joint venture, perhaps with Iranian cooperation and financing? Iran has the same incentive as North Korea to hide its nuclear activities from prying international eyes, and what better place to hide than a place no one was looking? Or so they thought, until Israeli strike aircraft flattened the Yongbyon twin.

The world's nuclear proliferators are nothing if not determined. For them, diplomacy is not intended to solve common problems, but a very effective way to string along guileless Westerners, thus buying more valuable time to achieve their proliferation objectives. Iran has most graphically demonstrated this by using over five years of negotiations with Britain, France and Germany to perfect the critical nuclear technologies of uranium conversion and enrichment. As one keen observer put it, negotiating with Iran or North Korea is like the police sitting down with the Mafia to discuss their common interest in law-enforcement. President Bush's North Korea deal reflects the Administration's lame-duck status. Europeans appear overwhelmingly to favour the election this November of Senator Obama, in many

respects because his foreign policy is so congenial to their tastes. It may be comforting now to think that the unilateralist cowboys are about to retire to their ranches. It will be less so when we are all confronted, as we will be inevitably, with the continuing reality of Iranian, North Korean -- and other -- nuclear weapons programs.

## **Israel's Airstrike on Syria's Reactor: Implications for the Nonproliferation Regime**

Leonard S. Spector and Avner Cohen

Arms Control Today July/August 2008

Jul 2, 2008

On September 6, 2007, in a surprise dawn attack, seven Israeli warplanes destroyed an industrial facility near al-Kibar, Syria, later identified by the CIA as a nearly completed nuclear reactor secretly under construction since 2001.[1]

According to the CIA, the unit was built with North Korean assistance and was modeled on one used by North Korea to produce plutonium for nuclear weapons.

The CIA declared that it had only "low confidence" that Syria was pursuing a nuclear weapons program, however, because the agency had not unearthed evidence of other key facilities that would be needed for such an effort, in particular a plant to fabricate fuel for the reactor and one to extract weapons-usable plutonium from its spent nuclear fuel. Nonetheless, the CIA acknowledged that the reactor was not suited for the production of electricity or for nuclear research, leaving little room for doubt that the unit was intended to produce plutonium for nuclear arms. Although the location of the plant would strongly indicate that it was part of a secret Syrian nuclear weapons program, a recent story in the German weekly *Der Spiegel*, suggests another possibility: the article cites "intelligence documents" as indicating that the unit was in fact part of a multinational nuclear weapons effort led by Iran, in which Syria and North Korea were collaborating.[2] Both Syria and Iran are non-nuclear-weapon states-parties to the nuclear Nonproliferation Treaty (NPT), which prohibits such parties from developing and producing nuclear weapons.

What was particularly notable about this attack was what occurred afterward: the near total lack of international comment or criticism of Israel's action. The lack of reaction contrasted starkly to the international outcry that followed Israel's preventive strike in 1981 that destroyed Iraq's Osiraq reactor. To be sure, foreign governments may have reserved comment because of the lack of information after the attack. The Israeli and U.S. governments imposed virtually total news blackouts immediately after the raid that held for seven months, and Syria was initially silent on the matter and then subsequently denied that the bombed target was a nuclear facility. Yet, the international silence continued even after the CIA on April 24, 2008, provided a 12-minute video and an extensive briefing that made a strong case that the target was a North Korean-built reactor designed for producing weapons-usable plutonium.

Was the international community tacitly condoning the 2007 Israeli raid even though it appeared that the Syrian reactor did not pose an imminent threat to Israel, the sole justification under international law for the anticipatory use of military force?[3] Were foreign governments, cognizant that the UN Security Council had been unable to halt Iran's continuing development of previously undeclared sensitive nuclear facilities, tacitly endorsing Israel's decision not to invoke the diplomatic tools at its disposal, such as demanding an International Atomic Energy Agency (IAEA) investigation of the site, another traditional prerequisite to the anticipatory use of force?

With the case still unfolding, it is premature to draw firm conclusions about its meaning for the future of global nonproliferation efforts, but two issues will bear close watching. Has confidence in the enforcement of nonproliferation norms eroded to the point that the international community is prepared to accept more readily than in the past the preventive use of force to suppress suspected nuclear weapons programs in certain narrowly defined cases? If so, what does this augur for the future use of military force to arrest Iran's weapons-relevant nuclear activities?

### **Contrasting Reactions: Osiraq versus al-Kibar**

On June 7, 1981, minutes before sunset, eight Israeli F-16 jet fighters in a surprise raid dropped 16 tons of high explosives on the French-supplied, nearly completed Osiraq research nuclear reactor in Tuwaitha, Iraq's main nuclear center, some 26 kilometers southeast of Baghdad. Two days later, in a dramatic press conference in Tel Aviv, Israeli Prime Minister Menachem Begin took full responsibility for the operation, praised its execution as extraordinary, and justified it both on moral and legal grounds. Begin referred to the strike as an act of "anticipatory self-defense at its best."<sup>[4]</sup>

The message that Begin conveyed was that the raid on Osiraq was not a one-time operation but rather a long-term national commitment. He ended his press conference with these dramatic words:

We chose this moment: now, not later, because later may be too late, perhaps forever. And if we stood by idly, two, three years, at the most four years, and Saddam Hussein would have produced his three, four, five bombs.... Then, this country and this people would have been lost, after the Holocaust. Another Holocaust would have happened in the history of the Jewish people. Never again, never again! Tell so your friends, tell anyone you meet, we shall defend our people with all the means at our disposal. We shall not allow any enemy to develop weapons of mass destruction turned against us.<sup>[5]</sup>

A few days later, in a CBS News television interview, Begin reiterated this doctrinal point: "This attack will be a precedent for every future government in Israel.... [E]very future Israeli prime minister will act, in similar circumstances, in the same way."<sup>[6]</sup>

The international community did not share Begin's view. On the contrary, the Israeli raid against a declared nuclear facility belonging to an NPT signatory state in good standing met with near-universal condemnation. Within two days, the surprised Reagan White House suspended the delivery of F-16 warplanes to Israel (the suspension was cancelled two months later).<sup>[7]</sup>

If the U.S. reaction, especially in Congress, was somewhat ambivalent, the worldwide reaction from Moscow to Paris was blunt and strongly disapproving. In the UN Security Council, after a week marked by some 40 speeches all fiercely critical of Israel's action, a tough seven-point resolution, which "strongly condemned" Israel for the strike against Osiraq, was unanimously approved.<sup>[8]</sup> The resolution characterized the Israeli action as a "clear violation of the UN charter and the norms of international conduct" and admonished Israel to refrain in the future from similar actions. Defending the right of Iraq to develop nuclear technology for peaceful purposes, the resolution urged Israel to accept IAEA inspections on all its nuclear facilities (a step that would force Israel to eliminate its widely assumed nuclear arsenal) and concluded by recognizing Iraq's right to "appropriate redress."

The IAEA Board of Governors was equally condemnatory, repeating the Security Council demand that Israel place its nuclear facilities under agency safeguards and warning that Israel might be expelled from the agency if it declined to do so. Finally, on November 10, the UN General Assembly approved a resolution harshly critical of the Israeli attack on Osiraq, with 109 states voting in favor, 34 states abstaining, and only Israel and the United States voting against the measure.

More than a quarter century later, however, after Israel's similar raid on the al-Kibar reactor, the international repercussions were strikingly different. This time, Israel said nothing after the attack and imposed a tight and unprecedented news blackout on the Israeli press regarding the episode. The Bush administration, which apparently consulted with Israel on its concerns about the site before the attack, was also mute and ordered U.S. officials not to discuss the matter. Although several articles in the U.S. media reported that the Syrian installation was a nuclear facility of some kind, there was no official confirmation of such speculation in Jerusalem or Washington until the CIA release of information in April 2008.[9]

Syria said very little as well. Initially, Syria complained only that Israeli aircraft had violated its airspace and dropped some explosive charges in a remote, desolate area, but Damascus went no further. [10] Two weeks later, Syrian President Bashar Assad confirmed in an interview with the BBC that a Syrian military facility under construction was attacked by Israel but provided no details.[11] At the time, Syria (with North Korean help, according to the CIA) was razing the remnants of the al-Kibar facility, in an apparent effort to remove any remaining evidence of the nature of the installation. Within weeks, a new facility was erected, covering the location of the former reactor.

In subsequent statements, Syrian officials categorically denied that the country was building a covert nuclear facility at the site of the Israeli attack.[12] In early June 2008, Syria agreed to an inspection of the site by an IAEA team, to be dispatched later in the month. With Syria having razed the remnants of the facility and built a new structure in its place, it was not clear whether IAEA inspectors would be able to confirm that the site originally housed a reactor. Nor was it clear whether Damascus would grant IAEA monitors access to other undeclared sites that might house the still unidentified fuel fabrication and reprocessing plants that would be needed for a nuclear weapons program.

In a stunning contrast with developments in 1981, no Arab government commented on the Israeli raid, much less pressed for retaliation against Israel, diplomatic or otherwise. The Egyptian Al-Ahram Weekly characterized the state of affairs as the "synchronized silence of the Arab world." [13] The restraint may have reflected the fact that many Arab governments were not displeased that a possible clandestine Syrian nuclear weapons effort had been dealt a serious setback. Iran, Syria's closest ally, also remained largely silent on the issue (possibly to avoid calling attention to itself, if it was, indeed, helping to build the facility). Surprisingly, given that virtually nothing was known publicly about al-Kibar at the time, North Korea strongly condemned the Israeli attack, the only state to do so.[14] Some in the Western press took this as evidence that North Korean nationals were involved in the project and may have been injured in the Israeli attack.[15]

Similarly, the matter was not brought up for debate at the UN Security Council. Nor did the First Committee of the UN General Assembly, which deals with disarmament and international security, address the attack and Syria's possible violation of its NPT pledges at its meetings, held from October 8 to November 2, 2007.

Perhaps more importantly, this pattern of silence continued after the CIA video and briefings were published on April 24, 2008, which disclosed that Israel had attacked what the U.S. intelligence agency alleged was a Syrian nuclear reactor in a preventive strike. To be sure, IAEA Director-General Mohamed ElBaradei issued a disapproving statement on April 25. The statement deplored the fact that the United States and Israel had not provided information to the IAEA “in a timely manner, in accordance with the agency’s responsibilities under the [NPT] to enable it to verify its veracity and establish the facts.” It went on to declare that “the director general views the unilateral use of force by Israel as undermining the due process of verification that is at the heart of the nonproliferation regime.”[16] Although expressing concern about the impact of the Israeli strike on the NPT and the IAEA, ElBaradei’s statement did not directly challenge Israel’s exercise of a right to anticipatory self-defense in this case, in sharp contrast to the findings in 1981 of the UN Security Council, the General Assembly, and the IAEA Board of Governors regarding the Osiraq raid.

Indeed, the Security Council, the body that in 1981 had unanimously condemned Israel’s raid as contrary to the UN Charter and “to norms of international conduct,” had an obvious opportunity to debate the matter at its meeting on April 25. At that session, it addressed a major nonproliferation issue, whether to extend the mandate of the council’s committee to oversee implementation of UN Security Council Resolution 1540. The resolution calls on all UN member states to establish domestic controls and adopt legislation to prevent the proliferation of weapons of mass destruction. Yet, according to the official summary of the debate on the matter, neither the Israeli attack nor Syria’s secret nuclear activities was mentioned.[17]

The Israeli attack also was not criticized at recent international meetings held in Geneva from April 28 to May 9 to prepare for the 2010 NPT Review Conference.[18] Presumably to avoid calling attention to its own alleged misconduct, even Syria did not raise a complaint about Israel’s airstrike in its official statement to the forum but focused instead on the traditional Arab state criticism of Israel for blocking the establishment of a nuclear-weapons-free zone in the Middle East and of the nuclear-weapon states for not making better progress toward disarmament.[19] A number of other Arab states also called for universal adherence to the NPT, the indirect language commonly used to press Israel to renounce its nuclear weapons and join the pact, but again these familiar calls were made without reference to the September 6 airstrike.[20] The United States and Canada complained openly about North Korea assistance to Syria and to Syria’s noncompliance with its obligations under the NPT and under its safeguards agreement with the IAEA. Both states not only declined to criticize Israel, but they did not even mention that Israel had attacked the site.[21]

At the recent meeting of IAEA Board of Governors in early June, ElBaradei declared in his opening remarks, “It is deeply regrettable that information concerning this installation was not provided to the Agency in a timely manner and that force was resorted to unilaterally before the Agency was given an opportunity to establish the facts, in accordance with its responsibilities under the NPT and Syria’s Safeguards Agreement.” He went on to stress, however, that “Syria, like all States with comprehensive safeguards agreements, has an obligation to report the planning and construction of any nuclear facility to the Agency. We are therefore treating this information with the seriousness it deserves,” noting that an IAEA inspection team would visit Syria June 22-24, 2008.[22] Nonetheless, the IAEA’s official summary of the meeting does not indicate that the matter was further debated, a silence on the matter that at least one official present confirmed.[23]

## **Bush Doctrine**

Adding to the difficulties of understanding the implications of this case is the Bush doctrine, articulated in the 2002 U.S. National Security Strategy.[24] The traditionally accepted justification for the use of force in the absence of actual aggression was established in 1837 in a U.S.-British controversy known as the Caroline case, which permitted a state to use appropriate military force when not under attack only in case of necessity, “where the attack was imminent and only forcible action could forestall such attack.”[25]

The Bush doctrine sought to expand this definition to justify pre-emptive military action. Highlighting the catastrophic destructive potential of weapons of mass destruction, the readiness of international terrorist groups and isolated leaders of anti-status quo states to use them, and the ease of concealing such weapons, the doctrine declared that “[t]he greater the threat, the greater is the risk of inaction—and the more compelling the case for taking anticipatory action to defend ourselves, even if uncertainty remains as to the time and place of the enemy’s attack. To forestall or prevent such hostile acts by our adversaries, the United States will, if necessary, act preemptively.”[26]

Then-national security adviser Condoleezza Rice expanded on the new doctrine in an address shortly after the release of the National Security Strategy.

The National Security Strategy does not overturn five decades of doctrine and jettison either containment or deterrence. These strategic concepts can and will continue to be employed where appropriate. But some threats are so potentially catastrophic—and can arrive with so little warning, by means that are untraceable—that they cannot be contained. Extremists who seem to view suicide as a sacrament are unlikely to ever be deterred. And new technology requires new thinking about when a threat actually becomes “imminent.” So as a matter of common sense, the United States must be prepared to take action, when necessary, before threats have fully materialized.

But this approach must be treated with great caution. The number of cases in which it might be justified will always be small. It does not give a green light—to the United States or any other nation—to act first without exhausting other means, including diplomacy. Preemptive action does not come at the beginning of a long chain of effort. The threat must be very grave. And the risks of waiting must far outweigh the risks of action.[27]

The National Security Strategy sparked immediate controversy, in part because it was articulated by the world’s sole superpower and by an administration with a reputation for acting unilaterally and seemingly eager to advance U.S. interests through the use of military force, particularly in the then-looming confrontation with Iraq.[28] The Bush doctrine misfired badly in Iraq, where the U.S.-led intervention was justified as essential to destroy Saddam Hussein’s WMD programs, which were later found not to exist. Nonetheless, the underlying rationale for modifying the norms governing anticipatory self-defense to confront nascent nuclear weapons programs has gained a degree of recognition within the U.S. policy community, even among some who have criticized the Bush administration for its assertive projection of U.S. military might.[29] Internationally, however, the doctrine has remained the target of strong criticism.[30]

Israel’s strike on al-Kibar in September 2007 was, in effect, a clear application of this internationally disfavored doctrine. Given that the al-Kibar reactor had not started to operate and, according to the

CIA, Syria's fuel fabrication and reprocessing facilities had not been discovered and might not yet have been completed, Syria was unquestionably some time away from producing fissile material for nuclear weapons and still further from producing the weapons themselves. Thus, few could argue that Israel met the traditional necessity/imminence standard in the case of the al-Kibar reactor strike. (The same would be true if the reactor was, in fact, part of an Iranian nuclear weapon program.) Moreover, Israel bypassed a key restraint enumerated by Rice, in that Israel did not exhaust or apparently ever initiate other diplomatic means for dealing with this threat. Yet, even then, the international community refrained from condemning the Israeli attack.

### **Explaining the Silence**

What can account for this reaction, now that the major details of the episode have begun to emerge? One senior Middle Eastern diplomat, Egyptian Ambassador Nabil Fahmy, said at a June 2008 forum in Washington that governments in the region had refrained from commenting because so little authoritative information was originally provided officially by the governments involved. He added that the episode had also been overshadowed by other events in the region and that governments would be more likely to speak to the issue once the IAEA had completed its initial investigation of the incident. Yet, the reasons behind the international silence appear to be considerably more complex and could indicate a broader concern about the underlying weakness of the NPT regime.

Regional politics have certainly played a role. An isolated state with close ties to Iran, Syria is perceived as a disruptive influence in the region, even within the Arab community, making it a decidedly less sympathetic victim of Israeli pre-emption than Iraq in 1981. Also, the specific details of the al-Kibar case itself, coupled with the as yet ineffective efforts to enforce the NPT in the case of Iran, have undoubtedly influenced thinking in foreign capitals.

In contrast to the Osiraq reactor, which was openly purchased from France, declared, and subject to IAEA monitoring, the Syrian reactor was secretly built with North Korean aid, undeclared, deliberately concealed, and not subject to IAEA safeguards. These differences in themselves made the Syrian reactor, once revealed, immediately suspect and lent an element of credibility to Israel's underlying concerns about the installation. The physical characteristics of the al-Kibar reactor reinforce these points. The Osiraq reactor was appropriately sized and designed for nuclear research; only by a complex scheme of emplacing and removing uranium targets around its core between IAEA inspections could it have been used to secretly produce plutonium for weapons. Al-Kibar, in contrast, was modeled on a reactor specifically designed to produce plutonium for nuclear arms, immediately creating an additional cause for suspicion and concern.

At the same time, Israel's principal diplomatic option for eliminating the risk posed by the facility—seeking an IAEA investigation, possibly leading to UN Security Council action—hardly appeared promising. Israel has never placed trust in international organizations to guarantee its security, particularly in cases where its very existence may be at stake. Indeed, this is the philosophy behind the 1981 Begin doctrine. In recent years, as international nonproliferation enforcement efforts to curb Iran's nuclear program have escalated from IAEA demands to UN Security Council sanctions, Israel has grappled with the profound dilemma of deciding how long it can rely on these efforts before reverting to the Begin doctrine.

By the time of the al-Kibar raid, the Security Council had adopted two resolutions demanding that Iran cease its uranium-enrichment and plutonium-production-related activities and had imposed sanctions against Iran until it did so. Iran has defied these measures, however, as well as demands from the IAEA that it provide a full explanation of evidence that it conducted work on nuclear weapons at least through early 2004.[31] Meanwhile, Tehran significantly expanded its uranium-enrichment capabilities and indicated its intent to continue doing so, in effect bringing it ever closer to the ability to produce material for nuclear weapons. (On April 25, 2008, the council adopted a third sanctions resolution seeking to halt the sensitive elements of the Iranian nuclear program, Resolution 1803.)

Given this history, had Israel brought the matter to the IAEA, Israel would have had reason to fear that Syria would have followed the Iranian example: stalling for time, delaying inspections, removing evidence, asserting (however falsely) that the site was peaceful in nature, and claiming that it had disguised the unit in order to protect it from possible attack. Moreover, for Israel to have approached the agency might have required it to compromise intelligence about the al-Kibar site and would certainly have led Syria to heavily protect the facility, potentially constraining Israel's option to destroy the reactor if IAEA inspections and other diplomatic measures failed to prevent its operation. Once it was operating, Israel would have been further constrained because destroying the facility could have created significant radiological fallout.

It probably would be an overstatement to interpret the international silence on the al-Kibar attack as constituting tacit endorsement that diplomatic mechanisms for enforcing the nonproliferation regime have proven ineffective and that threatened states have a right to preventively attack clandestine foreign nuclear facilities. Silence is a convenient, noncommittal reaction that avoids the need for a government to openly take sides in a potentially incendiary international controversy. Nonetheless, the persistence of the silence suggests that states are becoming increasingly concerned about the weakness of the nonproliferation regime in enforcing its norms and, therefore, cautiously more tolerant of an affected state using force preventively, beyond the classic rule limiting anticipatory self-defense to cases where a threat is imminent.[32]

### **Impact on Nonproliferation**

If the international response was indeed an unspoken expression of anxiety about current regime enforcement mechanisms, the most important means to begin to restore confidence in the regime is for the IAEA and the Security Council to act decisively to address the Iranian nuclear program. In its most recent report, the IAEA appears to be intensifying its pressure on Tehran, but the Security Council seems incapable of decisive action because of Chinese and Russian reluctance to impose strong sanctions against Iran. The international response to the Israeli attack should be taken as a clear rebuke for their hesitancy.

After all, Iran pursued a clandestine uranium-enrichment program for some 18 years, with secret support from the Abdul Qadeer Khan nuclear smuggling network, behavior not unlike Syria's pursuit of the al-Kibar project. Even after placing all of its known nuclear facilities under IAEA inspection, Tehran continues to bring new suspicions on the program. Since 2005, for example, Tehran has rescinded expanded authority it had previously granted the IAEA to conduct inspections on its territory. Moreover, according to U.S. intelligence estimates and documents now in the hands of the IAEA, Iran pursued work specifically on nuclear weapons at least through early 2004, including development of a nuclear warhead for its intermediate-range Shahab-3 missile. As recently reported by the IAEA, Iran

has refused to acknowledge or explain this earlier work and has denied the agency the access necessary to confirm that Iran is not currently engaging in any nuclear weapons research or clandestine fissile material production activities.[33]

These are the principal underlying reasons the UN Security Council has demanded, *inter alia*, that Iran cease all enrichment activities. At the same time, the response to the Syria attack is far from a clear precedent implicitly endorsing the use of military force against the Iranian nuclear program. The cases are not identical. The council has imposed sanctions against Iran under Article 41 of the UN Charter, which excludes the use of military force to implement Security Council mandates. Thus, the al-Kibar strike, even if seen as tacitly expanding the right of preventive attacks against clandestine nuclear programs, can hardly be said to provide Israel or any other state with a green light for attacking threatening nuclear installations in Iran.

Moreover, from an operational military perspective, there is a huge difference between the ability (especially for Israel) to conduct a successful strike against a single, ground-level reactor in nearby Syria and the ability to destroy the dozen or so major nuclear weapons-relevant components of a much larger nuclear program in distant Iran, including Iran's underground, heavily shielded enrichment facility at Natanz. These are two radically different military missions. Moreover, with allies in Iraq, southern Lebanon, and Gaza, as well as missiles able to reach Israel, Iran would have a wide range of retaliatory measures at its disposal. Thus even if international quiescence regarding the al-Kibar attack might provide a political opening for striking Iran, military realities would make this a very dangerous and daunting effort. Nonetheless, with the recent war of words between Iranian officials, threatening to "erase" Israel and declaring that it will soon disappear, and one potential Israeli candidate for prime minister, Shaul Mofaz, declaring that military strikes to stop Iran developing nuclear weapons looked "unavoidable," this option cannot be ruled out.[34]

Although other senior Israeli officials criticized Mofaz's declaration as reckless and driven by domestic considerations, only days before he spoke Israel carried out a major military exercise involving over 100 jet fighters and refueling tankers, apparently intended to rehearse the execution of long-range strikes. Some U.S. officials characterized the maneuvers as a warning to Iran.[35] Moreover, if the *Der Spiegel* report is accurate and Iran was the hidden hand behind al-Kibar, Israel's attack against Iran's nuclear weapon program may have already begun.

Finally, as analysts consider the lasting impact of the al-Kibar attack, some may criticize it as a challenge to the treaty- and inspection-based nonproliferation regime. Although it is still too early to predict the lasting normative legacy of the Israeli action on al-Kibar, the difference in international attitudes between 1981 (Osiraq) and 2007-2008 (al-Kibar and subsequent release of information about the attack) is unmistakable. One explanation may be that in the intervening years, the gross violations of nonproliferation regime compliance rules by Iraq, Iran, and North Korea—all NPT non-nuclear weapon state parties—have altered thinking regarding the legitimacy of unilateral preventive action, at least in cases of undeclared nuclear facilities that are apparently oriented towards the production of weapons.

There may also be a growing appreciation in the international community that military action can sometimes complement and reinforce the regime. Military modalities, such as alliances and security assurances, have traditionally played a supporting role in reducing the motivations of states to go nuclear, but it appears that since the first Gulf War there may be an increased recognition that, in some

cases, military action or the threat of such action may also play a more direct role in halting violations of the regime compliance rules. This was the case in the 1991 Persian Gulf War, which, with the subsequent work of the UN Special Commission, eliminated Saddam Hussein's WMD programs; with the threat of military intervention against North Korea in the early 1990s, which facilitated the freeze of Pyongyang's plutonium program under the 1994 Agreed Framework; and with the enforcement of the inspection requirements in UN Security Council Resolution 687 in Iraq through the threat of invasion in 2002-2003.

## Conclusion

Although many details about this incident are yet to be revealed, it is already evident that its reverberations challenging the efficacy of the classic nonproliferation regime and potentially expanding the rights of states to intervene against clandestine nuclear programs in their early stages appear inevitable. Effective investigations by the IAEA in Syria, perhaps unearthing still undiscovered clandestine facilities, and significantly intensified efforts by the agency and the Security Council in addressing the Iranian threat could do much to help restore the regime's integrity and need to be urgently pursued. ## **Bush's North Korea Decision Twists the Partisan Divide**

By Matt Korade, CQ Staff

CQ HOMELAND SECURITY

July 2, 2008 – 9:09 p.m.

What some are hailing as a largely symbolic gesture by the Bush administration toward North Korea has a political mix of lawmakers in Congress plotting opposition.

In a partisan twist, Democrats on key committees are cautiously supportive of the administration's decision to ease trade sanctions on North Korea and remove it from the terrorism blacklist in return for information on its nuclear programs.

Republicans, on the other hand, have been joined by hawkish counterparts across the aisle in publicly and privately expressing outrage.

In a statement, California Democrat Howard L. Berman, chairman of the House Foreign Affairs Committee, called the agreement "encouraging."

The Bush administration, he said, "has wisely chosen to assess Pyongyang's sincerity" in moving forward with verifying North Korea's nuclear program disclosures."

"You can be sure Congress will also closely monitor North Korea's actions. For now, the ball is squarely in Pyongyang's court," he said.

Rep. Silvestre Reyes, D-Texas, chairman of the House Intelligence Committee, said in a statement it was not clear to him why the administration would choose to lift sanctions on Kim Jong Il's regime just weeks after publicly confirming North Korea's assistance in developing a covert nuclear reactor in Syria — and while the press was reporting the regime may also have a covert uranium enrichment program.

Information compromising North Korea's credibility reached his committee just hours after the president's announcement, he said. "I intend to work with my colleagues over the next 45 days to examine whether the Congress should intercede and block the president from removing North Korea from the state sponsors of terror list."

The ranking Republican on Reyes' panel, Peter Hoekstra of Michigan, had even harsher words for Bush.

"A decision seemingly has been made that it is more important for the White House to reach a legacy agreement than to get to the bottom of North Korea's nuclear efforts," he said in a statement. "The administration has repeatedly delayed briefing Congress on North Korean proliferation because it knows any deal reached would not likely survive the scrutiny of Congress. It has never sought to hold North Korea accountable for its nuclear weapons test, its known nuclear proliferation activities or its willingness to sell arms to any nation or group that can pay."

The most vocal opponents may be Reps. Brad Sherman , D-Calif., and Ileana Ros-Lehtinen , R-Fla.

Sherman, who chairs the Foreign Affairs Subcommittee on International Terrorism, Nonproliferation and Human Rights, has introduced — with Ros-Lehtinen as a cosponsor — legislation (HR 6420) that would effectively halt the deal until Pyongyang releases the complete details of its nuclear programs. The two were sharply critical of the deal announced June 26.

“The president has caved, he’s desperate to tell voters that the Republicans have accomplished something, and even more desperate to get something good in the history books, and he just took whatever they could get out of North Korea, which is pitiful, as far as a declaration,” Sherman said. Bush’s North Korea Decision Twists the Partisan Divide

The declaration, he added, is the diplomatic equivalent of a chocolate-chip cookie — deceptively tasty, but possibly lethal if swallowed whole.

“So the State Department Web site says they’re going to verify the hell out of the chocolate-chip recipe,” he said. “How about starting with a declaration that covers the issues?”

Rather than reflect concerns over nonproliferation, the White House’s actions showed a subservience to multinational corporations, which also is reflected in the administration’s refusal to make China’s currency manipulation a leverage point for cooperation in the six-party talks, Sherman said.

“I would think that the folks in Tehran are just giggling right now,” Sherman said. “I think they may be a little worried about what Jerusalem does, but it’s real clear that the multinational corporations have won big-time, year after year, action after action, and any statement by this administration that they care about proliferation — yes, but only at a distant second to letting these multinationals do whatever they want, and not just U.S.-based multinationals, but international multinationals. This president is very ecumenical when it comes to multinational corporations.

“That combined with fooling the American public that something has been accomplished, and maybe fooling the historians as well, is the only explanation for why a president who is world famous for his bellicose rhetoric has, when the rubber meets the road, put us on the road to capitulation.”

Ros-Lehtinen, the ranking Republican on the Foreign Affairs Committee, said in a release that the decision was cause for “profound concern.” In rewarding North Korea for providing a limited nuclear-program declaration that left out much of what it was asked, the administration risked abandoning allies such as Japan while sending a message to Syria and Iran that the United States is willing to betray its own interests.

“Serious verification questions linger,” Ros-Lehtinen said, “and I would have hoped that the administration would have shown more caution, and less haste, on a matter of this gravity.”

Meanwhile, the United States is giving up valuable leverage without any certainty North Korea will offer a complete, verifiable accounting of its nuclear activities, said Ros-Lehtinen, who introduced earlier legislation (HR 3650) containing a slew of additional conditions North Korea would have to meet before removal from the terrorism blacklist.

From the administration's perspective, the decision was premised on North Korea's agreeing to dismantle its plutonium reactor at Yongbyon and provide details about its nuclear programs, which entitled it to removal from the "Trading with the Enemy Act" (PL 65-91) and the state sponsors of terrorism list, said national security adviser Stephen Hadley after Bush's announcement.

The bilateral trade sanctions to be lifted, Hadley said, were "relatively minor," including some licensing requirements for goods imported from North Korea, U.S. citizens' involvement in third-party shipments to the communist nation, and some prohibitions on financial transfers by its government.

Meanwhile, removal from the terrorism blacklist would entitle North Korea to international aid, such as loans from the World Bank. But easing these restrictions was minimal in the scheme of things, because North Korea remained one of the most sanctioned countries in the world, both from the United States and the international community, Hadley said.

Although the United States had some concerns over how much plutonium North Korea has produced, the existence of its uranium-enrichment program, and its building of a nuclear reactor in Syria, the six-party talks with the United States, China, Japan, South Korea, and Russia, over time will allow both verification of this information and preventive monitoring, Hadley said.

Michael O'Hanlon, senior fellow for foreign policy at the liberal-leaning Brookings Institution, supported the administration's view. One of the main benefits of the administration's decision was that it would allay criticisms from China and Russia that the United States has been stubbornly inflexible in its dealings with North Korea while setting up an ironclad rationale for further punishment if North Korea fails to follow through on its promises, O'Hanlon said.

Bush's North Korea Decision Twists the Partisan Divide

China and, to a lesser degree, South Korea, have kept North Korea afloat and have been unimpressed with blunt U.S. demands to squeeze the country over nonproliferation issues, he said, while Russia sits on the U.N. Security Council and problematically sides with China in the six-party talks.

The general goal, O'Hanlon said, should be to move North Korea in the direction of Vietnam, making aid and diplomacy contingent on such things as denuclearization and improved human rights. But while the current deal opens the door to aid, it doesn't provide that aid.

"I think it's a smart step, but it's not a huge accomplishment in and of itself," O'Hanlon said.

By law, Bush must give Congress 45 days' notice before removing a country from the terrorism blacklist. The Sherman-Ros-Lehtinen bill would freeze the 45-day notification period, preventing removal from the list, until Pyongyang supplies the declaration it originally promised. This includes a full accounting of its uranium enrichment programs, existing nuclear weapons, and proliferation to countries such as Syria and Iran.

If floor votes were counted by zeal, the legislation would sail to passage. Right now, however, Sherman isn't so sure.

"I would think that the president will veto any bill that does pass, that he will be able to stymie in the Senate any bill that he does veto," Sherman said. "The president does not have the capacity to get a

declaration out of North Korea that means anything, but he does have enough support in a very partisan year to disenfranchise Congress on this issue.”

One Senate aide who has followed the issue closely said legislative action might be a possibility.

“Supporters of this policy have been attempting to marginalize the opposition in Congress by saying it’s only conservative Republicans, but that’s just not true,” the aide said. On the controversial issue of waiving sanction restrictions to spend money on dismantling North Korean nuclear reactors, as well as on other, related legislation, the administration was dealt setbacks from both sides of the aisle, the aide said.

“The most vocal opponents have been Republicans for sure, but you’ll see that there’s skepticism and push-back from Democrats as well.”

## **The Madness of Chris Hill**

Backstory on a bad deal.

By James Rosen

July 03, 2008, 4:00 a.m.

‘You will be better advised,’ John Mitchell once famously said, “to watch what we do instead of what we say.” This maxim, uttered by Richard Nixon’s pipe-smoking attorney general, has echoed through the ages, applauded and denounced for its frankness in acknowledging the occasional need for duplicity, or at least the odd sleight of hand, in the practice of government.

Now, with the arrival of North Korea’s declaration of its nuclear programs — long overdue and woefully inadequate in its disclosure of key data — and with the enthusiastic reception afforded the document by the current White House and State Department, the Bush administration seems to have taken Mitchell’s maxim to heart.

The 60-page declaration is a product of the so-called February 13 agreement, the road map for North Korean denuclearization signed in 2007 by all members of the Six-Party talks. The accord, entitled “Initial Actions To Implement Six-Party Joint Statement,” obligated Pyongyang to submit, by the end of 2007 and in exchange for certain benefits it has already received, such as large shipments of heavy fuel oil and infrastructural upgrades, “a complete declaration of all nuclear programs.”

Time and again, the top State Department official on the North Korean account, Assistant Secretary Christopher Hill, insisted the United States and its allies in the Six-Party talks would accept nothing less. “We can’t go with something that’s 80 percent or 90 percent,” Hill told reporters at the Okura Hotel in Tokyo this past January, when the deadline for the declaration’s submission had already passed. “We really need to go with something that’s complete.” “Frankly speaking,” Hill added at the Japanese Foreign Ministry, “a partial declaration is really no declaration at all.” Asked about the lapsed deadline, Hill exalted comprehensiveness over timeliness: “We felt it was better for them to give us a complete one and correct one even if it’s going to be a late one.” The following month, Hill reiterated, in testimony before the Senate Foreign Relations Committee, that “we cannot accept a declaration that is incomplete or incorrect.”

Half a year later, the declaration we have accepted is by all accounts far from “complete” or “correct.” First, it omits the number of plutonium-based bombs produced at the massive and aging reactor at Yongbyon, which the North Koreans, having tested a nuclear device in October 2006, have now begun to disable. Equally concerning, the declaration also fails to provide any data on two other key issues: the regime’s secret highly enriched uranium (HEU) program, which the U.S. intelligence community judges with “high confidence” to have existed, and with “moderate confidence” to be ongoing; and the North’s proliferation of nuclear technology to other state sponsors of terrorism. This latter issue came to the fore last September, after Israeli fighter jets destroyed a nuclear facility North Korean workers were building in the deserts of northeastern Syria.

These were, we heard repeatedly, the issues of gravest concern to Ambassador Hill. Eight days after the ink dried on the February 13 agreement, he told a Washington think tank audience that the North Koreans had “attempted to purchase some aluminum tubes from Germany” and that there were

“indications that they were successful in getting some of these tubes elsewhere.” Six days later, he told the House Foreign Affairs Committee: “We know from the Pakistanis that [the North Koreans] bought these centrifuges. There’s no other purpose for a centrifuge of that kind than to produce highly enriched uranium.” Last November, senior Bush administration officials gathered at the headquarters of the Air Force Technical Applications Center, located on Patrick Air Force Base in Florida, for a special briefing on the traces of HEU discovered on some of the aluminum tubes Pyongyang, inexplicably, provided for our inspection. “It is my professional judgment,” Hill had confidently told a House subcommittee the previous month, “that by the end of this year, we will have a clarity on [the North’s] uranium enrichment such that we can be assured that a highly enriched uranium program is no longer a threat to our country.”

Yet in welcoming the North’s declaration last week, eight months after Hill offered his “professional judgment,” White House National Security Advisor Stephen Hadley admitted the Six-Party allies still need to “get to the bottom of this issue of the uranium enrichment... Our intelligence community has some concerns about their past activities and has some concerns about potentially ongoing activities.” And the proliferation activity? “We want to get to the bottom of that” as well, Hadley said, “to make sure there is not continuing activity going on between North Korea and Syria, or activity with respect to other locations as well.”

So it would appear that, after long delay, the Bush administration has chosen to accept — and to hail as “a good step forward,” in the words of Secretary of State Condoleezza Rice — a “partial declaration” of the very sort her point man on the issue, Ambassador Hill, dismissed earlier this year as “no declaration at all.” Indeed, given the nature of the document’s omissions, and the administration’s own stated suspicions about ongoing activities, it is fair to wonder whether the declaration even rises to the level of the “80 percent or 90 percent” Hill also declared unacceptable in January. All the North Koreans were willing to say in their declaration about HEU and Syria, according to Hadley, was that “they’re not engaged in these activities now and won’t [be] in the future.” “They also have acknowledged in writing that we have raised concerns,” Hadley added, as if that were a victory for American diplomacy.

Pressed to explain the administration’s apparent relaxation of standards for accepting the North’s declaration, Hill defended the progress made to date in the Six-Party talks, even as he acknowledged “you’re looking at a partially finished product here and we’ve got to finish the job.” “Obviously, we would like to deal with things in one fell swoop, but sometimes,” Hill told an audience at the Center for Strategic and International Studies in Washington on July 1, “you have to kind of do things on an incremental basis... I would draw your attention to the fact that a year ago they were producing plutonium and not only are they not producing plutonium, but they can’t produce plutonium because the thing is disabled.”

To close observers of the Six-Party process, however, the Bush administration’s capitulation on the contents of the declaration came as no surprise. On January 25 of this year, citing foreign diplomats involved in the Six-Party talks and American analysts familiar with the negotiations, Fox News reported that Hill “is now considering accepting a declaration that would be less than complete, carving out the two most contentious issues for later resolution... Hill has floated the idea of allowing the North Koreans to exclude from their declaration both their highly enriched uranium (HEU) program and their nuclear collaboration with Syria, with the understanding that these issues would be revisited later.”

In a series of angry e-mails, all on the record but unpublished until now, Hill vehemently denied the story. “Completely inaccurate,” he wrote. “This idea that we would ignore the most contentious items and take them up later is ridiculous. I don’t believe in ‘carve outs’ and even if I did (which I don’t) how in the world would this work in practical terms? Do you really think we could make concessions on the basis of an incomplete declaration, then somehow we would be able to return to the contentious issues AFTER – AFTER!!!?? — giving away all our leverage? Why? I can tell you this stupidity has never been under consideration by anyone who is part of the process or truly close to the process.

“I suspect,” Hill continued, “that you have sources who are a little out of it, a little frustrated either because they want the process to go forward or are afraid it might, and who are much more interested in manipulating you rather than enlightening you because I can assure you that nobody involved in this process has ever suggested this foolishness or floated such ideas because they don’t make any sense.” Finally, Hill addressed, without invitation or foundation, what he assumed to be the reporter’s political leanings. “And, btw, I am a conservative, meaning I take this messy world as I see it and try to deal with painful reality, stay in channels, respect institutions, observe service discipline and follow instructions. You are not talking to conservatives. Believe me.”

When the reporter politely thanked Hill and promised to distill his rant down to a quotable reaction, suitable for use in reporting, Hill shot back: “Just to be clear. I am calling your piece completely inaccurate. And since you are unable to provide a single named source — not a one, I have to wonder what you have been drinking (or smoking since you are obviously not a conservative).”

The reporter still hasn’t disclosed what he is smoking, but the plumes from John Mitchell’s pipe hang heavy today over the Bush White House and Rice’s State.

## Mending fences

France and now Germany have decided if they can't beat 'em, they will let them join, notes Bassel Oudat from Damascus

Slowly but surely, Europe is edging closer to Syria. European Parliament President Hans-Gert Pottering, who is planning a visit to Damascus next month, told reporters that Syria "is a key country in the Middle East and a major partner in the peace process". He is not the only one to think so. Last week, Syria played host to Iceland's Foreign Minister Ingibjorg Gisladdottir and German Foreign Ministry Middle East coordinator Andreas Michaelis. For the moment, Europe's overtures to Syria are still of an exploratory nature. And Western sources say that Damascus has some way to go to prove its willingness to cooperate on various regional issues.

It's a message that the Syrians are taking to heart. Syrian Vice-President Farouk Al-Sharaa recently told Hizbullah-run Al-Manar television that Syrian-European relations were "going into a new phase".

In mid-2004, Syrian-French relations took a turn for the worst after the assassination of Lebanese Prime Minister Rafik Al-Hariri. But French attempts to ostracise Syria did not stop Damascus from trying to stay in Europe's good books. Syrian officials, civil society representatives and businessmen continued to exchange visits with their German, Italian, and Spanish counterparts.

Syria also managed to keep its economic relations with European countries going. And many Europeans preferred to contain rather than to isolate Syria, a country they know has considerable influence in Lebanon, Iraq, and Palestine.

Economic and commercial exchanges between Syria and Europe remained intact (Syria exports oil, cotton, phosphates, and textiles to EU countries). At one point, Damascus started looking around for alternative trade partners in case Europe turns completely against it.

"Europe is not our only option. We have strategic connections with various economic blocks around the world. Syria is determined to upgrade its relations with countries in the East, such as Iran, Russia, China, and Malaysia, as well as countries in Latin America and Africa, including South Africa," Syrian Deputy Prime Minister Abdullah Al-Dardari said recently.

Making good on Syrian promises, President Al-Assad visited China, Foreign Minister Walid Al-Muallem held talks in South Africa, and various Syrian officials have been in Tehran. Syria is attracting many investors from Malaysia, China, and Iran. The Syrians say that they can survive without Europe, but they have done all they can to keep their economic ties with Europe intact, even when the political scene looked discouraging.

Finally, France has begun to change its tune. Following the Doha talks about Lebanon, French officials expressed satisfaction with the Syrian position. Then President Nicolas Sarkozy telephoned President Bashar Al-Assad and invited him to attend the Union for the Mediterranean conference, scheduled to be held in Paris on 13 July, one day before the French National Day celebrations. This was big news for the Syrians, opening other doors for them in Europe. According to a German source, Germany plans to "take immediate measures to improve ties with Syria in a similar fashion to what France has done."

Damascus is thrilled with any gesture coming from European countries. During a conference in Tripoli last month, Syrian officials discouraged any statements hostile to the Union for the Mediterranean. In talks with visiting European officials, the Syrians are said to have expressed their desire to promote regional peace and stability.

In exchanges with European officials, the Syrians defend their policies in Iraq and Palestine. They admit to having vital interests in Lebanon, but deny interfering in Lebanese affairs. As for the accusations concerning an alleged nuclear reactor in Al-Kibar, one that Israel bombed recently, Syrian officials maintain that it was an old military site. Last week, they allowed officials of the International Atomic Energy Agency to inspect the site.

According to Saber Falhout, media advisor to the Syrian president, the US allegations about a Syrian covert nuclear programme were designed to "dampen the peace process in the Middle East and drive a wedge between Syria and Europe." He told Al-Ahram Weekly that the US has been trying to put pressure on Syria for years.

"The US has satellites that can trace the movement of ants in the desert, and therefore knows better than anyone else that Syria doesn't have nuclear reactors that can be used for military purposes," Falhout said, noting that Syria has signed all international agreements banning nuclear weapons and agrees to opening its facilities to investigation.

According to well-informed sources, the site in question did not contain a nuclear reactor. But it may have been used as a warehouse for missiles from suspicious sources or to produce non-nuclear weapons. Syria is not cooperating with neither Iran nor Korea in nuclear matters and doesn't have the technical, financial, and human resources needed to build a nuclear weapon, the sources note.

In an interview with the Weekly, a Damascus-based French diplomat said that Europe's rapprochement with Syria was not exactly taking place "without US endorsement". He added that both Europe and the US failed to contain Syria through sanctions and pressure and couldn't get it to distance itself from Iran, Hizbullah, and Palestinian groups. "Therefore, the West decided that improving ties would be a better option."

The French diplomat, who spoke on condition of anonymity, noted that the West encouraged Turkey to improve its ties with Syria and act as mediator between Syria and Israel. The West is hoping that Turkey may prove so useful to the Syrians that the latter would feel no need for their special ties with Tehran. This may not be as far-fetched as it seems. Damascus is less than pleased with Iranian policy in Iraq, and the Iranians are not exactly thrilled with the prospect of Syrian-Israeli talks.

The Syrians are pleased with recent developments, but they cannot take Europe for granted. Damascus still has a lot of explaining to do with regard to its policies in Lebanon, Iraq, and Palestine. Unless what it says is acceptable to its European interlocutors, hopes for improved Syrian-European relations may be dashed.

<http://verificationthoughts.blogspot.com/2008/07/three-other-syrian-sites.html>

## **The three other Syrian sites**

**Wednesday, 9 July 2008**

Syria's destroyed nuclear reactor at Al-Kibar has been the focus of considerable attention throughout July. Few would have missed the International Atomic Energy Agency's visit to Syria in late June. James blogged about it at the work. He expressed skepticism over the alleged link with Iran, which I think is a healthy reaction.

Having observed the interaction between Syrian and Iranian diplomats at the Agency GC for some years now, I would personally be surprised if they're not talking. Close personal interactions in Vienna does not mean, however, close cooperation on undeclared nuclear facilities.

Anyway. A three man team, headed in person by the DDG-S Olli Heinonen, arrived at Damascus International Airport on Sunday, 22 June. No details of the trip has been released by anyone, and officials on both sides of the Atlantic are very tight-lipped about what, if anything, might have been uncovered.

Most press reports claim that Heinonen and his crew met Syrian officials on Sunday evening, and then headed out on a 400 kilometer trek to Al-Kibar first thing Monday morning. According to Mark Heinrich, the Syrians had restricted inspections to that site, at which Heinonen and his entourage were allowed to take "extensive environmental samples".

It is not clear where samples were taken. Understandably, Heinonen himself did not give much detail. In his quite Finnish way he simply said that samples had been taken of "quite a lot of things". Obviously, that can mean anything.

It can also yield surprising results. Consider that the Iranians thought that they were home-free at Kalaye Electric before Chris Charlier's team swiped at a place where the Iranians forgot to sanitize.

Ephraim Asculai, a senior research fellow at the Institute for Science and International Security, have argued that, "Inspectors will [...] attempt to sample for particles of uranium, particles of the cladding, and particles of graphite", but does not seem very optimistic that tell-tale signs will be picked up. Moreover, he argues that it "is highly unlikely that inspectors will find any above-ground major components of the reactor and affiliated equipment" but that remnants of the reactor foundation might still be present at the site.

So, we'll see what the sampling will reveal. I am pessimistic, but you never know.

## **The three other sites**

The Syrians did not allow Heinonen and his limited team to get access to three other sites fingered by US intelligence as being associated with the country's nuclear programme. Reportedly, one of the sites may have some reprocessing capability. Two sites are operational and one is under construction.

I have tried to find out what these sites are and where they might be located, but no-one honestly have a clue. Even people that usually are in the know. I've noticed, though, that someone has been buying coverage of two areas in Syria. First in January then again in May. The dates indicate that it is the same client - although that might also be a coincidence.

One location is the chemical weapons facility near Al Safir and the adjacent SCUD site (36° 3'31.23"N 37°20'9.57"E). The other location might be a triple fenced compound in the Syrian desert (34°37'35.72"N 37°14'2.10"E). Of course, this is not evidence of anything. It is simply an observation. But there is SAM coverage of both areas.

The Agency team flew back on Tuesday, 24 June. If I have to guess, they probably took Austrian Airline's daily 3.55 pm shuttle to Vienna.

## **Nukes under concrete?**

**Aug. 16, 2008**

EPHRAIM ASCULAI , THE JERUSALEM POST

In some old gangster films, as well as probably in real life, there is the scene where the victim is thrown into a building construction mold and drowned in a thick layer of cement. A tell-tale shoe that fell off in the old movies - and more recently the hidden security camera - provides the clues that bring the culprit to justice, even though the body has not been found. The case of Syria's bombed Al-Kibar site holds many similarities to these gangster movie scenarios.

The photographic evidence of the existence of a nuclear reactor under construction at the site was overwhelming: pictures of the reactor under construction, with great similarities to a North Korean plutonium production reactor, and its later camouflage by the construction of a surrounding building that completely enclosed the structure; the intake of water from the Euphrates River and the outlet of returning water from the building back into the downstream of the river, which indicated the existence of a strong energy source at the site. The most damning piece of evidence probably is the way the Syrians razed the site, poured concrete over it and claimed that it was some sort of a military site and not a nuclear reactor.

THIS SHOULD have been enough for the International Atomic Energy Agency (IAEA) to indict Syria for its violation of the Non-Proliferation Treaty (NPT). However, the IAEA requested an inspection of the bombed site in the hope that it would be able to collect evidence that would clinch the matter. A four-day inspection trip was made in June 2008, months after the Syrians finished their clean-up of the site, but was probably limited by the Syrians to "classical" IAEA inspection methods of visual observations and collection of samples. It is doubtful whether these would uncover much, given the Syrian efforts at a cleanup. The "corpse" still lies buried in the huge amount of poured concrete. It is possible, however, that the IAEA inspectors were getting too close for comfort, since Syria recently announced that it would not permit the inspectors to return to the site.

In addition, the Syrians made an important diplomatic move, seeking a seat on the IAEA Board of Governors, a 35-member forum that could decide that Syria violated its obligations. Since most of the decisions in this body are made by consensus, Syria would thus insure itself against condemnation. Thus, by refusing inspections and gaining the seat of governor, which it has a good chance of doing, Syria is taking out double insurance.

THE TIME has come for the IAEA to take a strong stance on the Syrian issue and state that the burden is now upon Syria to prove that there was no reactor under construction at the site. Syria would have to permit the most intrusive inspections, using advanced technologies, such as thus called for in on-site inspections of the Comprehensive Test-Ban Treaty. If Syria is unwilling to do this, it should be censured and, at the very least, banned from becoming a member of the IAEA Board of Governors. Given the attitude of the present Director General of the IAEA, it is doubtful that this will happen.

The United States is also an important actor in the Syrian affair, since it provided the evidence on Syria's misdeeds, and the connection to North Korea. The US is acting against the proposal to let Syria become a member of the Board. If it can persuade North Korea to disclose its connection to the Syrian nuclear reactor, it will put an end to Syria's lies and denials.

[The writer is a senior research fellow at the Institute for National Security Studies \(INSS\).](#)

## **Editorial: North Korea must not suspend work to disable nuclear facilities**

(Mainichi Japan) August 30, 2008

As the Bush administration nears the end of its term, it will have to deal with another thorny issue. North Korea has declared that it will immediately suspend the disabling of its Yongbyon nuclear facilities, and that it would also consider restoring nuclear facilities that have already been disabled.

This is not a temperate declaration. North Korea claims that even though it fulfilled its own obligations by submitting a report on its nuclear program in June, the U.S. has not removed it from the list of state sponsors of terrorism. North Korea asserts that the U.S. has clearly reneged on its agreement.

But there is something wrong with this line of argument. North Korea timed the convening of working level talks with Japan to coincide with the passing of the Aug. 11 deadline for removing it from the terrorism blacklist. In doing so, North Korea probably intended to communicate its own willingness to be flexible to Japan and the U.S.

However, North Korea has failed to meet its own obligations. The six nations that are included in the six-party consultations have offered various enticements in exchange for actions by North Korea in order to remove Pyongyang's nuclear threat. These enticements include removal from the terrorism blacklist. However, North Korea's submission of a report is not sufficient to fulfill its own obligations. It would be impossible to ensure that the nuclear threat has been eliminated without conducting strict inspections. The U.S. State Department has every right to point out that inspections are one of the items agreed to in the six-nation talks, and that North Korea is in violation of the agreement.

However, if the standoff between the U.S. and North Korea drags out, major progress toward nuclear disarmament cannot be expected before the Bush administration leaves office in January. And it is uncertain what kind of North Korea policy the next U.S. administration will adopt. If the current stalemate persists, and North Korea's nuclear weapons and related facilities remain largely untouched, it goes without saying that this would constitute a major setback for Japan.

It is crucial that steps toward disarmament not be impeded, and that the U.S. and North Korea conduct a dialogue for this purpose. But we should also place our hopes on efforts by China, as the host of the six-party talks, to bring North Korea around. As the so-called "New Cold War" between the U.S. and Russia erupts in various regions of the world, and attempts are made to preserve the unity of the six-party talks, Japan's diplomatic efforts will certainly be tested.

However, subtle differences in emphasis within the U.S. administration are also a concern. Assistant Secretary of State Christopher Hill, the American delegate to the six-nation talks, and Secretary of State Condoleezza Rice appeared to be comparatively amenable to removing North Korea from the terrorism blacklist. On the other hand, President George Bush seemed to adopt a harsher line toward North Korea in his summit meeting with his South Korean counterpart earlier this month.

Compared to previous U.S. presidents, President Bush has been one of the most ardent supporters of Israel. The threat that North Korea poses to Israel through its nuclear technology ties with Syria is a

concern to President Bush and conservatives in the U.S. Congress, and has certainly put the brakes on efforts to remove North Korea from the terrorism blacklist prior to the U.S. presidential election.

North Korea is alert to the subtle differences within the U.S. government, and is probably using them as fodder to stir things up, but it must not forget its obligation to fully disclose information related to its nuclear weapons, relations with Syria, and uranium enrichment program, and comply with inspections. It is North Korea that has still not delivered on its promises.

## **We May Miss Kim Jong-il (and Maybe Musharraf)**

By DAVID E. SANGER

September 14, 2008

*[EXCERPTS]*

WASHINGTON — Last week, when the news filtered out of the black hole of North Korea that Kim Jong-il likely suffered a stroke in August, no one in the Bush administration rushed out to buy a get-well-soon card. This is, after all, a man President Bush has described as a “tyrant,” a dictator who starves his own people, and, according to some Senators, a “pygmy” — the biggest insult for a guy who keeps a lot of elevator shoes in the presidential closet in Pyongyang.

But whatever names he is called, there was a surprising ambivalence in official Washington about the news — more than a whiff of reluctance, in fact, to lose Mr. Kim at the helm just now.

This was true especially among intelligence officials, who wake up every day worried about what happens when states implode, and whether there will be a free-for-all for their weapons.

*[deletia]*

That is why the American bomb-watching community has a grudging fondness for Mr. Kim, the “pygmy dictator.” The Americans’ biggest fear about North Korea is a collapse of the state, in which a starving, broke nation simply implodes. That could send everyone on a mad scramble for the country’s arsenal — the Chinese, the South Koreans, the Russians, the Americans. “The bad news about North Korea,” said Jonathan Pollack, a North Korea expert at the Naval War College, “is that we don’t know much about their nuclear control system. Or even if they have much of one.”

The good news is that the arsenal is small. In recent negotiations with the United States, before Mr. Kim fell ill, the country said it possessed about 82 pounds of bomb-grade plutonium. If they are not lying (a significant “if”) that’s about enough to make six weapons. Some in the C.I.A. think the North Koreans could have 12 or more weapons. It’s nothing to sneeze at, but compared to Pakistan’s arsenal, it’s a manageable number.

*[deletia]*

Recent history is not especially reassuring about either Pakistan or North Korea, considering how much technology has already leaked from them to other states. Pakistan’s laboratories were where Abdul Qadeer Khan started his nuclear proliferation ring and flourished during political upheaval in the 1990s. Dr. Khan has been under house arrest, but in recent months he has been allowed to move around much more freely.

And when the Israelis bombed a nuclear reactor in Syria a year ago, it soon came out that they had a lot of design and building help — from the North Koreans. That was when Mr. Kim had his full faculties. The nightmare is how much worse the leakage could get if it is unclear who is in charge.

## **Time to close deal with India**

By Boston Herald Editorial Staff

Sunday, September 14, 2008 - Added 22h ago [*as of 2008-09-14T14:05Z*]

The end of the international ban on nuclear trade with India is being greeted by groans from the arms-control crowd. But President Bush is right to try to bring India's civilian nuclear program under international regulation and bring the world's largest democracy closer to the United States.

The 45-nation Nuclear Suppliers Group agreed on Sept. 6 to permit civilian nuclear trade despite the fact that India, which has nuclear weapons, never signed the Non-Proliferation Treaty or the Test Ban Treaty. Last month, the International Atomic Energy Agency reached agreement with India to inspect its 14 civilian power reactors.

Congress now has 30 days to pass implementing legislation. It isn't clear whether the administration can win the necessary waiver of the waiting period or whether the matter must be left for next year, but it is going to try and it has a chance. The Democrats' nominee for vice president, Sen. Joseph Biden of Delaware, is chairman of the Senate Foreign Relations Committee and supports the changes.

Electricity-short India found it hard to expand production from its reactors because it lacks uranium and could not legally buy any abroad. Critics of the new arrangement say it permits the eight military reactors to concentrate on material for bombs. This is true, but the bomb material train left the New Delhi station in 1974.

Critics also claim that the deal makes it harder to persuade North Korea and Iran to give up their nuclear projects, but that train also has departed. The Non-Proliferation Treaty binds Syria, but that didn't stop Syria from trying to build a nuclear reactor with help from North Korea, another treaty signer that disregarded it (before withdrawing) on the way to its own nuclear weapon. It didn't stop Libya from trying, before it was scared out of the attempt, or discourage Iran. Treaty or no treaty, nations will pursue or shun nuclear weapons according to calculations of their own interests. Several started such pursuits only to stop once concluding that they were not advancing their security one whit.

The closer technological, scientific, commercial and military relations between India and the United States that are bound to follow nuclear trade should also induce prudence in China if it should ever be tempted to adventurism.

## **Note to European Union: Say NO to Syria**

By ILEANA ROS-LEHTINEN

Sep 20, 2008 21:53 | Updated Sep 20, 2008 22:30

*[EXCERPTS]*

Even as the civilized world condemned Russia's invasion of Georgia, other countries have rushed to praise it. Among these is Syria, whose strongman Bashar Assad - on a recent visit to Moscow - proclaimed his support for Russia's actions while eagerly shopping for advanced conventional weapons and announcing his willingness to deploy Russian missile systems in Syrian territory.

Yet, European allies appear ready to reward Syria's belligerent regime with an "Association Agreement" that would provide Assad's regime with eagerly sought political legitimacy and material assistance.

These developments are worrisome indeed.

*[deletia]*

EVEN MORE troubling is Syria's record on nuclear proliferation. As a signatory of the Nuclear Non-Proliferation Treaty, Syria has pledged to never acquire nuclear weapons and to do all in its power to prevent the technology and materials necessary for these weapons to reach other countries.

However, despite vehement denials from Damascus, the evidence clearly shows that Syria was nearing completion of a nuclear reactor built with assistance from North Korea when Israel conducted its strike in September 2007. US intelligence officials have publicly stated that this reactor, had it become operational, would have been capable of producing enough plutonium to build at least two nuclear weapons within a year. Damascus continues to bar inspectors from the International Atomic Energy Agency from further examining the site to determine the extent of Syria's nuclear activities.

Sound familiar? It is. Syria is following Iran's approach to nuclear weapons. The world has done far too little to stop Iran's nuclear ambitions. We must learn from those mistakes. The U.S. has called on France and other EU member-states to force Damascus to grant IAEA inspectors full access to all Syrian nuclear facilities. Our European allies must increase the pressure on Syria if we are to thwart the regime's nuclear ambitions.

European leaders should cease all further action toward an Association Agreement with Damascus. They must require that Syria verifiably end its interference in Lebanon, its support for Islamist terrorist organizations, and its pursuit of nuclear, biological, and chemical weapons and the means to deliver them. They must also clarify that this must be accomplished before Syria is treated as a responsible partner and included in the councils of the West. If Europe ignores the lessons of inaction and accommodation as it has with Iran and Russian aggression in Georgia, and chooses a similar path toward Syria, we may all soon regret it.

The writer, a congresswoman from Florida, serves as the senior Republican on the House Foreign Affairs Committee.

Freedom's Edge

## **A Clear And Present Nuclear Danger**

Claudia Rosett 09.25.08, 12:00 AM ET

Wall Street's meltdown has almost swept it from the news, but right now Secretary of State Condoleezza Rice has on her hands a diplomatic debacle in North Korea that may ultimately prove even more dangerous than the mess in the markets.

The problem is not just that Pyongyang is now trumpeting its plan to re-start the same Yongbyon nuclear reactor that it has twice shut down since 1994--each time in exchange for massive aid and concessions from America and friends. Nor does the problem stop with signs that North Korea is planning another long-range missile test (hello, Los Angeles) or with worries that, along with peddling missiles and nuclear technology to the Middle East, North Korea might just sell a nuclear weapon or two to terrorists who have a grudge against America.

The jumbo, overarching problem is that North Korea's regime, with its knack for making Washington's star diplomats dance like marionettes, has become a world showcase for the payola of running a nuclear extortion racket. Especially for the past year and a half, Pyongyang has been demonstrating to thug governments everywhere the amazing leverage that a nuclear arms program can provide to even a small rogue regime willing to play chicken with the U.S.

Since agreeing in February 2007 to the latest denuclearization deal, North Korea has unilaterally revised the terms as it pleases, demanded hard cash upfront, shrugged off deadlines and refused to disclose anything about the clandestine uranium-enrichment program that it appears to have. Oh, and while promising last year to give up its nukes, North Korea went on for months secretly collaborating with Syria in completing a copy-Yongbyon reactor on the Euphrates, with no clear purpose but to produce plutonium for weapons, smack in the heart of the Middle East. That was shut down not by the North Koreans or the Syrians, but by an Israeli air strike last September.

Were U.S. diplomats daunted by any of this? Hardly. Like the Clinton administration, when Kim cheated on a previous nuclear freeze deal, the Bush administration in recent years has winked, shrugged and even abetted Pyongyang's games. Last year, to comply with North Korean demands, Assistant Secretary Christopher Hill, top wheedler to North Korea, enlisted the help of the U.S. Federal Reserve, no less, to transfer \$25 million in crime-tainted frozen funds from Macau's Banco Delta Asia back to Pyongyang. Since then, North Korea has been receiving free fuel shipments and America has been pouring in aid via the United Nations World Food Program, which now proposes to send more than half a billion dollars worth of food to North Korea over the next 15 months--despite Pyongyang's long record of diverting such help to the military.

The list of American concessions and gifts goes on. But most appalling has been the U.S. surrender of principle on matters of human rights for North Korea's 22 million people, who during Kim's 14-year reign have been imprisoned by the hundreds of thousands and starved to death by the millions. Having

appointed a special envoy, Jay Lefkowitz, to address these horrors, Bush and Rice then sidelined him as irrelevant to wheeling-and-dealing with North Korea--especially after Lefkowitz gave a speech this past January noting, correctly, that the Six-Party talks had failed.

What has the U.S. received from North Korea in return? No real access, that's for sure. Along with the continuing mystery about the full scope of North Korea's nuclear programs, networks and weapons stockpiles, U.S. officials aren't even sure right now whether North Korean ruler, Kim Jong Il, is alive or dead. And despite the diplomatic and financial bonanza for Pyongyang, not one ounce of plutonium has been handed over. Not one bomb or missile has been destroyed. Apparently nothing has been demolished that can't be rebuilt in a hurry.

When the State Department, to its credit, finally balked recently at removing North Korea from the list of terrorist-sponsoring states, pending some way to verify its nuclear activities, North Korea told the U.S. to take a hike. But even now, the State Department can't tear itself away from the bargaining table. "We're going to remain engaged with the North Koreans," was how a spokesman put it last week, adding that the next president--whoever that might be--is unlikely to do anything different.

One can only hope the next president will take a different tack. The way it's going now, should anyone be surprised that Iran is speeding along the wayward nuclear trail blazed by North Korea? Is it any wonder that Syria thought it worth a shot to collaborate with North Korea in building a secret nuclear plant? Can others be far behind?

## **Syria's Nuclear Revival**

by Robert Maginnis

10/07/2008

Hohenfels, Germany -- Last year's Israeli air force strike on an alleged Syrian plutonium reactor appears to have had two unintended consequences. It spurred Damascus to redouble its efforts to continue its atomic program, and it has drawn attention away from the Iranian and North Korean atomic weapons programs -- thus making the world more dangerous.

The London-based Asharq Alawsat newspaper reported on October 2nd that Syrian President Bashar Assad has redoubled his efforts to develop a nuclear program. The paper reports that, following the Israeli airstrike, Syria changed course and began a nuclear program based on the Iranian model of simultaneously building multiple facilities in various sites throughout the country to make any effort to destroy its atomic facilities more difficult.

Further, the addition of Syria to the list of rogue nations seeking atomic weapons demonstrates the failure of ongoing efforts by the international community to denuclearize North Korea and Iran. Rather than cooperating in those efforts, Pyongyang and Tehran are each involved heavily (either on their own or in partnership) in developing Damascus' atomic program.

Syria's nuclear ambitions are an open secret. In 1986, then Syrian chief of staff, Gen. Hihmet al-Siabi, said his country seeks nuclear parity with arch rival Israel. Israel is believed to have at least 180 nuclear warheads.

But Syria denies that it has a covert nuclear weapons program. It says that its atomic ambitions are focused exclusively on energy production, which is supported by official statements. In August, President Assad visited Iranian President Mahmud Ahmadinejad in Tehran, where the Syrian gave his support for the Iranian nuclear program, claiming that every state has the right to acquire atomic technology.

Of course, that is the same façade used by North Korea and Iran to give their atomic weapons program deniability. The Central Intelligence Agency director Michael Hayden warned Congress against naivete when he said Syria will act like its rogue partners "to delay and deceive" outsiders regarding its true nuclear intentions. Remember, North Korea successfully used these tactics for many years before testing a plutonium device in 2006. Iran is perhaps less than two years from a similar milestone.

There is plenty of evidence that Syria has gone well beyond rhetoric in its bid to secure a nuclear arsenal. This spring, Hayden told Congress "Do not assume that al Kibar [the Syrian reactor destroyed by Israel] exhausted our knowledge of Syrian efforts with regard to nuclear weapons." Hayden said the agency had the "highest confidence level" that al Kibar housed a plutonium reactor designed to produce weapon grade fissile material.

What's shrouded in uncertainty is the accuracy of America's information regarding other aspects of Syria's nuclear program. However, the information in the public domain is very compelling.

Apparently, the U.S. has information about a number of suspected Syrian nuclear sites. American officials have been pressing the International Atomic Energy Agency (IAEA), the United Nation's nuclear watchdog group, to demand access to three Syrian sites to look for evidence of nuclear activity, but Damascus has denied admittance, citing concerns over its "security."

Certainly the U.S. is aware that Syria has accumulated nuclear technology which aids its secret weapons efforts. Syria likely received assistance from the nuclear trafficking network run by Pakistani nuclear official Abdul Qadeer Khan, the same man who proliferated atomic technologies to Iran and North Korea. Even the IAEA has helped Syria with numerous atomic projects, including uranium extraction from phosphoric acid, isotope production and the construction of a cyclotron facility.

A 2004 CIA report to Congress on weapons proliferation is revealing. The report observes that Syria "... continued to develop civilian nuclear capabilities, including uranium extraction technology and hot cell facilities." These are critical technologies potentially applicable to a weapons program.

Syria has also solicited nuclear assistance from a variety of countries, including Russia. That country, which has provided Iran and North Korea with nuclear assistance, is now seeking to renew its influence in the Mideast through the sale of sophisticated weapons, defense agreements and perhaps atomic energy knowhow. Broader access by Syria to Russian atomic expertise could provide opportunities for Syria to expand its indigenous weapons development capabilities.

Syria's nuclear program has also been helped by the Iraq war. There is evidence that Iraqi nuclear scientists escaped to Syria and are working for Assad's regime. A group of about 12 Iraqi nuclear technicians fled to Syria before the fall of Saddam's regime. These experts allegedly brought considerable nuclear technology with them.

The second consequence of Israel's destruction of the al Kibar site is the attention it takes away from the Iranian and North Korean nuclear programs. This is exacerbated by Tehran and Pyongyang, which are doing their best to accelerate Syria's nuclear program.

Specifically, Syria has developed a very close relationship with North Korea. Moshe Arens, Israel's three time minister of defense, told this writer that North Korea has been "peddling technology" in the Mideast for "20 to 30 years." Recently, North Korean nuclear officials have been very busy in Syria helping to "Iranize" that atomic program.

The Syria-North Korea nuclear cooperation began "probably as early as 1997," said a US intelligence official. The Syrian reactor destroyed by Israel was a North Korean designed reactor being built with assistance from Pyongyang. It was configured similarly to North Korea's five megawatt reactor at Yongbyon, which was used to produce the plutonium for North Korea's 2006 nuclear weapon test.

The Asharq Alawsat report which broke the Syrian nuclear story indicated that the new Iranian model is being built with experts from Pyongyang and that just last month Iranian experts arrived in Syria to join the project.

The al Kabir incident which spawned these consequences recently became even darker. The "point man" for Syria's nuclear weapons program, Brig. Gen. Muhammad Suleiman, was assassinated at a beach resort near Tartus, Syria. The immediate impact of his death is that the IAEA's investigation of

the al Kibar site will be slowed. But the likely long-term implication is that Syria will use the incident to stiff-arm the IAEA, as Iran and North Korea have done for the past couple decades.

It's clear that Syria has joined a growing club of atomic weapons rogues that threaten their neighbors and could lead to the proliferation of nuclear technologies to terrorist groups and other dangerous regimes.

It's unfortunate that Israel's strike on the al Kibar reactor created undesirable geopolitical consequences. But lack of action by the West will have vastly more undesirable consequences if inaction results in Syria and Iran achieving their nuclear weapons ambitions.

## **There is no need for evidence, buddy**

*[Author believed to be Andreas Persbo]*

**Thursday, 9 October 2008**

Over the last month, discussions on verification activities in Syria has increased. Mohamed ElBaradei gave a short statement on the matter to the Board of Governors on 22 September 2008. He informed the assembled governors that:

In April this year, the Agency received information claiming that an installation destroyed by Israel in September 2007 at Al Kibar in Syria was a nuclear reactor. The Syrian authorities have repeatedly stated that the alleged site was not involved in any nuclear activities.

With Syria's cooperation, the Agency was able to visit Al Kibar in June 2008. Samples taken from the site are still being analyzed and evaluated by the Agency, but so far we have found no indication of any nuclear material.

In order to assess the veracity of information available to the Agency, we asked the Syrian authorities in July to provide access to additional information and locations. Syria has not yet responded to this request but has indicated that any further developments would depend on the results of the samples taken during the first visit.

I trust that Syria will show maximum cooperation and transparency and provide all the information needed by the Agency to complete its assessment.

Yesterday, I highlighted that samples taken at the site may indicate the presence of reactor-grade graphite. However, there seem to be no trace of nuclear material at the site. This is not entirely surprising given that the facility was not operating when it was struck by the Israeli air-raid.

The majority view within the Department of Safeguards is reportedly that the site very likely housed a graphite moderated reactor. The departmental firewalls are strongly upheld and information flows within the Agency itself is constricted. This is how it should be. Nevertheless, there is a minority within the Department that isn't convinced by the data collected thus far, and that is reluctant to accept the conclusions of the U.S. intelligence community. Indeed, it would seem like the U.S. intelligence agencies enjoys a not insignificant confidence-deficit with large parts of the wider analytic community.

Now, there is an emerging debate about the utility of special inspections in Syria. Unfortunately, there has been a significant meshing of legal, political and tactical arguments. I think that some clarity is needed.

At heart is the assertion that the IAEA needs some sort of evidence to call for a special inspection. Those who advocate this view often equate evidence with documents or objects that establishes facts about the Syrian programme. This argument may be correct from a tactical or political point of view, but certainly not from a legal one.

Safeguards in Syria is implemented through the country's comprehensive safeguards agreement (INFCIRC/407). This agreement entered into force on 18 May 1992. I'm going to refer to this agreement in this post, and not the model CSA (which is contained in INFCIRC/153),

Article 72 of Syria's safeguards agreement reads, in applicable parts,

...the Agency may make special inspections ... if the Agency considers that information made available by Syria, including explanations from Syria and information obtained from routine inspections, is not adequate for the Agency to fulfill its responsibilities under this Agreement.

Note that a special inspection is made at the Agency's discretion. It may engage in this activity, but may also choose not to if it can find other ways to fulfill its obligations. The IAEA's main responsibility under the agreement is defined in article 2, which reads:

The Agency shall have the right and the obligation to ensure that safeguards will be applied, in accordance with the terms of this Agreement, on all source or special fissionable material in all peaceful nuclear activities within the territory of Syria, under its jurisdiction or carried out under its control anywhere, for the exclusive purpose of verifying that such material is not diverted to nuclear weapons or other nuclear explosive devices.

In other words, the Agency cannot choose not to follow up on leads that may involve the diversion of nuclear materials. While a reactor under construction doesn't prima facie fall under article 2, associated activities such as the manufacturing and handling of nuclear fuel most certainly will.

If a country constructs a reactor, but does not have any associated safeguarded fuel cycle activities, all kinds of alarm bells should go off in Vienna. The fuel has to come from somewhere. Is it in the country? Do they intend to import it from somewhere? If so, import and exports may need to be declared. These questions alone raise doubt whether all source or special fissionable material is safeguarded.

And indeed, if there is nothing in the routine declarations, it is not far fetched to conclude that the information given by the state isn't adequate for the organization to fulfill its obligation.

Technically, no evidence is needed for the Agency to start consider the special inspection procedure.

Theoretically, a similar procedure could be initiated if, say, a country decides not to submit routine declarations on known sites (or submit incomplete information). The attentive reader may observe that this scenario is foreseen in article 76 (a) of the safeguards agreement.

Tactically, however, it may not be prudent to use the special inspection tool. According to Article 76 of the agreement, the Agency and Syria shall consult over the circumstances leading up to the inspection. This is a mandatory requirement. There is no time limit for consultations. Talking may take a long time.

As a result of the consultations the Agency may obtain access, in agreement with Syria, to information. It may also get access to any location under Syrian jurisdiction or control. If Syria refuses to cooperate at this point the matter could get referred to the Agency Board of Governors. The Board may call on Syria to take the required action without delay. However, broadly speaking that's the limit of the Board's enforcement capabilities (see article 18, but see also article 19).

It has been said that this procedure would take months, which would allow a country to relocate potentially incriminating evidence from locations, and to shred any documentation that may be harmful.

The Agency may therefore decide that a special inspection is not the best way to enable it to fulfill its own obligations. This call, however, is political and tactical and has nothing to do with the Agency's rights and obligations.

I thought that distinction had to be made.

## **The Curse of American Reasonableness by Victor Cha**

**Updated Oct.20,2008 09:11 KST**

The hardest thing to accept about President Bush's October 11 decision to take North Korea off of the terrorism blacklist is not that he was rewarding bad behavior after Pyongyang fired missiles and kicked out IAEA inspectors. Nor was it that Bush as a beleaguered lame duck president might have made bad decisions not unlike Bill Clinton at the end of his term of office. Instead it is that Pyongyang appears capable of forever exploiting the curse of American reasonableness. As a former negotiator, I find this to be the most maddening aspect of Six Party talks.

The curse of American reasonableness means that every agreement in the Six Party process is negotiated with painstaking care in which parties hammer out specific quid pro quos, the synchronization of steps, timelines, with concomitant rewards and penalties. Yet sooner or later, Pyongyang plays brinkmanship and demands more than it was promised or does less than it should. While everyone accepts that the DPRK is being completely unreasonable, they also realize that a failure of the agreement could mean the failure of the Six Party talks and the precipitation of another crisis. To avoid this, the parties end up pressing the U.S., knowing full well that the DPRK is at fault and traversing the bounds of fairness and good faith, but at the same time, certain that the only chance of progress can be had from American reasonableness rather than DPRK unreasonableness. The result is that any additional American flexibility is widely perceived in the region as evidence of American leadership, but is viewed in Washington as some combination of desperation and weakness.

An element of this dynamic was almost certainly at play in the current agreement. The ostensible reason for North Korea's unraveling of the Six Party denuclearization agreement was that the United States once again was "moving the goal posts" in demanding Pyongyang's agreement on a verification protocol for its nuclear declaration as a pre-condition for the North's removal from the U.S. blacklist of terrorist states.

It has become the reflexive analysis of respected media outlets like the New York Times and CNN to blame this negotiation stalemate in Six Party talks on so-called "hardliners" in the Bush administration trying to submarine Assistant Secretary Christopher Hill's negotiation process.

This is the wrong focus. Sure, the nonproliferation and arms control functional bureaus in State and the NSC pushed for a tough verification protocol. That is their job, particularly with a target state as untrustworthy as the DPRK. The focus instead should be on DPRK unreasonableness. The requirement of a verification protocol for the North's nuclear declaration has always been the clear understanding of all the parties at the talks. The principle of verifiability was first enunciated in 2002 as part of the CVID concept ("complete, verifiable, and irreversible dismantlement") during the first Bush administration. The concept was included in the Six Party September 2005 Joint Statement, and it was reaffirmed in the February 2007 agreement. I was involved in negotiations for both of these and the DPRK fully understood our need for verification of any declaration.

And lest people forget, President Bush's official statement on June 26 of his intention to delist North Korea was equally clear in its conditioning delisting on verification: "I am notifying Congress of my intent to rescind North Korea's designation as a state sponsor of terror in 45 days. The next 45 days will

be an important period for North Korea to show its seriousness of its cooperation. We will work through the six-party talks to develop a comprehensive and rigorous verification protocol. And during this period, the United States will carefully observe North Korea's actions -- and act accordingly.” Thirteen days later, Secretary of State Rice met with North Korean foreign minister Pak Eui-chun on the sidelines of the ASEAN regional forum meetings in Singapore, the first such meeting at the cabinet level in years and continued to insist on a verification protocol.

Yet when the North starts to rollback disablement, claiming verification was not part of the deal, all parties while angered with Pyongyang’s unreasonableness understand that their best chance at avoiding a collapse of the negotiations and full-blown crisis lies with asking for a little more US flexibility. And so the U.S. takes steps which are praised in the region as signs of American political commitment, but roundly criticized in Washington as rewarding bad behavior.

The verification agreement will soon be codified at the next Six Party meeting in Beijing. While it is weak in its specificity on the North’s uranium-based nuclear activities, proliferation, and undeclared nuclear sites, the agreement will be useful in terms of closing down Yongbyon, hopefully, permanently. In this regard, while the Clinton administration achieved a freeze of Yongbyon, the Bush administration will have achieved a shutdown of it, which constitutes progress. A McCain or Obama administration will have to contend with the problems of dismantlement, uranium, and Syria, and other nuclear issues which undeniably will come up during the verification of Yongbyon.

Conservatives are skeptical that the North will live up to the agreement. But they should be heartened by the fact that if Pyongyang again prevaricates, the United States can always put the North back on the list of terrorist states, particularly if there is unsatisfactory information on the North’s proliferation connections.

**Mr. Assad's Medicine**

After sponsoring terrorism against three of its neighbors, Syria plays the victim when its own border is breached.

Tuesday, October 28, 2008; A16

IT WAS interesting to observe the wails of outrage from Syrian officials yesterday following a raid on a target near the country's border with Iraq, carried out by helicopter-borne U.S. commandos. "Criminal and terrorist aggression," charged Foreign Minister Walid al-Moualem. "The law of the jungle," bemoaned spokesman Jihad Makdissi at the Syrian Embassy in London. This from a regime whose most notable activities of the past few years have been the serial assassination of senior Lebanese politicians, including former prime minister Rafik Hariri; the continuous and illegal supplying of weapons to the Hezbollah militia for use against Israel and Lebanon's democratic government; the harboring in Damascus of senior leaders of Hamas and other Palestinian terrorist groups; and -- most relevant -- the sheltering of an al-Qaeda network that dispatches 90 percent of the foreign fighters who wage war against U.S. troops and the Iraqi government.

The logic of Syrian dictator Bashar al-Assad seems to be that his regime can sponsor murders, arms trafficking, infiltrations and suicide bombings in neighboring countries while expecting to be shielded from any retaliation in kind by the diplomatic scruples of democracies. For most of this decade that has been lamentably true: U.S. commanders and Iraqi officials have over and over again pointed to the infiltration of al-Qaeda militants through the Damascus airport and the land border with Iraq, and Syria's refusal to curtail it, without taking direct action. Yet in the past year Israel has intervened in Syria several times to defend its vital interests, including bombing a secret nuclear reactor. If Sunday's raid, which targeted a senior al-Qaeda operative, serves only to put Mr. Assad on notice that the United States, too, is no longer prepared to respect the sovereignty of a criminal regime, it will have been worthwhile.

Mr. Assad's government has lately taken a few cautious steps toward breaking out of its isolation, participating in indirect peace talks with Israel and granting formal diplomatic recognition to Lebanon for the first time. European governments have been quick with rewards, and the next U.S. president -- if it is Barack Obama -- may also hasten to upgrade contacts. If the Syrian regime is genuinely interested in making peace with Israel, distancing itself from Iran and the terrorist movements it sponsors, and rebuilding ties with the West, that is to be welcomed. What Damascus should not be allowed to do is reap the diplomatic and economic rewards of a rapprochement while continuing to plant car bombs, transport illegal weapons and harbor terrorists. Israel has let Mr. Assad know that it is prepared to respond to his terrorism with strikes against legitimate military targets. Now that the United States has sent the same message, maybe the dictator at last will rethink his strategy.

## Shooting first, talking later

About the only US comment on a special forces raid that killed at least seven people in a Syrian village close to the Iraqi border on Sunday came yesterday from an unnamed military official in Washington. He said that since Syria had been unable to shut down the so-called rat lines, the network of foreign fighters moving into Iraq, US forces would take matters into their own hands. But that is precisely the problem.

Syria's sovereignty is a weak enough concept from whichever border it is viewed - from Israel, whose fighters bombed a nuclear reactor under construction in the desert, or from Iran, whose missiles transit the country bound for Hizbullah in Lebanon. A withdrawal of US combat troops from Iraq will depend on securing Iraq's borders, with the assistance of its neighbours. Hence the policy pursued in both France and Britain of encouraging Damascus back into the diplomatic fold, of which yesterday's talks in London between David Miliband and his Syrian counterpart were a part. It has also been the policy of the caretaker Israeli prime minister Ehud Olmert to pursue Turkish-mediated talks with Syria on the return of the Golan Heights. Unless Washington believed that a raid inside Syria would spur Damascus into taking action against foreign jihadis, or they thought the target was too important to miss, then the attack was another sign of a US administration which shoots first and thinks later.

Not only long-term goals such as withdrawal are damaged. Short-term objectives - among them the need to strike a deal with Baghdad over the legal status of US forces in Iraq by the end of the year - are also affected. For Shia politicians sensitive to the degree of sovereignty their government will exercise as it enters an election year, the US raid into Syria bears a striking resemblance to an operation they carried out recently in Anbar province. A senior member of the main Sunni party was killed in a province which the US had ostensibly handed over to the Iraqi authorities. If America ignores Syria's borders, to what extent will they honour Iraq's sovereignty?

A government seeking to encourage a regional solution should also bear in mind what could happen in Israel. The Likud leader, Binyamin Netanyahu, said yesterday in the Knesset that if he became prime minister, Israel would keep the Golan Heights, large parts of the West Bank and all of Jerusalem - each of which would be enough to sink a deal with the Palestinians. Although his rival Tzipi Livni gained in the polls by refusing to cut a deal with the ultra-orthodox party, the Shas, the election will be close. The hardline Likud leader has gained in popularity since Hamas seized power in Gaza and could well be returned to power.

## **The Leaks by El-Baradei's Agency**

Elias Harfoush

Al-Hayat

13/11/08/ [2008-11-13]

Regardless of the identity of the IAEA diplomats who leaked the information about uranium traces found at the Syrian al-Kibar site, it is evident that those leaks were intended to cast doubts on the Syrian story which has from the very beginning denied the construction of a nuclear reactor in that location bombed by Israeli planes last September.

The leaks are also likely to prevent any possible future cooperation between Syria and the Vienna-based IAEA. Such cooperation is necessary for two reasons: first because it helps the IAEA reach conclusive results with its experts active on the ground - instead of reaching conclusions from a distance - and secondly because it would assert the impression the Syrians are trying to create about the site as an incomplete facility that was still under construction. If the facility was indeed under construction as Minister Walid Moallem reiterated in his press conference with the Iraqi Foreign Minister Hoshiyar Zebari, then where did the traces of uranium in question come from?

The Syrian foreign minister answered that the Israeli planes might have dropped some of those nuclear materials at the site, which is what American and Israeli planes do when they drop uranium-bearing bombs on Iraq, Afghanistan and South Lebanon. Moallem confirmed that the objective of the leaks to the media was political with the aim of pressuring Syria rather than technical with the aim of obtaining information on an alleged nuclear program.

It is well-known that the site hit by the Israeli planes was eventually leveled to the ground. The IAEA experts who visited the site were only able to get soil samples for testing with their request to visit other sites denied. All this fueled the suspicions that were further reinforced by IAEA director Mohamed El-Baradei when he said two days ago that the agency was taking the allegations about the Syrian nuclear program seriously and was asking Damascus to fully cooperate with the investigation. El-Baradei had complained about the Israeli raid on al-Kibar site, arguing that the raid prevented his agency from conducting a full technical investigation at this site to verify the purpose of its construction. He also urged states that possess information about assumed nuclear programs in the Middle East and other areas to present that information to the agency rather than taking unilateral initiatives as Israel did through its raid in September last year.

Until the IAEA holds its meeting in the last week of this month (27 and 28 November), the story of the Syrian uranium will remain hanging between political exploitation and technical leaks. Damascus says it will not respond to the accusations until a complete report is issued by the meeting; the IAEA spokeswoman prefers waiting for the results to come out instead of jumping to conclusions. Jumping to conclusions and leaking information, however, had come from the agency itself this time although the watchdog's performance is supposed to be objective and free of any political exploitation. Perhaps this may be an opportunity to control the agency's modus operandi to avoid contradicting remarks on the objectives of the Syrian nuclear program, ones similar to those surrounding the Iranian nuclear program. This would result in a new diplomatic crisis at the beginning of the new American term at a time when big efforts are made to defuse the Iranian problem.

## **Syria and the Iranian path**

By Yossi Melman

Last update - 02:57 16/11/2008

The discovery of enriched uranium at the Syrian military site that Israel bombed last year may be the first step toward revealing Syria's smoking gun. This week, International Atomic Energy Agency Director Mohamed ElBaradei will submit a report to the organization's Board of Governors on Syria's nuclear program. The report will state that IAEA inspectors discovered traces of enriched uranium at the site on the bank of the Euphrates River.

This will be ElBaradei's first written report on the Syrian issue, and the first time since the bombing that a non-American, non-Israeli official has expressed suspicions that the bombed site was a nuclear reactor. Until now, only the CIA claimed the structure was a nuclear reactor in the final stages of construction, but even it spoke cautiously, noting that radioactive material had yet to be introduced to the site.

The IAEA report not only strengthens claims by the American and Israeli intelligence community, it even goes beyond them. Since the bombing, the Syrians have made every effort to deny, confuse and conceal the nature of the site. At first they claimed Israeli planes entered their airspace but were repelled. Then they said the planes dropped a few bombs, but caused no damage.

Later, Syrian President Bashar Assad confirmed that the planes had bombed a military building, but denied vehemently that the location contained a nuclear reactor. North Korea, which built the facility, echoed Assad's sentiments.

Photographs released by U.S. intelligence show clearly that the structures that survived the bombing were quickly cleared away, and vast amounts of soil were removed from the area, most likely to remove traces of radioactivity.

Furthermore, Syria found various ways to block IAEA inspectors from the site. In June, nine months after the bombing, Damascus finally allowed inspectors to enter. They took samples of earth, rocks, air, water and plants, and transferred them to IAEA laboratories in Austria.

The results that emerged were complicated and ambiguous, and experts struggled to come to definitive conclusions. For a while it seemed as if Syria's efforts to hide the circumstances of the bombing were succeeding. Lately, however, experts have drawn clear results - traces of man-made uranium were identified at the site.

The experts were unable to determine the precise source of the radioactive material, but have cited three options. The first is that small amounts of radioactive material entered the site during its construction, which conflicts with U.S. intelligence's preliminary findings. The second option is that Syrian or foreign nuclear experts came into contact with radioactive material at their workplace and unintentionally left it behind at the facility. A final option is that equipment previously used to enrich uranium was installed at the site.

The discovery of uranium now reinforces the onus on the Assad regime, which will be forced to provide comprehensive explanations. The strange pronouncements made last week by Syrian Foreign Minister Walid Moallem - that the Israeli planes dropped bombs bearing radioactive material - can hardly be considered such an explanation.

The IAEA will demand that Syria allow its officials to speak with the experts who discovered the radioactive material or equipment at the site. For several weeks Damascus has refused to allow additional visits from IAEA inspectors, and if it persists, suspicions will heighten that it has something to hide.

Pushing Syria into the corner is reminiscent of what happened to Iran. Tehran also denied at first that it had built hidden nuclear facilities (such as the uranium enrichment facility in Natanz, the centrifuge factory in Tehran and the reactor in Arak.)

When the truth finally emerged, Iran was forced to admit the existence of the sites, but continued to deny that they were being used for nuclear activity. As it was confronted with ever more facts, it continued weaving its web of lies, until the IAEA finally labeled it a non-compliant country that had violated its obligations under the Nuclear Non-Proliferation Treaty, and the UN Security Council imposed sanctions on it.

Syria is still far from that point, but the discovery of uranium at the bombed site could be a turning point. It could be the first step toward finding the smoking gun that incriminates Damascus in the international community, and strengthens Israel's claim that its own operation was necessary and justified to prevent Syria from developing a nuclear weapon.

## **Syria's Reactor: Can the IAEA Act Effectively?**

By Patrick Clawson and David Schenker

November 21, 2008

High on the agenda of the November 27-28 meeting of the International Atomic Energy Agency (IAEA) Board of Governors (BOG) will be the November 19 report from Director General Mohammed ElBaradei about Syria. How the IAEA responds to the Syrian challenge may determine whether future urgent proliferation concerns are taken to the IAEA and UN Security Council or resolved through military force, such as Israel's airstrike last year on Syria's Dayr Az Zor site.

### **Background**

On September 6, 2007, Israeli warplanes bombed a site at al Kibar near Dayr Az Zor (referred to as Dair Alzour in the IAEA report) in northeastern Syria. Days later, Syria demolished the remaining portions of the damaged facility, bulldozed the site, and erected a new building atop the buried rubble. On April 24, 2008, senior U.S. intelligence officials briefed Congress and the press about the Dayr Az Zor site, saying that the United States had "detailed information showing that the al Kibar facility was a nuclear reactor."

Following the briefing, Syria granted IAEA inspectors access to Dayr Az Zor (but denied them access to three other sites), where they took environmental samples on June 23, 2008. After the visit, Syria suspended cooperation with the IAEA, saying it was awaiting the results of the samples. Despite all that Damascus had done to scrub the site, IAEA soil samples revealed "a significant number of natural uranium particles" that were "anthropogenic," that is, produced by human action rather than being already present in the environment.

Since then, Syria has refused to respond to IAEA requests for additional information. In its defense, Syria told the IAEA that particles found at the site "were contained in the missiles that were dropped from the Israeli planes onto the buildings." These claims have been widely dismissed, however, as no country is known to have ever used natural uranium in a bomb or a missile.

### **The IAEA and Syria**

Syria's safeguards agreement with the IAEA requires notification to the agency in advance of construction of any nuclear facility, regardless of the presence of nuclear material. So, if indeed Syria was building a reactor, it would have violated its IAEA obligations. Not surprisingly, Syria has claimed that the site was not a reactor, but Damascus has not made much of a case on its own behalf. As the IAEA report notes, "Syria has not yet acceded to the Agency's request to provide any documentation relevant to the destroyed building, or any of the other buildings, to support its statements." Damascus also said that the site could not have been a reactor because of "the unreliable and insufficient electricity supplies [and] the unavailability of large quantities of treated water." Yet, according to the IAEA report, the water "pumping capacity is adequate for a reactor of the size referred to" and the site had "sufficient electrical capacity to operate the pumping system."

While the very construction of a reactor without notification violates Syria's international treaty obligations, evidence of nuclear material at the site significantly raises the level of concern. The natural uranium found by the IAEA is the type of fuel that would be fed into a reactor to produce plutonium, which after extraction in a reprocessing facility, could fuel a nuclear bomb. At a minimum, the presence of the natural uranium particles suggests that fuel for the reactor may have been on site when the facility was bombed.

### **Violations of International Commitments**

The Bashar Asad regime's apparent violations of Syria's nuclear nonproliferation treaty commitments are only the latest in a series of broken agreements. In his eight years as president, Asad has established an impressive history of broken pledges to Washington. Two examples provide illustration:

In June 2001, then Secretary of State Colin Powell traveled to Damascus with the express goal of securing a Syrian commitment to end the smuggling of oil from Saddam Hussein's Iraq in contravention of the UN Oil for Food program. Powell hoped to close the Kirkuk-Banyas pipeline that supplied Damascus with 150,000 barrels per day of Iraqi crude and Saddam with hundreds of millions of dollars. According to Powell, Asad agreed to close the pipeline but reneged on this promise, and the pipeline remained open until 2003, when U.S. forces in Iraq closed the spigot. Secretary Powell again traveled to Damascus, in April 2003, this time to gain a Syrian commitment on terrorism. In an interview following his return, Powell relayed that "Asad said that he was taking action to close down these [Damascus-based Palestinian terrorist] offices, and that he would restrict their ability to communicate." Nevertheless, these offices continued to operate; five months later, in August 2003, a Palestinian Islamic Jihad suicide bomber killed 23 in Jerusalem.

The Asad regime's pattern of broken bilateral agreements with Washington -- and now, of international treaty obligations to the IAEA—raises doubts about whether Syria can be trusted to implement the terms of a peace treaty with Israel. At a minimum, these experiences should inform Washington's policy should the next administration decide to actively mediate in Syrian-Israeli peace negotiations. Based on the Asad regime's record of keeping commitments, Washington cannot effectively guarantee Syrian treaty obligations to Israel. As such, within the context of any U.S.-brokered deal, Washington should ensure that tangible and irreversible Syrian concessions coincide with -- if not precede -- Israeli territorial withdrawals.

### **Judging the IAEA Meeting**

The November 19 IAEA report is the latest evidence of the superb technical capabilities of the IAEA staff. Regrettably, however, this work has at times been undercut by IAEA director general ElBaradei, who has a tendency to emphasize benign interpretations of ambiguous findings while ignoring mechanisms available for suspected proliferators to provide evidence to the contrary. The real shortcoming with the international law approach, however, has been the failure of will by the governments that sit on the IAEA BOG and the Security Council.

Next week's meeting will answer longstanding questions regarding the utility of the IAEA for resolving nuclear problems. If Syrian stonewalling continues, how will the IAEA proceed? Will the BOG recommend sanctions if the investigation yields derogatory conclusions or if Syria continues to put forth implausible explanations unsupported by evidence?

A serious response by the IAEA BOG would be to warn Syria that failure to resolve the outstanding issues on a timely basis would constitute a violation of Syria's obligations, which the IAEA would have to report to the Security Council for action by that body. At a minimum, the BOG should demand documentation of Syria's claims about the destroyed building and follow-up inspections of Dayr Az Zor and access to the three facilities to which Syria denied the IAEA. The unfortunate reality is that the IAEA/Security Council approach has, to date, not dealt effectively with several proliferation threats. In contrast, Israeli military action resulted in the complete destruction of the reactor site and evidently to an indefinite postponement if not abandonment of Syria's nuclear ambitions. Moreover, the Israeli action was tacitly accepted by the international community: no Arab country (other than Syria) and no European government complained about the Israeli raid. Even the Arab League statement was mild.

International reaction to Israel's Al Kibar strike stands in stark contrast to its 1981 raid on the Iraqi Osiraq reactor, which was nearly universally condemned. One way to understand the difference between 1981 and 2007 is that the world today is less optimistic that reliance on the IAEA can stop proliferation. The IAEA can change this perception by acting decisively on Syria during its next meeting. And in the process, it just might generate enough credibility regarding IAEA effectiveness to forestall an airstrike -- Israeli or American -- against Tehran's nuclear facilities.

Hovering in the background is Syria's tentative reopening of peace talks with Israel. The November 20 Financial Times nicely summed up the situation, describing these talks as "a get-out-of-jail-free card [when] Syria has not changed its regional behavior. [French president] Sarkozy, nonetheless, invited [Assad] to a summit in Paris. . . . The message this sends to the Middle East is disastrous."

## **Israeli hawks ready to fly on Iran**

Paul Sheehan

November 24, 2008 [Accessed 2008-11-23T14:40Z]

[EXCERPT]

In effect, Israel has already conducted a test run into an enemy country and been encouraged by the results. In September last year, Israeli Air Force jets destroyed a nuclear facility under construction in Syria. Israel never said a word. Syria never said a word. No government in the Middle East ever said a word.

"Israel's raid on Syria was greeted by a thunderous silence from the rest of the region," Eran Lerman [a former senior member of Israel's Directorate of Military Intelligence] said. "What that silence told us was that the rest of the region regard Syria as part of the Iranian problem. If Iran obtains the bomb, even if they don't use it or threaten to use it, they will have positioned themselves in a way that will transform this region into a much more dangerous place. Iran has influence on the Shiia communities, not just in Iraq and through Hezbollah in Lebanon but in Syria and the Gulf states. The position of the moderate states in the Gulf will have been rendered more fragile."

## **So it Really was a Reactor in Syria**

Asculai, Ephraim

INSS Insight No. 81

November 23, 2008

*[EXCERPT]*

There are two outstanding issues on the table for the forthcoming IAEA Board of Governors meeting: the nuclear programs of Syria and Iran.

### **Syria**

The IAEA report on the Syrian issue that finally came out on November 19, 2008 gave a detailed summary of its findings but omitted two important items: the technical details of the sampled uranium particles found in the vicinity of the Syrian reactor site at Dair Alzour (or al-Kibar, as called by US reports) and the unequivocal statement that the site housed a nuclear reactor under construction when it was destroyed on the night of September 6, 2007. By leaving out these two elements, the report gave everyone what it wanted: Syria and its supporters could happily claim that there was no reactor at the site, while others could vary in their conclusions from uncertainty to firm belief that the destruction of the construction prevented or at least delayed Syria from acquiring a military nuclear capability. This ambiguity on the part of the IAEA should have been expected, since it is in line with its organizational culture – try to have something nice to say about member states.

Not all the technical facts detailed in the report are needed to reach the conclusion that the installation housed a nuclear reactor that was nearing operation, much as the US claimed. It is sufficient to note that the report confirmed that the water pumping capacity was sufficient for removing 25 megawatts of energy. An energy source of this magnitude would need to burn either fossil or nuclear fuel, or it would have to consume electrical energy imported to the site. Since the Syrians confirmed "the unreliable and insufficient electricity supplies in the area," the last option is not viable. Since it is obvious that this was not a fossil fuel electricity producing station (and no one claimed that it was) the conclusion is unequivocal. In addition, a fossil fuel plant would have been constructed near the Euphrates River for efficiency reasons and not hidden inland, out of sight. The IAEA chose to state that "While it cannot be excluded that the building in question was intended for non-nuclear use, the features of the building, as described above, along with the connectivity of the site to adequate pumping capacity of cooling water, are similar to what may be found in connection with a reactor site." One cannot but wonder, what could have possibly been the "non-nuclear use"?

Although not essential for the evaluation, the visit to the site and the results of the samples taken showed the presence of a few natural uranium particles that had undergone chemical processing. Natural uranium is used in the North-Korean-type reactor, assessed by the US to have been constructed in Syria. The IAEA chose not to divulge the composition and other characteristics of the uranium particles (information it certainly has, since it assessed the chemical processes), yet thereby confirmed the relationship between the particles and nuclear fuel. Otherwise, it would have certainly noted it. Although the Syrians did their best to clean the area around the site, they evidently did not do a good enough job and a few particles remained on the surface, some of which were detected by the very sensitive analytical methods of the IAEA laboratories.

It is possible that the fact that no graphite particles were found indicates that the bombs did not penetrate the reactor's core, and the source of the uranium particles were the fuel rods waiting to be loaded into the core. If true, this could indicate that the reactor was a short time away from its startup, when hitting it could already cause environmental damage.

The IAEA Director General reiterates his accusation that "the Agency was severely hampered in discharging its responsibilities under the NPT and under Syria's Safeguards Agreement by the unilateral use of force and by the late provision of information concerning the building at the Dair Alzour site." One can only speculate what would have been the international consequences of such a visit to an operating reactor, or much worse, whether Syria's nuclear program would have been confirmed by a Syrian nuclear explosion.

## **Outside View: A litmus test for the IAEA**

by Patrick Clawson | David Schenker  
Washington (UPI) Nov 25, 2008

High on the agenda of this week's meeting of the International Atomic Energy Agency's Board of Governors will be the recent report from Director General Mohammed ElBaradei about Syria.

How the agency responds to the Syrian challenge may determine whether future urgent proliferation concerns are brought before it and the U.N. Security Council or resolved through military force, as Israel did with its airstrike last year on Syria's al-Kibar site.

On Sept. 6, 2007, Israeli warplanes bombed the site in northeastern Syria. Days later Syria demolished the remaining portions of the damaged facility, bulldozed the site and erected a new building atop the buried rubble. In April 2008 senior U.S. intelligence officials briefed Congress and the press, saying they had detailed information showing that the al-Kibar facility was a nuclear reactor.

In June Syria granted IAEA inspectors access to the site (while denying them access to three other sites), where they took environmental samples. After the visit Syria suspended cooperation with the agency, saying it was awaiting the results of the samples. Despite all that Damascus had done to scrub the site, IAEA soil samples revealed "a significant number of natural uranium particles" that were "anthropogenic," that is, produced by human action rather than being already present in the environment.

Since then Syria has refused to respond to IAEA requests for additional information. In its defense Syria told the IAEA that particles found at the site "were contained in the missiles that were dropped from the Israeli planes onto the buildings." These claims have been widely dismissed, however, as no country is known to have ever used natural uranium in a bomb or a missile.

Syria's safeguards agreement with the IAEA requires notification to the agency in advance of construction of any nuclear facility, regardless of the presence of nuclear material. So, if indeed Syria was building a reactor, it would have violated its IAEA obligations. Not surprisingly, Syria has claimed the site was not a reactor, but Damascus has not made much of a case on its own behalf. As the IAEA report notes, "Syria has not yet acceded to the Agency's request to provide any documentation relevant to the destroyed building, or any of the other buildings, to support its statements."

While the very construction of a reactor without notification violates Syria's international treaty obligations, evidence of nuclear material at the site significantly raises the level of concern. The natural uranium found by the IAEA is the type of fuel that would be fed into a reactor to produce plutonium, which, after extraction in a reprocessing facility, could fuel a nuclear bomb. At a minimum, the presence of the natural uranium particles suggests that fuel for the reactor may have been on site when the facility was bombed.

The IAEA report is the latest evidence of the superb technical capabilities of the IAEA staff. Regrettably, however, this work at times has been undercut by ElBaradei, who has a tendency to emphasize benign interpretations of ambiguous findings while ignoring mechanisms available for

suspected proliferators to provide evidence to the contrary. The real shortcoming with the international law approach, however, has been the failure of will by the governments that sit on the agency's board of governors and the U.N. Security Council.

Next week's meeting will answer longstanding questions regarding the utility of the agency for resolving nuclear problems. If Syrian stonewalling continues, how will the IAEA proceed? Will the governors recommend sanctions if the investigation yields derogatory conclusions or if Syria continues to put forth implausible explanations unsupported by evidence?

A serious response by the governors would be to warn Syria that failure to resolve the outstanding issues on a timely basis would constitute a violation of Syria's obligations, which the IAEA would have to report to the Security Council for action by that body. At a minimum, the governors should demand documentation of Syria's claims about the destroyed building and follow-up inspections of the site and access to the three facilities to which Syria denied the IAEA.

The unfortunate reality is that the IAEA/Security Council approach, to date, has not dealt effectively with several proliferation threats. In contrast, Israeli military action resulted in the complete destruction of the reactor site and evidently to an indefinite postponement if not abandonment of Syria's nuclear ambitions. Moreover, the Israeli action was tacitly accepted by the international community: No Arab country (other than Syria) and no European government complained about the Israeli raid. Even the Arab League statement was mild.

International reaction to Israel's al-Kibar strike stands in stark contrast to its 1981 raid on the Iraqi Osiraq reactor, which was nearly universally condemned. One way to understand the difference between 1981 and 2007 is that the world today is less optimistic that reliance on the IAEA can stop proliferation. The agency can change this perception by acting decisively on Syria during its next meeting. And in the process, it just might generate enough credibility regarding its effectiveness to forestall an airstrike -- Israeli or American -- against Tehran's nuclear facilities.

## Particles of doubt

27 November - 3 December 2008

Issue No. 924

1 hour ago [Accessed 2008-11-27T14:45Z]

Damascus won't allow further inspections of Al-Kibar, the site that Israel bombed last September and that the US claims was a nuclear facility, Bassel Oudat reports from Damascus

The International Atomic Energy Agency (IAEA) said that it will ask Syria for topsoil and equipment removed from Al-Kibar site, in northeast Syria. The IAEA says that it is still trying to determine the nature of the site, which was bombed by Israel in September 2007, but thinks that it bears "the characteristics of a nuclear reactor".

"While it cannot be excluded that the building in question was intended for non-nuclear use, the features of the building... are similar to what may be found in connection with a reactor site," the report says.

According to the report, IAEA inspectors found a "significant number" of uranium particles in the site, even though the Syrian authorities hastened to bury the facility completely after the Israeli raid. Still, the IAEA report notes that the IAEA cannot determine the source of the uranium unless Damascus allows international experts to uncover the debris of the building.

The IAEA expressed the hope that Syria would allow it to visit the site, inspect the debris, and examine any equipment that has been removed from the venue. IAEA officials have asked Israel to provide information concerning the Syrian allegation that the uranium particles found in the scene come from the depleted uranium (DU) coating of Israeli shells.

"Syria has not yet provided the requested documentation" to back up its assertion that the bombed building was a non-nuclear military facility, IAEA officials said. They added that Israel's "unilateral use of force" interfered with the efficacy of the investigation, but despite this, that the Syrian dossier will be treated just like the Iranian dossier should Syria refuse to cooperate.

IAEA chief Mohamed El-Baradei said that IAEA intends to discuss with Syrian officials pictures of the Al-Kibar site, which the agency obtained from Israel, France and the US in an attempt to spur Damascus to release more information about the case.

Syrian Nuclear Energy Agency chief Ibrahim Othman, speaking to reporters in Geneva, dismissed the IAEA report as "proving nothing" and called for an end to the investigation. Othman said that Syria allowed international investigators one visit in June, and will not allow another.

Asked if Syria was rejecting further communication with the IAEA, the Syrian official said, "No, no. If the requested information is related to the accusation, we will provide it." But he said that further on-site inspection was "difficult".

Syrian Foreign Minister Walid Al-Muallem commented on the report by saying that it aims to "pressure Syria". He said that any traces of uranium in the site were due to the shells Israel used in the attack. He pointed out that both Israel and the US have a history of using shells coated with DU in Iraq and Afghanistan. Israeli use of DU bombs and its own nuclear weapons programme were not mentioned in the IAEA report.

The US suspects that the site contained a nuclear reactor based on a North Korean design. US officials claim that the facility was capable of producing bomb-grade plutonium if allowed to operate. The White House maintains that North Korea helped Syria in secret nuclear activities, something that Damascus denies.

With the US calling for investigation in Syria's nuclear activities, the IAEA sent a team of experts to Syria last April to investigate Al-Kibar site. Syria didn't announce the visit at the time and discouraged any reporting on the IAEA investigation. Syrian officials declined to comment on the activities of the inspectors. Well-informed Syrian sources said that Damascus cooperated with the experts, but didn't allow them to move beyond 500 metres from the site.

Ri Tau Hai, a North Korean diplomat based in Damascus, denied that there is any nuclear cooperation between his country and Syria. He told Al-Ahram Weekly that, "Syria is a friendly country and we have strong economic and military cooperation with it. There are Korean experts working in more than one field in Syria, including military experts, but there is no cooperation of any kind in the nuclear field... There are no North Korean reactors or nuclear substances in Syria," he said.

Saber Fahout, media advisor to the Syrian president, denied that Syria has a military nuclear programme, saying that the current interest in Syrian nuclear activities is designed to "undermine the potential for the peace process." He added that the "US, through its highly accurate satellite monitoring, knows better than anyone that Syria doesn't have nuclear reactors of a military nature."

Ghassan Abdel-Aziz, a member of the Syrian ruling National Front Command, told the Weekly that, "Syria has never sought to acquire nuclear weapons... and is utterly committed to international resolutions in this regard."

Well-informed Syrian sources say that Damascus has no desire to build a military nuclear programme, adding that Syria lacks the technical, human, and financial capabilities to guarantee the safety of such installations.

Syria is still in a state of war with Israel, despite the recent indirect talks they held with Turkish mediation. In the event of any nuclear confrontation between the two countries, the Syrians claim, nuclear weapons would be of no value. Syria also has long-range missiles that can reach any point in Israel. Therefore, nuclear weapons would not be of any use in war, according to the same sources.

Syria doesn't have the human resources needed to build a big nuclear programme. Also, the security of nuclear facilities is a very complex matter, involving for example the choice of a seismically stable site

and precautions for preventing radioactive leaks. Such precautions would be hard to conceal and would require a very high technical, scientific and industrial level.

The IAEA report on Syria's nuclear activities coincided with an offer by the same agency to help Syria build a nuclear power station costing \$200 million. The offer, which would require ratification of the IAEA Board of Governors, involves assistance in small nuclear projects related to medical and agricultural use. Several Western countries, including the US and the UK are reluctant to endorse the offer. But other members of the IAEA Board of Governors approved the proposal, saying that such agreements must not be politicised without clear and good reasons.

Syrian sources say that claims that traces of uranium have been found in Syria aim to undermine future agreements between Damascus and the IAEA.

It is worth noting that the Syrian Nuclear Energy Agency is a small establishment with little more than laboratory-level nuclear reactors. The agency is mainly active in examining medical, agricultural, and industrial substances and assessing their radioactive level.

## REVIEW & OUTLOOK

### **Syria and the Nuclear Cops**

IAEA Chief Mohamed ElBaradei believes Syria deserves a new reactor.

**NOVEMBER 28, 2008**

The International Atomic Energy Agency (IAEA) confirmed last week that it had discovered a "significant number" of chemically processed uranium particles at a suspected Syrian nuclear site destroyed last year by Israel. The IAEA also reported that satellite images of the site taken prior to its destruction had the markings of a nuclear reactor.

So what did IAEA chief Mohamed ElBaradei do with this information? Why, urge the approval of a Syrian request for a \$350,000 feasibility study for a new reactor.

"People and countries are innocent until proven guilty," the Egyptian told an IAEA committee studying the request, according to a transcript of his comments obtained by Agence-France Presse. "Technical cooperation programs to any member states should not be blocked, delayed or otherwise hindered for mere suspicion or unproven allegations."

Mr. ElBaradei has an interesting idea of what "mere suspicion" amounts to. Syria bulldozed the wreckage of the destroyed reactor -- the existence of which it has always denied -- shortly after the Israeli raid. It later limited IAEA inspectors to a single visit to the area, and has ruled out an IAEA request to inspect three other sites suspected of being part of a covert nuclear program. Those three sites were also landscaped by the Syrians after the IAEA requested visits, according to the agency's chief investigator.

By its own admission, the IAEA knew nothing about the Syrian reactor, much less of North Korea's involvement in it, until it was destroyed. For an agency charged with enforcing the nonproliferation regime, that's bad enough, if not altogether surprising. That Mr. ElBaradei should now abet Syria's nuclear ambitions -- even as it obstructs his own inspectors -- is astonishing. Remind us again why Condoleezza Rice agreed to give this man a second term?

LETTERS

**Probing Syria's Nuclear Project**

**DECEMBER 2, 2008**, 9:38 P.M. ET

In regard to your Nov. 28 editorial "Syria and the Nuclear Cops":

The way the international nonproliferation system is meant to work is as follows: If states, many of which have surveillance capabilities, have any suspicions of clandestine nuclear activity, they should report them to the International Atomic Energy Agency. Armed with this information, the IAEA investigates its veracity. In the case of Syria, instead of providing the IAEA with images of a building alleged to be a reactor, Israel unilaterally bombed the installation. Meanwhile, information was withheld from the IAEA for more than six months, by which time Syria had cleaned away the rubble and built a new facility. This made the agency's verification work difficult and complex.

The results, so far, are inconclusive and the verification process continues. To aid his inspectors, IAEA chief Mohamed ElBaradei is calling on Syria to provide maximum transparency. He is also calling on other states, including Israel, that have inexplicably withheld critical information on the site, particularly the images from the immediate aftermath, to provide that information to the IAEA.

The 35 member countries of the IAEA Board of Governors have agreed to approve a nuclear power feasibility project requested by Syria. Similar IAEA-mandated studies on the use of nuclear energy for peaceful purposes are being conducted in 20 other countries. The Syria project is at an early stage, and the board may revisit it during its different phases.

Unlike in the cases of Iraq, Israel, Iran and North Korea, where the agency found these countries to be in violation of its rules and restricted their IAEA technical cooperation projects, the agency has not made any such judgment of Syria. In accordance with principles of fairness and equity, a state has full rights of membership until decided otherwise, based on established facts.

*[ARTICLE AND SELECTED COMMENTS]*

## **Can the IAEA Suspend Assistance to Syria?**

posted Tuesday **November 25, 2008** under Syria by james\_acton

There is a storm brewing over in Vienna about whether the IAEA should cease technical cooperation with Syria on account of the latter's suspected nuclear programme.

The IAEA Director General weighed in on Monday. According to Reuters

IAEA Director Mohamed ElBaradei urged governors to approve the aid project, saying there was no legal basis for curbing Syria's IAEA membership rights based on unverified accusations.

"There are claims against Syria, which we're looking at. There were claims against Iraq, which were proven bonkers (mad), and after, the result was a terrible war," he said in remarks to the closed gathering relayed to Reuters.

...

"So we have to be very careful when we talk about an investigation," ElBaradei said. "Even people who are not a lawyer would know that people and countries are innocent until proven guilty. And we continue to act on that basis."

Let me say first off that, on a personal level, I entirely agree with suspending technical cooperation with Syria. Ceasing to assist Syria to develop a nuclear power programme is an entirely appropriate and proportionate step given the very strong evidence that Syria built a clandestine reactor—in fact, in my opinion, it would be "bonkers" not to take this step.

But, putting my personal feelings aside, is ElBaradei right about the lack of a legal basis for stopping technical cooperation?

Article 19 of Syria's Comprehensive Safeguards agreement states that

If the Board, upon examination of relevant information reported to it by the Director General, finds that the Agency is not able to verify that there has been no diversion of nuclear material required to be safeguarded under this Agreement to nuclear weapons or other nuclear explosive devices, it may make the reports provided for in paragraph C of Article XII of the Statute of the Agency (hereinafter referred to as "the Statute") and may also take, where applicable, the other measures provided for in that paragraph. In taking such action the Board shall take account of the degree of assurance provided by the safeguards measures that have been applied and shall afford Syria every reasonable opportunity to furnish the Board with any necessary reassurance.

Note the way this article is phrased. The IAEA is required to make a finding of non-compliance if it is unable to verify the non-diversion of nuclear material. It does not have to prove there has been a

diversion; it only needs to be unable to prove that there hasn't been one. So, ElBaradei is quite wrong when he says that states are innocent until proven guilty. Fair or not, Syria signed up to a system that works the other way around.

Given the evidence in GOV/2008/60, there seems little doubt that the IAEA cannot verify the non-diversion of nuclear material in Syria. Moreover, it has given Syria "every reasonable opportunity to furnish the Board with any necessary reassurance". Syria has recently said it will allow no more inspections.

So, there seems to me little doubt that the Board already has legal right (if not the obligation) to find Syria in non-compliance. If that is done, article XII.C of the Statute comes into play:

The Board shall call upon the recipient State or States to remedy forthwith any non-compliance which it finds to have occurred. The Board shall report the non-compliance to all members and to the Security Council and General Assembly of the United Nations. In the event of failure of the recipient State or States to take fully corrective action within a reasonable time, the Board may take one or both of the following measures: direct curtailment or suspension of assistance being provided by the Agency...

The article manifestly gives the IAEA the right to suspend technical cooperation. I would argue that it could do this right away since it has already given Syria "reasonable time" to take "fully corrective actions" but I am sure that others would argue this article means that Syria must be given some more time after it is found in non-compliance. In any event, even if the IAEA can't suspend technical cooperation right now, it should be able to do so in the near future, if it finds Syria in non-compliance now.

There, however, is the rub. My reading of the law is that the IAEA can only suspend technical cooperation after finding Syria in non-compliance. As much as I think such a finding would be legally justified (and entirely deserved), it seems like a non-starter right now. And because of that it also seems to me that the legal basis for denying Syria technical cooperation is shaky—even if the reasons are totally different from those implied by the Director General.

### *[Selected Comments]*

James,

While I agree with your post in principle, I think it is important to look at the big picture and think tactically. Specifically, what is the goal and what is the best way to get there? If the goal is a full accounting of the BOE then I don't think a finding of noncompliance is going to get you there (or anywhere useful) unless it's part of a bigger political strategy.

So while the IAEA may have the legal right to declare Syria in noncompliance, it probably is not wise to do so, at least at this time.

— Andy · Nov 25, 11:17 PM ·

#

For a long time, there was a dangerous disconnect between the IAEA's technical assistance and standards put forward by the Departments of Nuclear Safety and Safeguards. This was particularly true in the case of radioactive source material. Some shocking lapses were discovered by the Agency, and, over time, ElBaradei and Blix largely corrected this problem.

What is often overlooked by some is the political bargain that creates such support for the Agency: although the technical cooperation (TC) budget is voluntary, if there were no technical assistance, support for safeguards from less-developed countries would evaporate. The big nuclear power countries are there for safeguards, the less-developed are there for the TC program[me].

Because of this interdependence, it seems to me that the objectives of TC and safeguards/safety should seamlessly complement each other. But ElBaradei and other politicians clearly understand the attendant political risks of a point-of-no-return referral to the UNSC for non-compliance. I expect the Agency will defer or slow-roll the Syria TC project until things become more clear.

— AWR · Nov 26, 12:49

#

I agree with Andy that we should think of the larger goal. First, what would ending technical cooperation with Syria do? Here, one should consider both Syria's reaction and that of other states. Syria is not likely to provide more or better information on the BoE. As for other states, seems to me that a few might be deterred from following what appears to be the Syrian path, but many would believe this is yet another case of the "haves" preemptively taking out the "have-nots" without evidence.

Secondly, take a look at the cooperation the IAEA has with Syria: conversion of the MNSR reactor from HEU to LEU fuel, starting up medical isotope production (Mo-99) with LEU targets, as well as potential nuclear power cooperation.

So let's see — nuclear power is not likely to be constructed quickly, but we can quickly torpedo conversion of the MNSR to LEU fuel, part of a multinational nonproliferation and anti-terrorism initiative (GTRI). And ending hopes for medical isotope production both looks horrible from a humanitarian standpoint, and certainly does not help bring Western security culture, improved understanding, etc. etc. to Syria (and could force them into the better-known process of using HEU targets, maybe?)

There certainly are cases where ending cooperation should be an automatic penalty, but I think we have to be very careful about accusations, and consider both the short- and long-term consequences. If IAEA is to reject Syrian cooperation, it has to have an iron-clad legal basis, and should be designed to ensure other nations do not think that the IAEA is picking on a "have-not" nation.

— Cristina Hansell · Dec 1, 04:01 PM ·

#

@ Cristina Hansell:

IMHO, you can't have it both ways – you can't blow off IAEA safeguards requests for info and benefit from technical cooperation at the same time. The Agency needs to think this out carefully, and the Board, like it or not, will be reluctant, to say the least, in approving projects for Syria that are not clearly related to a development or public health need, like cancer stuff. Despite the flaws in the NPT bargain, there should be no cooperation on TC with Syria until they cooperate on safeguards. The IAEA rarely, if ever, asks for things that are unreasonable.

— AWR · Dec 1, 04:56 PM ·

—

#

AWR:

I agree the NPT is meant to be a bargain. The difficulty is in what we mean by “benefiting from technical cooperation.” If we mean sales of a nuclear reactor, I'm with you. But if the IAEA TC is in reactor safety... and the reactor is question is one Syria will build itself or with partners whom the IAEA isn't influencing...

While an unsafe reactor could put Syria at risk, doesn't it put the neighbors at risk, too? So my question is what TC should be allowed (continue IAEA cooperation with Syria on medicine? fresh water? not reactor safety?) and how can this be legally sustained so that the incentives for other actors are as positive as we can make them.

— Cristina Hansell · Dec 2, 03:23 PM ·

#

AWR: on the subject of Syria and TC, see my letter to the editor of the Wall Street Journal, published today:

In regard to your Nov. 28 editorial “Syria and the Nuclear Cops”:

The way the international nonproliferation system is meant to work is as follows: If states, many of which have surveillance capabilities, have any suspicions of clandestine nuclear activity, they should report them to the International Atomic Energy Agency. Jihad el-Khazen

Al-Hayat

10/12/08/

*[EXCERPT]*

I called Dr Mohamed ElBaradei and his wife Aida to wish them a happy Adha *[7-8 December 2008]*, but I ended up having a long discussion with the Director General of the International Atomic Energy Agency (IAEA) on Iran and Syria and on the degree of truth or fiction in the talk about the two countries' nuclear programs.

The agency, as its Director General said, is still waiting for many clarifications from Syria and still wants its inspectors to check different sites. But, ElBaradei cannot deprive Syria of the right to join the nuclear club. Such a decision is taken once Syria is proven to have violated concluded agreements and existing conditions.

I understood from Dr ElBaradei that the agency is weighing many projects with Syria within the framework of a technical feasibility study. The appropriate project, if any, will be implemented under the agency supervision. But so far no project is worth an official request.

Dr ElBaradei insisted on Syria's need to prove its innocence amidst the charges that have been circulating following the Israeli air raid. He complained that the Israeli strike was mounted on mere suspicions; Israel and the US should have provided the nuclear watchdog with all available information so that it would verify its validity.

**Fmr. Weapons Inspector On Nuclear Iran, Syria, And Barack Obama  
Hans Blix Says Demanding Iran Suspend Enrichment Before Negotiations Is 'Silly'**

By LARA SETRAKIAN

ABU DHABI, United Arab Emirates, Dec. 10, 2008

*[EXCERPT]*

ABC: What do you think of what happened in Syria, the strike on an alleged nuclear facility?

**Blix :** I think it's mystifying ... Mohammed Al Baradei had a point, saying why didn't they come to us, ask for an inspection? Instead, they bombed. A bit more transparency, by those who often ask for transparency, would be desirable. What puzzles me now are reports from the IAEA that they've found some traces of uranium. That puzzles me because if it was a reactor, uranium is about the last thing you would introduce. If it were a reactor, that would mean it was practically ready.

## **Israel Responds to IAEA's Letter on Syria's Site**

The International Atomic Energy Agency's letter of Dec. 3 ("Probing Syria's Nuclear Project") [*See above*] defending the agency's record in investigating Syria is astonishing, but not surprising. Each time the agency comes under political criticism for handling of a Middle Eastern country's flagrant breaches of its obligations under the Nuclear Non-Proliferation Treaty or its safeguards agreement, the agency immediately resorts to publicly invoking Israel's name.

It is the government of Israel's firm position that compliance with legally binding nonproliferation commitments is the cornerstone of an effective global regime. Israel has always been guided by this principle and has strictly adhered to it.

Past and present practices by four Middle Eastern countries which exploit their NPT membership to disguise the true nature of their nuclear programs have been a source of grave concern to the international community. The IAEA should take responsibility for the manner in which it has been dealing with these four countries, none of which is Israel.

The IAEA, as specified in its recent report, is examining uranium particles found at the Syrian site where some features are similar to what may be found in connection with a reactor site. Syria is also requested to allow visits to locations containing the debris and any equipment removed from the site for the purpose of taking samples.

If the agency needs relevant commercial satellite images to ascertain its findings on the Syrian site currently under investigation, it should obtain them. Nothing should stand in the way of the agency's search for evidence. The claim that Israel is withholding critical information on the site is nothing but a smoke screen.

Targeting Israel is a poor excuse. It will not absolve IAEA of its prime duty to get to the bottom of Syria's nuclear activities. Only a different approach by the agency, one which focuses on its professional mission, will reinstate its reputation and credibility in the mission to uncover clandestine nuclear programs and effectively handle dangerous proliferation activity by rogue regimes.

Israel Atomic Energy Commission  
Tel Aviv

## **ANALYSIS / How did Assad manage to gain international respect?**

By Aluf Benn,

Haaretz

26/12/2008

*[EXCERPTS]*

After eight and a half years at Syria's helm, President Bashar Assad is gaining the respect and admiration that had been reserved for his father Hafez. Israeli Prime Minister Ehud Olmert has been courting him enthusiastically with the help of a Turkish matchmaker, Prime Minister Recep Tayyip Erdogan. European leaders are standing in line to meet with him. Close associates of U.S. president-elect Barack Obama see Syria as the basis for a new balance of power in the region.

*[deletia]*

According to Olmert, he began the peace probes with Syria in February 2007 during a visit to Erdogan in Turkey. If this is so, the Hezbollah victory had shaken Israel's nonchalance and prompted him to put the Golan up for sale, for fear of a further strengthening of the "axis of evil."

But the plot thickened with the discovery of the Syrian nuclear reactor. Olmert cut off contact and prepared to attack the reactor, recruiting international support. He was worried about how Assad would react. Would he launch a missile attack on Tel Aviv and deploy in the Golan, or show restraint and continue the quiet in the north? Olmert ordered a psychological profile of Assad from MI, which analyzed his complex relationship with his father and elder brother - the heir-apparent before his death in a car accident in 1994.

Olmert's gamble paid off. The reactor was destroyed, Syria remained outside the nuclear club and the world supported Israel. The cold war in the north continued with assassinations of high-ranking Hezbollah leader Imad Mughniyeh in Damascus and Syrian general Mohammed Suleiman, an Assad adviser who had been in charge of the nuclear project. Syrian sovereignty was once again harmed and Bashar decided to sit by quietly.

*[deletia]*

## **EDITORIAL: Obama's North Korean challenge**

**Tuesday, January 6, 2009**

In the wake of last month's collapse of U.S.-North Korean nuclear disarmament talks, the incoming Obama administration will have some difficult decisions to make about dealing with Pyongyang.

In his second term, President Bush adopted a conciliatory approach toward the Stalinist regime, often choosing to overlook North Korean cheating. In June, Pyongyang asserted that by providing a declaration of its nuclear activities to U.S. officials, it had earned its removal from the U.S. list of terror-supporting states - without Washington having to worry whether its assertions could be verified. The claim was false. For more than three years, American officials had repeatedly told the North Koreans that verification was a critical component of any agreement. But when push came to shove, North Korea sought to renege and Washington acquiesced.

The report agreed to by the Bush administration fell short in three major ways: It didn't account for nuclear weapons already produced; it failed to address North Korean proliferation activities involving Iran and Syria; and it did not provide details of North Korea's covert uranium enrichment activities. But these concessions to North Korea were not enough to salvage the Washington-Pyongyang nuclear arms talks, which fell apart last month after North Korea refused to agree to a system of verifying that it had ended all nuclear activities - as it had pledged to do.

While Mr. Obama has said relatively little about his approach to North Korea, his on-the-record statements suggest that the new administration's policy will not differ very much from the soft approach taken by the Bush administration during the president's second term. During a September debate with Sen. John McCain, Mr. Obama suggested that the Bush administration's tougher first-term approach toward North Korea was to blame for its decisions to abandon the Nuclear Nonproliferation Treaty in 2003 and to test a nuclear weapon in 2006. He asserted that because the Bush administration had softened its approach toward North Korea, "we have at least made some progress." The facts suggest otherwise.

There is one issue on which Mr. Obama would do well to clarify his policy: ballistic missile defense - an essential component of any policy aimed at deterring Pyongyang from staging a nuclear and/or ballistic missile attack. "Blueprint for Change," the Obama campaign doctrine, declares that Mr. Obama will support missile defense that is "pragmatic and cost-effective" and "does not divert resources from other national security priorities until we are positive the technology will protect the American public from nuclear attack." These statements imply incorrectly that missile defense technology is unproven and that it is not a national security priority. As a recent Heritage Foundation study on missile defense points out, successful intercepts were achieved on 34 of 42 tests from 2001 to 2007. If the new president clings to old myths about missile defense, he can probably say goodbye to any chance, however remote, of persuading North Korea to change its behavior.

## **Now Is No Time to Downplay North Korea**

By JOHN R. BOLTON

JANUARY 31, 2009

*[EXCERPT]*

The belief that North Korea is not an imminent danger is closely related to the fallacy that it is "merely" a threat to peace and security in Northeast Asia, a longstanding State Department fixation. In fact, North Korea is an urgent threat in the Middle East, both because of its nuclear program and its strenuous efforts to proliferate ballistic missile technology there.

The clone of North Korea's Yongbyon reactor -- under construction in Syria until it was destroyed by Israel in September 2007 -- demonstrates beyond debate how the North's nuclear program contributes directly and palpably to Middle East tensions. Trying to ignore or downplay the relationship guarantees that we will resolve neither Pyongyang's, nor Tehran's, nuclear ambitions.

## **One on One: 'With no likelihood of US use of force, that leaves Israel'**

By RUTHIE BLUM LEIBOWITZ

Feb 5, 2009 20:51 | Updated Feb 7, 2009 22:08

*[EXCERPTS]*

John Bolton makes no bones about his bleak forecasts. Rather than leaving his listener in a state of despair, however, his straight talk is surprisingly comforting, especially under the circumstances.

*[deletia]*

**[Leibowitz:]** But doesn't Israel rely on the US? Can Israel "go it alone," without American approval?

**[Bolton:]** Well, it has done so in the past. For example, it undertook the very important operation, in September 2007, to destroy the North Korean nuclear reactor in Syria. That was done, if not over US opposition, certainly without US approval. Personally, I think that US policy was wrong. I think Israel's destroying of that nuclear facility was beneficial to international peace and security.

**[Leibowitz:]** You're saying the US was actually against that operation?

**[Bolton:]** Secretary of state Condoleezza Rice wanted very much to avoid that strike. In fact, when Israel came to the US and first proposed it in the spring of 2007, she urged that it be postponed indefinitely. The Israeli response was, "We'll postpone it, but not past the end of the summer."

And that's exactly what happened.

PolicyWatch #1483

## **Urge Damascus to Come Clean on Nuclear Activity**

By Michael Singh

February 26, 2009

The International Atomic Energy Agency's (IAEA) recent progress report on its investigation into Syria's nuclear activities reinforces concerns, voiced most prominently by the United States, that the al-Asad regime was secretly building a nuclear reactor until it was destroyed in late 2007. With the March 2 meeting of the IAEA Board of Governors (BOG) just around the corner, the world is watching carefully to see what stance the Obama administration takes on this issue. The extent to which the United States can persuade Syria to change its attitude toward the IAEA investigation from one of recalcitrance to one of voluntary cooperation will serve as a concrete test of Damascus's willingness to change its ways and mend fences with the international community.

### **Background**

On February 19, the IAEA released its second report concerning Syria's alleged nuclear activities, centering on the facility near Dair al-Zour that was destroyed on September 6, 2007. This latest report is as remarkable for its brevity as it is for its substance. It conveys three vital pieces of information: first, continued exploitation of environmental samples obtained in the IAEA's one and only visit to the site revealed additional anthropogenic (man-made) uranium particles, of a type not included in Syria's declared nuclear inventory; second, there exists only a "low probability" that these particles could have been introduced at the site by Israeli munitions, as Syria has asserted; and finally, Syria has not cooperated with the investigation, providing only partial responses to IAEA requests and not permitting further IAEA visits to Dair al-Zour or other potentially related sites. The report reaches no conclusions about the Dair al-Zour site, and IAEA director General Mohamed ElBaradei asserted recently that the agency will not "jump the gun" in doing so. The report's findings, however, appear to discredit Syria's official explanation of the site's purpose and thus lend credence to suspicions that Syria was covertly building a nuclear reactor in contravention of its Nuclear Nonproliferation Treaty (NPT) Safeguards Agreement obligation to notify the IAEA in advance of such work.

### **Implications for U.S. Policy**

One month into its tenure, the Obama administration has already signaled that it intends to take a different approach toward Damascus than that pursued during President Bush's second term. Both President Barack Obama and Secretary of State Hillary Clinton have indicated their preference for direct engagement with the al-Asad regime and have signaled their intent to ease sanctions on Syria by granting a license for the export of spare parts for a Syrian government-owned airline. In doing so, they have adopted a policy similar to that pursued during the first term of the Bush administration, where high-level envoys and the U.S. ambassador in Damascus conveyed concerns about Syrian policies directly to Syrian officials, to little avail.

As the United States pursues this outreach, the IAEA investigation could prove be double-edged. On the one hand, the IAEA BOG could eventually refer Syria's apparent flagrant violation of its NPT obligations to the UN Security Council. The Security Council could then impose sanctions on Syria, as it has in the cases of Iran and others. In this sense, the IAEA investigation might prove a powerful point

of leverage in persuading Syrian president Bashar al-Asad to finally revise policies long decried by Washington, such as Syria's support for Hamas and Palestinian Islamic Jihad. If al-Asad refuses to do so, the IAEA's findings could serve to rally international support for sanctions, which has not been forthcoming in the past.

On the other hand, even as it provides the United States with leverage, the IAEA investigation also limits U.S. flexibility in pursuing a rapprochement with Damascus and constrains the Obama administration's policy options. Like the Hariri Tribunal (the UN investigation of the 2005 killing of former Lebanese premier Rafiq Hariri), the international inquiry into Syria's nuclear activities is not a bilateral matter between the United States and Syria. As a result, the administration could face a dilemma arising from the mounting evidence of Syria's deception of the IAEA. The United States may conclude, if it believes its outreach to Damascus is making progress, that there is no benefit to pursuing the matter further: the Dair al-Zour reactor, after all, is no more. In this case, the United States could likely prevent further international action on the matter simply by doing nothing: an IAEA BOG referral to the UN Security Council is unlikely to take place without active U.S. advocacy, judging from the tenor of the November 28, 2008, BOG meeting on the issue.

Such an approach, however, would incur significant costs. First and foremost, it would further tarnish the credibility of an already shaky global nonproliferation regime. The Syrian nuclear episode suggests that this regime must be strengthened -- for example, by seeking broader observance of the IAEA's Additional Protocol and by developing tighter and more innovative export controls. Failure to take action in response to Syria's apparent violations of its NPT requirements would have the opposite effect, pushing would-be proliferators to increase their risk taking and responsible countries to rely less on the international regime and more on ad hoc efforts to stymie those proliferators.

Failing to pursue the case against Syria could also send a negative signal to Iran and North Korea. At a time when both of these regimes are taking the new U.S. administration's measure and gauging its toughness, laxity on Syria could be misinterpreted as a lack of commitment to countering Tehran and Pyongyang's own nuclear programs. At the last meeting of the IAEA BOG, U.S. representative Greg Schulte suggested that Syria, in seeking to "sanitize" the Dair al-Zour site, was adopting tactics honed by Iran. It is unlikely that this learning flows in just one direction -- if the Iranian regime sees that al-Asad was excused his nuclear improprieties, it may be emboldened to seek the same dispensation.

Finally, giving Syria a pass at the IAEA could paradoxically damage efforts by the Obama administration to improve relations with Damascus. Al-Asad has a reputation in the region for overreaching in response to a perceived advantage. A typical example is his August 2006 speech in which, likely emboldened by what he saw as a favorable outcome to the Israel-Hizballah conflict earlier that summer, he unwisely lambasted his fellow Arab rulers as "half-men." Following this pattern, it is highly possible that al-Asad would see a U.S. decision not to pursue Syria's case at the BOG as a sign of weakness and correspondingly harden his positions in talks.

## **The Way Forward**

The Obama administration will face an uphill climb in its apparent drive to improve U.S.-Syria relations. According to the U.S. intelligence community's publicly released 2009 threat assessment, the al-Asad regime, despite its professed desire for better relations with Washington, has maintained its interference in Lebanon, support for Palestinian terrorist groups, and close ties with Iran; further, it has "increased substantially" its military support for Hizballah. It is in this inauspicious environment that the new administration must formulate its position on the IAEA's investigation into Syria, with the

knowledge that aggressively pursuing the case could derail any outreach to Damascus, while deemphasizing the investigation could impair the administration's national security agenda on multiple fronts.

If the administration wishes to avoid these negative outcomes, a potential solution is for the United States to stress in any talks with Syrian officials -- who continue to deny any nuclear wrongdoing despite mounting evidence -- the need for Damascus to voluntarily cooperate with the IAEA. Doing so would mean sharing with investigators the information and documentation noted in the February 19 report and allowing them to visit the additional sites to which they have requested access (eventually dismantling those sites should they prove to be nuclear related).

Voluntary disclosure and cooperation by Syria has a nearby precedent in Libya and could actually serve to strengthen, rather than weaken, the global nonproliferation regime. This approach would support a broader effort to rehabilitate Damascus as a responsible member of the international community without compromising other vital [whose?] national security goals; additionally, it would provide a more concrete measure of Syria's sincerity than would vague pledges by Damascus to be more constructive on other regional issues. In a recent interview, al-Asad said that he would "wait for the reality and the results" in dealing with the United States. Washington would be wise to do the same in its dealings with Syria.

## **The Attack on Syria's al-Kibar Nuclear Facility**

by Daveed Gartenstein-Ross and Joshua D. Goodman

inFocus

SPRING 2009 • VOLUME III: NUMBER 1

*[Accessed 2009-03-10]*

Israel's September 6, 2007, attack on Syria's al-Kibar nuclear facility surprised the world—Syria most of all. The operation, executed by the Israeli Air Force (IAF), was reminiscent of Israel's 1981 attack on Iraq's Osirak reactor, but with two noticeable differences. First, Israel remained silent following the al-Kibar bombing, while in 1981 it boasted publicly about the Iraq strike even before the pilots had returned. Second, whereas the international community knew of Saddam Hussein's nuclear plans in 1981, few were aware of the extent of Syria's nuclear program in 2007.

The IAF's attack raises two important questions: What was Syria hiding? Why did Israel feel compelled to launch a military strike? Subsequent investigations have painted a clearer picture of what took place at al-Kibar.

### **Early Indicators**

In hindsight, there were several warnings in recent years that Syria might be pursuing nuclear weapons. The December 2001 National Intelligence Estimate, focusing on foreign missile development, noted the U.S. intelligence community's concerns about "Syria's intentions regarding nuclear weapons." An unclassified 2004 report by the Deputy Director of National Intelligence for Analysis stated that Pakistani investigators had confirmed that Abdul Qadeer Khan—the Pakistani nuclear scientist who ran a clandestine black market network—offered "nuclear technology and hardware to Syria." The report expressed concern "that expertise or technology could have been transferred."

Press reports also began to circulate in 2004 that Khan had visited Syria on several occasions, and had met with senior Syrian officials in Iran. While Syria denied this, Bashar al-Assad acknowledged in a 2007 interview with an Austrian newspaper that he had received a letter from Khan in 2001. He claimed that he rebuffed the overture, unsure "if it was an Israeli trap."

Still, a generalized assessment of Syria's nuclear intentions could not be gleaned from these early warnings. Indeed, Western intelligence agencies were unaware of the purpose of the al-Kibar facility until the summer of 2007. According to an ABC News report, Israel's Mossad learned that Syria was building a covert nuclear facility that summer, and proceeded to either place a mole inside the plant or convince a worker to provide Israel with intelligence. Through this source, Israel obtained important video footage, as well as photographs, providing evidence that al-Kibar was indeed a nuclear facility (with a large cylindrical structure, a pumping station, etc).

Israel approached the Central Intelligence Agency with this evidence, and, according to the Jerusalem Post, the U.S. "looked up satellite coordinates for the site" and "helped Israel pinpoint possible 'drop sites'." The two countries discussed the possibility of the U.S. carrying out the strike; American officials even examined options for doing so. Eventually, the White House conveyed the message "that the U.S. preferred not to attack." In fact, "U.S. Secretary of State Condoleezza Rice and Defense Secretary Robert Gates attempted to convince Israel 'to confront, not attack!'"

### **What Was Syria Hiding?**

Syria's response in the wake of Israel's bombing was curious. The regime sought no retaliatory measures. It did not even ask the U.N. Security Council to discuss or condemn the incident. Rather, satellite photos show Syria's efforts to scrub the site of any traces of the nuclear reactor that Syria denied having. Reuters reported that Syria

bulldozed the area, "removed debris and erected a new building in a possible cover-up." Former U.N. weapons inspector David Albright, president of the prestigious Institute for Science and International Security (ISIS), told the New York Times, "It looks like Syria is trying to hide something and destroy the evidence of some activity. But it won't work. Syria has got to answer questions about what it was doing."

International Atomic Energy Agency (IAEA) director Mohammed ElBaradei condemned the U.S. and Israel for their "shoot first and ask questions later" approach. Nonetheless, the IAEA began probing Syrian nuclear activity, and Syria gave its inspectors access to the al-Kibar site in June 2008. (Syria later refused IAEA requests to revisit al-Kibar and examine three other related sites.)

The IAEA released a report on November 19, 2008, containing a number of relevant data points. The report establishes that construction of the al-Kibar facility began between April 26 and August 4, 2001. Based on analysis of satellite imagery, the IAEA also notes:

Imagery taken prior to and immediately after the bombing indicates that the destroyed box-shaped building may have had underground levels. Its containment structure appears to have been similar in dimension and layout to that required for a biological shield for nuclear reactors, and the overall size of the building was sufficient to house the equipment needed for a nuclear reactor of the type alleged.

The IAEA's on-the-ground evaluation also found a water pump and other adequate infrastructure to support a reactor. Environmental samples from the site also yielded a "significant number of natural uranium particles" that were of anthropogenic origin. (Syria claimed that the particles came from the missiles Israel used to destroy the facility.)

Consistent with the caution for which the IAEA is known, its report did not conclusively state that the Syrian site was a nuclear reactor—but the implication was strong.

### **North Korea's Connection**

Post-attack analysis also highlighted North Korea's connection to al-Kibar. Shortly after Israel's strike, press reports suggested that the characteristics of the Syrian facility were similar to North Korea's reactor in Yongbyon. David Albright and Paul Brannan of ISIS confirmed this in April 2008. Specifically, they "measured the footprint of the Yongbyon reactor building and compared it to that of the suspected reactor building in Syria and found the two footprints were approximately the same." Prior to Syria's construction of al-Kibar, the Yongbyon model had been the only one of its type built in 35 years.

Video from inside the Syrian facility has also been described as "very, very damning" by a nuclear weapons specialist who spoke to the Washington Post. The video demonstrates that al-Kibar's core design was the same as the Yongbyon reactor, "including a virtually identical configuration and number of holes for fuel rods." The video also shows North Korean personnel inside the site.

Subsequent investigations have revealed that key materials for al-Kibar were smuggled from China and possibly Europe into Syria by Namchongang Trading, a North Korean firm.

### **Why Did Israel Attack?**

There are several explanations for why Israel elected to launch a strike against the Syrian facility. The most obvious is that Israel feared the prospect of having a nuclear neighbor—particularly one with which Israel has been in a constant state of war since the Jewish state's independence in 1948. The two countries have clashed several times since the 1973 Yom Kippur war, including a major engagement in the 1982 Lebanon war and occasional skirmishes at their shared border. Moreover, Syria threatens Israel by proxy—through its support of such terrorist groups as Hamas, Hezbollah, and Palestinian Islamic Jihad.

A second possible motivation is Israel's desire to re-establish deterrence in the Arab world. Israel's failures in its 2006 war with Hezbollah weakened the perceived deterrent that it held over its neighbors. The al-Kibar strike may have been an attempt to reestablish the supremacy of Israel's military apparatus in its enemies' eyes. Christopher Pang, head of the Middle East and North Africa program at the Royal United Services Institute in London, told the Associated Press, "In terms of deterrence, the effect was clear by invading Syrian airspace, by showing that Israel is not only able, but willing, to still launch strikes against Syrian targets."

The IAF's strike may also have been intended as a warning to Iran—or even a practice run on an eventual bombing raid on Iranian nuclear facilities. Obviously, al-Kibar differed greatly from the primary nuclear targets in Iran. Indeed, al-Kibar was at least partially located above ground, and was within Israeli warplanes' striking range. Nonetheless, al-Kibar was protected by the same Russian-built Tor-M1 air defense system used to protect Iranian facilities. Thus, Israel's strike may have been a test run to find flaws in Iran's air defenses.

If indeed Israel's strategy was to diagnose Iran's air defense weaknesses, the strategy appeared to backfire. The apparent failure of these systems prompted Iran in December 2007 to purchase the more advanced S-300 system from Russia. (Both Russia and Iran insist the deal had been in the works well before then.)

In the end, however, the Israeli operation seems to have been motivated by necessity; the pictures collected by Israel's mole depicted a nearly complete facility. Albright and Brannan argue that the late detection of the reactor, coupled with the perception of a nearly operational facility, compelled Israel to choose the military option as a measure of first resort. They write that Israel's "analysis, which in hindsight must be viewed as a worst-case assessment, was that Syria could soon load uranium fuel and start the reactor." Israel did not want to attack after the reactor was fully operational, because doing so would run the risk of spreading radioactive material.

### **A Warning For The Future**

As primary energy grows more expensive, many countries are turning to nuclear power. The expansion of "civilian nuclear programs" highlights the need for a more robust non-proliferation regime; the Middle East alone has about a dozen states with at least nascent nuclear programs. The existence of al-Kibar, however fleeting, should serve as a serious warning about the current non-proliferation regime, as well as U.S. engagement of Syria.

If Washington does attempt to engage Syria, it cannot simply ignore al-Kibar. Syria's apparent nuclear development and subsequent deception reinforce pre-existing concerns about the country's interest in regional peace and stability. Pretending that the al-Kibar incident did not occur would send the wrong signal to Syria and other potentially dangerous proliferators in the Middle East.

## **Syrian nuclear mystery remains unsolved**

20:28 | 11/ 03/ 2009

Print version

MOSCOW. (RIA Novosti political commentator Andrei Murtazin) - Last week, the Board of Governors of the International Atomic Energy Agency (IAEA) met in Vienna to discuss the Iranian nuclear file and the Syrian nuclear mystery.

The IAEA has some misgivings about Syria's al-Kibar nuclear facility, reportedly bombed by the Israeli Air Force (IAF) on September 6, 2007. After IAEA experts found uranium particles at the scene of the attack, Damascus said that Israel had bombed a vacant plot belonging to an inter-Arab agricultural cooperative in the Deir ez-Zor Governorate, 450 km from the Syrian capital, and that uranium particles belong to missiles that had been used during the air strike.

Top IAEA officials remained unconvinced; what's more, Syria refused to admit another expert group to the suspicious facility.

Israel claims that the al-Kibar facility was, in fact, a nuclear reactor, built by Syria with assistance from North Korea. There is still no evidence to refute or to confirm this claim. However, immediately after the bombing Damascus did not raise an uproar and did not demand that the aggressor be punished.

Instead, construction machines demolished all the buildings at the al-Kibar facility. Damascus issued an official statement about the Israeli air strike only several weeks later.

One more fact that does not speak in favor of Syria: On August 1, 2008, Brigadier General Mohammad Suleiman, a close associate of Syrian President Bashar al-Assad, was gunned down at a beach resort near the Syrian port city of Tartous. This happened ten months after the Israeli air strike when the IAEA wanted to ask Damascus some more questions. U.S. intelligence reports say that General Suleiman was responsible for the Syrian nuclear program.

The Syrian response to various suspicions and accusations is the central issue so far. Damascus is behaving very much like Iran does in a similar situation.

The IAEA Board of Governors said nothing new about the Iranian nuclear program. On March 3, the so-called Iran Six of international mediators, namely, Russia, China, France, Germany, the United Kingdom and the United States, addressed the Board of Governors and called on Tehran to fully cooperate on all contentious aspects of its nuclear program.

As usual, Tehran replied that the actions of the Iran Six trying to solve the Iranian nuclear-file problem could only harm the country's cooperation with the international community on this issue.

Nor did the first official meeting between Russian Foreign Minister Sergei Lavrov and U.S. Secretary of State Hillary Clinton in Geneva produce any new results. Lavrov reiterated the need for turning the Middle East into a nuclear-free zone and for eliminating all other weapons of mass destruction in the region.

Both sides once again expressed their concern about the Iranian nuclear program's military component and once again demonstrated their differences on the issue. It is common knowledge that Washington opposes this program in any form, while Moscow only opposes its military aspects.

Two weeks ago, Gholamreza Agazadeh, the Iranian Vice-President and Head of Iran's Atomic Energy Organization, said Tehran planned to install 50,000 operational centrifuges at the Natanz uranium enrichment facility in the next five years.

Russia, the United States, Europe and Israel deserve to know why Iran needs so much enriched uranium at a time when Moscow undertakes the delivery of nuclear fuel for the Bushehr nuclear power plant built by Russian power engineers and the disposal of used fuel.

Iran says enriched uranium is needed to guarantee the future of its nuclear program and to prevent dependence on the West and probably Russia. Thus a mystery surrounding Iranian centrifuges is not far off from a Syrian nuclear mystery.

But for Tehran's militant rhetoric, constant threats and verbal attacks against Israel, the United States and some Arab nations, the Iranian nuclear program would not cause so many questions on the part of the international community.

At the same time, Tehran is trying to turn Moscow into a guarantor of its nuclear and political security. Iran expands its contacts with Russia each time the situation becomes aggravated.

It is hardly surprising that the current visit of Sergei Kiriyenko, Head of Rosatom, Russia's state nuclear energy corporation, to Bushehr has coincided with the visit of Iranian Defense Minister Mostafa Mohammad Najjar to Moscow.

Although diplomats tried hard to hush up the main purpose of Najjar's visit, namely, the sale of S-300 surface-to-air missile (SAM) systems to Tehran, the Iranian media actively discussed the issue. Iran wants to use these SAM systems for shielding its nuclear facilities from Israeli missiles and warplanes.

Although the S-300 contract was initiated two years ago, Moscow is still in no hurry to implement it because of insistent U.S. and Israeli requests, therefore retaining leverage with Tehran. Owing to Russian efforts, the UN Security Council has not yet passed any tough sanctions against Iran, while Israeli warplanes have so far avoided hitting the incomplete Bushehr NPP and reducing it to heaps of twisted concrete and smoking rubble.

Although Russia does not build any NPPs in Syria, it sells weapons to Damascus. The administration of U.S. President Barack Obama has resumed negotiations with Syria for the first time since 2005. Two senior U.S. officials, namely, Acting Assistant Secretary of State for Near Eastern Asian Affairs Jeffrey Feltman and Daniel Shapiro, the head of the Middle East desk at the National Security Council, have just visited Damascus.

At a meeting with Syria's Foreign Minister Walid al-Muallem, both sides agreed on the importance of resumed Syrian-U.S. dialogue for mutual interests and regional peace and security, the Syrian Arab News Agency (SANA) said.

Although no details of the talks were disclosed, it is obvious that Washington is trying to gradually reduce Iranian influence on Damascus. If it succeeds, then the IAEA would have no more questions for Syria.

Incidentally, claims to Tehran may disappear in exactly the same way.

PolicyWatch #1493: Special Forum Report

## **The Washington-Beirut-Damascus Triangle (Part I)**

Featuring John Hannah

March 17, 2009

On March 13, 2009, Andrew Tabler, Magnus Norell, and John Hannah addressed a special Policy Forum luncheon at The Washington Institute to discuss the Washington-Beirut-Damascus triangle. Mr. Hannah, senior fellow at The Washington Institute and national security advisor to former vice president Dick Cheney, focused his remarks on U.S. policy toward Lebanon and Syria. The following summary draws from his presentation. A summary of the presentations by Andrew Tabler and Magnus Norell was published as PolicyWatch #1494.

### The Stakes in Lebanon

Lebanon's fate has become part of a larger struggle for power and influence that is playing out across the Middle East, a struggle pitting the United States and its friends against Iran and its proxies. The outcome of that struggle will have strategic implications for the United States that extend well beyond Lebanon.

Whether or not the U.S. government sees events in Lebanon this way, the rest of the Middle East will have their scorecards out in the days and weeks following Lebanon's June elections to determine which side won. Based on that tally, the region will proceed to draw broader conclusions about the correlation of forces in the region that will have real consequences for U.S. interests.

A clear-cut electoral victory for Hizballah would greatly undermine U.S. prestige and credibility in the region, while providing a major boost to the perceived power of America's adversaries. The strategic dilemma that Hizballah's strength already poses would escalate dangerously should the terrorist group -- with Iran and Syria behind it -- come to dominate virtually all the institutions of the Lebanese state. The result could well be the consolidation of a permanent Iranian military outpost on the eastern Mediterranean and a major presence of Iran's Qods (Jerusalem) Force -- a special unit of the Islamic Revolutionary Guard Corps -- directly on Israel's northern border, with all its deadly capabilities and intentions.

A total collapse of Lebanon's Cedar Revolution would complicate the Obama administration's overarching strategy of engagement. Not only would it make the already difficult task of trying to convince Iran to discontinue its nuclear program much harder, it would also make sustaining engagement over time more difficult if the American public concludes that such diplomacy requires sacrificing the interests of America's friends on the altar of some hoped-for rapprochement with its enemies. In this sense, Lebanon's elections will most likely become the first real test case of engagement's viability as a strategy for protecting U.S. interests more broadly.

### Risks of Engagement

The Obama administration needs to remain acutely sensitive to how U.S.-Syrian engagement impacts Lebanon's elections. Lebanon is poised on a razor's edge, with a significant bloc of voters on the fence,

not wanting to be caught on the losing side. In a close election, a perception that the United States is once again ready to sacrifice Lebanon's independence for a deal with Damascus could tip the balance in the wrong direction.

Syria will almost certainly try to exploit U.S. engagement for exactly that purpose. Just after President Obama's inauguration, a Syrian commentator close to the al-Asad regime declared that "The new Obama administration knows that the plans of the previous U.S. administration have been defeated and that Syria played the primary role in ensuring that defeat. Syria is not in a hurry to pick the fruits of its policies. It is up to the defeated to present his menu and up to the victor to present his demands." Especially in the context of what is seen to be a dramatic U-turn in U.S. policy from isolation to engagement, this narrative of Syrian strength and U.S. defeat, with Washington coming to Damascus on bended knee, could resonate in the region -- unless it is aggressively countered by the United States.

To its credit, the Obama administration has done an admirable job so far of balancing its outreach to Syria with a strong effort to reassure the Lebanese government. Both the president and Secretary of State Hillary Clinton made strong statements in February supporting Lebanon's independence and reaffirming U.S. support for the Hariri tribunal (the international tribunal created to investigate the 2005 assassination of the former Lebanese prime minister). Congressional delegations rushing to Damascus have been encouraged to include Beirut on their itineraries as well. The first high-level U.S. envoys to Syria in four years included Jeff Feltman, who more than any other person in the U.S. government has been identified with the struggle for Lebanon's independence, and Dan Shapiro, who helped draft the Syria Accountability Act. The administration should also consider whether its messages of reassurance to the Lebanese public need to be coupled with a warning about the potential consequences for U.S. and international support of a Hizballah electoral victory.

Washington should aggressively use its engagement with Syria to deter Damascus from resorting to violence in Lebanon, either in the run-up to elections or in their aftermath. In mid-March, President Bashar al-Asad gave an interview in which he issued veiled threats against Lebanon should the Hariri tribunal reach the wrong conclusions or should the March 14 coalition win the elections and actually attempt to govern as a democratic majority. It is hard to avoid the conclusion that violence remains an integral part of Syria's strategy. The Obama administration should act now to put the Syrian regime on notice that the relatively smooth passing of Lebanon's elections will be a critical metric by which the United States assesses the value of engagement going forward.

### Challenges of Engagement

Pursuing engagement in a way that meets U.S. objectives, rather than simply addressing Syria's narrow agenda, will not be easy. The thinking today is that dealing with Syria must no longer just be about "land for peace" with respect to the Golan Heights, but rather "land for strategic realignment" with respect to Syria's alliance with Iran. But ensuring that the wide range of U.S. concerns vis-a-vis Syria are dealt with in a meaningful and systematic way will be much easier said than done. Syria will likely do everything it can to limit its engagement to resuming U.S.-sponsored peace talks with Israel to recover the Golan, with strategic realignment to follow at some point in the distant future.

What will happen if Syria insists on pursuing its version of engagement rather than ours? Will the Obama administration be able to stop and declare the process a failure after having made engagement its signature initiative -- especially with the allure of an ongoing Israeli-Syrian peace process, if not peace itself, to claim as a major diplomatic achievement?

## If Engagement Fails

It will be important for the administration to have -- and for Syria to know that it has -- a contingency plan should engagement be given a fair trial and shown not to address key American concerns. At a minimum, such a contingency should include the option of significantly ramping up multilateral pressure and sanctions against the al-Asad regime. In this regard, the administration should do everything in its power to ensure that the two most important levers available -- the Hariri tribunal and the International Atomic Energy Agency investigation of Syria's secret plutonium reactor -- remain robust and hanging over the head of the al-Asad regime. Syria will no doubt seek to use engagement to neutralize those threats, and the Obama team must resist. History suggests that only pressure that threatens the al-Asad regime's survival is likely to trigger the kinds of strategic Syrian shifts that advance U.S. interests.

While Washington is focused on the potential merits and promise of engagement, it bears remembering that the withdrawal of Syrian troops from Lebanon four years ago -- arguably, the high point of American policy vis-a-vis Syria in the past several decades -- was itself the product of a policy of intensely focused confrontation, multilateral pressure, and veiled threats against the al-Asad regime. Such an approach may indeed be out of fashion. Although the Bush administration proved unable to sustain this policy over the long term, it was undoubtedly effective at that particular moment in history. For this reason alone, it may be a model worth keeping in reserve.

## Iran's Axis of Nuclear Evil

By JOHN BOLTON

MARCH 21, 2009

While President Obama's unanticipated Nowruz holiday greeting to Iran generated considerable press attention, his video wasn't really this week's big news related to the Islamic Republic. Far more important was that a senior defector -- Iran's former Deputy Minister of Defense Ali Reza Asghari -- disclosed Tehran's financing of Syria's nuclear weapons program. That program's centerpiece was a North Korean nuclear reactor in Syria. Israel destroyed it in September 2007.

At this point, it is impossible to ignore Iran's active efforts to expand, improve and conceal its nuclear weapons program in Syria while it pretends to "negotiate" with Britain, France and Germany (the "EU-3"). No amount of video messages will change this reality. The question is whether this new information about Iran will sink in, or if Washington will continue to turn a blind eye toward Iran's nuclear deceptions.

That the Pyongyang-Damascus-Tehran nuclear axis went undetected and unacknowledged for so long is an intelligence failure of the highest magnitude. It represents a plain unwillingness to allow hard truths to overcome well-entrenched policy views disguised as intelligence findings.

Key elements of our intelligence community (IC) fought against the idea of a Syrian nuclear program for years. In mid-2003, I had a bitter struggle with several IC agencies -- news of which was leaked to the press -- concerning my testimony before the House Foreign Affairs Committee about the Syrian program. Then Sen. Joe Biden made the Syria testimony an issue in my 2005 confirmation battle to become ambassador to the United Nations, alleging that I had tried to hype concern about Syria's nuclear intentions. (In fact, my testimony, in both its classified and unclassified versions, was far more anodyne than the facts warranted.)

Key IC agencies made two arguments in 2003 against the possibility of a clandestine Syrian nuclear weapons program. First, they argued that Syria lacked the scientific and technological capabilities to sustain such a program. Second, they said that Syria did not have the necessary economic resources to fund a program.

These assertions were not based on highly classified intelligence. Instead, they were personal views that some IC members developed based on public information. The intelligence that did exist -- which I thought warranted close observation of Syria, at a minimum -- the IC discounted as inconsistent with its fixed opinions. In short, theirs was not an intelligence conclusion, but a policy view presented under the guise of intelligence.

How wrong they were.

As for Syria's technical expertise, North Korea obviously had the scientific and technological ability to construct the reactor, which was essentially a clone of the North's own at Yongbyon. Moreover, it is entirely possible that Syria's nuclear program -- undertaken with Pyongyang's assistance -- is even more extensive. We will certainly never know from Syria directly, since Damascus continues to deny it

has any nuclear program whatever. It's also stonewalling investigation efforts by the International Atomic Energy Agency.

As for Syria's ability to finance a nuclear program, Iran could easily supply whatever Syria might need -- even in a time of fluctuating oil prices. Moreover, given Iran's hegemony over Syria, it is impossible to believe Syria would ever undertake extensive nuclear cooperation with North Korea without Iran's acquiescence. Iran was likely an active partner in a three-way joint venture on the reactor, supplying key financial support and its own share of scientific knowledge. Cooperation on ballistic missile programs between Pyongyang and Tehran is longstanding and well-advanced, and thereby forms a basis of trust for nuclear cooperation. Moreover, both Iran and North Korea share a common incentive: to conceal illicit nuclear weapons programs from international scrutiny. What better way to hide such programs than to conduct them in a third country where no one is looking?

Uncovering the North Korean reactor in Syria was a grave inconvenience for the Bush administration. It enormously complicated both the failing six-party talks on North Korea and the EU-3's diplomatic efforts with Iran, which Secretaries of State Colin Powell and Condoleezza Rice so actively supported.

Mr. Asghari's revelations about Iranian financing of Syria's nuclear program -- if borne out -- will have precisely the same negative impact on Obama administration policies, since they track Mr. Bush's so closely. In fact, the two administrations' approaches differ only to the extent that Mr. Obama is poised to pursue policies, like face-to-face negotiations with Iran, that the second term Bush State Department wanted to do, but faced too much internal dissonance to implement.

The Nowruz video reflects the dominant view within the Obama administration that its "open hand" will be reciprocated. It's likely Iran will respond affirmatively to the near-plaintive administration request to "engage."

And why not? Such dialogue allows Iran to conceal its true intentions and activities under the camouflage of negotiations, just as it has done for the past six years with the EU-3. What's more, Iran will see it as confirmation of U.S. weakness and evidence that its policies are succeeding.

There is very little time for Mr. Obama to change course before he is committed to negotiations. He could start by following Iran's money trail.

## **Certifying Syria's Nuclear Program**

by Gordon Prather

March 21, 2009

The Likudniks, here and abroad, are running scared. Why? Well, it may turn out that President Obama genuinely intends to solve Middle East conflicts peacefully, diplomatically.

For example, Obama just had Secretary of State Clinton send, Jeffrey Feltman, her Deputy Assistant Secretary of State for Near Eastern Affairs, in company with Dan Shapiro, head of the Middle East Division of the National Security Council Staff, to meet last week with Syrian Foreign Minister Walid Al-Muallim and presidential advisor Bothainia Shaaban in Damascus.

According to Feltman, the talks covered "Lebanon, Israel, Iran, Hamas, Iraq" and "Syria's attempts to develop a nuclear program."

Feltman was the Bush-Cheney Ambassador to Israel in 2006 during the Israel-Hezbollah-Hamas war and the associated Israeli unrestricted bombing of Lebanon.

Shapiro was Obama's "emissary" to "Jewish groups" during the presidential campaign and reportedly drafted the Syria Accountability and Lebanese Sovereignty Restoration Act of 2003 [.pdf], which contained, among many onerous findings and determinations, the following;

"[T]he United States will not provide any assistance to Syria and will oppose multilateral assistance for Syria until Syria ends all support for terrorism, withdraws its armed forces from Lebanon, and halts the development and deployment of weapons of mass destruction and medium- and long-range surface-to-surface ballistic missiles."

According to Shapiro's Act, if Obama now wishes to normalize relations with Syria, he will have to certify to Congress that

"[T]he Government of Syria has ceased the development and deployment of medium- and long-range surface-to-surface ballistic missiles, is not pursuing or engaged in the research, development, acquisition, production, transfer, or deployment of biological, chemical, or nuclear weapons, has provided credible assurances that such behavior will not be undertaken in the future, and has agreed to allow United Nations and other international observers to verify such actions and assurances."

Which brings us to the otherwise inexplicable publication this week of a seemingly authoritative "report" by Hans Ruhle in the Swiss daily, Neue Zuercher Zeitung. Ruhle alleges – in the course of "revealing" what retired Iranian general Ali Reza Asghari allegedly told the CIA when he defected back in February, 2007 – that the immediate imperative for the Israeli aerial attack on a site near Al Kabir on September 6, 2007 was that a "North Korean" ship had been "checked" and determined to be carrying "nuclear fuel" to Syria.

Checked? By whom?

Determined? By whom?

Ruhle doesn't say.

But surely, not by the United States or any "concerned state" associated with the Proliferation Security Initiative of Bonkers Bolton, established by President Bush the Younger back in 2003. According to Bolton;

"Our [PSI] goal is to work with other concerned states to develop new means to disrupt the proliferation trade at sea, in the air, and on land. The initiative reflects the need for a more dynamic, proactive approach to the global proliferation problem. It [PSI] envisions partnerships of states working in concert, employing their national capabilities to develop a broad range of legal, diplomatic, economic, military and other tools to interdict threatening shipments of WMD- and missile-related equipment and technologies. To jumpstart this initiative, we have begun working with several close friends and allies to expand our ability to stop and seize suspected WMD transfers."

Surely, therefore, if any of our PSI "partners" had "checked" this ship and "determined" that it was carrying North Korean "nuclear fuel," bound for Syria, along the "axis of evil," it would have seized this shipment.

What then?

Well, at a minimum Bush-Cheney would have informed the International Atomic Energy that their suspicions about North Korea's and Syria's nuclear programs had been vindicated. More likely, with a nuclear "smoking gun" implicating both North Korea and Syria in their possession, Bush-Cheney would have launched wars against both.

But, reportedly, Bush-Cheney refused to even participate in the Israeli raid on the Al Kabir site. A raid for which the Israelis reportedly insisted there could be no delay.

Yet, in April, 2008, the CIA released a detailed computer-simulation based video depicting what they were "convinced" the Syrians – assisted by the North Koreans – had been doing at the Al Kabir site since 2001.

To wit:

"Syria was building a gas-cooled graphite-moderated reactor that was nearing operational capability in August 2007. The reactor would have been capable of producing plutonium for nuclear weapons, was not configured to produce electricity and was ill-suited for research."

Now, while the CIA claimed that the alleged reactor was "nearing operational capability" at the time of the Israeli raid, it is important to note that there was no mention whatsoever in their report of the "smoking gun" just now "reported" in the Neue Zuercher Zeitung – the shipment of what was "checked" and "determined" to be North Korean startup "nuclear fuel" for a clone of the North Korean weapons-grade plutonium-producing reactor at Yongbyon.

The most likely explanation is that neither the CIA – nor any of our PSI partners – had any reason to believe that such a shipment had taken place.

So, why the seemingly inexplicable publication this week of what now seems anything but an authoritative report on nuke weapon collaboration between North Korea and Syria (and funded by Iran)?

Perhaps to make it virtually impossible for President Obama to ever certify to Congress that the Government of Syria "is not pursuing or engaged in the research, development, acquisition, production, transfer, or deployment of biological, chemical, or nuclear weapons" and "has agreed to allow United Nations and other international observers to verify" that they are not?

Perhaps, but maybe Hans Rühle, allegedly a former Chief of the Planning Staff in the German Ministry of Defense, is also an alarmed Likudnik.

## **Syria Unlikely to Resume Nuclear-Weapon Program, Expert Says**

By Chris Schneidmiller

Tuesday, April 7, 2009

Global Security Newswire

WASHINGTON -- The Syrian facility destroyed in a 2007 Israeli air strike almost certainly housed a reactor being readied to produce nuclear-weapon material, an effort that the Middle Eastern state is not likely to resume, one expert said yesterday (see GSN, March 20).

"I think for the moment this program is really quite dead, not likely to be restarted," said Leonard Spector, head of the Washington office for the Monterey Institute's James Martin Center for Nonproliferation Studies.

Spector spoke here on the first day of a nonproliferation conference organized by the Carnegie Endowment for International Peace, on a panel that addressed several "nuclear crisis points" -- also including Iran, North Korea and Pakistan.

Syria, which joined the Nuclear Nonproliferation Treaty in 1969 as a non-nuclear-weapon state, is perhaps the most recent addition to that list.

Israel has not commented publicly on its reasons for eliminating the structure at al-Kibar in September 2007, but U.S. intelligence officials would later allege it was the core of Syria's attempts to establish itself as a nuclear-weapon state (see GSN, April 25, 2008).

Damascus denied that claim, and in the wake of the attack razed the site and built a new structure in the same location. It has allowed only one inspection by the International Atomic Energy Agency, which found some evidence to support the assertion that the facility was a nearly finished reactor designed with help from North Korea to produce weapon-ready plutonium (see GSN, Nov. 19, 2008).

"From my point of view, there really wasn't too much doubt, based on the information provided by the CIA, and some of the information ... obtained by the IAEA, that this was indeed a nuclear-weapon program that Syria was embarked on," Spector said, citing "the style of the reactor, the secrecy with which it was built, the efforts to disguise its presence, [and] now we're hearing of some type of uranium on site."

Some audience members said the matter remained unresolved. The U.N. nuclear watchdog's investigation has been hampered by the attack, which eliminated the key piece of evidence, said Ambassador Taous Feroukhi of Algeria, current chairwoman of the IAEA Board of Governors.

"The board is still divided regarding Syria because there is no evidence that there is undeclared activity in that installation that has been destroyed," she said.

Her complaints echoed those of IAEA chief Mohamed ElBaradei, who has said that Jerusalem and Washington should have shared their suspicions with his organization before the strike.

Even the CIA appears to have doubts, Spector said. The agency says the absence of a reactor fuel fabrication facility and a reprocessing plant at al-Kibar leaves it only "low confidence" that Syria sought a weapons capability. He argued, though, that the presence of processed uranium at the location indicates that Syria might have obtained reactor fuel from North Korea or another source, while Pyongyang has showed that a reactor can begin operations before a reprocessor comes online.

"The sequence here does not really push you away from the view that this was in fact a nuclear-weapon program," Spector said.

Panelist Ariel Levite, a nonresident senior associate at the Carnegie Endowment, noted that Damascus has blocked IAEA access to several other facilities: "They may be part of the mystery."

Syria had several reasons for wanting a nuclear-weapon program, according to Spector. By 1997, when discussions are believed to have begun with North Korea, Syria no longer enjoyed the patronage of the former Soviet Union and the political backing and access to weaponry that came with it, he said.

"The entire role of Syria in the Middle East was diminished, in part, because of this," Spector said. "There was also increasing fear of possible encirclement because of growing Israeli capabilities and the increasing presence of the United States in the region."

The "critical factor" was North Korea's willingness to assist then-Syrian leader Hafez Assad realize his ambitions for his nation, Spector said: "I think without that there could not have been a program."

Video taken inside the facility shows North Korean personnel and indicates that the plant itself appears to be modeled after the Stalinist state's plutonium-producing reactor at Yongbyon, U.S. officials have said. Washington has claimed that Pyongyang is no longer providing nuclear assistance to Damascus.

Lack of access to that expertise and the seeming elimination of the black market nuclear network once led by former top Pakistani atomic scientist Abdul Qadeer Khan is likely to prevent Syria from trying to build another reactor, Spector said.

Spector asked why the international community has not pressed the case on Syria as hard as it has other nations suspected of operating illicit nuclear programs. He then offered several possible answers to his own question.

Observers might be waiting for additional evidence, though little could be expected from the current level of access allowed by Syria, he said. Nations might also be reluctant to pressure Damascus as they try to diplomatically try to "woo" it back into the global community, Spector added.

"With the Israeli attack, the actual urgency, the danger that might have been posed by the evolution of the Syrian nuclear-weapon capability is no longer before us," he said.

Syria's nuclear program was the fourth to go undetected -- at least for some period of time -- in recent decades, Spector said, naming Iraq in the 1980s, Iran in the 1980s to 1990s and Libya early this decade as the others.

"These were failings of detection by the NPT-IAEA system," he said. "We know there are limits on what the IAEA can do, but certainly this is a very unhappy development."

The U.N. Security Council's inability to enforce nuclear rules, as shown in the cases of Iran and North Korea, "undoubtedly" played a role in Israel's decision to destroy the al-Kibar facility, according to Spector. He labeled the strike a "pure case" of the Bush administration's doctrine of preventive war to eliminate possible threats at an early stage.

"The fact that the international community has responded so cautiously to this event suggests that there may be increased tolerance for these kinds of activities in very, very specific circumstances involving a clandestine facility that appears to be oriented toward the production of nuclear weapons," Spector said.

*[EXCERPT]*

An Iran with nuclear weapons is a palpable risk not only for Israel, and the Arab states know it. That is what accounts for the mysterious silence on the part of the Arab world in September 2007, when Israel bombed the nearly completed North Korean nuclear reactor on the Euphrates River in Syria. Israel exposed and degraded yet another Middle Eastern clandestine nuclear program, **one that could not have come into being without some measure of Iranian support**, and the lack of Arab protest was deafening.

## **Netanyahu and Obama Have a Shared Interest in Iran**

By REUEL MARC GERECHT

*[EXCERPT]*

We shouldn't be surprised if the Israelis reach a conclusion at odds with Washington's near-consensus against pre-emptive strikes on Iran's nuclear facilities. In 1981, Jerusalem certainly surmised that a raid against Iraq's Osirak nuclear reactor could make Saddam Hussein furious and that he possessed conventional and unconventional means of getting even. But they went ahead and destroyed the reactor.

The consensus in Israel is just as widespread about the correctness of last year's strike against the secret North Korean-designed reactor at Dir A-Zur in Syria -- a project that may well have had Iranian backing. Prime Minister Ehud Olmert ordered the attack although the Bush administration opposed it. And in 1967, Israelis believed that pre-emptive action saved their nation from an Arab-initiated, multifront offensive that could have proved lethal.

## **Damascus Gets What it Needs**

Jonathan Spyer, Ph.D.

5/25/2009

In his letter to Congress announcing the renewal of US sanctions on Syria, President Barack Obama was specific regarding the reasons for his decision.

Syria, the President said, was "supporting terrorism, pursuing weapons of mass destruction and missile programs, and undermining US and international efforts with respect to the stabilization and reconstruction of Iraq."

These three accusations are related to verifiable activity currently being undertaken by the Damascus regime. Syria's activity in turn reflects the firmness of the regime's strategic choice to align itself with the regional alliance led by Iran.

Syria's actions should be observed well by all those currently promoting the feasibility of a "grand bargain" between Israel and the Arab world. They are evidence of the reality of a Middle East Cold War, in which the fault lines are growing ever clearer.

First, let's recall the details. With regard to supporting terrorism, it is well known that the leaderships of Hamas and Islamic Jihad are domiciled in Damascus. Syria has over the last decade built a close, mutually beneficial strategic relationship with Hizbullah. Damascus also serves as a large care home for various superannuated leftist Palestinian groups.

On weapons of mass destruction, reports have surfaced in recent days suggesting that the Syrians have constructed a biological weapons facility, on the site of the al-Kibar plutonium reactor destroyed by Israel in 2007. Certainly, Damascus's interest in both biological and chemical weapons is long-standing.

Syria possesses one of the largest and most advanced chemical warfare programs in the Arab world - including chemical warheads for all its major missile systems. It is known to possess a stockpile of the nerve agent sarin, and is in the process of attempting to develop the more powerful VX nerve agent, according to the CIA's bi-annual report on WMD proliferation. Damascus is also thought by western governments to possess a biological warfare development program.

On the "stabilization and reconstruction" of Iraq - the latest news is that after a short pause, Damascus has in the last month recommenced its practice of facilitating the entry of Sunni jihadi fighters into Iraq by way of Syria's eastern border. At the height of the Sunni insurgency, Damascus airport became a transit point for fighters from across the Arab world and beyond it seeking to make their way to Iraq. In mid 2007, 80-100 fighters per month were crossing into Iraq from Syria. Having fallen to close to zero earlier this year, the numbers are now up to 20 per month.

The charge sheet is both substantial, and formidable. It isn't hard to see why the US administration found it necessary to renew the sanctions. But the interesting question remains that of Syria's motive.

Assistant Secretary of State for Near Eastern Affairs, Jeffrey Feltman, and NSC senior official Daniel Shapiro have visited Damascus twice in the last two months. Feltman noted that the two sides found "lots of common ground" between them. Syrian Ambassador to the US Imad Moustapha happily described the "new spirit of serious discussion" that he found in his meetings with Obama administration officials.

So why, four months into Washington's courting of the Assad regime, has there been no improvement of any kind in Syria's stances regarding issues of concern to the US? Rather, where there has been change, it has been for the worse - as in the situation on the Iraqi border, and perhaps with regard to al-Kibar.

The regime has evidently done its calculations, and concluded that it has nothing to gain by loosening its relationship with the Iranians at the present time. US sanctions are not toothless. Oil and gas production in Syria has been hit because of lack of access to US technology. The aviation and banking sectors have also been affected. Damascus would substantively gain from seeing the sanctions lifted.

But Syria is also aware that with the region polarized between US and Iranian blocs, moving toward the former entails moving away from the latter. And it is not at all clear that the US could, or would, wish to provide Syria with the very tangible strategic benefits it currently gains from its close relations with Iran.

Washington wants a free Lebanon, a stable, strong Iraq, and progress towards peace between Israel and the Palestinians. Syria opposes all of these. Damascus seeks to rebuild its own power in Lebanon, to keep Iraq weak and strife-torn, and to benefit from its own self-proclaimed stance as the expression of pride and defiance in the Arab dispute with Israel.

Allies of Iran and Syria may be about to win elections in Lebanon, and are growing daily more powerful among the Palestinians. The alliance with Iran also makes Syrian meddling in Iraq a possibility, and may well prevent the reemergence of a strong and independent Baghdad.

The firmness of the Syrian stance suggests that Damascus expects US attempts at engagement with Iran to fail - making the issue a zero-sum game. On that basis, the reasons for the Syrian choice become clear. While rapprochement with the US might give the Assad regime something of what it wants, its alliance with Iran gives it most of what it needs.

## North Korea Advertises Its Nukes

Syria has already been a customer.

By GORDON G. CHANG

MAY 26, 2009

North Korea yesterday tested a second nuclear weapon at its underground site near the northeastern city of Kilju. This follows the launch of a long-range missile early last month.

What does Kim Jong Il want? First and foremost, he wants the international community to recognize his nation as a nuclear weapons state. Second, the regime seeks to destabilize the South Korean government of President Lee Myung-bak, who has taken a much tougher approach to Pyongyang than his two predecessors. Third, Kim undoubtedly wants additional assistance from international donors to alleviate the hardship caused by a downturn in the North Korean economy. And as always, Pyongyang's ruler hopes to bolster the popularity of his regime among hungry North Koreans -- and the senior generals whose backing he needs.

All these objectives have been known -- or should have been known -- for some time in American foreign policy circles. Yet both the administrations of George W. Bush and Barack Obama have put North Korea on the back burner.

Kim had one more frightening objective in mind when he set off the nuclear device yesterday. And that reason alone should be sufficient to put North Korea at the top of the foreign-policy inbox for the next several years. The official Korean Central News Agency said this immediately after the detonation: "The results of the test helped satisfactorily settle the scientific and technological problems arising in further increasing the power of nuclear weapons and steadily developing nuclear technology." This is sales talk. North Korea appears set to go into high gear and merchandise its nuclear arsenal.

North Korea's last nuclear test, in October 2006, was by all accounts a dud. The North Koreans were too ambitious in their designs, used unsuitable plutonium, or had not mastered the intricacies of the triggering device. In any event, the yield was less than a kiloton, well below the four kilotons they had predicted when they gave the Chinese a warning of the test. To get over the embarrassment of the "fizzle," Kim's technicians had to detonate another device to validate their designs and demonstrate the power of their weapon.

The Iranians who witnessed the event three years ago could not have been overly impressed with the low yield. And Tehran is an important customer to the North Koreans because the Islamic Republic has, in all probability, funded at least one acquirer of Kim's nuclear technology.

That acquirer would be Syria, which was building what looked like a reactor of North Korean design. The Israelis destroyed that secret facility in September 2007 in a daring air raid. We do not know at this moment if Damascus has abandoned its nuclear ambitions, but it is clear the Iranians have not. They are somewhere between one to three years to a working nuclear device of their own. Undoubtedly, we will hear in the next few months reports that Tehran's technicians were again witnesses to yesterday's test.

There is no greater threat to the U.S. than the proliferation of nuclear weapons to dangerous and hostile regimes. The Bush administration, however, never made North Korea pay any price for crossing the red line of selling nuclear technology. In fact, Bush policy in later years centered on providing benefits to Pyongyang for its continued participation in denuclearization talks.

The critical question is what Washington will do in the coming days. After the early-April test of a long-range missile, Stephen Bosworth, President Obama's part-time envoy for North Korea, said he was "relaxed" and even

suggested direct talks with Pyongyang, which is what the North always wanted from Washington. The feckless American response was a big green light for Kim to continue his destabilizing behavior.

The North does not need to possess sophisticated weapons to make itself a real threat. It soon will be able to deliver a nuclear device to the American homeland by either a short-range missile launched from a rusting merchant ship or, as some fear, a pickup truck. Another danger is the dissemination of nuclear technology to hostile states and their terrorist allies.

This is a consequential moment. North Korea is taking on the world, and we have no choice but to respond.

## **Bolton: We Need to Apply More Pressure to North Korea's Regime**

**Wednesday, May 27, 2009**

This is a rush transcript from "On the Record," **May 26, 2009**. This copy may not be in its final form and may be updated.

GRETA VAN SUSTEREN, FOX NEWS HOST: There is breaking news out of the Korean peninsula. There are reports tonight that North Korea has test fired another short range missile from an east coast launch pad.

If true, that means North Korea has launched six short range missiles in two days.

And yesterday, the rogue regime tested a nuclear device underground.

So what should the United States do? Moments ago, former U.S. Ambassador to the United Nations John Bolton when on the "On the Record."

(BEGIN VIDEOTAPE)

VAN SUSTEREN: Ambassador Bolton, nice to see you, sir.

JOHN BOLTON, FORMER U.S. AMBASSADOR TO THE U.N.: Glad to be here.

VAN SUSTEREN: Yesterday, the world was surprised by the detonation of nuclear device by the North Koreans -- today two short range missiles shot off. So now what?

BOLTON: I think it shows the North Koreans are not very impressed by statements of world leaders about their test or about the launches. I think it shows they want a deliverable nuclear weapons capability, and they're continuing to take steps to that end.

I think the response by the U.S. ought to be to get rid of the six- party talks. I think they have failed. There is no way the North Koreans are going to be talked out of their nuclear weapons.

We need to apply more pressure to this regime, and we need China to do the same.

VAN SUSTEREN: Currently there are no talks. I guess we could just officially say we are not talking either. North Korea says they're not talking, but we could say, OK, we're not either.

But France, for instance, has called for greater sanctions. What more sanctions are available out there? They have virtually nothing.

BOLTON: There are a number of things the U.S. can do. We can put them back on our list of state sponsors of terrorism, once again eliminate their access to international financial markets, both things the Bush administration did.

We could certainly do more on the proliferation security initiative, another Bush administration effort, that today South Korea announced it was joining for the first time. That is a significant step forward. But the real key here is China. China supplies 80 to 90 percent of North Korea's energy, a substantial amount of food. China could change that regime. And, in fact, if they want a more secure, peaceful northeast Asia, it is really in their interest to do that.

VAN SUSTEREN: Are we a little bit closer to that being a realistic possibility, because China was dismayed, to put it gently, after the April 5th launch of the longer-range missile they were just made? And now the detonation of the nuclear device, it looks like they have really been snubbed by North Korea, and that is their biggest trading partner, North Korea is.

Is China now more vulnerable to being persuaded they need to lowering the hammer on North Korea and put some force on them?

BOLTON: I think there's a possibility. In the old days, they used to say that the North Korean and Chinese communist party's were as close as lips and teeth. I do not think that is as true anymore.

I think that China does understand that if North Korea keeps its nuclear weapons, Japan, possibly South Korea, possibly Taiwan will go nuclear too. That can't be in China's interests.

Where we disagree is that they kind of like having the Korean peninsula divided. They like having a buffer between them and the South Korean/American forces.

But the fact is North Korea is a very artificial creation. The regime is fragile. One day the Korean peninsula will reunite, and China could get on the right side of history.

This will not be easy by any stretch of imagination. But the comparison between the difficulties of eliminating the Kim Jong Il regime and that regime with nuclear weapons are night and day.

VAN SUSTEREN: When you talk about the reunification of the peninsula, when we went to North Korea last summer, they have a monument showing the reunification of Korea. But they see it as North Korea being the re-unifier and not South Korea.

Japan is deeply disturbed by the latest developments, and so is South Korea. And they have got China worried that if North Korea does come apart, then you have all these North Koreans fleeing into China.

So how does this realistically play out?

BOLTON: Again, the risk of a refugee flow is simply not anything in the same league with the risk of North Korea with nuclear weapons.

And I think if the regime collapsed, you would have the interest of both South Korea and the U.S. on one hand and China on the other to try to reestablish stability in the north, to get the refugees back into North Korea and feed them there.

So I think that we could say, in all candor, that we would be willing to work with China in a post Kim Jong-II North Korea to have stability and to have a situation where neither China nor South Korea are overburdened by refugee flows.

VAN SUSTEREN: How do we know they have enough money? If they get \$10, it does not go to feeding their people. It goes to their weapons program. But if their weapons program ends up costing \$30, \$40, or \$50, they still do not have enough money for their weapons program.

Is it possible that they will be strangled economically so they can't even build their weapons program?

BOLTON: Well, there is some reason to believe that there may be an Iranian financial connection here, as well. Certainly Iran and North Korea trade information on ballistic missiles. We know that. That is been going on for over 10 years.

They may be trading information on the nuclear programs too. It has not gone unnoticed that North Korea was building a nuclear reactor in Syria, very unlikely that Syria could pay for that.

So the Iranian connection is quite significant. And it's a major reason why I do not think you can look at North Korea's nuclear program only as an east Asia problem. It is a Middle East problem, too.

VAN SUSTEREN: What about Japan? How long is Japan going to be patient, because they are very worried with the events that have occurred in the last couple of days, last couple of months? How long will Japan be patient?

BOLTON: I don't think that it's infinite. That's for sure. They are also quite concerned about North Korea's abduction of Japanese citizens. You can imagine how Americans would feel if North Korea were kidnapping our people. The North Koreans have never given full disclosure.

And the fact that North Korea has now exploded two nuclear devices in a country where, after all, Hiroshima and Nagasaki took place during World War II, is of enormous political consequence.

I think Japan also worries about the solidity of the American nuclear umbrella. And if they do not think we are there to protect their interests, it's a powerful argument for them to go nuclear, as well.

VAN SUSTEREN: What is so bizarre to me is that what I've been reading in the last two days is that the reason that they are launching these short-range missiles is, in part, so it is been reported, is that when on April 5, when they launched that rocket, and the United States and the U.N. Security Council, basically everyone said it was a flop, it was a failure, they got mad. And they want an apology for calling their launch anything but a peaceful launch of a satellite.

And because nobody is apologizing, they are now doing these nuclear tests and the short-range missiles.

BOLTON: I think the North Koreans are taking advantage of what they see as an opening. They have not seen a strong reaction to the Taepodong-2 launch in April or the nuclear test. They are doing other testing, clearly in violation of Resolution 1718.

Everything they do gives them more information and a greater capability to marry that nuclear device with a long-range missile. And that really would be the point at which we all need to worry a lot more.

## **Column One: Israel and the Axis of Evil**

Caroline Glick , THE JERUSALEM POST

May. 27, 2009

*[EXCERPT]*

North Korea is half a world away from Israel. Yet the nuclear test it conducted on Monday has the Israeli defense establishment up in arms and its Iranian nemesis smiling like the Cheshire Cat. Understanding why this is the case is key to understanding the danger posed by what someone once impolitely referred to as the Axis of Evil.

Less than two years ago, on September 6, 2007, the IAF destroyed a North Korean-built plutonium production facility at Kibar, Syria. The destroyed installation was a virtual clone of North Korea's Yongbyon plutonium production facility.

This past March the Swiss daily Neue Zuercher Zeitung reported that Iranian defector Ali Reza Asghari, who before his March 2007 defection to the US served as a general in Iran's Revolutionary Guards and as deputy defense minister, divulged that Iran paid for the North Korean facility. Teheran viewed the installation in Syria as an extension of its own nuclear program. According to Israeli estimates, Teheran spent between \$1 billion and \$2b. for the project.

## **World Passivity in the Face of Advanced Nuclear Challenges**

**Wednesday, June 10, 2009**

World Passivity in the Face of Advanced Nuclear Challenges

INSS Insight No. 112, June 8, 2009

Asculai, Ephraim

With the countries of the world looking on, Iran reached its next serious milestone: the accumulation of enough low enriched uranium (LEU) to enable it to further enrich it and produce one Significant Quantity (S.Q.), or 25 kilograms, of high enriched uranium (HEU). This is considered the quantity that is sufficient for the production of one core for an HEU-based nuclear explosive device. The Iranians reached this milestone some months earlier than expected, due mainly to their efficiency in installing and operating a large number of gas centrifuges, the machines that perform the enrichment operation.

This assessment is based on the information contained in the latest (June 5, 2009) report of the International Atomic Energy Agency (IAEA). At the present time Iran has no reason to produce HEU, since it would be more reasonable for it to accumulate a much larger quantity of LEU, and then enrich it in one batch to a quantity of HEU, sufficient for building a small arsenal of nuclear weapons. Should Iran decide that it wants to further enrich LEU to HEU, it could transform some of the operating LEU cascades (agglomerations of centrifuges), and complete the HEU enrichment in much less than a year. It would probably reason that it needs two explosive devices for underground nuclear tests (the second comes in case of the failure of the first) and then an additional one or two, as a deterrent or for actual use.

The information contained in the IAEA report suggests that four S.Q.s could be produced by the end of 2011 or even somewhat earlier. This could certainly happen if the world continues with the mild and ineffective actions ostensibly intended to prevent Iran from reaching further milestones. In the short term, the world is waiting for Iran's upcoming presidential elections, yet the fact is that no real change can be expected since more than the president, the Supreme Leader, Ayatollah Khamenei, is the de-facto ruler of Iran, and it is his decisions that matter. In addition, the Supreme Leader controls the Revolutionary Guards, who control the weapons of mass destruction production and deployment, including the missiles of Iran. The change that could come out of the elections is a change of tone to one more conciliatory towards the West that could further lull it into thinking that there is a chance for a complete halt, if not a rollback of the nuclear weapons development program. Although many have agreed that Iran is succeeding in its play for time, the Obama administration is still taking its time, pinning hope on elusive "talks" that may or may not succeed. Yet Iran is now so close to its target that the chances of halting if not dismantling its nuclear program are almost gone. Only very strong action, such as sanctions of the type imposed on Iraq in 1991, with "catch-all" prohibitions on commerce and diplomatic relations, could perhaps force Iran into obeying the Security Council's demands concerning the suspension of activities.

The same day that the IAEA sent its report on Iran to its Member States, it also issued a report on Syria. Although less elaborate than the report on Iran, it has one very interesting point and an

unfortunate omission. Paragraph 17 of the IAEA report, mentions that samples taken by the IAEA at a declared nuclear facility contained anthropogenic natural uranium particles, of an unnoted type. These were found inside hot-cells and associated equipment. This is quite interesting, since the natural uranium particles found at the Dir Alzour bombed reactor site were also denoted as "anthropogenic," i.e., the uranium was processed by human hands and not transformed by processes in nature. Inexplicably the IAEA report does not give any details of the composition of the particles, and more importantly, does not answer the question whether the particles found at both sites were similar. If similar, could they be indicative of reactor-fuel origin? If the particles are similar, why then does the IAEA continue to hamper on the issue of the possible Israeli bomb origin of the particles found at Dir Alzour? Whoever bombed the Dir Alzour site certainly did not bomb the declared laboratories and introduce the particles into them. This would refute any Syrian claim that the particles at the bombed site are of Israeli bomb origin. Moreover, what were these particles doing in and around the hot-cells?

The second issue and the significant omission from the report on Syria is that the IAEA desists from declaring the Syrian activities indicative of illicit nuclear activities and in non-compliance with Syria's obligations as a member of the NPT. This, unfortunately, is consistent with IAEA behavior, where the Director General is not willing to point a finger at a Member State and declare it as possibly being in non-compliance. He should have done that, and then given the state in question some time to disprove the allegations against it. Once the grace period elapses, the verdict against that state should become absolute. In the present system, however, no state can do wrong. As long as the state has stories to tell, and as long as it vaguely promises access, no indictment will come out of the IAEA. That is the case with Syria.

The issue of the IAEA and Iran is much worse, since the IAEA first became aware of and then noted in its reports Iran's lies, its concealed and undeclared activities, and its refusal, even now, to give the IAEA information to which it is legally entitled. As Dr. ElBaradei's term as IAEA director general draws to a close, one can only hope that the next director general, to be elected soon, will take a more realistic and less forgiving attitude towards those NPT members that are not willing to cooperate fully with the IAEA.

## **Interview With John Bolton**

By Jamie Colby Associated Press

Saturday, June 13, 2009

<Show: FOX ON THE RECORD WITH GRETA VAN SUSTEREN>

<Date: June 12, 2009>

<Time: 22:30:00>

[EXCERPTS]

COLBY: The U.N. Security Council voting unanimously for new sanctions against the communist state. But is this more talk from the U.N. that will not change a thing? Earlier, we spoke to former U.S. Ambassador to the U.N. John Bolton about the ongoing threat from North Korea, the elections happening right now in Iran come, and how threats from the two rogue nations may tie together. Take a look.

(BEGIN VIDEO CLIP)

COLBY: Ambassador Bolton, thank you so much for joining us.

JOHN BOLTON, FORMER AMBASSADOR TO THE U.N.: Glad to be here.

*[deletia]*

COLBY: Before we talk about the news being made in Iran and the outpouring of people want to participate in the elections there, can you explain to the viewers, because I find it very interesting, the role that Iran plays in North Korea's nuclear program?

BOLTON: Well, there is very little doubt there has been extensive cooperation between Iran and North Korea over a long time on their ballistic missile program.

And I think there is pretty solid reason to believe that cooperation exists in the nuclear field as well.

If you look at the North Korean reactor being built in Syria that the Israelis destroyed in 2007, I think it is almost impossible to believe that Syria could have financed and supported that reactor unless Iran were heavily involved.

So the idea that there really is an axis of the evil between North Korea and Iran, I think, has a solid evidentiary foundation. And that is one reason why the treatment of North Korea is so important for how Iran perceives its ability to continue its nuclear weapons program.

## **The Syria Syndrome**

By Cyrus G. Robati

June 15, 2009

Two years after Israeli jets knocked out what was alleged to be a controversial plutonium-producing plant placed in the rural site on the Euphrates River near the village of al-Kibar, close to the Turkish border, there are now revelations surfacing that the Syrians have started re-structuring the plant after having it flattened and then built another building on top of it.

Syrians have also been involved in a string of military nuclear-bio-chemical research not too far from Deir el-Hajjar -- a titanic tourist magnet. Deir el-Hajjar is also known for agricultural research, which is intended to hide the real purpose of nuclear research. Experts believe some of the satellite early detection technology will be dismissed because of the agricultural component of the location. There are also three other sites, geographically speaking in the shape of something like the Bermuda Triangle, currently engaged in highly suspicious activities - and curiously all close to rivers too: as-Safirah and Deir-az- Zwar and Hamah -- like al-Kibar - located on the Euphrates and the Orontes Rivers.

With attempts to acquire dual-use technologies that could be applied to a nuclear weapons programme, three top Syrian scientists working closely with the regime of Dr Bashar al-Assad are back in business. The most prominent is Dr Ibrahim Othman who heads the Atomic Energy Commission (AECS) -- an organisation established in 1979 by Hafez al-Assad for peaceful use of nuclear technology for power plants. Dr Othman is a habitual visitor to all International Atomic Energy Agency (IAEA) annual meetings in Vienna. It is believed he was the contact man with his Pakistani counterpart, Abdul Qadeer Khan, known to have passed classified secrets onto rogue nations.

The other two scientists are Dr Mustapha Hamolella, a Kurdish nuclear physicist and Dr Faris Al-Asfari. Both work closely on the nuclear programme and are closely associated with the regime. It is also believed some of Iraqi nuclear scientists who had escaped to Damascus days after the invasion are working closely with the regime to build a bomb. This is plausible since a galaxy of about 12 middle-ranking Iraqi nuclear technicians and their families were transported to Syria before Saddam Hussein's regime fell. The transfer was arranged under a combined operation by Saddam's now defunct Special Security Organisation and Syrian Military Security, headed until recently by Assef Shawqat, Mr Assad's brother-in-law, who was at the centre of a failed February 2008 coup attempt.

The Iraqis, who brought with them CDs crammed with research data on Saddam's nuclear programme, were given new-born identities, including Syrian citizenship papers and faked birth, education and health certificates. Since then they have been hidden away at a secret military installation where they have been conducting research on behalf of their hosts.

Later the nuclear watchdog's investigators revealed that the still-under-watch Dr Khan, who was finally freed in February this year -- because of suffering from cancer -- after being put under house arrest, had sold nuclear secrets to Iran, Libya and North Korea, and that he was also behind the proliferation of sensitive nuclear technologies to Damascus. "The leadership of Pakistan was well aware of the export of Pakistani nuclear technologies," an unnamed IAEA official was quoted as saying. "It is not ruled out that besides Iran, Libya and North Korea, such supplies could have been made to Syria."

Prior to Dr Khan's arrest and quizzing, several Western diplomats had been saying for months that Damascus was a customary customer of Dr Khan's "black market business network in the Middle East and Asia Pacific".

“Syria certainly had contact with [Dr] Khan,” said a non-American Western diplomat, adding that suspicions of Syrian research in atomic weapons have existed for decades.

But the Khan connection goes much deeper than that. On August 25, 2004 the American intelligence community had obtained evidence that the Khan network sold and delivered components for an unspecified number of Pakistani-designed P1 centrifuges to Syrians. On April 29 Undersecretary of State for Arms Control John Bolton said Dr Khan had “several other” customers who might want the bomb. Western diplomats in Vienna said Mr Bolton was clearly referring to Damascus' future dirty bomb. And on June 9, a North Korean expert disclosed to Future Korea that Syrians had visited capital Pyongyang to acquire equipment.

According to his testimony,

Syria ordered a series of Scuds tipped with bio-chem warheads.

Syria ordered rocket engines that were made at “January 8th Factory” in Kaechon.

Syria ordered missile bodies that were made at “No. 26 Factory” in Namchon-dong, Kanggye city.

The missiles were assembled at “Shin-eum-ri Factory” in capital Pyongyang.

And bio-chem warheads, the most sensitive parts, were finished at “Namheung Chemical Factory” and transported via train.

On March 5, substantial sums of uranium had gone missing from a nuclear technology company in Sweden. A Central Intelligence Agency (CIA) official later told the Swedish newspaper, Expressen, “The company [Ranstad Mineral] is a security risk and we have taken the matter to top level to get the Swedes to stop them.”

The CIA operative claims to know that the small Swedish company has educated Syrian nuclear physicists in the treatment of uranium. The Syrian scientists left the company right after the uranium vanished. He also has information that a Swedish consultancy has sold nuclear equipment to the Syrians that can be used in the treatment of radioactive material. “If it transpires that radioactive or nuclear material has been sent on from Sweden to Syria then this is a very serious matter for Sweden,” the CIA official said.

After a meeting with the CIA operative, the Swedish authorities raided Ranstad Mineral several times and shut the company down on the grounds of security lax. Apart from that earlier nuclear saga, the Syrians were the conduit for the purchase of SAM (surface-to-air missile) engines for the Saddam government from Belarus (via arms sale firm “Beltechexport”) and Ukraine (via “Motor Sich”, the state's mega manufacturer of aircraft and rocket engines) that would have enabled Iraq to use them to deliver any weapon up to 180 kilometres in radius. These same engines can be mounted two-to-a-rocket, which would have enabled Iraq to deliver any missile up to 600 kilometres. Of the 352 engines that were purchased by Syria from Belarus, only a handful were delivered to Iraq and accounted for, the rest are still in Syria's possession.

On May 14, 2004 the Western diplomatic sources said Beijing has sent several delegations and technicians to accelerate Damascus' programme for extended-range Scuds. The sources said the increased aid was first detected in late 2003 in what they termed a major development. “The Chinese effort is meant to provide Syrians with technical assistance that they have not been able to receive from other countries,” a diplomatic source said. “The focus is to extend the Scud from short-range to medium- and even intermediate-range.”

The Chinese assistance appears to be replacing that of North Koreans -- the prime supplier to and developer of Syrians' missile programmes. Pyongyang supplied and helped develop the Scud C and D programmes.

On February 29 this year, during a press conference in Lebanese capital Beirut, Iranian Defence Minister Shamkhani said his country had signed a memorandum of understanding with Syria and another with Lebanon to bolster the military apparatuses of both countries. The Syrian deal in fact was intended to send a clear signal that cooperation between Iran and Syria are an integral part of their foreign policy on a parallel nuclear programme that too includes Venezuela supplying Iran with uranium and Bolivia supplying the nuclear material -- courtesy of a leaked Israeli foreign ministry report.

But perhaps a more crucial factor to remember about Damascus's alliance with Tehran is that it gives the former access to Iranian, Russian, Ukrainian, and Belarusian, North Korean, and Chinese military and economic aid. There is of course another aspect of that alliance too: Dr Assad's "Mukhbarrat" (Syria's Intelligence Agency) and Mr Ahmadinejad's "VEVAK" (is the Farsi acronym for Vezerat-e Ettela'at va Amniyat-e Keshvar, the Ministry of Intelligence and Security, or MOIS), both have gained quite some notoriety for espionage and counter-espionage, using local agents to infiltrate nuclear-powered nations, such as Pakistan, India, Jordan and Algeria.

Tehran is calculating that Damascus' involvement may distract attention away from its own nuclear programme (which never ever transpired, anyway) but also the intended purpose is to present Washington with another challenge that Tehran knows well Washington will be unable to face simultaneously and because of a multiple fronts opened to confront terror tremor.

Israel's September 6, 2007 attack on the Yongbyon-copycat al-Kibar nuclear facility was reminiscent of that of 1981 on Iraq's Osirak reactor, but with two noticeable differences. First, Israel remained silent following the al-Kibar bombing, while in 1981 it boasted publicly about the Iraq strike even before the pilots had returned. Second, whereas the international community knew of Saddam's nuclear plans -- in addition to his so-called 40-metre "supergun" project designed by Canadian-born astrophysicist Gerald Bull -- few were aware of the extent of Syria's nuclear programme back in 2007.

The reactor would have produced enough plutonium for one or two bombs within a year of becoming operational. It appears that the Syrians were trying to add tubes in rings from centre and the outer ring was not yet in place. Counting fuel tubes and it appears that the reactor was considerably smaller than its North Korean counterpart, Yongbyon, which has considerably more fuel channels. If you model the core of a reactor as a sphere, the volume (and hence capacity) of al-Kibar would be about one-fifth that of Yongbyon -- sixty percent cubed. The implication of a smaller reactor is smaller plutonium production -- roughly, while Yongbyon could produce 5-7 kilogrammes of plutonium per year, al-Kibar could have only produced about 1 kilogramme of plutonium per year. That is still not good, but it also invites comparison's to the fuss over Algerian Es Salam reactor, near the town of Ain Oussera, which was resolved with safeguards not airstrikes.

Yet, a smaller reactor would also require less natural uranium fuel -- something that might matter if one planned to extract uranium from phosphates. Finally, a smaller reactor would also, presumably, reduce the design throughput for whatever reprocessing facility the Syrians intended to build or have squirreled away. Curiously, a video from inside the Syrian facility also later described as "very, very damning" by a nuclear weapons specialist who spoke to The Washington Post. The video demonstrated that al-Kibar's core design was the same as that of the Yongbyon reactor, "including a virtually identical configuration and number of holes for fuel rods". The video also showed North Korean personnel inside the site.

Subsequent investigations then revealed that key materials for al-Kibar were smuggled from China and possibly Europe into Syria by Namchongang Trading, a North Korean firm. In February 2009, the Syrians let it be known that the al-Kibar facility was being used as a missile base. They never said what kind of missile base. But apparently the missiles being developed there will carry biological and chemical weapons.

Between 2007 and 2009 the Syrians have rebuilt the al-Kibar structure and three other sites into facilities for the production of chemical and biological weapons. Two American envoys who recently visited Syria were aware of the report and presented satellite photos to the Syrians, who denied it.

But then if photos can't talk loud enough, tests certainly can.

And as suspicions have gained momentum with the discovery of uranium at a second site, experts say they indicate attempts to isolate plutonium from spent reactor fuel. The IAEA's random test at a small research reactor in Damascus turned up processed uranium particles of a "type not included in Syria's declared inventory of nuclear material". Independent experts believe the uranium appeared to indicate Syria could have been experimenting with a technology that, used under more sophisticated conditions, could be used to isolate plutonium from spent nuclear power plant fuel.

Something real fishy is going on at al-Kibar and the other three suspicious sites, as Reform Party of Syria, a Washington-based group seeking regime change in Syria, has closely monitored and verified suspicious Syrian behaviour since the 1990s. The most dangerous of the four sites is, of course, the capital's Scientific Studies and Research Centre -- the nucleus of the regime's chemical, biological, and missile WMD programme. The centre's scientists regularly travel to Tehran to coordinate with their counterparts in Amir Kabir University of Technology for critical support in the fields of chemical weapons and ballistic missile research. The centre is also behind the super-secret Syrian Air Force chemical weapons arm, Unit 417, which has held test launches of short-range ballistic missiles equipped with chemical warheads.

One such test occurred in the summer of 2006, when fighting between Israel and Hezbollah had reached a peak, followed by another one in October 2007. Furthermore, the centre runs high-tech covert chemical and bio labs in a barren rural strip of land in the northwest known as the Dubaya Centre. Jane's Intelligence Review, using satellite images from commercial sources gathered between 2005 and 2008 to examine activity at the chemical weapons facility, has identified as-Safir in northwest Syria. The Jane Review report says it has observed in the imagery "significant levels of construction have taken place at the facility's production plant and adjacent missile base", noting that the site is hardly "a civilian industrial complex".

As primary energy grows more expensive, many countries are turning to nuclear power. The expansion of civilian nuclear programmes highlights the need for a more robust non-proliferation regime; the Middle East alone has about a dozen states with at least nascent nuclear programmes. The existence of al-Kibar, however fleeting, should serve as a serious warning about the current non-proliferation regime, as well as American engagement of the Syrians.

If Washington does attempt to engage Damascus, it cannot simply ignore al-Kibar and those three sites. Damascus' apparent nuclear and missile development and subsequent deception reinforce pre-existing concerns about the country's interest in regional peace and stability. Pretending that the al-Kibar incident never occurred would send the wrong signal to Damascus and other potentially dangerous proliferators in the Middle East.

And all indications are that Damascus - which has already doubled its Scud arsenal -- is building a potent nuclear programme with Iran's assistance and help. With Barrak Obama's zeal to "engage" with both the Assad and Ahmadinejad regimes, one would think that for the May sanctions to be re-imposed there would have to be an awfully good reason - no matter even if George Mitchell is trying to mark a further thaw of relations between Washington and Damascus.

## **IAEA Report Raises Suspicions on Syrian Site**

Peter Crail

A Syrian facility destroyed by Israel last year could have been a nuclear reactor, a Nov. 19 International Atomic Energy Agency (IAEA) report determined. Although the IAEA has not completed its investigation, its early findings appear to support U.S. claims made in April that Syria was constructing a nuclear reactor in secret with North Korean assistance at a site called Dair al Zour. (See ACT, May 2008.)

According to the report, the investigation faces serious challenges due to the bombing of the facility by Israel in September 2007 and the subsequent bulldozing and construction over the site by Syria. (See ACT, November 2007.) Moreover, due to the lack of information provided to the agency regarding the facility, IAEA inspectors did not arrive until nearly 10 months after the facility was destroyed.

In spite of these challenges, the IAEA has uncovered evidence that potentially points to undeclared Syrian nuclear activities, including the presence of uranium particles found at the site and Syrian procurement activities consistent with the construction of a reactor.

### **IAEA Discovers Traces of Uranium**

One of the key pieces of evidence uncovered during the IAEA inspection of Dair al Zour was the presence of a "significant number of natural uranium particles" in some of the samples taken from the site. The agency noted that this uranium was produced through chemical processing and was therefore man-made. Speaking in regard to the uranium particles, a senior UN official said during a Nov. 19 background briefing, "[T]hat kind of material should not be there." The official further noted that the size of the particles was "extremely small," making it more difficult to tell its exact composition and therefore its potential purpose.

The possible origin of any man-made uranium particles is far from clear. Syria pursued a small-scale effort to extract yellowcake uranium from phosphates in technical cooperation programs with the IAEA during the 1980s and 1990s. Yellowcake uranium is chemically processed uranium ore and is the result in one of the first steps in manufacturing nuclear fuel.

According to the agency, financial difficulties prevented these uranium-extraction projects from moving beyond the experimental stage. It is unclear whether Syria has pursued any undeclared efforts to fuel a nuclear reactor. An unclassified 2005 CIA report to Congress judged that, "in 2004 Syria continued to develop civilian nuclear capabilities which may also be potentially applicable to a weapons program," including uranium-extraction technology. This judgment did not appear in subsequent annual unclassified reports to Congress in 2006 and 2007.

If the U.S. intelligence assessment of the design of the alleged Syrian reactor is correct, such a plant would be able to operate on natural uranium fuel, which requires only limited steps beyond yellowcake uranium to purify it into uranium dioxide and fashion it into metal fuel rods. During an April 24 briefing, U.S. intelligence agencies claimed that the facility was a reactor based on the design of North Korea's Yongbyon nuclear plant. The senior UN official surmised that the uranium particles could have been reactor fuel but that further analysis was needed to come to any conclusion.

Damascus claims that the uranium came from Israel. In a Nov. 11 response to the agency's findings, Syria alleged that "the only explanation" for the presence of the uranium particles "is that they were contained in the missiles that were dropped from the Israeli planes onto the building."

Although some types of munitions contain depleted uranium, the senior UN official stated that "not one single depleted uranium particle has been found so far."

#### Activities Consistent With a Reactor

A number of other verification activities undertaken by the agency have also suggested that the Dair al Zour facility was a nuclear reactor. Making use of available satellite imagery of the facility prior to its destruction, the agency assessed that its size and layout were similar to those of a reactor. The IAEA also noted that a pumping facility on the Euphrates River that still remains after the facility's destruction provides a pumping capacity "adequate for a reactor [of] the size referred to" by U.S. intelligence.

The agency has also sought clarification regarding Syrian procurement activities that the IAEA judged "could support the construction and operation of a nuclear reactor." The report cautioned that it was possible that such equipment was intended for a non-nuclear use.

Lastly, the report stated that the agency has requested visits to three additional sites in Syria that may have installations "of relevance to the activities" at Dair al Zour. The IAEA determined from satellite imagery that Syria landscaped these sites and removed large containers shortly after the agency's request. The senior UN official noted Nov. 19 that the agency did not have any information suggesting that any of these locations were involved in producing fuel for a reactor or reprocessing spent nuclear fuel from a reactor.

A reprocessing capability is necessary to extract plutonium from spent nuclear fuel to use in nuclear weapons. The U.S. intelligence community judged that the Dair al Zour facility was intended to produce this spent fuel. The 2005 CIA report assessed that Syria was developing hot cell facilities, which can be used to extract plutonium from spent nuclear fuel.

#### Investigation Hampered by Bombing, Syria

The agency report stressed that its investigation was "severely hampered" by Israel's bombing of the facility and "the late provision of information" regarding the site. Following the destruction of the facility and media speculation that it was a nuclear reactor, IAEA Director-General Mohamed ElBaradei called on any state with information regarding the facility to share it with the agency. Nearly eight months had passed between the time that Israel destroyed the facility and when the United States provided information to the IAEA in April.

In the months following the bombing, Syria plowed over the site and erected new buildings whose purpose is unclear. The agency stated that both the bombing and the removal of the remains has made the investigation "more difficult and complex."

The IAEA has also been hampered by Syria's failure to fully cooperate with its requests. Although Damascus provided full access to the Dair al Zour site, it has not fulfilled the agency's requests to turn over documentation regarding the purpose of the destroyed facility to back up claims that the building was a military installation of a non-nuclear function. Moreover, Syria has rebuffed agency requests for additional visits to Syria and inspections of the three additional sites.

Despite the current difficulties faced by the agency in carrying out its investigation, the senior UN official said Nov. 19 that the agency is unlikely to carry out a special inspection in the near future. Special inspections invoke a rarely used legal authority mandating that a state provide the agency with additional access to information and locations beyond those covered in routine inspections. This authority may be invoked either in cases in which there is the possibility of a loss or removal of nuclear material or in which the IAEA cannot ensure that safeguards are applied to all nuclear activities and material in a state based on the information that state has provided. The IAEA Board of Governors determined in 1992 that special inspections should only occur on "rare occasions."

The board has invoked its special inspections authority twice in its history. The first was carried out in 1992 at the invitation of Romania to clarify nuclear activities carried out under the ousted regime of Nicolai Ceausescu. In the second case, it mandated a special inspection in North Korea in 1993 following a discrepancy in North Korea's nuclear accounting. Pyongyang refused to comply with the inspection, resulting in the board referring the issue to the UN Security Council and a tense standoff.

In addition to the agency's investigation, the United States has stated that it will pursue answers regarding any North Korean involvement in a Syrian nuclear program within six-way talks on Pyongyang's nuclear program. (See ACT, October 2007.) North Korea has been reluctant to discuss this topic but has committed to Washington that no such assistance is ongoing and that none will occur in the future. (See ACT, July/August 2008.)

## **Will Syria Fold?**

Why U.S. efforts to get Syria to give up its bad behavior might come to naught.

BY MARA E. KARLIN

AUGUST 13, 2009

*[EXCERPTS]*

This week, a U.S. military delegation is in Damascus, Syria, to discuss how the two countries can collaborate to stabilize Iraq. Having served in the Pentagon for four years, including as the Levant director responsible for U.S. policy on Syria, among other countries, I wish them luck. During the last eight years, U.S. engagement with Syria fluctuated considerably as the Bush administration initially tried to convince the Syrian government to play a positive role in the Middle East and then, once Syrian actions to the contrary became quite clear, implemented a robust slate of sanctions against the regime. Interactions between the two governments were substantially curtailed and consisted entirely of rare discussions on Iraqi refugees and the Arab-Israeli peace process.

I cannot help but be impressed by the Obama administration's deft efforts in dealing with this difficult regime. But, difficult -- indeed intractable -- issues remain that could stymie its best efforts. Getting Syria to change its bad behavior in Iraq and Lebanon, to cease its partnership with terrorists and terror-sponsoring states, and to come clean about its nuclear program will not be easy.

*[deletia]*

There is also that persnickety problem of Syria's nuclear reactor, which was quietly destroyed by Israel in September 2007 before it could become operational. Putting this issue on the table for discussion is inconvenient, to say the least, for those dealing with Syria or North Korea (just imagine the dilemma that U.S. Ambassador to Iraq Christopher Hill faces; in his previous job he worked with North Korea on nuclear issues and now he needs to gain Syria's cooperation on Iraq).

## **Ship seizure**

Last Updated: August 29. 2009 7:51PM UAE / August 29. 2009 3:51PM GMT

North Korea has long been a pivotal figure in the illicit arms trade, its reclusive leadership persistently flaunting international sanctions to buy and sell sensitive technologies. As we report today in The National, the UAE has seized a cargo ship carrying North Korean weapons destined for Iran. Preliminary reports indicate the contraband was rocket-propelled grenades hidden as “machine parts”, but the incident sheds light on the greater issue of proliferation and regional security.

Pyongyang’s second atomic test earlier this year demonstrated a nuclear weapons programme that is steadily gaining ground. With substantial evidence linking the country in the past to the Pakistani scientist AQ Khan, the Syrian reactor that was destroyed by Israel in 2007 and the suspected programme in Myanmar, there is little doubt that North Korea is a key supporter of illicit nuclear programmes.

In one way, the seizure of the ship holding North Korean contraband is a reminder of the vigilance needed to keep the Gulf free of illicitly trafficked arms. Unfortunately in the globalised world, the problems of East Asia now concern us all.

## **Cheney depicts Clinton's North Korea trip as mistake**

By Hwang Doo-hyong

2009/08/31 05:09 KST

WASHINGTON, Aug. 30 (Yonhap) -- Former U.S. Vice President Dick Cheney Sunday said that ex-President Bill Clinton made a mistake when he visited Pyongyang to meet with North Korean leader Kim Jong-il to win the release of two American journalists.

"Well, obviously, you're concerned for the reporters and their circumstances. But I think if we look at it from a policy standpoint, it's a big reward for bad behavior on the part of the North Korean leadership," Cheney told "Fox News Sunday."

Clinton met with Kim for more than three hours before coming back home with the journalists from Current TV, founded by former Vice President Al Gore, who were held in Pyongyang for several months for illegal entry into the North on a reporting tour.

"I think when a former president of the United States goes and meets with the leader and so forth, that we're rewarding their bad behavior," Cheney said. "And I think it's a mistake."

Cheney, a neo-conservative who took a hardline policy toward the North during Bush's tenure, insisted North be punished for its development and proliferation of nuclear weapons.

"They've been major proliferators of nuclear weapons technology," he said. "They've built a reactor in the Syrian desert very much like their own reactor for producing plutonium for nuclear weapons. They probably are the worst proliferators of nuclear technology any place in the world today. And there ought to be a price for that."

Israel air raided the purported reactor in Syria last year, although Damascus denied the allegations the air bombed facility is a nuclear reactor for production of weapons-grade plutonium.

## Damascus Deception

Two years after their reactor was destroyed, the Syrians still haven't come clean about their covert nuclear program and the world's nuclear watchdog is powerless to make them.

BY GREGORY L. SCHULTE

SEPTEMBER 2, 2009

Last Friday, Mohammed ElBaradei, director general of the International Atomic Energy Agency (IAEA), issued a fourth report on the agency's investigation into Syria's attempts to construct a covert nuclear program with the help of North Korea. The report shows that two years after their suspected reactor was destroyed, Damascus continues to stonewall the IAEA. It also illustrates the agency's limitations in detecting and investigating clandestine activities. The reactor may no longer exist, but Syria's past pursuits and North Korea's dangerous role are still causes for concern -- as is the IAEA's inability to do anything about them.

Syria's rogue nuclear program was shrouded in secrecy from the beginning. The reactor was constructed in a remote desert canyon, its resemblance to a North Korean reactor disguised with false walls and a false ceiling, and its cooling pipes buried underground. Syria did not notify the IAEA of the reactor's construction, thereby violating its Safeguards Agreement, a standard agreement meant to allow the IAEA to verify the peaceful use of nuclear material.

After an Israeli airstrike in September 2007 destroyed the reactor, Syria went to great lengths to cover up its violation. President Bashar al-Assad denied that the destroyed facility housed a reactor, and North Korea refused to acknowledge its involvement. Incriminating components were hauled away, the facility remains were further destroyed, much of a surrounding hill was bulldozed over the site, and a new building was quickly erected on top.

When IAEA inspectors arrived at the site in June 2008, what was left of the reactor had already been removed or buried. But the inspectors still did their job: They took environmental samples, which when analyzed showed traces of man-made uranium. They asked detailed questions about the destroyed facility and suspicious Syrian procurement activities, which Syrian authorities refused to answer. Syria soon announced that IAEA inspectors were no longer welcome except at sites they had already declared.

It is now well over a year since that one and only visit to the destroyed reactor site. Syria has refused IAEA requests to visit other suspect sites. And as the director general reports, Syria "did not cooperate with the agency to confirm Syria's statements regarding the non-nuclear nature of the destroyed building." Earlier in the investigation, ElBaradei sought to highlight cooperation. Now, he reports that the agency's "ability to confirm Syria's explanation regarding the past nature of the destroyed building ... is severely impeded because Syria has not provided sufficient access to information, locations, equipment or materials." "Severely impeded" is about as strong as language gets in Vienna.

Assad obviously wants to bury the investigation in the same way that Syrian bulldozers buried the reactor remains. But the IAEA cannot let this happen, both for the credibility of its safeguards regime and to ensure that leaders in Damascus, Pyongyang, and other capitals are not tempted to try again. The IAEA must keep the spotlight on Syria, insist on Syria's full cooperation, and be prepared to exercise the IAEA's full authority. Ultimately the IAEA Board must be ready to find that Syria's noncooperation constitutes noncompliance and report that noncompliance to the U.N. Security Council.

Syria is trying to limit the IAEA investigation by strictly interpreting its safeguards agreement, which focuses on accounting for nuclear material at sites that, unlike that of the destroyed reactor, were formally declared to the IAEA. However, the agreement also includes a provision for “special inspections” of any site if the agency concludes that the access and information being provided by Syria is insufficient. The director general’s report suggests that this time has come.

Part of the problem in Syria is the inherent weakness of today’s safeguards system. An additional protocol to the standard safeguards agreement was meant to help IAEA inspectors uncover illicit nuclear activities at undeclared sites. However, Syria is one of a group of countries -- including Egypt, Brazil, and Argentina -- that have refused to sign the additional protocol. Iran has signed a protocol but refuses to implement it. The Syrian case shows why the this protocol needs to become a universal standard.

Yet even with the additional protocol, there is no assurance that the IAEA would have detected Syria’s elaborately concealed reactor. To detect and investigate clandestine activities, the IAEA must assemble a mosaic of information acquired from many sources. The IAEA is accordingly moving to a more information-driven investigative approach.

But this frequently involves member states providing sensitive information, often acquired by intelligence agencies -- not always an easy task. The sharing of information from other member states requires confidence -- confidence that the information provided will be protected as necessary and confidence that it will be used with good effect to further safeguards investigations. Removing the politics from these investigations and returning the IAEA to its technical verification role will go a long way to ensuring this confidence and strengthening the agency in face of future violations.

Strangely, the report only mentions North Korea’s role briefly, but the IAEA must not let the country’s role stay buried in the rubble. It was North Korea’s willingness to sell its nuclear expertise that gave Syria the opportunity to build the reactor. Even if Syria is dissuaded from trying again, North Korea’s leaders might find another willing customer, particularly if that customer thinks that cooperation with North Korea carries no international penalty.

The IAEA Board must also take its verification role far more seriously. It is striking how many board members are always eager to criticize Israel or the United States but remained silent on Syria’s violation and failure to cooperate. Yet it is many of these same countries -- such as Egypt or Malaysia -- that could suffer most from a nuclear arms race in the Middle East or from North Korea exporting nuclear technology to an irresponsible country or terrorist group in their region. Moreover, President Obama’s vision of a world without nuclear weapons, a vision widely supported by IAEA member states, is unthinkable without a robust verification system.

The case of Syria’s reactor underscores the importance of strengthening the IAEA -- removing the politics from IAEA investigations, refocusing the agency on its technical verification role, and ensuring that it has the authority, resources, and will to have the bark required of the world’s nuclear watchdog.

## **The ElBaradei Legacy**

Andreas Persbo & Mark Hibbs,

Bulletin of the Atomic Scientists

September/October 2009, vol. 65, no. 5, pp. 10–23.

*[EXCERPTS]*

*[deletia]*

Concerns that an IAEA referral of Tehran to the Security Council could trigger U.S.-led military action gradually abated as Washington became bogged down in Iraq after 2003. By 2007, some IAEA officials were concerned that Israel—supported by the United States—might attack Iranian nuclear fuel-cycle installations that Tehran refused to idle in disregard of a 2006 Security Council order. Instead, in September 2007, Israel attacked a site in Syria called Al Kibar where Israel and the United States had concluded a secret plutonium production reactor was nearly completed.

**A secret reactor in Syria?** After Israel bombed the site at Al Kibar, ElBaradei upbraided the United States and Israel for failing to provide the IAEA with intelligence they had obtained on Syria's nuclear program. (U.S. lawmakers were the first to be briefed in March 2008.) As he had done previously in Iraq and Iran, ElBaradei assigned the Department of Safeguards to probe allegations of Syria's undeclared nuclear activity.

Some sources at the IAEA suggest that ElBaradei's approach to Syria was informed by his support for an ongoing diplomatic initiative, involving Israel, Turkey, and the EU, to urge Damascus to abandon its support for Iran and for Islamic fundamentalists in the region. The IAEA successfully negotiated access to the site to take environmental samples. But for nearly a year after the attack, sources suggest, the IAEA secretariat discreetly urged board members to keep the matter off the agenda to buy time. During this period, they say, ElBaradei conferred with senior government officials whose countries were involved in protracted talks aimed at securing Syria's political realignment.

By September 2008, according to Western officials, the United States and its allies on the IAEA board made sure the Syrian issue would be formally discussed. But in late 2008, ElBaradei and the Bush administration clashed yet again over a Syrian request for technical assistance from the agency to pursue a nuclear power program. While the IAEA's Department of Technical Cooperation was prepared to provide the assistance, according to agency officials, Washington fiercely objected on the grounds that the country was suspected of having a clandestine nuclear weapons program. One U.S. official involved in preparations for a November board meeting in Vienna privately complained to us at the time that ElBaradei was meddling in opposition to U.S. interests over yet another nuclear program in the Middle East. At the meeting, ElBaradei angrily defended Syria's right to technical assistance on the grounds that neither the IAEA secretariat nor the Board of Governors had determined that Syria had violated its safeguard obligations.

As the Department of Safeguards analyzed its Syrian samples during the second half of 2008, it became clear that if the IAEA's analysts were going to achieve a breakthrough, they would have to return to

sites in Syria. A senior ElBaradei aide tells us that in September 2008 the IAEA decided against requesting a special inspection—permitted under Syria’s safeguards agreement with the IAEA—because the agency had yet to find suspicious nuclear material in its probe of the site. But even when tiny particles of processed oxidized uranium were found in the samples shortly thereafter, no special inspection was openly requested. A senior U.S. official tells us that Washington plans to raise this issue with the IAEA again this fall.

Iran, North Korea and the bomb  
**Spinning dark new tales**

From The Economist print edition  
**Something new to worry about**  
Sep 10th 2009

HONESTY is a rare commodity in the nuclear underworld, where Pakistan, North Korea, Iran, Syria and possibly others—as well as Argentina, Brazil, Libya and South Africa in times past—have long done deals for the equipment, technology and materials needed for their illicit nuclear programmes. Yet North Korea and Pakistan's notorious blackmarket-maker, Abdul Qadeer Khan, have both proudly and separately decided to tell the world more about their nuclear exploits. **By contrast there is a worrying silence from Iran and Syria, two countries in the spotlight this week at the International Atomic Energy Agency, the UN's nuclear guardian, for their suspect nuclear activities.**

*[deletia]*

Either way, even with Mr Khan out of the picture and some of his network rolled up, there is scope for mutual help between his customers. **North Korea is known to have secretly built a nuclear reactor for Syria, of the sort it used to make the plutonium for its own bomb; that structure was destroyed in an Israeli air raid in 2007.**

North Korea's claim (assuming it is true) that it can now enrich uranium opens up a another dark possibility. Centrifuge machines are hard to operate. North Korea will have needed help in getting them up and running. North Korea and Iran are already known to co-operate intensively in developing nuclear-capable missiles. So what is to stop them helping each other with their nuclear programmes? North Korea has plutonium and warhead-building skills. A master tunneller, it could also help any country wanting to hide its nuclear efforts from satellites. Iran, meanwhile, has the uranium-enrichment skills that North Korea previously lacked. Small wonder Iran thinks it can enrich on happily.

## **For Tehran, Talk Is Cheap**

Gordon G. Chang

09.11.09, 12:01 AM EDT

*[EXCERPT]*

So far, Kim's abhorrent state has paid no price for first hiding its nuclear weapons program and now negotiating in bad faith with the international community--the same things Iran is now doing. This should come as no surprise--there have been reports that the North Koreans have been schooling the Iranians on how to deceive ElBaradei's IAEA. And when it comes to nuclear matters, the two nations are as thick as thieves. Iranian observers were on hand for both of North Korea's nuclear detonations, and North Korea has sold the Iranians at least one nuclear reactor, the one Israeli planes destroyed in the Syrian desert in September 2007.

Gordon G. Chang is the author of *The Coming Collapse of China*. He writes a weekly column for Forbes.

## **Syria Defence and Security Report Q4 2009** **(Business Monitor International)**

- \* Market: Defence
- \* Published Date: 16/09/2009
- \* Report Title: Syria Defence and Security Report Q4 2009
- \* Report Type: Market Report
- \* Country: Syria
- \* Number of Pages: 44

*[EXTRACT from summary]*

Despite the overwhelming sense that relations between Syria and the West are moving forward, ongoing investigations into the country's alleged nuclear programme will raise some concerns. Without greater cooperation from Syria, we believe that the nuclear issue could become a stumbling block in its negotiations with the US. The reported discovery of traces of uranium at a second Syrian site by the International Atomic Energy Association (IAEA) provides an illustration of the numerous obstacles that still remain to the resumption of full and friendly relations between Syria, the US and the wider international community.

## **How to Manage a Nuclear Iran**

Obama's diplomacy is the first step. Here are steps 2 through 5.

BY GREGORY L. SCHULTE

OCTOBER 8, 2009

*[EXCERPT]*

Another requirement is total transparency. In his Oct. 1 statement, Obama insisted that Iran demonstrate its commitment to transparency. In particular, he called on Tehran to grant the IAEA unfettered access to the enrichment site near Qom. Iran's leaders have agreed, and the IAEA is preparing to send inspectors to the site later this month.

But the transparency shouldn't end there. First, Iran must commit to notifying the IAEA of the construction of any other nuclear sites, and Iran's leaders cannot be allowed to hide behind the argument that they "suspended" this requirement. Worryingly, Syria also violated this requirement by secretly constructing a nuclear reactor with North Korea's help. Clandestine construction of nuclear facilities cannot become a new norm in the Middle East, or anywhere else.

Ambassador Gregory L. Schulte, the U.S. permanent representative to the International Atomic Energy Agency from July 2005 to June 2009, is a senior visiting fellow at the Center for the Study of Weapons of Mass Destruction at the National Defense University (NDU). This contribution reflects his personal views and not those of NDU or the U.S. government.

## **VIEW: Iran and US options**

Leonard S Spector

Friday, October 09, 2009

*[EXCERPT]*

If the threat of intensified “diplomatic pressure” seems insufficient to spur Tehran’s revelation of the facility, what might have been an added unspoken incentive for taking this step? Perhaps, fears of a military strike on the facility.

Iranian leaders knew the history: In September 2007, Syria suffered just such an attack, when Israeli warplanes destroyed an installation near the town of Dair Alzour. The CIA later revealed the site housed a nuclear reactor, modelled on the one used by North Korea to produce plutonium for its nuclear weapons. Syria had taken great pains, the CIA stated, to disguise the facility, whose configuration made it unsuited to the production of nuclear power or for traditional nuclear research.

Perhaps the most important aspect of the Israeli attack, however, was the virtual total absence of international criticism: no condemnation by the IAEA Board of Governors, no condemnation by the UN Security Council, and, indeed, no coordinated condemnation by the traditionally antagonistic Arab states. This contrasts starkly with the international hue and cry that followed Israel’s 1981 attack on Iraq’s Osiraq nuclear reactor, a facility that was openly purchased from France, modelled on another legitimate French research reactor, and under IAEA inspection.

Although the Qom facility is a different type of nuclear plant from that at Dair Alzour, like the latter, it is apparently configured to produce fuel for nuclear weapons, built in secret, not disclosed to the IAEA, and carefully disguised and dug deep underground — all implying that it was intended for a nuclear weapon programme. And, if the Syrian case is a legitimate precedent, an attack on the facility might not have been met with an international outcry. Iran, after all, is no more popular internationally than Syria.

In effect, Iran might have had little or no diplomatic recourse after such a strike, while the attacking state – presumably Israel, with behind-the-scenes support from the United States – might have dealt the Iranian nuclear program a serious blow and given an implicit warning of things to come if Iran failed to close down its sensitive nuclear sites, as the UN Security Council has demanded.

Commentary

**Don't underestimate nuclear terror threat**

Graham Allison

Friday, October 9, 2009

*[EXCERPT]*

- Where could terrorists acquire a nuclear bomb? Russia is the most likely source of materials used for a nuclear attack. North Korea is a close second. Kim Jong Il's regime already has displayed recklessness in risk-taking by selling to Syria a plutonium-producing nuclear reactor a thousand times larger than a nuclear weapon. Further, research reactors in 40 developing and transitional countries still hold the essential ingredient for nuclear bombs.

Graham Allison, director of the Belfer Center for Science and International Affairs at Harvard University's Kennedy School of Government, is a former assistant secretary of defense and author of "Nuclear Terrorism: The Ultimate Preventable Catastrophe."

## **In the fight against nuclear proliferation, don't forget about Syria**

Bennett Ramberg

THE JERUSALEM POST

Oct. 20, 2009

Renewed international efforts to reign in Iran's atomic program have shrouded another unresolved Middle East nuclear challenger, Syria. The International Atomic Energy Agency's failure to get Damascus to reveal the history of its secret nuclear reactor and related elements raise troubling questions not simply about the Assad regime's nuclear intentions but, more fundamentally, about the ability of the IAEA to act as an effective watchdog. Unless Syria provides a full accounting, its successful stonewalling will only serve further to undermine international efforts to curb proliferation.

International awareness that Syria poses a nuclear threat emerged only in September 2007 when it is believed that Israeli aircraft destroyed the nuclear plant under construction in the country's remote northeast desert.

The attack generated a surprisingly muted response from Damascus and Jerusalem, but in Vienna, the IAEA condemned the strike arguing that Israel should have informed the agency about Syria's installation. Israel's unwillingness reflected a common and growing uneasiness that the IAEA has become a hollow instrument to ferret out nuclear cheaters or reverse them once revealed. The result - Jerusalem, unwilling to risk international dithering, allegedly took matters into its own hands.

THE SEPTEMBER 2009 meetings of the agency's 35 nation Board of Governors and the General Conference - the annual conclave of the IAEA's entire membership - sustained growing apprehensions about Middle East nuclear proliferation but focused on Israel to abandon its program. The General Conference only gently rapped the knuckles of Syria and Iran, calling on both "to cooperate fully with the IAEA within the framework of their respective obligations."

The statement reflected a "coaxing" strategy - repeated requests that nuclear transgressors provide transparency and eliminate contraband - that has become the agency's trademark to constrain violators. The approach builds on the hope that calibrated calls for openness can prompt transgressors to feel more comfortable with revelation. However, too often the response is otherwise. Violators throw a few bones followed by agency demands for more. The dance repeats but never comes to a satisfactory non-proliferation conclusion.

The Iran case illustrates. Coaxing discouraged the revolutionary regime from bolting the non-proliferation treaty while tethering it to safeguards on declared nuclear sites. Coaxing also generated IAEA inspector access to sites otherwise unavailable for review, but not "comprehensive" nuclear transparency. But the policy also allowed Teheran to buy time to build a nuclear weapons breakout capacity.

Evidently, Syria has learned much from the Iranian experience as it denies agency requests for a full explanation of its nuclear enterprise. The behavior reveals why coaxing that buys time wastes time to promote accountability.

Syria, which became an NPT party in 1968, applied safeguards to a small research reactor in Damascus in 1992. The agreement required Syria to inform the IAEA about any planned nuclear installations. The alleged Israeli strike clearly spoke to the Assad regime's failure to do so.

In a time line provided by Washington eight months later, officials traced the origins of the Dair Alzour reactor to a collaborative North Korean undertaking that broke ground in 2001. Israeli operatives confirmed the facility's weapons potential prior to the assault, although there remains the mystery of how Damascus intended to extract weapons usable plutonium absent a chemical extraction plant.

Following the attack, the IAEA attempted to get Syria to clarify the plant's purpose. Ten months would pass before Damascus allowed inspectors access to the site. Syria used the interim to demolish the installation's skeleton. It then buried its foundation, plowed over the ground and built a structure over the remains. It removed debris to an undisclosed location. Despite the cover-up, inspectors found uranium particles in soil samples. Syria unsatisfactorily explained that the residue came from Israeli munitions that destroyed the plant.

IN FOUR reports published by the agency since 2007, Director-General Mohammed ElBaradei repeatedly called upon an "uncooperative" Damascus to reveal the facility's function, the uranium residue and the location of debris carted away. He also requested access to three additional suspect sites. Syria stonewalled.

Damascus' repeated resistance to transparency naturally raises questions about what the Assad regime is hiding. But Syria's behavior also begs a response to an equally fundamental matter: How ought the international community deal with current and future violators? Evidently coaxing does not work. Transgressors see coaxing as IAEA impotence. Change requires the agency and the Security Council to replace the practice with meaningful "benchmarks" enforced by with "time certain" sanctions that nuclear violators cannot ignore.

In the months to come the IAEA will have an opportunity to strengthen its policing function, with a new director-general in December followed in May 2010 with the important NPT Review Conference that convenes every five years. The meeting offers an opportunity for attendees to press the Security Council to authorize the IAEA to be more assertive with nuclear violators. The practice is long overdue.

The writer served as a State Department policy analyst during the George H. W. Bush administration and as a consultant to the US Senate, Rand, Nuclear Control Institute, Henry Stimson Center, Global Green and Committee to Bridge the Gap.

## Tourist Trip To Halabiye

posted Wednesday **October 28, 2009** under Syria by jeffrey

One of the unique features of the AlKibar (Dair Alzour) site is that it is located near a (somewhat offbeat) tourist attraction. I even joked that a visit “seems like a good use of my grant money.”

I didn’t expect one of you to actually do it. A reader, on a visit to Syria, took a day trip to Halabiye. He has decided to share his observations and photographs:

As you might know, close to the reactor there is an old Byzantine fortress called Halabiye (Frank Pabian mentioned it in his presentation). Tourists only seldom visit Halabiye, but still some travel-guides mention it, so a visit to the fortress was not too obvious. I tried to see how close I could get to the reactor, in the end I was 1.5 km away. This whole area is really, really far off and lies about 60-70 km away from Deir ez-Zour, which also is seldom visited by tourists. Every Syrian I told I was going to Deir ez-Zour immediately asked why I would want to visit such an ugly “\$#&%hole”. After all it is a six hours drive from Damascus and a three hours drive from Palmyra. On holidays lot of Syrians villagers picnic near the fortress. As they apparently had never seen a foreigner before, I quickly became the attraction of the day.

So here my impressions and thoughts on the Al Kibar site:

First let me state, that I think it indeed was a nuclear reactor. I know many people question this and their main argument is that the site is not defended in any way.

This notion is wrong. There are simply no visible defenses. Actually the area is so far off that little defenses are necessary, climbing up the cliffs there is extremely exhausting, difficult and takes a long time. I almost fell twice when climbing up the hill of the castle. Security forces would have plenty of time to thwart any “misguided” hikers. Ten soldiers or so garrisoned inside the canyon and some light barriers would be more than enough to keep away any any intruders. Additionally I can confirm that the site is defended even if a bit differently than people would expect. There were three men simply hanging around next to the bridge. Our very nice taxi driver offered us to go over the bridge to take some photographs of the castle from the other side (where the reactor is located). Then suddenly those guys approached our driver who told us: “Wait I will do this for you”

They started questioning him with one of them taking out a small book to take notes. When we were going further down the bridge to the other side of the river our always amiable driver asked us aggressively “What do you want there? There is nothing there”. That was the only time he talked to us in such way. My friend and I took three pictures on which those suspicious guys are visible — the one tying his shoes was the guy who took out his notebook. They monitored us very closely until we went back to Deir Ez Zour.

In my opinion all of that really makes sense, the Syrians would never be able to stop a concentrated Israeli attack on a pin point target. Hiding it was the only way to go. Of course that was a big gamble, which they lost.

**Putting** an old Russian SAM next to it, which would have been eliminated in a matter of minutes anyway would have been the most stupid thing to do. Constructing a SAM station

anywhere is like painting “here is an important installation” in big red letters into the desert for all satellites to see, especially in such a remote region.

The pumping station (above) seems to be somewhat hidden, too. A big earthen wall makes it impossible to see it from the ground. The fortress is situated on a big hill and you can inescapably view the pumping station from the top of it, even if from a distance of two kilometers. I did photograph it, unfortunately the weather was rather misty making the picture a little blurred. I was lucky enough to capture a man standing behind the pumping station, he gives a clear indication of the size of the building. When considering the earthen wall hides the lower part, it also gets clear how tall the building actually is.

Another point is the position of the building itself. I photographed a different canyon (above) behind the castle. The canyon where the reactor was located probably looked similar before construction started. Flattening the ground and laying the foundations for such a giant building like an reactor is a major task which simply would not make sense for a normal construction. There is more than enough free, even space right next to the Euphrates only two kilometers down the river (where the cement factory, pictured below, is located)

This is also why the “water treatment” plant is suspicious to me. Why build such a plant kilometers away when there is enough space right next to the river and right next to the main road? Laying kilometers of water pipes in Syria’s hottest region is no fun either. But who knows perhaps the Syrian’s converted this facility into a real water treatment plant later on.

There are some ruins on the other side of the Euphrates (the reactor side) but our driver stated he could not pass the river over that very pontoon bridge. The bridge, despite being partially made of wood, can carry cars, however. I photographed a van crossing it, interestingly with a “Danger” sign on it (below). Apparently it was forbidden only for us.

There seems to be a frequent truck traffic to the cement factory, so steady supply of the reactor using trucks would not be noticeable. In fact, I recall that Frederick Forsyth, in *The Fist of God* (his novel about Saddam getting the bomb), describes an asphalted road and a steady flow of trucks as the most pressing problem when concealing a nuclear factory (in *The Fist of God*, the Iraqis disguise the plant as a car dump).

A lot of people claim the photos from the briefing could have been taken anywhere but the whole atmosphere and colors were just spot on. OK, I know this argument is anything but objective, but the photos of the presentation and my travel pictures correspond rather well (see the screenshot).

Another major claim of skeptics is the lack of support structures. Syria has an history of underground sites. And more important, why should such structures have to be 10m away from the reactor? In the age of fibre optics control stations could be placed kilometers away. Even storage sites could be placed far away, due to the many lorries there transports to the reactor would hardly be noticeable. It again reminded me of Forsythe. In *The Fist of God*, analysts don't recognize a nuclear factory as such because its facilities are placed so far apart.

I photographed a vast building which looked a little out of place, because of its tower-like structures and sheer size. The inscriptions says "workshop for gypsum and decor". Of course, it could be just that but still one should not discard the idea the Syrians may have "outsourced" some of the necessary structures to buildings like this one or the alleged water treatment plant. There seems to be a lot of cooperation with the DPRK in general. In Damascus I once saw a North Korean delegation (above), which I unfortunately could only photograph from behind. I tried to ask my Arabic teacher, from Syria's main port of Tartous, about it, but he said the subject was not appropriate to discuss.

[Note: I asked “Why did you conclude the Asian men were from the DPRK?” Our reader responded: “The guy in the uniform walked past me very closely. I could see he wore the Kim Il Sung pin North Koreans are obliged to wear on his chest.”]

I hasten to add that I take the photographer at his word; the pictures certainly look accurate.

I edited a couple of the images to block out anything that I thought might make trouble for certain people. Which brings me to a very important point:

I want to discourage, in the strongest possible terms, readers from doing anything illegal or that might otherwise endanger yourself, your host or people around you. Many governments have no sense of proportion when it comes to the line between what is innocent behavior in a free society — taking pictures of public events; using your intellect to draw conclusions — and espionage. Recent events in Iran and North Korea demonstrate this too clearly for my taste.

So, please don't go taking silly risks. We can leave that to the professionals.

## Mysterious Air Strike How Operation Orchard proceeded in the night of Sept. 5-6, 2007

### AROUND 11 P.M.

Ten Israeli F-15I fighters from the Israeli Air Force's 69th Squadron take off from Ramat David air base southeast of Haifa for a supposed emergency exercise and fly out into the Mediterranean. ①

Satellite images of the complex before and after its destruction

Image from August 2007

Image from late October 2007

Satellite image: Google Earth

### HALF AN HOUR LATER

Three aircraft are ordered back. ② The remaining seven change course and head for the Syrian border. There they deactivate a Syrian radar station near Tall al-Abuad using laser-guided precision weapons and electronic jamming signals. ③

### AFTER A FURTHER 18 FLIGHT MINUTES

The aircraft reach the area near the town of Deir el-Zor on the Euphrates River and destroy the Al Kibar complex using Maverick missiles and 500-kilogram bombs. ④

## The Story of 'Operation Orchard' How Israel Destroyed Syria's Al Kibar Nuclear Reactor

By Erich Follath and Holger Stark

11/02/2009 04:53 PM

In September 2007, Israeli fighter jets destroyed a mysterious complex in the Syrian desert. The incident could have led to war, but it was hushed up by all sides. Was it a nuclear plant and who gave the orders for the strike?

The mighty Euphrates river is the subject of the prophecies in the Bible's Book of Revelation, where it is written that the river will be the scene of the battle of Armageddon: "The sixth angel poured out his bowl on the great river Euphrates, and its water was dried up to prepare the way for the kings from the East."

Today, time seems to stand still along the river. The turquoise waters of the Euphrates flow slowly through the northern Syrian provincial city Deir el-Zor, whose name translates as "monastery in the forest." Farmers till the fields, and vendors sell camel's hair blankets, cardamom and coriander in the city's bazaars. Occasionally archaeologists visit the region to excavate the remains of ancient cities in the surrounding area, a place where many peoples have left their mark -- the Parthians and the Sassanids, the Romans and the Jews, the Ottomans and the French, who were assigned the mandate for Syria by the League of Nations and who only withdrew their troops in 1946. Deir el-Zor is the last outpost before the vast, empty desert, a lifeless place of jagged mountains and inaccessible valleys that begins not far from the town center.

But on a night two years ago, something dramatic happened in this sleepy place. It's an event that local residents discuss in whispers in teahouses along the river, when the water pipes glow and they are confident that no officials are listening -- the subject is taboo in the state-controlled media, and they know that drawing too much attention to themselves in this authoritarian state could be hazardous to their health.

Some in Deir el-Zor talk of a bright flash which lit up the night in the distant desert. Others report seeing a gigantic column of smoke over the Euphrates, like a threatening finger. Some talk of omens, while others relate conspiracy theories. The pious older guests at Jisr al-Kabir, a popular restaurant near the city's landmark suspension bridge, believe it was a sign from heaven.

All the rumors have long since muddied the waters as to what people may or may not have seen. But even the supposedly advanced Western world, with its state-of-the-art surveillance technology and interconnectedness through the mass media, has little more solid information than the people in this Syrian desert town. What happened in the night of Sept. 6, 2007 in the desert, 130 kilometers (81 miles) from the Iraqi border, 30 kilometers from Deir el-Zor, is one of the great mysteries of our times.

### **'This Incident Never Occurred'**

At 2:55 p.m. on that day, the Damascus-based Syrian Arab News Agency (SANA) reported that Israeli fighter jets coming from the Mediterranean had violated Syrian airspace at "about one o'clock" in the morning. "Air defense units confronted them and forced them to leave after they dropped some ammunition in deserted areas without causing any human or material damage," a Syrian military spokesman said, according to the news agency. There was no explanation whatsoever for why such a dramatic event was concealed for half a day.

At 6:46 p.m., Israeli government radio quoted a military spokesman as saying: "This incident never occurred." At 8:46 p.m., a spokesperson for the US State Department said during a daily press briefing that he had only heard "second-hand reports" which "contradict" each other.

To this day, Syria and Israel, two countries that have technically been at war since the founding of the Jewish state in 1948, have largely adhered to a bizarre policy of downplaying what was clearly an act of war. Gradually it became clear that the fighter pilots did not drop some random ammunition over empty no-man's land on that night in 2007, but had in fact deliberately targeted and destroyed a secret Syrian complex.

Was it a nuclear plant, in which scientists were on the verge of completing the bomb? Were North Korean, perhaps even Iranian experts, also working in this secret Syrian facility? When and how did the Israelis learn about the project, and why did they take such a great risk to conduct their clandestine operation? Was the destruction of the Al Kibar complex meant as a final warning to the Iranians, a trial run of sorts intended to show them what the Israelis plan to do if Tehran continues with its suspected nuclear weapons program?

In recent months, SPIEGEL has spoken with key politicians and experts about the mysterious incident in the Syrian desert, including Syrian President Bashar Assad, leading Israeli intelligence expert Ronen Bergman, International Atomic Energy Agency head Mohammed ElBaradei and influential American nuclear expert David Albright. SPIEGEL has also talked with individuals involved in the operation, who have only now agreed to reveal, under conditions of anonymity, what they know.

These efforts have led to an account that, while not solving the mystery in its entirety, at least delivers many pieces of the puzzle. It also offers an assessment of an operation that changed the Middle East and generated shock waves that are still being felt today.

## Syria's Unpredictable President

Tel Aviv, late 2001. An inconspicuous block of houses located among eucalyptus trees is home to the headquarters of the legendary Israeli foreign intelligence agency, the Mossad. A memorial to agents who died in commando operations behind enemy lines stands in the small garden. There are already more than 400 names engraved on the gray marble, with room for many more. In the main building, intelligence analysts are trying to assemble a picture of the new Syrian president.

In July 2000, Bashar Assad succeeded his deceased father, former President Hafez Assad. The Israelis believed that the younger Assad, a politically inexperienced ophthalmologist who had lived in London for many years and who was only 34 when he took office, would be a weak leader. Unlike his father, an unscrupulous political realist nicknamed "The Lion" who had almost struck a deal with the Israelis over the Golan Heights in the last few months of his life, Bashar Assad was considered relatively unpredictable.

According to Israeli agents in Damascus, the younger Assad was trying to consolidate his power by espousing radical and controversial positions. He supplied massive amounts of weapons to the Iranian-backed Hezbollah in Lebanon, for their "struggle for independence" from the "Zionist regime." He received high-ranking delegations from North Korea. The Mossad was convinced that the subject of these secret talks was a further upgrading of Syria's military capabilities. Pyongyang had already helped Damascus in the past in the development of medium-range ballistic missiles and chemical weapons like sarin and mustard gas. But when Israeli military intelligence informed their Mossad counterparts that a Syrian nuclear program was apparently under discussion, the intelligence professionals were dismissive.

Nuclear weapons for Damascus, a nuclear plant literally on Israel's doorstep? For the experts, it seemed much too implausible.

Besides, the senior Assad had rebuffed Abdul Qadeer Khan, the Pakistani "father of the atom bomb," when Khan tried to sell him centrifuges for uranium enrichment on the black market in the early 1990s. The Israelis also knew all too well how complex the road to the bomb is, after having spent a lengthy period of time in the 1960s to covertly procure uranium and then develop nuclear weapons at their secret laboratories in the town of Dimona in the Negev desert. They took extreme measures to prevent then-Iraqi dictator Saddam Hussein from following their example: On a June night in 1981, Israeli F-16s, in violation of international law, entered Iraqi airspace and destroyed the Osirak nuclear reactor near Baghdad.

### Key Phase

The Israelis took a pinprick approach to dealing with the "little" Assad. In 2003, the air force conducted multiple air strikes against positions on the Syrian border, and in October Israeli fighter jets flew a low-altitude mission over Assad's residence in Damascus. It was an arrogant show of power that even had many at the Mossad shaking their heads, wondering how Assad would respond to such humiliating treatment.

At that time, the nuclear plant on Euphrates had likely entered its first key phase. In the spring of 2004, the American National Security Agency (NSA) detected a suspiciously high number of telephone calls between Syria and North Korea, with a noticeably busy line of communication between the North Korean capital Pyongyang and a place in the northern Syrian desert called Al Kibar. The NSA dossier was sent to the Israeli military's "8200" unit, which is responsible for radio reconnaissance and has its antennas set up in the hills near Tel Aviv. Al-Kibar was "flagged," as they say in intelligence jargon.

In late 2006, Israeli military intelligence decided to ask the British for their opinion. But almost at the same time as the delegation from Tel Aviv was arriving in London, a senior Syrian government official checked into a hotel in the exclusive London neighborhood of Kensington. He was under Mossad surveillance and turned out to be

incredibly careless, leaving his computer in his hotel room when he went out. Israeli agents took the opportunity to install a so-called "Trojan horse" program, which can be used to secretly steal data, onto the Syrian's laptop.

The hard drive contained construction plans, letters and hundreds of photos. The photos, which were particularly revealing, showed the Al Kibar complex at various stages in its development. At the beginning -- probably in 2002, although the material was undated -- the construction site looked like a treehouse on stilts, complete with suspicious-looking pipes leading to a pumping station at the Euphrates. Later photos show concrete piers and roofs, which apparently had only one function: to modify the building so that it would look unsuspecting from above. In the end, the whole thing looked as if a shoebox had been placed over something in an attempt to conceal it. But photos from the interior revealed that what was going on at the site was in fact probably work on fissile material.

One of the photos showed an Asian in blue tracksuit trousers, standing next to an Arab. The Mossad quickly identified the two men as Chon Chibu and Ibrahim Othman. Chon is one of the leading members of the North Korean nuclear program, and experts believe that he is the chief engineer behind the Yongbyon plutonium reactor. Othman is the director of the Syrian Atomic Energy Commission.

By now, both Israeli military intelligence and the Mossad were on high alert. After being briefed, then-Prime Minister Ehud Olmert asked: "Will the reactor be up and running soon, and is there is a need to take action?" Hard to say, the experts said. The prime minister asked for more detailed information, preferably from first hand.

### **The CIA Catches a Big Fish**

Istanbul, a CIA safe house for high-profile defectors, February 2007. An Iranian general had decided to switch sides. He was a big fish, of the sort rarely caught in the nets of the CIA and the Mossad.

Ali-Reza Asgari, 63, a handsome man with a moustache, was the head of Iran's Revolutionary Guard in Lebanon in the 1980s and became Iran's deputy defense minister in the mid-1990s. Though well-liked under the relatively liberal then-President Mohammad Khatami, Asgari fell out of favor after the election victory of hardliner Mahmoud Ahmadinejad in 2005. Because he had branded several men close to Ahmadinejad as corrupt, there was suddenly more at stake for Asgari than his career: His life was in danger.

Sources in the intelligence community claim that Asgari's defection to the West was meticulously planned over a period of months. However Amir Farshad Ebrahimi, a former Iranian media attaché in Beirut who fled to Berlin in 2003 and who had known Asgari personally for many years, told SPIEGEL that the general contacted him twice to ask for help in his escape -- first from Iran in the second half of 2006 and later from Damascus. In Ebrahimi's version of events, Asgari succeeded in crossing the border into Turkey at night with the help of a smuggler. Ebrahimi says he only notified the CIA and turned his friend over to the Americans after Asgari had reached Istanbul.

But from that point on, the versions of the story coincide again. The Americans and Israelis soon discovered that the Tehran insider was an intelligence goldmine. For the Israelis, the most alarming part of Asgari's story was what he had to say about Iran's nuclear program. According to Asgari, Tehran was building a second, secret plant in addition to the uranium enrichment plant in Natanz, which was already known to the West. Besides, he said, Iran was apparently funding a top-secret nuclear project in Syria, launched in cooperation with the North Koreans. But Asgari claimed he did not know any further details about the plan.

After a few days, the general's handlers flew him from Istanbul, considered relatively unsafe, to the highly secure Rhein-Main Air Base near Frankfurt. "I brought my computer along. My entire life is in there," Asgari told his friend Ebrahimi, who identified him for the Americans. Asgari contacted Ebrahimi another two times, once from Washington and then from "somewhere in Texas." The defector wanted his friend to let his wife know

that he was safe and in good hands. The Iranian authorities had announced that Asgari had been "kidnapped by the Mossad and probably killed." But then nothing further was heard from Asgari. The American authorities had apparently created a new identity for their high-level Iranian source. Ali-Reza Asgari had ceased to exist.

### **The Need for US Support**

Olmert was kept apprised of the latest developments. In March 2007, three senior experts from the political, military and intelligence communities were summoned to his residence on Gaza Street in Jerusalem, where Olmert swore them to absolute secrecy. The trio was to advise him on matters relating to the Syrian nuclear program. Olmert wanted results, knowing that he would have to gain the support of the Americans before launching an attack. At the very least, he needed the Americans' tacit consent if he planned to send aircraft into regions that were only a few dozen kilometers from military bases in Turkey, a NATO member.

In August, Major General Yaakov Amidror, the trio's spokesman, delivered a devastating report to the prime minister. While the Mossad had tended to be reserved in its assessment of Al Kibar, the three men were now more than convinced that the site posed an existential threat to Israel and that there was evidence of intense cooperation between Syria and North Korea. There also appeared to be proof of connections to Iran. Mohsen Fakhrazadeh-Mahabadi, who experts believed was the head of Iran's secret "Project 111" for outfitting Iranian missiles with nuclear warheads, had visited Damascus in 2005. Iranian President Mahmoud Ahmadinejad traveled to Syria in 2006, where he is believed to have promised the Syrians more than \$1 billion (€675 million) in assistance and urged them to accelerate their efforts.

According to this version of the story, Al Kibar was to be a backup plant for the heavy-water reactor under construction near the Iranian city of Arak, designed to provide plutonium to build a bomb if Iran did not succeed in constructing a weapon using enriched uranium. "Assad apparently thought that, with his weapon, he could have a nuclear option for an Armageddon," says Aharon Zeevi-Farkash, the former director of Israeli military intelligence.

### **Suspicious Ships**

Olmert approved a highly risky undertaking: a fact-finding mission by Israeli agents on foreign soil. On an overcast night in August 2007, says intelligence expert Ronen Bergman, Israeli elite units traveling in helicopters at low altitude crossed the border into Syria, where they unloaded their testing equipment in the desert near Deir el-Zor and took soil samples in the general vicinity of the Al Kibar plant. The group had to abort its daring mission prematurely when it was discovered by a patrol. The Israelis still lacked the definitive proof they needed. However those in Tel Aviv who favored quick action argued that the results of the samples "provided evidence of the existence of a nuclear program."

One of them was the head of the trio of experts, Yaakov Amidror. Amidror, a deeply religious man strongly influenced by his fear of a new Holocaust, also found evidence suggesting that construction on the Syrian plant was to be accelerated. He told Olmert about a ship called the Gregorio, which was coming from North Korea and which was seized in Cyprus in September 2006. It was found to have suspicious-looking pipes bound for Syria on board. And in early September 2007, the freighter Al-Ahmad, also coming from Pyongyang, arrived at the Syrian port of Tartous -- with a cargo of uranium materials, according to the Mossad's information.

At the time, no one was claiming that Al Kibar represented an immediate threat to Israel's security. Nevertheless, Olmert wanted to attack, despite the tense conditions in the region, the Iraq crisis and the conflict in the Gaza Strip. Olmert notified then-US National Security Advisor Stephen Hadley and gave his own military staff the authority to bomb the Syrian plant. The countdown for Operation Orchard had begun.

## 'Target Destroyed'

Ramat David Air Base, Sept. 5, 2007. Israel's Ramat David air base is located south of the port city of Haifa. It is also near Megiddo, which according to the Bible will be the site of Armageddon, the final battle between good and evil.

The order that the pilots in the squadron received shortly before 11 p.m. on Sept. 5, 2007 seemed purely routine: They were to be prepared for an emergency exercise. All 10 available aircraft, known affectionately by their pilots as "Raam" ("Thunder"), took off into the night sky and headed westward, out into the Mediterranean. It was a maneuver designed to deflect attention from the extraordinary mobilization that had been taking place behind the scenes.

Three of the 10 F-15's were ordered to return home, while the remaining seven continued flying east-northeast, at low altitude, toward the nearby Syrian border, where they used their precision-guided weapons to eliminate a radar station. Within an additional 18 flight minutes, they had reached the area around Deir el-Zor. By then, the Israeli pilots had the coordinates of the Al Kibar complex programmed into their on-board computers. The attack was filmed from the air, and as is always the case with these strikes, the bombs were far more destructive than necessary. For the Israelis, it made little difference whether a few guards were killed or a larger number of people.

Immediately following the brief report from the military ("target destroyed"), Prime Minister Ehud Olmert called Turkish Prime Minister Recep Tayyip Erdogan, explained the situation, and asked him to inform President Assad in Damascus that Israel would not tolerate another nuclear plant -- but that no further hostile action was planned. Israel, Olmert said, did not want to play up the incident and was still interested in making peace with Damascus. He added that if Assad chose not to draw attention to the Israeli strike, he would do the same.

In this way, a deafening silence about the mysterious event in the desert began. Nevertheless, the story did not end there, because there were many who chose to shed light on the incident -- and others who were intent on exacting revenge.

Washington, DC, late October 2007. The independent Institute for Science and International Security (ISIS) is located less than a mile from the White House. It is more important than some US federal departments.

The office of its founder and president, David Albright, who holds a degree in physics and was a member of the United Nations International Atomic Energy Agency (IAEA) group of experts in Iraq, is in suite 500 of the brick building that houses the ISIS. As relaxed as he seems to his staff, in his pleated khaki trousers and rolled up shirtsleeves, they know that it is no accident that Albright has managed to turn the ISIS into one of the leading think tanks in Washington. Albright's words carry significant weight in the world of nuclear scientists.

The ISIS spent four weeks analyzing the initial reports about the mysterious air strike in Syria, combing over satellite images covering an area of 25,000 square kilometers (9,650 square miles) before they discovered the destroyed complex of buildings in the desert.

In April 2008, Albright received an unexpected invitation from the CIA to attend a meeting. There, then-CIA Director Michael Hayden showed him images that the Israelis had obtained from the Syrian computer in London (much to the outrage of officials in Tel Aviv, incidentally, as it provided insights into Mossad sources). The photos enabled Albright, who was familiar with the dimensions and characteristics of North Korea's Yongbyon reactor, to compare the various stages at Al Kibar. "There are no longer any serious doubts that we were dealing with a nuclear reactor in Syria," the scientist concluded.

Albright believes that the CIA's strange behavior had to be understood in the context of the Iraq disaster. At the time, the administration of then-President George W. Bush, citing CIA information, constantly repeated the false

claim that Saddam Hussein possessed weapons of mass destruction. This time around, American intelligence wanted to prove that the threat was real.

But where did the Syrians get the uranium they needed for their heavy-water reactor, and in which secret plants was it enriched? In addition to the North Koreans, were the Iranians also involved? And what did the latest images of this "Manhattan project" in the Syrian desert actually depict -- the conversion of an existing plant or a completely new facility?

### **The Sisyphus of Non-Proliferation**

Vienna, the UN complex on Wagramer Straße, headquarters of the IAEA's nuclear detectives. An impressive collection of national flags hangs in the lobby, like sails waiting for a tailwind. Of the 192 UN member states, 150 are also members of the IAEA, and almost all UN members have signed the Nuclear Non-Proliferation Treaty (NPT). The problem children of the nuclear world, Israel, Pakistan and India, have not signed the treaty. All three of them possess -- or in the case of Israel, are believed to possess -- nuclear weapons.

Signatory states like Syria and Iran are entitled to support in pursuing the peaceful use of nuclear energy. They are also required to either phase out nuclear weapons and prevent their proliferation (in the case of the nuclear "haves") or refrain from developing them in the first place (in the case of the "have-nots").

The IAEA, whose job is to verify compliance with the provisions of the NPT, has 2,200 employees and an annual budget of roughly \$300 million. That may sound impressive, but it is really just peanuts if the claim repeatedly made by politicians around the world is true, namely that the possibility of nuclear weapons falling into the hands of blackmailing dictators or terrorists poses the greatest danger to humanity.

During an interview with SPIEGEL in his Vienna office in May 2009, IAEA Director General Mohamed ElBaradei, 67, sighed as he took stock of his life. At times, the IAEA boss says, he has felt like Sisyphus, the tragic figure in Greek mythology who is constantly pushing a boulder up a mountain, only to lose hold of it shortly before the summit. ElBaradei, the winner of the 2005 Nobel Peace Prize, has repeatedly pointed out that his organization is subject to the whims of the member states. The nuclear detectives can admittedly be deployed to use their highly sensitive testing equipment to obtain a "nuclear fingerprint" in any particular place, but they also need access to reactors. Libya has caused problems in the past, while today's recalcitrants are North Korea and Iran -- in other words, the usual suspects. And now Syria. The news about the desert nuclear plant came as a great shock to the IAEA.

"What the Israelis did was a violation of international law. If the Israelis and the Americans had information about an illegal nuclear facility, they should have notified us immediately," says ElBaradei, who only learned of the dramatic incident from media reports. "When everything was over, we were supposed to head out and search for evidence in the rubble -- a virtually impossible task."

### **Alarming Findings**

But he had underestimated his inspectors. In June 2008, a team of IAEA experts visited the destroyed Al Kibar plant. The Syrians had given in to pressure from the weapons inspectors, but they had also done everything possible to dispose of the evidence first. They removed all the debris from the bombed facility and paved over the entire site with concrete. They told the inspectors that it had been a conventional weapons factory, and not a nuclear reactor, which they would have been required to report to the IAEA. They also insisted that foreigners had not been involved.

The IAEA experts painstakingly collected soil samples, and used special wipes to remove minute traces of material from furnishings or pipes still on the site. The samples were sent to the IAEA special laboratories in

Seibersdorf, a town near Vienna, where they were subjected to ultrasensitive isotope analyses capable of determining whether samples had come into contact with suspicious uranium. And indeed, the analysis produced some very alarming findings.

In its report, the IAEA describes "a significant number of anthropogenic natural uranium particles (i.e. produced as a result of chemical processing)" which were "of a type not included in Syria's declared inventory of nuclear material." The Syrian authorities claimed that the uranium was introduced by the Israeli bombing, something that the IAEA said was of "low probability."

In its latest report, released in June 2009, the IAEA demanded, in no uncertain terms, that Damascus grant it permission for another series of inspections, this time with access to "three other locations" that may have been related to Al Kibar. "The characteristics of the complex, including the cooling water capacities, bear a strong similarity to those of a nuclear reactor, something which urgently requires clarification," says one IAEA expert. In the cautious language of UN officials, this is practically a guilty verdict.

### **In the Crosshairs**

"Syria is not giving us the transparency we require," ElBaradei says angrily. A picture hanging in his office seems to reflect his mood. It is a print of "The Scream," by the Norwegian painter Edvard Munch, which depicts a deeply distraught person. ElBaradei does not believe that he is too lenient with those suspected of illegally pursuing nuclear weapons programs, as the Bush administration repeatedly claimed, particularly in relation to Iran. The IAEA, he says, will probably receive permission for a new inspection trip to Syria soon. Or at least he hopes it will.

If and when that happens, a different host will greet the UN team. The affable Brigadier General Mohammed Suleiman, an Assad confidant in charge of all manner of "sensitive security issues," was formerly in charge of presiding over the inspections. However he was assassinated in 2008. He landed in the crosshairs of his pursuers, just like Hezbollah commander Imad Mughniyah.

For the Israelis, Mughniyah was the epitome of terror, the most notorious terrorist mastermind in the Middle East. He was responsible for the bloody attack on American military headquarters in Beirut in the 1980s and on Jewish institutions in Argentina in the 1990s, attacks in which hundreds of innocent people died. He is regarded by some as the inventor of the suicide attack and was deeply rooted in Iranian power structures.

The Mossad had information that Mughniyah was planning to avenge the air strike on Al Kibar with an attack on an Israeli embassy -- either in the Azerbaijani capital Baku, Cairo or the Jordanian capital Amman.

### **Assassinated in an SUV**

Damascus, the building complex of the Atomic Energy Commission of Syria in the city's Kafar Soussa diplomatic quarter, February 2008. Visitors are not welcome. "Please contact post office box 6091," says the guard at the entrance. There is also an email address (atomic@aec.org.sy). But inquiries sent to both addresses remain unanswered. No wonder, say experts, who speculate that the threads of a secret nuclear weapons program come together in the inconspicuous AECS complex.

It was precisely on the street where the AECS complex is located that Imad Mughniyah, a.k.a. "The Fox," parked his Mitsubishi Pajero on Feb. 12, 2008 while he attended a reception at the nearby Iranian embassy. It was a rare appearance by a man who normally avoided being seen in public. But on that evening Mughniyah knew that he would be among friends, including Hamas leader Khaled Mashal and Syrian General Mohammed Suleiman, whom he had met many times in Tehran and at Hezbollah centers in Lebanon.

Shortly after 10:30 p.m., Mughniyah drank his last glass of freshly squeezed orange juice. Then he kissed the host, the newly installed Iranian diplomat Ahmed Mousavi, on both cheeks, as local custom dictates, and left the party. Mughniyah was "probably the most intelligent, most capable operative we've ever run across," said former CIA agent Robert Baer, who had been tracking him for a long time. The terrorist knew that he was at the very top of the Mossad's hit list, and he also knew that the FBI was offering a \$5 million reward for information leading to his arrest. But he felt relatively safe in Syria, as he did in Beirut and Tehran, which he visited on a regular basis.

The explosion completely destroyed the SUV and ripped apart Mughniyah's body. He was killed instantly. But the explosive charge was apparently calculated so carefully that nearby buildings were barely harmed. The terrorist leader remained the only victim on that night in Damascus.

Whoever committed the act, "the world is a better place without this man," the American government announced the next day through State Department spokesman Sean McCormack. Hezbollah, which had no doubts as to who was responsible for the killing, called Mughniyah a "martyr" and vowed to retaliate against the "Zionists."

The Israel government neither confirmed nor denied any involvement in the assassination. But agents at the Mossad could hardly contain their delight. According to information leaked to intelligence expert Uzi Mahnaimi, Israeli agents had removed the driver's seat headrest and filled it with a compound that would detonate on contact. Intelligence expert Ronen Bergman can even describe the reaction of Israelis who were involved. "It was a shame about that nice new Pajero," one of them reportedly said.

Tartous, a medieval stronghold of the Knights Templar on the Syrian Mediterranean coast, five months later. It was at this port city, 160 kilometers northwest of Damascus, that the mysterious freighter Hamed had once berthed with its supposed cargo of cement from North Korea. Here, on a beach 13 kilometers north of the medieval city walls, General Suleiman had a weekend house, not far from the Rimal al-Zahabiya luxury beach resort. In the summer, Suleiman traveled to his weekend house almost every Friday to review files, relax and swim. On this first August weekend in 2008, President Assad's eminence grise must have taken along a particularly large number of documents. A few days later, he had planned to accompany Assad on a secret visit to Tehran.

As always, Suleiman drove from Damascus to Tartous in an armored vehicle. Additional bodyguards were waiting for him at his chalet. They never let him out of their sight, even escorting him into the water when he went swimming. After Mughniyah's murder on a busy Damascus street, security was at the highest possible level. The general, who interacted with the global community as the regime's senior representative on nuclear issues, was considered particularly at risk.

The sea was calm that morning. Yachts were cruising off the coast, and there was nothing to raise suspicions in Tartous, a popular sailing destination for Syria's moneyed aristocracy where boats can be chartered for visits to nearby Arwad Island and its fish restaurants. An unusually sleek yacht came within 50 meters of the coast, but it was not close enough to raise any red flags with the bodyguards when their boss decided to jump into the sea.

No one even heard the gunshots, which were probably fired from precision rifles equipped with silencers. But they clearly came from offshore, striking Sulaiman in the head, chest and neck. The general died before his bodyguards could do anything for him. The yacht carrying the snipers turned away and disappeared into international waters.

## **Hushed Up**

The Syrian authorities kept the news of the murder from the public for days. After that, it issued terse statements about the "vicious crime." According to the official account, the general was "found shot dead near Tartous." There was no mention of a yacht or of the angle from which the shots were fired.

Speculation was rife in Damascus. Diplomats assumed that Suleiman had become too powerful for his fellow cabinet members, and that his killing was evidence of an internal Syrian power struggle. According to Western critics of the president, Suleiman had become a burden for Assad after the debacle involving the bombed nuclear plant and the Mughniyah murder, and he was eliminated on orders from Assad. For experts, however, the most likely scenario is that the Israelis were behind the highly professional assassination.

Suleiman, who was nicknamed "the imported general" because of his European appearance, was buried in a private ceremony in his native village of Draykish two days after his murder. President Assad sent his younger brother Maher to attend the secret funeral, while he himself embarked on his scheduled trip to Tehran. It was important for him to put on a show of self-control, no matter how distressed he may have felt.

Can bomb attacks and hit squads against real or presumed terrorists bring about progress in the Middle East? Is it true that Arabs and Israelis only understand the language of violence, as many in Tel Aviv are now saying? Did the operation against the Al Kibar complex, which violated international law, bring the Syrian president to his senses, or did it merely encourage him to harden his position?

And what does all this mean for a possible Iranian nuclear bomb?

### **The Consequences of Operation Orchard**

"The facility that was bombed was not a nuclear plant, but rather a conventional military installation," Syrian President Bashar Assad insisted during a SPIEGEL interview at his palace near Damascus in mid-January 2009. "We could have struck back. But should we really allow ourselves to be provoked into a war? Then we would have walked into an Israeli trap." What about the traces of uranium? "Perhaps the Israelis dropped it from the air to make us the target of precisely these suspicions."

Damascus, he said, is not interested in becoming a nuclear power, nor does it believe that Tehran is developing the bomb. "Syria is fundamentally opposed to the proliferation of nuclear weapons. We want a nuclear-free Middle East, Israel included."

Assad, outraged over Israeli belligerence in the Gaza Strip, has suspended secret peace talks with the enemy, which had been brokered by Turkey. But it is also abundantly clear that Assad is eager to remove himself from the list of global political pariahs and enter into dialogue with the United States and Europe.

In the autumn of 2009, relations between Damascus and the West seem to be on the mend, probably as the result of American concessions rather than Israeli bombs. French President Nicolas Sarkozy received Assad at the Elysée Palace and told him that the normalization of relations would depend on the Syrians meeting a provocatively worded condition: "End nuclear weapons cooperation with Iran." In the first week of October, Syrian Deputy Foreign Minister Faisal Mekdad traveled to Washington to meet with his counterparts there. And Saudi Arabia's King Abdullah, with Washington's explicit blessing, went to Damascus in an attempt to make a shift to the moderate camp more palatable for Assad.

President Barack Obama will probably send a US military attaché to Damascus soon, followed by an ambassador. Syria could be removed from the US's list of state sponsors of terrorism, a list which also includes Iran, Cuba and Sudan. The prospect of billions in aid, as well as transfers of high technology, is being held out to Assad. The Syrian president knows that this is probably his only hope to revive his ailing economy in the long term.

Relations between Damascus and Tehran have worsened considerably in recent weeks. Western intelligence agencies report that the Iranian leadership is demanding that Syria return -- in full and without compensation -- substantial shipments of uranium, which it no longer needs now that its nuclear program has been destroyed.

The latest news from Damascus, the ancient city where Saulus turned into Paulus according to the old scriptures: According to information SPIEGEL has obtained from sources in Damascus, Assad has been considering taking a sensational political step. He is believed to have suggested to contacts in Pyongyang that he is considering the disclosure of his "national" nuclear program, but without divulging any details of cooperation with his North Korean and Iranian partners. Libyan revolutionary leader Moammar Gadhafi reaped considerable benefits from the international community after a similar "confession" about his country's nuclear program.

The reaction from North Korea was swift and extremely harsh: Pyongyang sent a senior government representative to Damascus to inform Syrian authorities that the North Koreans would terminate all cooperation on chemical weapons if Assad proceeded with his plan. And this regardless whether he mentioned Pyongyang in this context or not.

Tehran's reaction is believed to have been even more severe. Saeed Jalili, the country's leading nuclear negotiator and a close associate of Iran's supreme religious leader, apparently brought along an urgent message from the Ayatollah Ali Khamenei, in which Khamenei called Assad's plan "unacceptable" and threatened that it would spell the end of the two countries' strategic alliance and a sharp decline in relations.

According to intelligence sources, Assad has backed down -- for the time being. However he is also looking for ways to do business with his enemies, even Israel's hard-line prime minister, Benjamin Netanyahu. Nevertheless, Assad is loath to give up his contacts to Hezbollah and Tehran completely, and he will demand a very high price for the possible recognition of Israel and for playing the role of mediator with Tehran, namely the return of the entire Golan Heights.

### **Time on Its Side**

Did Operation Orchard make an impression on the Iranians, and did they understand it the way it was probably intended by the Israelis: as a final warning to Tehran?

The Iranians have -- literally -- entrenched themselves, and not only since the Israeli attack on Syria. Many of the centrifuges they use for uranium enrichment are now operating in underground tunnels. Not even the bunker-busting super-bombs the Pentagon has requested be made available soon, citing "urgent operational requirements," are capable of fully destroying facilities like the one in Natanz.

The Americans -- or the Israelis -- would have to conduct air strikes for several weeks and destroy more than a dozen known nuclear facilities to set back the Iranian nuclear program by more than a few weeks. It would be a far more complex undertaking than the Israelis' past attacks on the Osirak reactor in Iraq and Syria's Al Kibar nuclear plant. And even after such a comprehensive operation, which would expose them to counterattacks, they could not be entirely sure of having wiped out all key elements of the Iranian nuclear program. Just in September, Tehran surprised the world with the confession that it had built a previously unreported uranium enrichment plant near Qom.

Operation Orchard achieved only one thing: If the Iranians had planned to build a "spare" nuclear plant in Syria, that is, a backup plutonium factory, their plans were thwarted. But Tehran has time on its side. The Iranians are already believed to have reached breakout capacity -- in other words, the ability to begin building a nuclear weapon if they so desire. Iran is on the verge of becoming a nuclear power.

And Syria? There is nothing to suggest that Damascus will or is even able to play with fire once again. A conventional factory has in fact been built over the ruins of the Al Kibar plant. There is no access to the plant -- for "security reasons," as residents of Deir el-Zor say tersely -- at the roadblock near the great river and the desert village of Tibnah.

The turquoise-colored river flows slowly, the river that Moses, according to the Bible, promised to the Israelites as part of their holy land. To this day, many radical Israelis take the relevant passage in the Bible as seriously as an entry in the land register: "Every place that your foot shall tread upon shall be yours. From the desert, and from Libanus, from the great river Euphrates unto the western sea."

Referring to the same river, the Prophet Muhammad is supposed to have said: "The Euphrates reveals the treasures within itself. Whoever sees it should not take anything from it."

Translated from the German by Christopher Sultan

## **Robert Satloff: U.S.-Syria Relations and the Peace Process**

Thursday 12 November 2009

Prepared remarks for delivery at debate with Syrian ambassador Imad Moustapha, American University, November 11, 2009.

*[EXCERPT]*

There are, of course, two other issues that hover above everything I've mentioned so far, issues that hang like a sword of Damocles over the Syrian regime: the UN investigation of the assassination of former Lebanese prime minister Rafiq al-Hariri and the IAEA investigation of Syria's al-Kibar nuclear reactor destroyed by the Israeli Air Force two years ago. These things clearly take time—time as measured in years. But they are huge issues. Did the Syrians play a role in the murder of Hariri? Right now, speculation ranges from whether it was the Syrians or the Syrians' local allies, Hizballah. Either way, Syria will get its fingers burned, and either way, Syria has already paid a huge price for the perception of involvement. On the nuclear issue, even the IAEA, which normally can't say a bad word about anyone, has roundly criticized Syria for its lack of cooperation in investigating the site that Syria has since paved over like a parking lot. What is remarkable about the nuclear issue is what it says about the Syrian regime: with few assets at its disposal, it jumped into bed with North Korea, one of its few allies, in a vain effort to gain leverage in the region.

## **George Jonas: The Iranian general vanishes**

by NP Editor George Jonas, Iran

Posted: **November 18, 2009**, 10:30 AM

People say life imitates art, but it's not necessarily Shakespeare. Sometimes it's a spy thriller, at other times a canard (the French word meaning false news). Telling thrillers from canards is what investigative journalists, intelligence officers and (eventually) historians get paid for. If they end up giving us value for money, it's only because they don't get paid very much.

Separating the wheat from the chaff is a challenge even in ordinary affairs, as any City Hall reporter can tell you. Trying to disentangle international intrigue is something else again. Consider the case of the Iranian general, Ali-Reza Asgari.

Having vanished about three years ago, Iran's former deputy defense minister came back into the news this week. According to the Israeli newspaper Ha'aretz, Israel's Army Radio monitoring the Iranian investigative news website Alef came up with the claim that Asgari had been kidnapped during a visit to Turkey by a cabal of German, British and Israeli intelligence agencies.

"On the basis of a two-year investigation carried out by concerned bodies, Asgari was abducted by foreign intelligence services and is being held in a Zionist prison," Ha'aretz quotes the Iranian news source reporting. The Iranians say Asgari was kidnapped to get information on Iran's nuclear program as well as on an Israeli Air Force airman missing since 1986. The website claims that, after interrogation, Asgari was secretly transferred to a prison facility in Israel, where he is currently being held.

Hmm. Have the theocrats of Tehran been watching too many Hollywood movies? Or could the Asgari saga, rather than a tall tale for the silver screen, really be an example of life imitating art?

With nothing confirmed, let's see what, if anything, is undisputed. Everyone agrees that Asgari did go missing in Turkey. It happened sometime between December 2006 and February 2007, depending on whether one relies on Ha'aretz's sources or the Farsi News Agency's. Asgari, a one-time commander of Iran's Revolutionary Guard, age reported as 57 (International Herald Tribune) or 63 (New York Post) might have gone into the olive oil business after his retirement from Iran's defense establishment the previous year. While in Turkey to peddle his wares, he could have aroused the curiosity of Mossad agents. They might have wondered if an Iranian, known as having played a role in setting up Hezbollah in Lebanon, had any information about Ron Arad, the Israeli airman captured by Hezbollah when his plane went down in the vicinity of Sidon, Lebanon, 20-plus years earlier.

But would the Mossad-men have been curious enough to kidnap Asgari and interrogate him? Then — since what the hell, he was there, anyway — ask him about Iran's nuclear program? One of Asgari's two wives, Ziba Ahmadi, certainly thought so. But then, she would have had reason to prefer it to the alternative.

The alternative was that after being pushed out from Mohammad Khatami's cabinet by Mahmoud Ahmadinejad in 2005, Asgari did decide to go into business for himself, except not the olive oil but the olive branch business. This was the merchandize he extended to his Western and Israeli counterparts during a trip to Turkey. In other words, he defected, as some students of cloak-and-dagger, such as Hans Rühle, former planning chief of the German Defense Ministry, suggested.

Any intelligence source may turn out to be the horse's mouth or a horse's ass. Asgari seems to have been the oracular orifice at the happy end of the equine equation. On Sept. 6, 2007, about seven months after his disappearance in Turkey, a squadron of Israeli Air Force warplanes struck a target in Syria. It had to be an important target, because instead of screaming bloody murder over Israel's violation of their airspace, the Syrians initially denied that there was any intrusion at all.

The reason for the subdued Syrian response became evident as more details emerged. Though official Damascus continued to deny it, the target was an Iranian-financed nuclear reactor, built and operated with North Korean assistance. Reportedly ten North Korean advisors lost their lives during the attack. Later several news and intelligence sources agreed that “Operation Orchard” wouldn’t have happened without information supplied by Ali-Reza Asgari. If so, whether he was 57 or 63, and whether his disappearance, either in December 2006 or in February 2007, was due to an olive oil trip going sour or an olive branch trip unfolding as designed, Asgari’s story was taking its place among the three-star entries in the annals of hush-hush.

Could there be a reason for Iranian news sources choosing to revisit Asgari’s defection or abduction last week? In the world of clandestine affairs few things are entirely due to chance. The kidnap-story is almost certainly a canard, but why float it nearly three years after the event?

The answer may be diplomacy, Persian Gulf-style. If this doesn’t immediately make sense, consider the title of the Seventh Annual Isaiah Berlin Lecture, delivered recently by a former head of the Mossad, Efraim Halevy. “Diplomacy and Intelligence in the Middle East: How and Why Are The Two Inexorably Intertwined?”

Stay tuned.

## Syria suspected of concealing nuclear activity

November 19, 2009 – 6:41am

J.J. Green, wtop.com

WASHINGTON - The International Atomic Energy Agency and Syria are walking a tightrope and appear to be headed toward a collision over two nuclear sites where undeclared uranium was recently found.

The agency found traces of uranium at the Dair Alzour nuclear site that are not included in Syria's declared inventory, according to a just released report. The Syrians said the uranium came from the Israeli missiles used to destroy the nearby al-Kibar reactor in September 2007.

The presence of uranium particles was detected at a second site near Damascus -- the Miniature Neutron Source Reactor. Syria said it came from the accumulation of samples and reference materials used in neutron activation analysis.

The IAEA is not buying either of the two explanations and is pressing Damascus for more answers and wants to know from where the uranium came. The agency has run its own tests and is certain the Syrian government is not telling the truth.

That's where the tightrope act comes in. The IAEA won't comment on what clearly appears to be evasive behavior by the Syrian government because of concern about its tenuous relationship with Syria.

The Syrian government, also aware of the slippery state of affairs, tells WTOP:

"We are taking up the matter with IAEA, and are in constant consultation with them. We are going through appropriate channels and Syria stands by its legal obligations to the NPT (Non-Proliferation Treaty)."

A U.S. counter-proliferation official is not convinced.

"Syria has a record of concealing nuclear activities. The whole world saw that with the al-Kibar reactor, an undeclared facility, destroyed in 2007."

Considering Syria's close relationship with Iran, which has refused to bend to international will to stop its nuclear weapons production activities, there is concern Syria is following the same path.

"I think it should be a significant worry," says David Kay, senior research fellow at the Potomac Institute. "This is what the Syria case points to. States can, on their own, clandestinely make arrangements to acquire at least portions of a nuclear weapons production cycle."

The precarious, global nuclear state of affairs involving Iran, North Korea and Pakistan is troubling to Kay.

"[Countries in] the Middle East procuring nuclear weapons would be at the top of my list of concerns. That's why dealing with the Iranian program is so important, and that's why paying continued attention to what's happening in Pakistan is important."

Kay, a former United Nations weapons inspector, says the existence of an underground nuclear weapons network could initiate a irreversible and harmful course of nuclear proliferation.

"Myanmar is a good example," Kay says. "On their own with their indigenous technical capacity to produce either plutonium or highly enriched uranium, it's not something that would keep me awake at night."

They simply don't have it. But this illicit network, government sanctioned and black market certainly means that if they desire it, there may be a real possibility of their gaining it."

The IAEA concluded in a Nov. 16 report that there has been "essentially no progress made" since the last report several months ago.

The report goes on to say Syria's evasive behavior, "gives rise to questions about the correctness and completeness of Syria's declaration, which the agency is obliged to pursue."

The Israeli government has said repeatedly it will not allow Syria's ally, Iran, to develop a nuclear weapons program and "all options are on the table to stop it."

Israeli intelligence suggests Iran could possibly have some type of weapon in 12 months. And because of that, Israeli Ambassador Alon Pinkus says Israel won't wait until a weapon is fully developed to attack.

"There are other stages before that are almost as dangerous," Pinkus says.

His comments lead to speculation that an attack could take place any day between now and a year.

"Not necessarily, because that depends on what happens in the political or diplomatic arena within that 12-month period," says Pinkus.

Syria was attacked quietly by the Israelis in the early morning hours of Sept. 6, 2007 -- but the April 24, 2008 announcement of the attack and the lack of tolerance for rogue nuclear weapons' operations by U.S. government officials was heard loud and clear.

Still the IAEA reports no cooperation from the Syrians on resolving the current issues.

The U.S. counter proliferation official says, "they [the Syrian Government] have a credibility problem, which this latest news will in no way resolve."

## **When it comes to Iran, 'rules must be binding'**

By Jamie M. Fly

Mon, 11/30/2009 - 1:26pm

*[EXCERPTS]*

The events of the past week pose a challenge to President Obama's vision of a world without nuclear weapons. Last week in Vienna, the Board of Governors of the International Atomic Energy Agency (IAEA) met to discuss Iran and Syria's continued stonewalling of IAEA investigations into illicit nuclear activities carried out by each country.

On November 16, IAEA Director General Mohammed ElBaradei submitted reports on both countries to the members of the Board. His report on Iran was perhaps the strongest IAEA report on Iran to date. It found that Iran violated its safeguards obligations by not reporting the existence of a covert enrichment facility near Qom. The report also noted that Iran continues to not cooperate with the IAEA's investigation into Iran's pre-2003 covert weaponization program. It was a damning final report from ElBaradei, who retired at the end of last week having spent much of his twelve years at the helm of the IAEA trying to cajole the Iranians into coming clean, often undermining U.S. and Western efforts to pressure in the process.

*[deletia]*

On Syria, the Board last week missed an opportunity to send a message to the Assad regime. ElBaradei's latest report makes clear that Syria has adopted the Iranian playbook on handling IAEA investigations. The report says that Syria has not responded to the IAEA's questions about its former covert nuclear reactor at Al Kibar even though some of its early answers contradict information that the IAEA has obtained from other sources. Syria has also refused to give the IAEA access to other facilities related to Al Kibar, claiming that these are sensitive military sites even though the IAEA has reminded Syria that under its safeguards agreement, this is not a reason to deny the IAEA access. In addition to unanswered questions about Al Kibar, the report raises new concerns about illicit activity at Syria's declared research reactor near Damascus.

Unlike Iran, Syria at the moment is experiencing a renaissance in its relations with the United States as well as Europe. This will have to change if the international community is serious about upholding the nuclear nonproliferation regime. The Board of Governors, which has largely been silent on the Syria nuclear issue, should have sent a strong message to Damascus that unless the Assad regime begins to share information, it will be subject to the same treatment as Iran (including eventual referral to the Security Council for further action).

The issue is not that Syria has an ongoing nuclear program (although it is difficult for the IAEA to verify this given Syria's lack of cooperation), but it is about the sanctity of the nuclear nonproliferation regime and the message that needs to be sent to other countries thinking about shirking their commitments. The lesson cannot be that such countries will be slapped on the wrist but then quickly forgiven, only to receive increased trade and diplomatic relations from the United States and Europe.

How President Obama handles these two issues in the coming months will say much about how serious he is about his supposed goal of ridding the world of nuclear weapons. As Obama said in his April speech in Prague after North Korea violated several United Nations Security Council Resolutions by conducting a missile test, "Rules must be binding. Violations must be punished. Words must mean something."

Last week's IAEA Board resolution on Iran was a start, but there is much work to be done before he can turn this rhetoric into reality.

## A Change in Leadership at the IAEA

James M. Acton Q&A

December 1, 2009

*[EXCERPTS]*

On Monday, Mohammed ElBaradei stepped down after twelve years as head of the UN's nuclear watchdog. Yukiya Amano, ElBaradei's successor as director general of the International Atomic Energy Agency, will confront growing proliferation challenges from nuclear weapons programs and nuclear power industries across Asia, the Middle East, and beyond.

In the final days of ElBaradei's tenure, the last week of November, the IAEA issued a stern resolution censuring Iran for continually defying its international nuclear obligations. In response, Iran announced that it would build 10 additional uranium enrichment plants, once again challenging the IAEA's enforcement authority. In a new Q&A, James Acton reflects on ElBaradei's leadership, discusses Amano's agenda, and calls attention to the importance of the IAEA's work.

*[deletia]*

*[Q:]* How will Amano's arrival impact international efforts to contain nuclear programs in Iran, North Korea, and Syria?

*[deletia]*

*[A:]* Although not so high-profile *[as Iran]*, Amano will also have to make a decision about whether to change tactics in handling the Syria investigation. There is strong evidence that the building the Israelis destroyed in an air strike in September 2007 was a nuclear reactor that Syria failed to declare to the IAEA—in breach of its legal obligations. The IAEA has repeatedly asked Syria for access on a voluntary basis so it can investigate the matter further. Syria has consistently refused. Amano must decide whether to make the Agency's request for access legally binding by asking for a "special inspection"—a step ElBaradei steadfastly refused to take.

## **Beware the winds of December**

By Alastair Crooke

Asia Times

Dec 2, 2009

*[EXCERPT]*

... We do not yet know that negotiations with Iran will fail; although it seems that the debate within the administration seems to be hardening against the idea of Iran retaining any enrichment capacity. If this does become the administration's position, then failure of negotiations is assured. Iran will not abjure its right to a nuclear fuel cycle for power generation - even at the risk of war. This is the essence of the dilemma: if sanctions seem likely to lead to nothing more than Republican sniping and taunts of weakness, how does the president display "toughness" on Iran - against the backdrop of withdrawal from Iraq, Afghanistan and abstention on the Israeli-Palestinian political process?

It is clear that Israel must be reading the region in the same fashion. Israelis are acutely sensitive to US politics, and the Israeli media already express understanding for the acute dilemma that will face the US president if sanctions do not succeed in persuading Iran to abandon all enrichment (the Israeli objective). How might Israel see the way to help President Barack Obama resolve this dilemma - given the improbability that Israel will be given any "green light" to attack Iran directly, with all the consequences that such military action might entail for US interests in the region?

A recent article by the veteran and well-connected Israeli columnist, Alex Fishman, in the Hebrew language newspaper, Yediot Ahronoth, perhaps offers some insights into how Israelis may be speculating about such issues when he warns about "the approaching December winds". These winds, Fishman tells us, will bring more and new revelations - not about Iran's nuclear ambitions - but about Syria's nuclear projects: the departure of Mohamed ElBaradei from the chair at the International Atomic Energy Agency (IAEA), he states, will open the door to new IAEA demands to inspect two suspected nuclear sites in Syria.

Fishman notes that, following the surfacing last month in Germany of stories that Israeli special forces had been on the ground covertly in Syria, no one should be surprised if more evidence and photographs of the nuclear reactor, destroyed by Israeli air attack in September 2007, come to dominate the headlines in the Western press this December.

The "star" turn in this prospective public relations campaign is to be evidence proving a direct Iranian nuclear connection and finance for Syria's alleged nuclear project.

Fishman suggests that it suits "Israel's internal as well as foreign PR efforts" for the time being to play along with talk of peace between Israel and Syria; but that both the December campaign against Syria's alleged Iranian nuclear cooperation in the Western press, and the playing along with the Syrian peace track "are directly linked to negotiations" that the US is conducting with Iran. Fishman concludes that these could end in confrontation with Iran - "and also lead to a military strike", in which case, "whomsoever is in the Iranian camp will also get a pounding" - a reference to Syria.

Does this piece truly reflect Israeli thinking? We do not know; but Fishman certainly is well connected. Does the Israeli security establishment really conceive that the road to military action against Iran passes through Damascus? For those who recall the tacit support given by Europe and the US to Israel's 2007 surprise military attack on Syria, Fishman's scenario is not as unlikely as it may seem.

That earlier episode could easily have escalated to a wider war. More likely is that this is but one of a number of "game changing" scenarios that Israel is considering, but which ultimately all have Iran as the "end game".

In the past, Israel's political parties of the right had a reputation for conceiving unconventional military actions, which sought to transform and invert the political paradigm of that time. Such actions did not always wait on, or seek, a US "green light". There was not direct collusion with the US. Israeli leaders looked more to the direction of the political wind in Washington. It was viewed by Israelis historically as finding a creative way to help a US president "get to yes" - to borrow Obama's own phraseology - by creating the public support and momentum to let a US president feel pulled forward by sentiment from a need to "hold Israel back".

Is a new scandal of Iranian nuclear malfeasance and proliferation into Syria to serve as the pretext? Will a repeat of the 2007 air strikes on Syria lead to a wider conflict? Does the Israeli leadership think to ease Obama out of his Iran dilemma, by using the supposed "provocation" of a "Syrian-Iranian nuclear partnership" for a widening conflict? Perhaps we should beware these December "winds"?

## **The end of an era**

By EPHRAIM ASCULAI

Dec 3, 2009 15:02 | Updated Dec 3, 2009 15:04

*[EXCERPT]*

On December 1 Dr. Mohamed ElBaradei, the threeterm International Atomic Energy Agency director-general and the sharer, with the IAEA, of the Nobel Peace Prize, passed the keys to his office to his successor, Ambassador Yukiya Amano of Japan. It is not possible to describe his controversial term of office in one or two sentences. Yet, he will probably be remembered as the director-general who politicized his position more than any of his predecessors.

The IAEA is a technical organization, with many technical duties, from the peaceful uses of nuclear techniques, in medicine and agriculture, to mention but two of the many useful areas that employ these techniques, to guiding the safe use of nuclear power reactors.

In addition, however, the IAEA was entrusted by the Nuclear Non-Proliferation Treaty (NPT) to verify, through inspections, that the Non-Nuclear Weapons States (NNWS) are not engaged in the illicit development of nuclear weapons. Although the IAEA's achievements in its purely technical tasks are impressive, it has failed in many of its non-proliferation duties. To be sure, the performance of the technical duties of inspections within the legal bounds of their authority was commendable.

However, the interpretation of the findings of the safeguards inspectors failed conspicuously in two areas: Not all findings were reported to the IAEA member states, and the interpretations of the findings were not only technically based, they were biased in their leniency toward some of the inspected states.

Moreover, the IAEA chief, in his reports to the board of governors did not explicitly transfer the burden of proof to the inspected states, when they did not provide satisfactory answers to findings that unequivocally implied non-compliance with the NPT. Two cases in point were Iran and Syria. IN THE case of Iran, he refrained from indicting it for its "technical" misdemeanors (according to his judgment) and, for years, kept begging Iran for serious replies to questions concerning information indicating the development of nuclear weapons. He did so instead of putting an end to this by the timely transmission of these serious issues to the Security Council for judgment.

In addition, there are reports that he kept to himself information concerning the weaponization part of the Iranian nuclear project. The fact that the information was not released, and the issue of the unanswered questions was not transmitted to the Security Council gave Iran the precious time it needed for advancing its uranium enrichment program, getting closer to the ultimate target of having the potential to produce nuclear weapons in short order.

A serious shortcoming of the interpretation of the results of inspections in Iran was the repeated statement that their purpose was to verify "the exclusively peaceful nature" of Iran's nuclear drive. Under no circumstances can this ambition be achieved in many countries, including Iran. This statement was conspicuously missing from ElBaradei's final report on Iran.

The case of Syria is even more bizarre, in that the IAEA had all the information it needed (supplied courtesy of the American intelligence agencies) to conclude that Syria had been constructing a nuclear reactor at the AlKibar site, similar in many respects to the North Korean plutonium production reactor. Instead, ElBaradei chose to scold Israel for not coming to the IAEA with the information, and letting it deal with the situation. This he did knowing well that the IAEA could do almost nothing about it. All it could have done was request a "special inspection," which Syria could refuse, in the same way North Korea did.

Meanwhile, Syria could have gone on with first the construction, then with the plutonium production, while fortifying its air defenses around the reactor.

While he earned his kudos for the Iraqi case in 2003, when he did not support the allegations that Iraq had an ongoing nuclear weapons development project, he lost them in his efforts to protect Iran and Syria from the same allegations. The motives for his behavior are uncertain, and will not be speculated on here.

## **Hope of North Korea's Return to the Six Party Talks**

Interviewee: Evans J.R. Revere, President and CEO, Korea Society

Interviewer: Bernard Gwertzman, Consulting Editor, CFR.org

**December 11, 2009**

*[EXCERPTS]*

A veteran State Department expert on Northeast Asia, Evans Revere says that the expectations for special envoy Stephen W. Bosworth's initial visit to Pyongyang were "probably pretty low." There were no dramatic results, such as North Korea's agreeing to immediately resume participation in the Six Party Talks on halting its nuclear weapons program. But Revere, who had been a Cyrus Vance Fellow in Diplomatic Studies at CFR, says "the North Koreans do not seem to have slammed the door in terms of coming back to the Six Party Talks, and, in fact, they may have left the door open just a bit more of a crack than it already was, and if that's the case, that's a positive thing."

**President Obama's special representative on North Korean policy, Stephen W. Bosworth, has completed two days of talks in Pyongyang. He had a press conference in Seoul where he spoke in diplomatic niceties, saying, essentially, that it was a "candid and businesslike" meeting and they will hopefully have further meetings in the future, but nothing concrete was apparently achieved. He made it clear that the Obama administration was asking North Korea to come to the Six Party Talks to resume the negotiations on halting North Korea's nuclear program, and he got no commitment on this yet. What did you make of this meeting?**

My sense is that it went pretty much as expected. I think everybody's expectations were pretty moderate, to put it lightly, probably pretty low in terms of what would come out of this initial encounter at the senior level between somebody from the Obama administration and the North Koreans. I think there was probably a lot of exploratory discussion that took place in this encounter seeking to explore North Korean willingness to come back to the Six Party Talks and to reaffirm its commitment to the agreements that had been made in previous rounds of those talks. The North Koreans almost certainly explored what the United States might be prepared to do to induce them to come back to the talks.

*[deletia]*

**Let's look at this from North Korea's point of view. What is it that's holding them back from just saying, "OK, let's go back to the talks and then see what we can get from it." In other words, what is it that they're waiting for?**

The North Koreans are increasingly suspicious, and have been increasingly suspicious of U.S. intentions in recent years. I think there is fundamentally a lack of trust on the part of the North Koreans towards the United States, and vice versa of course. The North Koreans, dealing with the George W. Bush administration, encountered a U.S. administration that they regarded as extremely hostile to them, unwilling to engage them in direct dialogue, unwilling to compromise for the first several years of the Bush term. After four or five years of that sort of a lack of engagement, the Bush administration then changed its approach and adopted a more concessionary or conciliatory approach toward North Korea. That made some very limited progress, but I think at the end of the Bush administration, the North Koreans decided to step back from the process, to reassess where things were.

**There was a pretty solid agreement wasn't there? In 2005 and in 2007?**

If you read the agreements on paper, yes, they were fairly solid agreements. But there was a decision on the part of the Bush administration to set aside two very critical areas of concern. One of those was the possibility that

the North Koreans were working on a surreptitious uranium enrichment program, and the decision was made to defer that issue until a later date when it could be discussed in a better atmosphere. And then there was also the issue of North Korean cooperation with Syria and the construction of a nuclear reactor facility that was eventually destroyed by the Israeli air force. That was an issue of great concern to many in the United States, but was also set aside. The Bush administration then went back to the North Koreans and said, "We have to intensify the verification requirements of these agreements that we've reached." The North Koreans reacted very badly to that; they said that the United States was moving the goalposts unfairly and inappropriately, and so the North Koreans began to back away from their commitments as well.

With the onset of the new U.S. administration, it's likely that the North Koreans decided to do some goalpost moving of their own, and [they] adopted a much harder, more confrontational posture late last year and early this year. They began to walk away even more dramatically from the commitments that they had made in 2005-2007; began to test the new U.S. administration, talking about launching missiles and restarting its reactor and reprocessing facilities like the Yongbyon nuclear facility in North Korea. They eventually fired off a series of missiles; they conducted another nuclear test after having kicked out the International Atomic Energy Agency monitors who were at the Yongbyon facility; they resumed reprocessing their plutonium. They also declared themselves, in effect, a de facto nuclear weapon state, and then they followed that up by stating that they would not give up their nuclear weapons and material even though they had committed to do so. They took a series of other steps, all of which put tremendous pressure on the other parties participating in the Six Party Talks. And the North Koreans also announced that they were pulling out of the Six Party Talks, that the Six Party Talks were dead. And that was essentially the situation up until President Clinton's visit in August, and it was at that point that the North Koreans began to signal that they might be willing to come back to the Six Party Talks, that they might be willing to reengage with the other parties and recommit themselves to their denuclearization obligations. That's pretty much what brought about, eventually, Bosworth's trip.

### **Looking ahead, what will happen next do you think?**

Well, there's been no announcement that North Korea is coming back to the talks, but it was pretty evident from Ambassador Bosworth's comments that there was some movement on this issue. I think it will probably take a few days for us to be completely clear as to how much movement there was. Obviously, the North Koreans do not seem to have slammed the door in terms of coming back to the Six Party Talks, and, in fact, they may have left the door open just a bit more of a crack than it already was. If that's the case, it's a positive thing. And I suspect there will probably have to be some additional encounters. At what level, I don't know. I don't know if it will be at the Ambassador Bosworth level or whether lower-level officials will be able to follow up on these discussions, but I would expect that there would be an additional meeting (or two or three) to clarify positions. Hopefully at the end of the day, this would result in some sort of a North Korean announcement of its willingness to come back to the Six Party Talks, and this is a process I suspect will take weeks, and perhaps even months.

## A Radioactive Situation

BY MARK HIBBS

DECEMBER 30, 2009

As Yukiya Amano takes the helm at the International Atomic Energy Agency, he must contend with escalating conflicts in Iran and Syria, sharp divides among nations on the Board of Governors -- and the long shadow cast by his predecessor.

*[EXCERPTS]*

Strategists in the United States and Iran are now wrestling with a question central to their high-stakes game of nuclear chicken: Who is Yukiya Amano?

At this point, both sides know little more than the contents of his resume: Amano, a Japanese career diplomat, is the successor of Nobel Peace Prize laureate Mohamed ElBaradei. After 12 increasingly high-profile years at the helm of the International Atomic Energy Agency (IAEA), ElBaradei departed the organization at the end of November. Unlike ElBaradei, who took about four years to begin making significant changes as director general, Amano may have to make his own mark at the IAEA very soon, because he will be forced to grapple with a range of challenges ElBaradei left behind: unresolved flashpoints in Iran and Syria, infighting among the staff, and political gridlock dividing the nations that sit on the organization's ruling body, the Board of Governors.

The world will be watching carefully. Amano was elected this July to succeed ElBaradei as director general by a single-vote majority of the 35-member board. Amano's support came from advanced, largely Western, powers. In throwing their weight behind Amano, these countries aimed to trim back the activist political agenda that ElBaradei had advanced over the last decade.

An early indicator of how far Amano is willing to depart from his predecessor's approach will come in mid-February, when he will finish drafting reports on Iran and Syria for the board.

*[deletia]*

Iran is not the only front where Amano will be under pressure to defend the IAEA's prerogatives and credibility. His report on Syria could also reignite an issue about which ElBaradei's critics charge that he failed to enforce international nonproliferation standards and obligations.

This controversy dates back to September 2007, when Israeli jets bombed an installation at a site in northern Syria called al-Kibar. In early 2008, the United States claimed, citing detailed photography of the installation's interior and exterior, that the destroyed plant was a nearly finished nuclear reactor. Since then, the IAEA has been investigating this allegation.

Going back to mid-2008, some Western diplomats and nonproliferation experts have charged that ElBaradei did not make use of the IAEA's established legal authority in pursuing allegations against Syria.

Under ElBaradei there was no internal consensus on this issue. Personnel at the IAEA's Office of Legal Affairs believed that, under Syria's safeguards agreement with the IAEA, the IAEA has the right to request a "special inspection" to get access to data and locations that Syria had previously not declared to the IAEA to be related to its nuclear activities. Such a request has been made only twice -- both times successfully -- in the IAEA's history. But ElBaradei, with the support of EXPO [*IAEA's Department of External Relations and Policy Coordination*], never requested such an inspection in Syria. As in the case of Iran, ElBaradei's reasons for not pushing Syria to the brink appear to have been guided by diplomatic considerations outside the confines of his safeguards mandate.

In September 2008, a senior EXPO official said that the IAEA was disinclined to seek a special inspection because the IAEA had no information suggesting that Syria had failed to declare any nuclear material to the IAEA, as it is required to do under its NPT safeguards agreement. But shortly thereafter, the Department of Safeguards discovered particles of chemically processed uranium in Syrian soil samples, a finding that appeared to corroborate the allegation that Syria had violated its agreement. However, ElBaradei and EXPO were not keen to take any provocative actions that might disrupt the diplomatic efforts of Turkey, EU states, and Israel to pry Syria away from Iran and Hezbollah.

They were also wary that a special inspection request, if denied by Syria, would send the matter to the Board of Governors, which would be intensely divided on how to proceed further. If Syria refused to comply with a special inspection request urged by the United States or other Western board members, the next logical step would be for these states to press for a board finding of noncompliance by Syria. Such a determination would raise the prospect -- as in the case of Iran in 2006 -- that the matter would be referred to the Security Council, and that it would consider imposing sanctions on Syria. Many nonaligned and developing member states, especially Arab and Muslim countries, would object to such a referral.

Today, efforts at engaging Iran appear to be stalled, while Syria continues to stonewall the IAEA's investigation. As Amano addresses these challenges, he will have to pay careful attention to the recent divide that has emerged between the developing and non-aligned countries on the Board of Governors, and the industrialized states that were responsible for his election. Developing nations look to the IAEA to protect their right to develop nuclear technology for peaceful means, and traditionally oppose ambitious programs which would increase their financial obligations. To this end, they supported Abdul Samad Minty, a South African diplomat, during the 2009 election campaign. Advanced nuclear states endorsed Amano hoping that he would reverse what they see as the politicization of the IAEA that occurred under ElBaradei, and fulfil the IAEA's verification mandate to the letter.

Beginning right after his July election, Amano has diligently attempted to win over the countries that opposed him. His initial statements aimed to assure developing countries that he would heed their concerns, and that the advanced states which supported him would not curb their access to nuclear technology or impose additional safeguards burdens. In prepared remarks on Dec. 9, he signalled that he would strictly keep to the IAEA's script in dealing with allegations of nonproliferation transgressions. "I see my role as being to ensure that safeguards agreements are concluded and fully implemented, to provide member states with factual and objective information and analysis, and to act in accordance with relevant resolutions of the U.N. Security Council and the agency's Board of Governors," he said.

His statement also emphasized the IAEA's work on issues such as food security, clean water, health care, cancer control, and assistance in developing nuclear power -- all issues near and dear to the hearts of the board members who did not support Amano in July. It is also no coincidence that Amano's first visit to a member state, in December, was to Nigeria.

As was the case when the Bush administration's actions directly affected ElBaradei's approach to safeguards-related conflicts, the policies of U.S. President Barack Obama will strongly impact Amano's four-year tenure. Should Obama now back off his willingness, displayed throughout 2009, to negotiate with Iran, the IAEA and Amano will come under renewed U.S. pressure to demonstrate firmness in spelling out safeguards noncompliance.

After Amano's election but before he took office, officials from several Western states said these states would urge him to make personnel changes -- particularly at EXPO -- to dismantle the network of aides who had supported ElBaradei and were responsible, in their view, for the IAEA Secretariat's failure to pursue nonproliferation transgressions by Iran and Syria. Pressure on Amano to make key staff changes could be renewed if Obama pursues a more confrontational course with Iran.

So far, however, Amano has made no dramatic interventions in personnel matters. ElBaradei's hand-picked aides at EXPO and in a few other key positions remain in place. Unlike high-ranking U.S. government appointees, senior IAEA staff are civil servants who stay on even when the agency's leadership changes.

As Amano attempts to step out of the long shadow cast by ElBaradei, he will be judged by his ability to re-establish the tradition of consensual governance that characterized the IAEA during most of its half century of existence. This consensus was seriously eroded during the Bush administration, whose propensity for unilateral action polarized member states. Repairing the damage will be no easy task: When Amano submits his two reports on Iran and Syria in February, he will likely face a Western alliance that is quickly losing patience with what it believes have been good-faith negotiations to reach an equitable solution to these countries' disputes with the international community. One thing, however, is certain: As Amano responds to these challenges, the world will begin to discover who he really is.

## Uncovering Syria's Covert Reactor

January 2010

Gregory L. Schulte

### Summary

- In June 2009, one year after the first and only inspector visit in Syria, the IAEA director general reported that the information provided by the country “does not adequately support its assertions about the nature of the site.” In August, he reported that the IAEA’s investigation was “severely impeded” by Syria’s non-cooperation.
- The IAEA must complete its investigation in order to verify the absence of other undeclared activities in Syria, and the country’s regime must be dissuaded from renewing such nuclear pursuits.
- This case is as much about North Korean proliferation as it is about Syrian violations. Exposing North Korean cooperation with Syria could help to disclose and disrupt North Korea’s global network.
- The IAEA Board of Governors should address the Syrian investigation and North Korean proliferation activities at its next meeting in March 2010, and the issues should also be taken up at the NPT Review Conference in May, and the Six-Party Talks on North Korea.
- Newly-appointed IAEA Director General Yukiya Amano should pursue a special inspection of Syria. The IAEA Board should be ready to back him, including through a report to the UN Security Council if the country’s non-cooperation continues.
- The European Union should condition future economic relations with Syria on its cooperation with the IAEA to demonstrate that non-compliance has real consequences.

“Essentially, no progress....” Thus stated bluntly the director general of the International Atomic Energy Agency (IAEA) in its November 2009 report on the agency’s investigation of undeclared nuclear activities in Syria.

The absence of progress is no fault of the IAEA’s professional cadre of inspectors. Indeed, the IAEA Department of Safeguards has uncovered more than the Syrian government ever wanted to be known about the reactor destroyed by an Israeli air strike in September 2007. The fault for the current stalemate lies with

President Bashar Assad's government, which first buried the remains of the reactor and now seeks to bury the IAEA investigation.

This essay reports on the current state of the IAEA investigation, explains why it must be completed, and suggests a way ahead. The importance of the investigation goes well beyond a destroyed facility in Syria's eastern desert; its outcome will advance or retard world efforts to disrupt North Korea's nuclear exports and to shore up a global nonproliferation regime shaken by Iran's nuclear pursuits.

## **An Investigation “Severely Impeded”**

The IAEA launched its investigation after being briefed by the U.S. government in April 2008 that Syria had been secretly building a nuclear reactor until its destruction seven months before. This reactor, which had no obvious civil purpose, was being built in the remote desert with North Korean assistance. It had striking similarities to the gas-cooled graphite-moderated reactor at Yongbyon, which North Korea had used to produce plutonium for its nuclear weapons.

By failing to notify the IAEA before the reactor's construction, Damascus had violated its Safeguards Agreement. Moreover, discovery of the reactor may help explain why Syria had refused to adopt the IAEA's Additional Protocol. This protocol, already signed by nearly 130 countries, would have granted IAEA inspectors expanded information and access related to Syria's nuclear activities and thus would have increased the likelihood of their finding this secret facility.

The IAEA's investigation was severely impeded by Syria, which vehemently denied the existence of the reactor and vigorously removed and covered up what remained. By the time IAEA inspectors arrived in June 2008, much of an adjacent hill had been bulldozed over the reactor remains and a new building had been constructed on top. Syrian authorities presumably thought that their extraordinary efforts at concealment would succeed in defeating the IAEA's inspectors. They were wrong.

The IAEA inspectors did their homework before the June 2008 visit, gathering and assessing information from a variety of sources. Upon arrival in Syria, the inspectors posed tough questions about the destroyed facility and suspicious procurement activities. The Syrian authorities refused to provide answers. The inspectors asked to visit three other suspect sites. The Syrian authorities again refused. The IAEA later obtained commercial satellite imagery showing apparent cleanup activities at those sites.

The inspectors also took environmental samples at the reactor site. Subsequent analysis by the IAEA's network of laboratories revealed manmade uranium particles of a type that Syria had not declared to the IAEA. Syrian authorities were quick to claim that the particles came from the Israeli air strike. International experts observed that the particles were not from depleted uranium, which is sometimes used in conventional munitions. After a careful assessment, the IAEA Department of Safeguards dismissed Syria's claim as a “low probability”—a very forceful denial by the standards of mildly-worded IAEA reports.

The presence of manmade uranium particles at the reactor site remains a mystery. Was uranium to fuel the reactor already there? Were other clandestine nuclear activities taking place at the site? Did the particles come from clandestine activities elsewhere in Syria, or even from North Korea?

In August 2008, IAEA inspectors discovered more unexplained uranium particles at Syria's Miniature Neutron Source Reactor, a known research reactor in Damascus. As of the November 2009 IAEA report, the Department of Safeguards is still not satisfied with Syrian explanations for the presence of these particles. Their source is another mystery. Were they associated with peaceful research that Syria neglected to declare to the IAEA? Were they associated with the reactor being built in the desert? Or were they associated with a different project entirely?

Despite the mystery, indications of undeclared material at two sites in Syria give the inspectors an indisputable basis for their investigation, in addition to the information provided by member states. Indeed, the existence of undeclared nuclear material in Syria obligates the Agency to investigate its origin.

Syria's cover-up having been less than successful, Damascus changed tactics. Claiming that the reactor site and the other three sites were "military related," Syrian authorities refused to provide any further access or information about those sites or associated activities. IAEA lawyers protested that Syria's Safeguards Agreement did not exclude "military" sites, but to no avail. Syrian cooperation ground to a halt, particularly after reports that a sniper's bullet killed the Syrian general who had escorted the IAEA inspectors on their only visit. Perhaps someone in Damascus or elsewhere did not want Syria's covert activities to be uncovered. Or perhaps someone elsewhere did not want them to be continued.

In June 2009, one year after the first and only inspector visit, the IAEA director general offered a grim report. He informed the IAEA Board of Governors that the information provided by Syria "does not adequately support its assertions about the nature of the site" and that Syria "needs to be more cooperative and transparent." In August, the director general went even further, reporting that the IAEA's "ability to confirm Syria's explanation regarding the past nature of the destroyed building ... is severely impeded because Syria has not provided sufficient access to information, locations, equipment or materials." In November, as described at the outset, he reported that "no progress has been made since the last report to clarify any of the outstanding issues relevant to the implementation of safeguards."

## **Why Does This Matter?**

Syria's secret reactor is history. Bombed, broken, and buried, it will never be resurrected for purposes peaceful or military. The IAEA investigation has some semblance to an archeological expedition in hostile territory. Yet uncovering Syria's clandestine activities is more—much more—than of historic interest.

First, the IAEA must verify the absence of other undeclared activities in Syria. The Syrian reactor had marked similarities to the North Korean reactor at Yongbyon. The Yongbyon reactor had an associated facility for nuclear fuel rod manufacture and another for plutonium reprocessing, where the plutonium was extracted for North Korea's nuclear weapons. Were comparable facilities contemplated or constructed in Syria? What was Syria doing at its research reactor near Damascus? What was it doing at the various sites that IAEA inspectors were not allowed to visit? IAEA inspectors must ensure that Syria is not hiding any other nuclear activities. Or, if further clandestine facilities are found, the IAEA must, at a minimum, put them under safeguards or, better yet, verify their destruction.

Second, the Syrian regime must be dissuaded from renewing such nuclear pursuits. Syria's motives in building a secret nuclear reactor are unknown. Even experts on Syria remain baffled. Was Syria's leadership seeking prestige and a demonstration of technical prowess? Did they see a nuclear program as leverage to regain the Golan Heights or to protect the regime from Israeli attack? Was the young President Assad trying to demonstrate his manhood after replacing his father? Some or all of these motives could still exist. Moreover, Iran's steady progress toward a nuclear weapons capability could give Damascus renewed impetus to renew its clandestine activities. The temptation will be greater if the Syrian regime believes that it can block an IAEA investigation and suffer no consequence.

Third, this case is as much about North Korean proliferation as it is about Syrian violations. North Korea has a long history of military cooperation with Syria and other countries, including Iran. Traditionally, cooperation has involved missile and conventional military equipment. Assistance in building the covert reactor shows that North Korea has also become a nuclear supplier. Where else might Pyongyang be peddling its nuclear wares? We must not allow North Korea to replace A. Q. Khan as the world's supplier of nuclear weapons technology. Exposing North Korean cooperation with Syria could help to disclose and disrupt North Korea's global network.

Finally, the integrity of the nonproliferation regime is at stake. Syria, North Korea, and other countries must not conclude that refusing cooperation with the IAEA protects against international scrutiny and sanction. President Barack Obama has called for a world with no nuclear weapons, a vision that has global appeal. Yet this vision will become fatally distant if the IAEA cannot investigate—let alone detect and deter—the type of clandestine activities conducted by Syria and North Korea.

## **What Is To Be Done?**

**First, the IAEA and its member states must keep a spotlight on Syria's illicit activity and the dangerous role of North Korea.**

The IAEA investigation should remain on the agenda of the IAEA Board of Governors, and Syria should be kept off the Board. A spotlight must also stay trained on North Korea's involvement. In one of his final acts as director general, Mohamed ElBaradei removed North Korea from the IAEA Board agenda. The Board should use the Syrian investigation to put North Korea back on the agenda with a new focus on DPRK proliferation activities.

Deliberations at the next meeting of the IAEA Board in March should be used to prepare discussion of both Syria's non-cooperation and North Korean proliferation at the Nuclear Non-Proliferation Treaty (NPT) Review Conference in May. Review Conference participants should use the illicit cooperation between the two countries to show the importance of strengthening the IAEA's verification capabilities, including the need for the Additional Protocol. They could also use the Syrian investigation to show how sustained non-cooperation should be treated as non-compliance so that safeguards violators are not rewarded for stonewalling IAEA investigations. Some experts may argue that, to avoid controversy, the Review Conference should not address specific cases of non-compliance. But as one leading nonproliferation expert recently remarked, it is irresponsible for firemen to hold a convention while ignoring a fire blazing outside. The presence of two arsonists in the convention should not keep the rest from their duty.

North Korea's role in building the Syrian reactor should also be a subject for the Six-Party Talks on the DPRK. To date, North Korea has merely declined to deny its involvement. This is not enough, particularly if one goal of the talks is to obtain verifiable assurances of nonproliferation. By raising this case with North Korea and pressing Syria at the same time, we may even generate some helpful mistrust between the two illicit nuclear conspirators.

Finally, the Syrian investigation should remain on the agenda of the many visitors to Damascus and the smaller number to Pyongyang. This issue may not be at the top of our diplomatic agenda with the two countries, but it must not fall off the bottom. Moreover, pressing for IAEA cooperation should not be a talking point only of the United States. Convincing Arab states to raise this in Damascus, and China in Pyongyang, would provide a new and useful diplomatic nudge.

**Second, the IAEA should move forward with a special inspection.**

Syria's Safeguards Agreement allows special inspections "if the Agency considers that information made available by Syria, including explanations from Syria and information obtained from routine inspections, is not adequate for the Agency to fulfill its responsibilities." The ongoing investigation, "severely impaired" by Syria's non-cooperation, easily meets this test. Indeed, James Acton, Mark Fitzpatrick, and Pierre Goldschmidt have argued persuasively that Syria is a "textbook definition of a case in which a special inspection is merited."<sup>1</sup>

A special inspection need not be restricted to locations that Syria has declared to the IAEA. Special inspections can also encompass any other sites that the inspectors seek to visit or any information that the inspectors need to fulfill their verification task. The IAEA has already laid a strong basis for a special inspection through its written

request on October 23, described in the November report, seeking “access to locations where the debris from the destroyed building, the remains of munitions, the debris from equipment and any salvaged equipment had been and/or are located.” If Syria refuses to grant this request on a voluntary basis, the director general can invoke a special inspection.

If Syria disputes a special inspection, the IAEA Board can decide that action is “essential and urgent” and “call upon Syria to take the required action without delay.” If Syria still refuses, the Board may conclude that Syria’s noncooperation constitutes non-compliance and report this to the UN Security Council. Indeed, the Security Council, in the very first operative paragraph of its Resolution 1887 of September 24, “emphasizes that a situation of noncompliance with non-proliferation obligations shall be brought to the attention of the Security Council.” Syria’s sustained non-cooperation is a “textbook case” for both a special inspection and a report to the Security Council.

If Syria persists in non-cooperation, the IAEA Board would need to make a succession of decisions to declare a special inspection “essential and urgent,” find Syria in non-compliance, and report it to the Security Council. This would provide both leverage and space—perhaps through next autumn—to convince Damascus to change its course. However, the decisions would also likely require a series of contentious votes, since spoilers like Cuba and Venezuela are among the Board’s 35 members. Positive Board decisions should be achievable with sizeable majorities, just as the Board adopted its recent resolution on Iran with 25 members voting in favor and only three voting against. However, the United States and other like-minded countries should start through quiet diplomacy laying the basis for these Board decisions.

While the IAEA Board must be ready to provide its support, special inspections must be initiated by the director general. Special inspections have not been used since North Korea, and a special inspection of Syria could be one of the first decisions for Ambassador Yukiya Amano, the new director general. This will be a difficult decision for Amano, who wants to rebuild consensus in the Board but also understands the critical importance of the IAEA’s verification role. The United States and other like-minded countries should signal to Amano their readiness to back him in initiating a special inspection and to solicit support from a majority of Board members if Syria refuses. This is critical since a failure by the Board to back a request for a special inspection would damage the new director general personally and the nonproliferation regime more broadly.

Some experts may argue that a special inspection that is refused would undercut the nonproliferation regime. I disagree. A refused special inspection that generates a report to the UN Security Council would at least show that the system works. On the other hand, shirking from a special inspection for fear of refusal would only encourage further non-cooperation by Syria and future violators of safeguards commitments. It is better to have a watchdog that barks, rather than one kept locked up and quiet in a cage.

In a recent speech on strengthening the nonproliferation regime, Secretary of State Hillary Clinton said that the IAEA “must make full use of existing verification authorities, including special inspections.” Syria is the textbook case. If not now, then when?

**Third, the European Union should condition future economic relations with Syria on its cooperation with the IAEA investigation and adoption of the IAEA’s Additional Protocol.**

Syria is accustomed to being under international scrutiny. Moreover, President Assad has been largely successful in diverting international attention from a separate UN investigation into the assassination of former Prime Minister Rafiq Hariri of Lebanon. Thus, international attention and special inspections may not be enough to convince Assad to expose past misconduct or to turn on his North Korean partner in proliferation.

In contrast, international trade and investment are vitally important to Assad and his pursuit of economic growth and reform. He and his advisers are eager to increase trade with Europe and attract European investment. Economic opportunity may be the one inducement that could entice Damascus away from Pyongyang.

The EU has signed an Association Agreement with Syria that would improve trade relations. The agreement will not enter into force until it goes over further procedural hurdles, including approval by European parliaments. The agreement with Syria, like many other EU agreements, includes a nonproliferation clause, and EU policy provides for the suspension of ratification in cases of nonproliferation concern. Catherine Ashton, the EU's new high representative, could inform Assad that the Association Agreement will be put "on hold" until the IAEA investigation is closed and Syria takes steps to rebuild international confidence, including by adopting the Additional Protocol.

The European Union stresses the use of multilateral diplomacy to prevent proliferation and strengthen the nonproliferation regime. Here is a case where Europe can back diplomacy with its economic weight. By taking this step before the NPT Review Conference in May, the EU could demonstrate that it is a serious player and that non-compliance has real consequences.

## **A Watchdog That Barks**

President Assad seeks to bury the IAEA investigation just as his bulldozers buried the reactor remains. He undoubtedly hopes that the world's focus on Iran will help him succeed.

Yet as Iran moves closer to possessing nuclear weapons, other countries in the Middle East and elsewhere may follow suit, with North Korea eager and ready to help. If we are serious about achieving a world without nuclear weapons, we must either dissuade or prevent these countries from joining a new arms race. This means that we must be in a position to detect, disrupt, and penalize further proliferation. The IAEA will need to play an important role. For it to be effective and credible, we must aggressively back its investigation of Syria. The stakes go well beyond reconstructing the history of a reactor in ruins.

Yukiya Amano, as the new director general, faces major challenges. Foremost among these is restoring the IAEA's effectiveness and credibility after its investigations of Iran and Syria became mired in obstruction, politics, and personal ambition. Open the cage, and take off the muzzle. Whether investigating Syria or other proliferators, the IAEA must be a watchdog that barks.

The author acknowledges the support of the Carnegie Endowment in helping him to think through this issue, including the discussion that Carnegie organized on September 22, 2009, entitled "Probing the Rubble of Syria's Covert Reactor: Next Steps and Implications for the IAEA." James Acton was the moderator.

## **Syria Defence And Security: Syria's Support Of Iran, Hamas And Hizbullah, While Popular Domestically, Is Straining Relations With The West**

New report provides detailed analysis of the Defence market

Published on January 27, 2010

by Press Office

(Companiesandmarkets.com and OfficialWire)

LONDON, ENGLAND

*[EXCERPT]*

Despite the overwhelming sense that relations between Syria and the West are moving forward, ongoing investigations into the country's alleged nuclear programme will raise some concerns. Without greater cooperation from Syria, we believe that the nuclear issue could become a stumbling block in its negotiations with the US. The reported discovery of traces of uranium at a second Syrian site by the International Atomic Energy Association (IAEA) provides an illustration of the numerous obstacles that still remain to the resumption of full and friendly relations between Syria, the US and the wider international community.

## **Can Iran's Accelerating Nuclear Program Be Stopped?**

Leonard S. Spector

10 March 2010

*[EXCERPT]*

Still more troubling is a report suggesting that North Korea may be assisting the Iranian nuclear effort. Although North Korea was believed to have helped Syria construct a reactor designed to produce plutonium for nuclear weapons no evidence had surfaced publicly that North Korea, Syria, and Iran might be collaborating to advance Tehran's nuclear capabilities.

Israel destroyed the Syrian reactor in a September 2007 air strike. In late February 2010, however, news reports quoting Western officials stated that before the reactor was attacked, North Korea had delivered 45 tons of unenriched uranium concentrate, known as "yellowcake," to Syria – and that North Korea had subsequently moved the material to Iran via Turkey. Iran has limited domestic supplies of uranium, and the US and its allies have been attempting to curtail Iran's access to external suppliers of the material. The 45 tons from North Korea (which has domestic sources of uranium) and Syria, sufficient for several nuclear weapons if enriched to weapons grade, would deal a setback to this US initiative.

A North Korea-Iran nuclear nexus could gravely undermine international nonproliferation efforts. The North Korean yellowcake transfer, for example, could be only the first of many such shipments. As North Korea itself has been attempting to enrich uranium using the same technology as Iran, Tehran could return the favor by assisting Pyongyang make this program a success. After having flagrantly violated relevant UN Security Council resolutions by continuing their respective nuclear operations, it now appears that North Korea and Iran may have begun to assist each other to bypass the Council's demands.

## America, Russia and arms control

### It takes two

Arms cuts get you only so far; a safer world needs tighter anti-proliferation rules too

Mar 31st 2010 | From The Economist print edition

*[EXCERPTS]*

WHEN Barack Obama promised, in Prague a year ago, to “seek the peace and security of a world without nuclear weapons” and won a Nobel peace prize for it, even he felt that the accolade was a bit premature. His Prague to-do list was long: reduce the role of nuclear weapons in America’s defences; cut the number of nukes, too, in a bold new treaty with Russia; win Senate ratification of the test-ban treaty; seek a United Nations ban (or “cut-off”) on making fissile material for bombs; and meanwhile secure all nuclear materials from terrorist reach.

The real prize Mr Obama was after was international support for a stronger Nuclear Non-Proliferation Treaty (NPT) at its upcoming five-yearly review in May. For North Korea, Iran and others have battered its anti-nuclear foundations.

Mr Obama will be back in Prague on April 8th to sign the promised new strategic-arms reduction treaty with Russia’s Dmitry Medvedev. Even as he lifted the spirits of would-be disarmers a year ago, Mr Obama acknowledged that a world without the bomb would probably not come in his lifetime. Since then he has found that ticking off items on his “getting to zero” list is considerably harder than he imagined.

*[deletia]*

So Mr Obama is hoping that a special nuclear-security summit in Washington, DC, on April 12th and 13th will provide some needed momentum going into the NPT review. The idea is to bring together disparate efforts to prevent illicit trade in nuclear technologies and materials, as part of parallel efforts to encourage countries to buy in nuclear-fuel services from reputable suppliers, rather than make it themselves with technologies that can also be abused for weapons.

But will this be enough? Mr Obama wants to strengthen the NPT’s rules, by getting everyone to sign up to an Additional Protocol of tougher inspections and by making it harder for a cheat simply to shrug off the treaty when caught, as North Korea did. Yet even those obvious steps run into opposition.

Iran is still a treaty member—in good standing, it claims, though others suspect a hidden military programme—and will resist moves that could cramp its nuclear style. Egypt has long refused to accept more intrusive inspections until there is progress on making the Middle East a zone free of weapons of mass destruction. This is a dig at Israel’s arsenal, though others are suspected of having chemical and biological weapons too, and Syria is suspected of having been planning to produce plutonium at a secret nuclear reactor built with North Korean help, and possibly Iranian finance, that was bombed by Israel in 2007 shortly before its completion.

## Ukraine Uranium Agreement Gives Obama Summit Result (Update1)

By Viola Gienger and Kate Andersen Brower

April 13, 2010, 1:45 PM EDT

[EXCERPTS]

April 13 (Bloomberg) -- Ukraine's agreement to relinquish its entire stockpile of highly enriched uranium gave President Barack Obama the first concrete result for a summit he convened on securing the world's atomic material.

Under the terms of the accord, Ukraine will dispose of roughly 90 kilograms of the uranium, "enough to construct several nuclear weapons," and convert nuclear research reactors to use lower grade fuel, White House press secretary Robert Gibbs said.

[deletia]

Two potentially high-risk sources of illicit nuclear materials, Iran and North Korea, weren't invited to the summit and aren't specifically part of the agenda.

While Iran isn't known to have succeeded in enriching uranium to weapons grade, its suspected support for militant groups raises the specter that it ultimately also might slip material to terrorist allies, said Robert Gallucci, a former U.S. special envoy on the spread of missiles and nuclear weapons.

North Korea

In North Korea, Kim Jong-Il's government has plutonium and said last year that it has almost succeeded in developing highly enriched uranium.

"We should not limit our concern about the nuclear programs in Iran and North Korea to their acquisition of nuclear weapons," said Gallucci, now president of the John D. and Catherine T. MacArthur Foundation, which supports projects to reduce the risk of nuclear weapons.

Tracing material back to its source may be difficult and even tracking movement of nuclear supplies across the globe presents challenges, Gallucci said. He cited North Korea's suspected role in helping Syria construct a nuclear reactor that the Israelis bombed in September 2007.

"To the best of my knowledge, the United States government was surprised to learn that the North Koreans were building a plutonium-production reactor in Syria," Gallucci said. "That tells me that, if we are looking for relatively small amounts of material, we should not expect to catch that movement."

## **Former US Officials Express Concern over N. Korea Selling Nuclear Technology**

Hwang Sung-hee, Arirang News

APR 13, 2010

Former high-ranking officials in the United States say North Korea may be selling its nuclear know-how to other nations.

At a recent meeting with a group of military officials, Gregory Schultz, the former US ambassador to the International Atomic Energy Agency from 2005 to 2009, said the latest speculation over a North Korea-Syria deal is a clear example of the communist state's readiness to trade not only its ready-made weapons, but also its nuclear technology.

According to Tuesday's report by Radio Free Asia, or RFA, Schultz said the rumored deal shows Pyongyang's willingness to share its know-how with not just Syria but any countries that seek it, such as Myanmar and Venezuela.

And during an interview with RFA on Monday, Robert Gallucci, an American non-proliferation expert and former ambassador, said many countries are under the illusion that North Korea will never use its nuclear weapons.

## War Games

By Yossi Melman

7:00 am Apr 15, 2010

[deletia]

Twice during the last three decades Israeli warplanes destroyed nuclear facilities built by its enemies.

[deletia]

After the [OSIRAK] raid, Begin's strong conviction—described by commentators as the “Begin Doctrine”—held that Israel would never allow any country in the Middle East to possess nuclear weapons that could threaten its existence.

The next time the Begin Doctrine was tested was in September 2007. This time the attack was directed at a nuclear reactor Syria was building on the banks of the Euphrates River, near its borders with Iraq and Turkey. The Syrian reactor was constructed with North Korean technology and expertise, modeled on the Pyongyang reactor, and partly financed by Iran.

Operationally, the second raid resembled the first. Formations of Israeli Air Force F-16 and F-15 fighters took off from the Ramat David base in northern Israel and flew at low altitude, this time over the Mediterranean. They penetrated Syria's air space near its border with Turkey without being detected and fired missiles from a distance of 40 kilometers. The Syrian air defenses were blinded by electronic warfare. By the time they realized what was happening, it was too late: The reactor had been completely destroyed.

There are a few outstanding differences between the two attacks. Before the attack against the Iraqi reactor, Israel shared its intentions with no one, not even its main strategic ally, the United States. After the raid, Israel took full credit and responsibility. In the Syrian case, Israel, led by Prime Minister Ehud Olmert and Defense Minister Ehud Barak, informed the United States a few hours before the attack and since then has neither confirmed nor denied its action.

[deletia]

Both of Israel's current defense leaders—the chief of staff, Major General Gabi Ashkenazi, and Defense Minister Ehud Barak—are considered cautious by nature and checks on the sometimes hasty Netanyahu. Both played key roles in the decision to bomb Syria's reactor, and both expressed private doubts and reservations about the wisdom of an Israeli attack on Iran.

[deletia]

## **How to React to a Reactor**

Using Syria's Nuclear Program to Engage Damascus

Andrew J. Tabler

April 19, 2010

### Summary:

The United States must push to reinvigorate the IAEA's investigation of Syria's suspected nuclear program. Washington's insistence would not only strengthen the global nonproliferation regime but also provide the Obama administration with leverage in its trying diplomatic engagement with Damascus.

ANDREW J. TABLER is Next Generation Fellow at the Washington Institute for Near East Policy and author of the forthcoming book *In the Lion's Den: Inside America's Cold War With Asad's Syria*.

In his confirmation hearing in March, Robert S. Ford, the U.S. ambassador-designate to Syria, listed five issues that will be at the core of the Obama administration's engagement with Damascus. Four were familiar: the United States wants Syria to prevent jihadi fighters from entering Iraq, end its support for Hezbollah, return to peace talks with Israel, and respect human rights at home.

But the fifth issue was a new one: Ford argued that Washington should insist that Syria end its foot-dragging on the International Atomic Energy Agency's investigation into its nuclear activities. For nearly two years, Syria has refused to cooperate with the IAEA's probe of a suspected nuclear reactor that was destroyed by Israel in September 2007. Now the IAEA may request a rare "special inspection" of Syrian sites, making the country's nuclear defiance the international community's main point of contention with Damascus -- eclipsing even the investigation into Syrian officials' involvement in the assassination of former Lebanese Premier Rafik Hariri.

Indeed, the international community cannot afford to let Syria's proliferation attempts go unaddressed, since the violations threaten the global nonproliferation regime and may be evidence of a wider nuclear program. Even more, the IAEA's investigation could provide Washington much needed leverage in its increasingly trying diplomatic engagement with Damascus.

The story of Syria's nuclear program has been quietly building for more than two and a half years. On September 6, 2007, Israeli jets took part in Operation Orchard, bombing a nondescript building at a site in eastern Syria called Al-Kibar, near the city of Deir ez-Zor. In April 2008, U.S. intelligence authorities released a video showing that the building had hid construction of a graphite-cooled nuclear reactor similar to North Korea's reactor at Yongbyon, which produces plutonium for the country's nuclear weapons. The video contained satellite photographs of the site, still shots of the reactor under construction, and a photograph of the directors of North Korea's and Syria's nuclear programs standing arm in arm.

In June 2008, Syria allowed the IAEA to access the Al Kibar site, but inspectors were unable to examine the reactor ruins because Syria had cleared the site of wreckage, buried what remained, and constructed a new building on top. Nevertheless, they found particles of chemically processed uranium of a type Syria had not declared to the IAEA. Satellite photos of the site and the list of parts Syria had procured for its construction posed additional questions. Syria soon cut off cooperation with the IAEA investigation, denying further visits to Al Kibar and three associated sites.

Separately, IAEA inspectors found other unexplained uranium particles during a routine inspection of Syria's miniature neutron source reactor, a research reactor outside Damascus that had been declared to the IAEA. Syrian authorities twice tried to explain the presence of these particles, but IAEA inspectors found their

explanations inadequate, believing instead that they raised concerns about possible links to the particles found at Al Kibar. Although Syria allowed IAEA inspectors to return to the research reactor this month, it continues to spurn IAEA requests to visit Al Kibar, citing national “sovereignty.” (A report written by Gregory L. Schulte, who was U.S. Ambassador to the IAEA from 2005 to 2009, lays out the IAEA’s investigation, Syria’s defiance, and the resulting policy recommendations. Schulte also contributed to this article.)

The IAEA’s latest report on the Syria investigation was the first released by the new IAEA director-general, Yukiya Amano, who took office in July 2009. It was blunt and forthright, clearly restating that the destroyed facility had all the characteristics of a nuclear reactor and openly questioning whether Syria’s declarations were correct and complete.

The Syrian government denies that the Al Kibar facility housed a nuclear reactor. At first, it claimed that the uranium particles found at the site came from the bombs Israel had used to destroy it, an explanation the IAEA dismissed as having a “low probability.” Then, at a recent IAEA Board of Governors’ meeting, Syrian Ambassador Bassam Sabbagh claimed that Israeli planes sprinkled the particles over the site -- an equally specious explanation that cannot account for the particles found at the research reactor outside Damascus. Glyn Davies, the current U.S. ambassador to the IAEA, described Syria’s latest assertion as “desperate.” Other ambassadors have shared his disdain: in a three-page statement, the European Union -- Syria’s largest Western donor -- said it was “essential” that Syria clarify its response and provide “access to all locations and documentation.”

Even though Syria’s covert reactor no longer exists, there are a number of reasons why the country’s nuclear program should remain at the top of the U.S. policy agenda in Syria. First, a strong IAEA is important at a time when the international community is confronting the nuclear ambitions of Syria’s ally, Iran. Allowing Syria to rebuff IAEA inspectors would undermine the global proliferation regime -- a particularly dangerous possibility given that Iran’s nuclear violations risk sparking a nuclear arms race in the Middle East. By getting to the bottom of Syria’s clandestine program, the world’s nuclear watchdog can show that it has regained its clout.

Second, the particles found at the research reactor, plus Syria’s refusal to allow the IAEA access to three other suspect sites, suggest the existence of a larger program. Particularly troubling is the apparent involvement of North Korea, a notorious nuclear violator and weapons proliferator. Reports of Iran’s involvement are equally worrisome. The IAEA has an obligation to ensure that there are no other undeclared activities in Syria, and the world has an interest in breaking up further multinational proliferation ventures, whether they traffic in missiles or nuclear weapons technology.

Third, although the precise motives behind Syria’s nuclear activities are unknown, a primary impetus was likely the Assad regime’s obsession with obtaining a deterrent against Israel. Syria’s nuclear program was the capstone of one of the Middle East’s most active chemical and biological weapons programs. This program, together with Syria’s extensive surface-to-surface missile capabilities, is a major source of potential contention and conflict between Syria and Israel. Any future U.S.-negotiated peace treaty between Syria and Israel may need to include a deal -- similar to the one that convinced Libya to end its nuclear program in exchange for the lifting of international sanctions -- for Syria to divulge its nuclear pursuits. Indeed, only a peace treaty with Israel may persuade Damascus that coming clean is in its strategic interest.

U.S. engagement with Syria has already been fraught with difficulty. After a February 25 meeting with Iranian President Mahmoud Ahmadinejad and the Hezbollah leader Hassan Nasrallah, President Bashar al-Assad mocked the United States’ goals of creating tension between Tehran and Damascus -- just days after U.S. Under Secretary of State William Burns visited Damascus to pursue that agenda. To make matters worse, new reports suggest that Syria has been supplying sophisticated weapons -- including missiles capable of carrying nuclear and chemical payloads -- to Hezbollah. And last but not least, U.S. efforts to foster even indirect negotiations between Syria and Israel have yet to yield results.

Regardless of whether talks between Syria and Israel resume any time soon, if Damascus were to come clean on its nuclear program, the revelation would be a major confidence-building measure that would significantly improve strained U.S.-Syrian relations. The IAEA investigation provides an opportunity for the United States and its Western and regional allies to gain some leverage in getting Syria to make concessions on central issues. To date, the engagement strategies of the United States, France, and the Arab Gulf states have been uncoordinated and conflicting, but all these countries have an interest in convincing Syria to admit its nuclear activities and to lure Damascus to the peace table and away from Tehran. Windows of opportunity to apply pressure -- as well as a way out for Syria -- will arise with every regular IAEA report.

Realistically, Assad is unlikely to move unless the IAEA orders a special inspection of Al Kibar and other sites. Syria's safeguards agreement with the IAEA, which outlines the country's obligations under the Nuclear Nonproliferation Treaty, allows special inspections "if the Agency considers that information made available by Syria . . . is not adequate for the Agency to fulfill its responsibilities." As its latest report documented, the IAEA has now reached that point. If Syria refuses to allow inspections, the IAEA Board of Governors can decide that the action is "essential and urgent." If Syria refuses again, it can find Syria in noncompliance and report the country to the UN Security Council.

There is no doubt that Assad wants the IAEA investigation -- like the Hariri tribunal -- to fall off the international agenda. If the IAEA refers the matter to the UN Security Council, it would be an embarrassment that would set back Assad's desire for closer trade and commercial ties with the West. It could even lead to sanctions.

Meanwhile, quiet engagement by the United States, coordinated with permanent members of the Security Council could show Assad a way out through full cooperation with the IAEA. Should Syria seize that opportunity, two major benefits would result: the role of North Korea and any involvement by Iran would be exposed, and the IAEA would prove that it cannot be stymied by uncooperative countries. If Syria balks, referring this issue to the Security Council would maintain the integrity of the nonproliferation regime while providing a source of leverage for the broader agenda of fostering Syrian-Israeli peace. Whatever the outcome, one thing will be clear: Syria's nuclear aspirations will not go unnoticed.

## **Achieving Success at the 2010 Nuclear Non-Proliferation Review Conference : David Albright Testimony before the House Committee on Foreign Affairs**

**April 21, 2010**

*[EXCERPT]*

Syria's purchase of a secret nuclear reactor from North Korea reminds the international community again of the weakness of IAEA inspections absent the Additional Protocol and the unreliability of national intelligence agencies to consistently detect secret nuclear facilities early in their construction. Although Israel's bombing of the reactor in 2007, soon before it would have gone into operation, is widely seen as a harsh criticism of the existing non-proliferation regime, the use of military force offers only short-term success in setting back nuclear ambitions. There is no assurance that Syria will not try again. Moreover, bombing is more of a desperate act of last resort and does not contribute to establishing a system in which confidence can exist that countries are not violating their NPT commitments.

## **Leon Panetta gets the CIA back on its feet**

By David Ignatius

Sunday, April 25, 2010

*[EXCERPT]*

Panetta put his mark on the agency this month by choosing his own deputy, Michael Morell, 51, to replace Stephen Kappes, a respected career officer who acted as Panetta's adviser on operations. Morell is a 30-year CIA veteran, but he comes from the analytical side of the house. This should give the clandestine service more running room. An autoworker's son from Akron, Morell defies the preppy, blue-blood CIA stereotype; that's another plus.

Morell's top priority will be to increase collaboration between analysts and operators, which is already paying dividends. To cite two examples: The secret Iranian enrichment facility at Qom was discovered after a tip from a human source, with analysts then focusing intelligence collectors on precisely where to look; and Syria's secret nuclear reactor was found in 2007 after analysts studied suspicious fragments of intercepted conversations and warned the operations division to look for the smoking gun.

Security Brief: 'The Agency man' a natural for CIA's #2  
April 27th, 2010 11:55 AM ET

*[EXCERPTS]*

No doubt about it, Michael Morell is an Agency man. As the CIA's current Director for Intelligence, Morell has put in some 30 years and counting and has done an impressive job of climbing the ranks in the intelligence world while keeping critics at bay, no small feat in today's controversial intelligence environment.

*[deletia]*

"He's been a strong proponent of integrating analysis and operations, something that has led to major intelligence successes such as the discovery of Iran's undeclared uranium enrichment facility and Syria's covert nuclear reactor," says CIA spokesman George Little. "Fusing those two vital aspects of our intelligence mission will remain a top priority for him as Deputy Director."

## **North Korea and Syria: A Warning in the Desert**

Pyongyang's covert sale of nuclear technology to Syria holds broader lesson

Gregory L. Schulte

28 April 2010

WASHINGTON: North Korea has dropped tantalizing hints about rejoining the Six-Party Talks on its nuclear program, having walked out of the talks in 2009. There is at least one catch: After its two nuclear tests, Pyongyang wants to rejoin as a nuclear-weapon state and not as a party that had committed to abandon its nuclear program.

According to South Korean press, North Korea's foreign ministry recently wrote that it is ready to "take part in international efforts on nuclear disarmament on an equal footing with other nuclear weapons states." Perhaps miffed at being excluded from President Barack Obama's recent nuclear security summit, North Korea reportedly proposes to "join forces with the international community in nuclear non-proliferation and safe storage of nuclear materials."

The recent sinking of a South Korean ship may also sink the Six-Party Talks, making moot both their purpose and the agenda. If the talks resume nonetheless, the United States and its diplomatic partners cannot accept North Korea's desire to be recognized as a nuclear weapon state. However, the five countries – US, Russia, Japan, South Korea and China can – and should – accept North Korea's suggestion that the talks address nonproliferation.

North Korea has a penchant to proliferate to earn a living, and warning about this proliferation lies buried in Syria's desert. There, at a remote location near the Euphrates, North Korean technicians were helping Syria build a covert nuclear reactor until Israel warplanes bombed it in September 2007.

North Korea reportedly proposes to "join forces with the international community in nuclear non-proliferation and safe storage of nuclear materials."

This reactor, destroyed before it started operations, had no obvious civil applications. It was built in great secrecy and without the required notification to the International Atomic Energy Agency. Once destroyed by Israeli bombs, Syria quickly hid the remains from international scrutiny. Much of a neighboring hill was bulldozed over the reactor remains, and a new building erected on top.

North Korean experts were reportedly involved in both construction and cover-up.

This gas-cooled, graphite-moderated reactor was strikingly similar to the North Korean reactor at Yongbyong, the same reactor which produced plutonium for Pyongyang's small stockpile of nuclear weapons. Indeed, the external configuration looked much the same until the shape of the facility in Syria was disguised with a false roof and walls.

Much of this joint Syrian-North Korean venture – from source of reactor fuel to funding – remains shrouded in mystery as do the motives. In the case of Syria, Bashar al-Assad, Syria's president since 2000, may have been seeking personal prestige, regional influence or a reinforced deterrent against Israel. North Korea, for its part, could have been seeking an offshore backup to its reactor at Yongbyong. More likely its leaders just wanted cash.

North Korea is an active trafficker in conventional weapons, missiles and associated technologies. The Syrian reactor provides a stark warning that Pyongyang is ready to extend its illicit marketing to nuclear technology.

In October 2006, after North Korea's first nuclear test, President George W. Bush warned that North Korea's transfer of nuclear weapons or material to states or non-state entities would be considered "a grave threat to the United States" and that the nation "would hold North Korea fully accountable for the consequences of such action." Yet when the US became aware of North Korea's nuclear cooperation with Syria, there were no consequence other than Israel's destruction of the North Korean reactor in Syria.

In the context of the Six-Party Talks, Syria's illicit venture was seen more as an unwelcome distraction than as a dangerous development. The US chief negotiator at the time was satisfied with North Korea not denying its involvement and promising not to proliferate again. And while the IAEA launched an investigation of the covert reactor – an investigation now stymied by Syria's refusal to cooperate – little was said in Vienna about the role of North Korea. The IAEA director general even removed North Korea from the agency's agenda.

The world's nonproliferation regime has been shaken by North Korea's flagrant violations and by Iran's determined pursuit of nuclear weapons capabilities. A nuclear-armed Iran risks sparking a nuclear arms race in the Middle East. Middle East countries that might consider acquiring their own atomic arsenals generally lack the necessary bombmaking technologies, would look abroad for equipment, material, and technical assistance. North Korea has shown its availability.

To prevent further proliferation, North Korea's activities need to be exposed, penalized, and disrupted. Three approaches should be pursued with those goals in mind:

- First, proliferation should be moved to the top of the agenda of renewed Six-Party Talks rather than being relegated to the bottom. Effective verification – two words detested by the North Koreans – must be a priority. Promises are not enough, particularly from a regime that has regularly dissembled about the scope of its nuclear activities. A better understanding of North Korea's nuclear activities will not only thwart proliferation but also better position efforts to limit and ultimately roll back the nation's nuclear program.
- Second, the US and like-minded countries should encourage the IAEA to revitalize its investigation of Syria's covert reactor. Convincing President Assad to cooperate will require some adept diplomacy backed by the threat of IAEA special inspections and, if Assad refuses, subsequent referral to the UN Security Council. It is important to ensure that there are no other undeclared activities in Syria, to demonstrate that a country cannot stymie the IAEA by refusing to cooperate, and to protect the integrity of the nuclear nonproliferation treaty. Getting Damascus to "rat out" Pyongyang would expose the North Korean network, make future joint ventures easier to detect, and discourage other countries – whether in the Middle East or Far East – from embarking on similar projects.
- Third, the US should step up its efforts to interdict North Korea's illicit trafficking and encourage China and others to do the same. The Proliferation Security Initiative, endorsed a year ago by President Obama, needs to be re-energized and targeted on North Korea. It should renew high-level diplomatic efforts to secure participation by countries like China, Indonesia and Malaysia that lie on the maritime routes used by North Korean shipping. The initiative should also be expanded to include financial measures of the type that the US Treasury has used so effectively. Because China is a regular transshipment point for North Korean vessels, it is essential to bring Beijing into maritime and financial interdiction efforts.

If the Six-Party talks remain on hold, the United States should not sit pat. It should instead convene the parties without North Korea, restate international expectations that North Korea disarm, and develop a regional approach to detect and disrupt Pyongyang's black market in weapons technology. The reactor in the Syrian

desert may lie in rubble, but the world cannot ignore its warning of North Korea's readiness to market the most dangerous of technologies.

Gregory L. Schulte was the US ambassador to the International Atomic Energy Agency from 2005 to 2009. He previously served three tours in the White House under two presidents and six years on the NATO International Staff, working on nuclear policy and the Balkans. He is now a senior fellow at the Center for the Study of Weapons of Mass Destruction at the National Defense University. This essay reflects his personal views.

The future of non-proliferation

## **An awkward guest-list**

Apr 29th 2010 | From The Economist print edition

*[EXCERPT]*

Syria has likewise dug in its heels: it was reported to have been building a nuclear reactor to produce bomb-usable plutonium with North Korea's help, and possibly Iranian cash, until the almost completed structure was bombed by Israel in 2007.

[http://blog.washingtonpost.com/spy-talk/2010/04/the\\_french\\_spy\\_the\\_cia\\_and\\_the.html#more](http://blog.washingtonpost.com/spy-talk/2010/04/the_french_spy_the_cia_and_the.html#more)

## **The French spy, the CIA, and the Syrian reactor**

By Jeff Stein

April 29, 2010; 7:00 PM ET

September, 2007: CIA officials peered at the “overhead” -- satellite photos.

The pictures were crystal clear: A clandestine Syrian nuclear facility, bombed by Israeli jets, lay in ruins on the edge of the desert, 90 miles south of Damascus.

Most important, the photos showed that the core of the reactor, built with secret North Korean help, had been totally destroyed.

But at CIA headquarters, Deputy Director Stephen R. Kappes was chafing -- at what he didn't have, according to two former intelligence officials, recounting the tale only on condition of anonymity because the incident remains sensitive.

Recently returned from a self-imposed, two-year exile, the career spy wanted somebody to eyeball that wreckage -- get in close, point a camera at it, maybe even take a radiation reading.

Days had passed, however, and the CIA, with an estimated budget of \$10 billion in 2009, had not been able to get a spy out there.

It wasn't that close-in photos would be crucial: It was a point of pride. This is what first-class intelligence services do. They dispatch spies to watch and hear things that their fabulous technology might have missed.

And Kappes, who had quit the agency in 2004 rather than take instruction from the staff of Bush's CIA Director Porter Goss, wanted to show what the spies under his direction could do. Alas, somebody else was about to beat him to it.

How galling it must have been for the CIA: It was the French.

According to the former officials, the French military attaché in Damascus simply took it upon himself to drive out to the reactor on his own and take pictures.

One of the former officials said that the attaché, whose name could not be learned, drove out to the desert site, near the village of At Tibnah, trailing a virtual caravan of Syrian “minders,” domestic security agents assigned to follow him around.

When he pulled up to the reactor site, according to this source, the attaché jerked his thumb over his shoulder and told the bewildered guards, “They're with me.”

Apparently that bought him enough time to snap some pictures.

But the second former official said “there was no sign of security personnel being present” at the site.

The attaché “drove there and took the photos from his vehicle,” said the former official. “A few had the steering wheel and dashboard prominently featured.

“He was never out of the vehicle, and he never got into the wreckage itself. But he was damn close, and it was a really ballsy move,” the source added.

A little while later, the French presented the photos to the CIA.

“It was a major embarrassment for [Kappes], who kept pushing them to come up with a plan on an almost daily basis,” the first former intelligence official maintains.

“I think the big issue was that CIA couldn't come up with a way of obtaining the photos. Near East Division management, as well as the Damascus station, was paralyzed, could not come up with a plan, and here the French just drive up and do it.”

CIA spokesman George Little called “this account ... off the mark.”

“But what is for certain,” Little added, “is that Deputy Director Kappes always encourages bold action and smart risk. The discovery of the Syrian covert nuclear reactor was a textbook intelligence success—one achieved after a careful review of information from multiple sources over a period of time.”

Likewise, the second former official pooh-poohed the idea that Kappes was embarrassed or upset.

“I don't recall him being pissed that we didn't have anyone there,” the former official said. “Syria for us is a tough place, and he understands that.”

“The French photos were nothing more than an unexpected extra, which confirmed the bomb damage we had seen,” the former official said. “We were just struck by how close the attaché got, and the lack of any apparent security. “

“The overhead was far better,” the former official added. “It showed us the reactor was out of action, and also helped later when the Syrians began hiding what was left, bulldozing and covering it with sand.”

Much ado about nothing, a third intelligence operations veteran snorted.

Military attachés everywhere, he said, “love to do ground-level photography, pretending like they're James Bonds or something.

“It's the kind of stunt those services like to perform.”

Editorial Defends Syria's Right To Acquire Nuclear Capability, Faults US Stand

**Editorial: "The Russians Are Coming Back Through the Syrian Gateway"**

Al-Quds al-Arabi Online

Saturday, May 15, 2010 T16:56:12Z

Document Type: OSC Translated Text

Russian President Dmitriy Medvedev's latest tour of Syria and Turkey, during which discussions were held to sign cooperation agreements on nuclear energy, marks the beginning of Russia's return to the Middle East more forcefully.

The Russian president, who was accorded a hospitable reception in both the Syrian and Turkish capitals, showed a strong desire to help the two countries build nuclear programs for peaceful purposes. This move angered Washington and prompted US State Department spokesman Philip Crowley to express his administration's concern. He said Syria has not answered questions on its compliance with the NPT.

This is a crooked stand in every sense of the word. Any state can sign agreements to build nuclear reactors for peaceful purposes and acquire the necessary technology from Western nations, such as the United States and France, if it is an ally of Washington. However, if any state that does not revolve in the Western orbit attempts to acquire the same technology from Russia or North Korea, it comes under campaigns of doubts and even bombing and aggression, as was the case with the alleged Syrian reactor near Dayr al-Zur in northeastern Syria, which Israeli planes destroyed.

Syria is a state that signed the NPT and declared its full compliance with the treaty's provisions. Therefore, it does not need to answer any US questions regarding its legitimate nuclear ambitions that are in line with international controls and criteria. In fact, we would not be exaggerating if we said that it is rude for the United States, rather than the IAEA, to ask Syria such questions.

It is obvious that Syria, after an Israeli aggression against its newly born nuclear facilities with a green light from the United States, decided to go to and cooperate with Moscow in this field because Israel will not dare to bomb a peaceful Syrian nuclear program, the construction and management of which is overseen by Russian experts.

It is no longer a secret that Russia is building a naval base in the Latakia area on the Syrian coast to serve its fleets, exactly as Washington does in Bahrain, Qatar, Kuwait, and the UAE. This is because alliances in today's world are based on interests too, not only good intentions.

Syria, Turkey, and all states in the Arab region have the right to develop nuclear expertise in all peaceful and military fields as long as Israel possesses more than 200 nuclear warheads. Israel uses them to terrorize the states of the region, continue to occupy the territories of many of these states, and block the peace process with its provocative settlement activity.

At the same time, Syria has the right not to pay any attention to the invented Israeli-US uproar over the Scud missiles, which Syria reportedly smuggled to Lebanese Hizballah. The reason is that Syrian officials are not so stupid not to know the aim of this uproar. Its aim is to secure an international resolution to deploy international observation forces on the Syrian-Lebanese border.

Israeli violations are increasing to a point where the United States' task of redressing them has become difficult. Therefore, Washington must stop adopting the Israeli policies and being hostile to most states of the region, as is currently happening.

## Can Israel afford to slow down Iran's nuclear program?

Although Prime Minister Netanyahu insists that Israel will not allow Iran to acquire the bomb, it's not clear Israel can afford to pay the price involved in slowing down Iran by even a few years. But what are the alternatives?

By Yossi Melman

Published 21:24 20.05.10

Latest update 21:24 20.05.10

[EXCERPTS]

[deletia]

On two separate occasions within the last quarter century have Israel Air Force pilots destroyed nuclear facilities in hostile Arab countries in order to prevent those states from acquiring nuclear armaments. The first instance occurred on the Shavuot holiday 29 years ago. On June 7, 1981, a squadron of eight IAF F-16 fighter jets, accompanied by eight other F-15s, attacked the nuclear reactor built by French scientists near Baghdad. Within two minutes, the reactor was destroyed.

[deletia]

...the Begin doctrine was put to another test 26 years later. In September 2007, IAF pilots successfully destroyed a nuclear reactor on the banks of the Euphrates River, in Syria. It was a facility built by that country, with financial assistance from Iran as well as expertise and know-how from North Korea.

Israel's image

A number of differences between these two attacks stand out. Prior to the Iraqi incident, Israel did not keep other countries - including the United States, whose president at the time was Ronald Reagan, one of the friendliest leaders Jerusalem has ever had in the White House - abreast of its plans. After the attack, the Israeli government officially announced that its pilots had done the deed. In Syria, the opposite is said to have occurred. Then-prime minister Ehud Olmert and Defense Minister Ehud Barak notified the Americans hours before the strike took place. Since the operation, however, Israel has been vague about its role in the attack, refraining from officially claiming responsibility.

[deletia]

It is not just former and current air force officers who recognize the difficult set of circumstances. An intimate knowledge of the character and behavior of most members of the national military and political echelons leads one to the conclusion that they too are well aware of the limitations of Israeli might. Netanyahu is considered to be hesitant, and someone who easily panics - traits that might well make it difficult for him to order the IDF to take action. Ehud Barak and Chief of Staff Gabi Ashkenazi, under whose tenures Israel launched the strike on Syria, are considered cautious, responsible leaders who are aware of the enormous differences between the Syrian reactor and the Iranian facilities.

[deletia]

## **Behind the Axis: The North Korean Connection**

By JONATHAN SPYER

22/05/2010 05:44

*[EXCERPTS]*

North Korean spokesmen reacted furiously last week to claims by Foreign Minister Avigdor Lieberman that Pyongyang is supplying weapons technology to Iran and Syria. Representatives of the regime of Kim Jong-Il described Lieberman as an “imbecile.” The official Korean Central News Agency in a memorable phrase accused the foreign minister in an official statement of “faking up sheer lies.”

The indignant denials notwithstanding, recent studies indicate that the Democratic People’s Republic of Korea, as North Korea is officially known, is indeed playing a crucial but little remarked upon role in facilitating the arming of the Iran-led regional axis, including in the area of weapons of mass destruction. The North Korean role is multifaceted, and evidence has emerged of direct links to terror organizations such as Hizbullah and extensive strategic relations with both Iran and Syria.

A recent study by Christina Lin, a former US Department Defense official and specialist on China, looked into North Korea’s strategic partnership with Iran. Lin noted that North Korea has been described as the “the most important single leak” in the international anti-proliferation effort in the Middle East.

*[deletia]*

The North Korean strategic link with Iran is not limited to Teheran. Rather, evidence suggests that it extends to cooperation with other, more junior members of the Iran-led regional alliance. Thus, Iranian defector Ali Reza Asghari is reported to have confirmed that Iran helped finance the participation of North Korean personnel in the Syrian plutonium reactor at al-Kibar destroyed by Israel in September 2007. Iranian scientists were also present at the site, the goal of which was to produce weapons-grade plutonium.

*[deletia]*

The writer is a senior researcher at the Global Research in International Affairs Center, IDC, Herzliya.

## **Iran and North Korea March On**

John Bolton

May 25, 2010

*[EXCERPT]*

Here, Iran and North Korea intersect. Cooperation between the two on improving their ballistic missiles has been extensive and Iran likely financed the North Korean reactor that was under construction in Syria until it was destroyed by Israel in September 2007.

<http://www.debka.com/article/8806/>

## **North Korea on war readiness. US-South prepare. Tehran watches**

DEBKAFfile Exclusive Analysis **May 25, 2010, 10:42 AM (GMT+02:00)**

*[EXCERPT]*

The plutonium reactor which the Israeli Air Force destroyed in September 2007 in northern Syria was made in North Korea and, according to debkafile's intelligence sources, North Korean nuclear scientists and technicians are back at work in the country.

## The IAEA's Agenda

Mark Hibbs Q&A

June 07, 2010

[EXCERPT]

[*Carnegie*] Is the IAEA's investigation of Syria's nuclear activities proceeding smoothly and will the board move forward on this issue?

[*Hibbs*] As in the case of Iran, it is not anticipated that the board will take any decisive action this month regarding the IAEA's ongoing investigation into Syria's nuclear activities. For over two years, the IAEA has failed to reach a conclusion about allegations raised by the United States and Israel concerning a site Israeli aircrafts bombed in Syria in 2007. Both countries assert that the facility was a clandestine plutonium production reactor built with North Korean assistance.

In principle, the United States supports the idea of the IAEA requesting a so-called "special inspection" in Syria, as the IAEA is empowered to do under its safeguards agreement with that country. If requested, that inspection would be designed to look at a few sites which the United States asserts, based on intelligence data, point to clandestine nuclear fuel cycle cooperation—for plutonium separation or uranium fuel production—between Syria and North Korea.

But neither the United States, nor a majority of board member countries, nor Amano himself is inclined to press for a special inspection in Syria at this time. The United States is in no hurry to call for a special inspection because, in its view, the Israeli attack destroyed the reactor and because the fuel cycle cooperation between Syria and North Korea at the sites identified by U.S. intelligence in Syria was at an early stage when the work was interrupted in 2007.

For political reasons the United States might even be inclined to accept that the IAEA's Syria probe is never decisively concluded, but some other Western board members, in particular European states, are becoming impatient with the IAEA's lack of progress in reaching closure on this issue

Some officials from these states believe that a failure to reach firm conclusions on Syria will damage the IAEA's credibility under Amano, especially since he has already informed the board that, on essential matters, Syria has not cooperated with the IAEA. Some board members may therefore want to see the IAEA request a special inspection later in 2010. But so far, there is not enough political will—either at the top of the IAEA secretariat or in the board—to press Syria for a special inspection.

**John Bolton: "We will not tolerate interference in Camp Ashraf"**

Friday, 02 July 2010

*[EXCERPTS]*

John Bolton, former US ambassador to the United Nations, underlined the concerns for Ashraf in his address to the gathering of Iranians in Paris on **June 26 [2010]** and said, "The US presence inside Ashraf has to be continued and perhaps expanded back to something like its previous level. I think the UN mission inside Ashraf has to be extended and I think we need to make it clear to the government of Iraq that we will not tolerate interference in the camp and certainly not the kind of assaults that have occurred on the inhabitants of the camp before. This is again something, I think, of a very high priority in the American Congress.

*[deletia]*

This meeting today is a signal both to the people still trapped inside Iran and the democratic countries all around the world that the people of Iran seek to have control over their own government and to participate in democratic elections. **It is a tragedy for Iran that its best friend and closest ally in the world is North Korea; North Korea, which has its own nuclear weapons, which pursues ballistic missile technology that threatens peace and security not only in Asia but in the Middle East as well, which financed by the regime in Tehran was building a nuclear reactor in Syria, and which partners with Iran on the nuclear program.**

## The Israel-Turkey Imbrolio

By ROGER COHEN

Published: July 8, 2010

NEW YORK — Here's an intriguing nugget, given Turkey's recent decision to close its airspace to Israeli military planes: When Israel attacked a covert Syrian nuclear reactor on Sept. 6, 2007, its bombers overflew Turkey.

A former senior U.S. official who was intimately involved in handling the fallout from the raid told me Turkish officials raised the issue with Israel, were invited to discuss the matter, but in the end let it drop.

Those were different times, before Turkish-Israeli ties entered their current poisonous phase.

*[deletia]*

Given the military trade between Israel and Turkey (\$1.8 billion in 2007), U.S. godfathering of the Turkish-Israeli relationship, and Turkey's commitment to remaining inside the Western tent even while reaching outside it, I don't expect cooperation to cease between Ankara and Jerusalem. But Israel has real reason for concern.

It could overfly Turkey in 2007 en route to taking out a Syrian facility of North Korean design because of the wink-and-nod nature of its military relationship with its best regional Muslim friend. That's history.

Since then Israel's actions, tactical bluster devoid of strategic sense, have left it far more isolated than before. I hear more hostility to Israel around the world than at any time I can recall.

*[deletia]*

The Mideast remains volatile. On the Iran drumbeat, some other nuggets from that former senior official are of interest. The Bush administration opposed the 2007 Israeli strike. It was worried the Syrians would respond and ignite a wider Middle East war. It believed tough U.S. diplomacy, backed by the threat of force, would ensure the Syrian reactor never became operational. President Bush's line was: Let me handle it.

Ehud Olmert, then the Israeli prime minister, was disappointed at American inaction. His line was: It's now in our hands. No U.S. green light was asked for, and none given, as Israel bombed.

The fallout was contained through sleight of hand. Israel feigned ignorance. A tight collar was placed for several months around U.S. intelligence. President Bashar al-Assad was not made to feel cornered. It was as if the reactor had gone poof in the night.

Could Iran's Natanz plant go poof in the night? Some people are thinking about it, an attack from "nowhere." I think those are dangerous thoughts. Iran is not Syria.

The Obama-Netanyahu statement said: "The president told the prime minister he recognizes that Israel must always have the ability to defend itself, by itself, against any threat or possible combination of threats, and that only Israel can determine its security needs."

Is that plain language or a hall of mirrors?

Hmmm.

Opinion

## **Beyond the Obama Nuke Policy**

How Congress and opinion leaders can counter administration weakness on North Korea and Iran.

BY JOHN R. BOLTON

**JULY 13, 2010**

*[EXCERPT]*

So are we consigned to two more years of growing danger? Not if Congress and opinion leaders take steps without White House leadership, beginning with these three initiatives:

First, they must demand increased intelligence collection on the North Korea-Iran connection. Where possible without compromising sources and methods, this information should be disseminated to increase public awareness.

Pyongyang has been a major proliferation player in the Middle East for some time, selling missiles and technology throughout the region. For over a decade, Iran has done extensive ballistic missile testing on its behalf. **Pyongyang's reactor in Syria—destroyed by Israel in September 2007—was likely financed by Iran, and other joint programs may still be underway in Syria and Burma.**

Although North Korea and Iran may be slipping off the front page, their nuclear and ballistic missile cooperation is almost certainly progressing. These proliferation threats are not separate, and a better understanding of the level of joint activity would reveal a much more realistic picture for the U.S. and its allies. Stepped up intelligence gathering and enhanced congressional and public discussion might even awaken the Obama administration.

## **Assad celebrates 10 years in power**

Smadar Peri

Published: 08.05.10, 09:24

*[EXCERPT]*

But Assad's problems are not just with Israel. The Syrian president fears that the Iranians also want to do away with him. His advisors warn that Tehran is not ready to forgive his efforts to establish a nuclear reactor behind Iran's back. Iran also recalls the killing of "its man," senior Hezbollah figure Imad Mughniyeh, two years ago in Damascus' most secure compound. If they could, the ayatollahs would get rid of him now, immediately, as soon as possible, and replace him with a Syrian leader from the Muslim Brotherhood. The tension between Hezbollah and Syria reached new heights Tuesday, and both sides alerted the regime in Beirut. Hezbollah warned: Assad wants to destroy us in order to take over Lebanon again.

## The long road to Syria

Ynetnews special: New book reveals full story behind bombing of Syrian reactor by Israel

Yedioth Ahronoth

Published: 08.26.10, 14:58

**London, end of July 2007.** A guest at a large Lexington hotel left his room in the evening, took the elevator down to the lobby, and stepped into a vehicle waiting for him outside. He was a senior Syrian official who arrived from Damascus a short while earlier and rushed to a meeting downtown.

The moment he left the hotel, two men rose from their seats at the corner of the lobby. They stepped into the elevator, reached the guest's room, and opened the door using keys. They searched the room professionally but did not need to work too hard. The Syrian's laptop was right on the desk. The two men installed a Trojan Horse - spyware that created a "backdoor" to the computer. Using this door, it became possible to monitor the computer remotely and copy all the material saved on it. Within minutes, the two men left the room.

The above story, and the information to follow, is based on both foreign and Israeli reports. The laptop provided Mossad with invaluable information, which for the first time exposed Syria's secret nuclear program. The findings were stunning: The blueprints of a nuclear reactor in the Dir al-Zur area; correspondence with North Korean officials; photographs showing the reactor covered with cement. The evidence was unequivocal. It complemented other information accumulated during 2006 and 2007 by Israel's top intelligence officials. According to this information, the Syrian government secretly built a nuclear reactor in the desert, near the Turkish border and roughly 100 miles from the Iraq border. **Officials were surprised to discover that the reactor was constructed with Iranian funding and with the help of North Korean experts.**

The "love affair" between Syria and North Korea started with the Korean prime minister's visit to Syria before the Gulf War, on then-President Hafez Assad's invitation. The two countries signed a military and technological cooperation agreement. Although the nuclear issue was brought up, Assad decided to put it aside and make do with developing chemical and biological weapons. **During his father's funeral in June 2000, Bashar Assad met with members of the North Korean delegation. At that time, they started to secretly push forward the construction of the Syrian reactor. In July 2002, a three-way deal was finalized, with an Iranian representative pledging to finance the reactor's construction (roughly \$2 billion.) As it turns out, for five years Israel's and America's intelligence agencies were in the dark.**

### Iranian general tells all

During those years, some warning signs emerged, yet nobody took notice. The American intelligence community misinterpreted the information it received, while Mossad and Military Intelligence officials in Israel estimated that the Syrians have no interest in or ability to acquire nuclear weapons. Hence, nobody bothered to look for information that would shatter the "conception." The Syrians adopted another tactic meant to lull Israel and the US into a false sense of security: They enforced a complete communication moratorium on all employees and experts at the nuclear site. Cellular and satellite phones were banned, and all communication was undertaken via messengers. The activity at the site was not exposed even though American and Israeli satellites photographed it regularly. However, a subsequent dramatic development stunned both Israel and the US.

**On February 7, 2007,** Iranian General Ali Reza Askari, formerly a senior Revolutionary Guard official and deputy defense minister, arrived in Damascus from Tehran. He stayed in the Syrian capital until he ensured his family was on its way out of Iran, before continuing to Turkey and disappearing in Istanbul. A month later, it

turned out that Askari defected to the West in an operation planned by the US in conjunction with Israel. He was questioned in a US base in Europe – apparently in Germany – and revealed some of Tehran's and Damascus' deepest secrets. Askari exposed the three-way relationship involving Syria, North Korea, and Iran. He told his interrogators that Tehran was encouraging and funding the establishment of the Syrian nuclear reactor. He provided further details about the reactor's condition and about the Iranians assisting and advising the Syrians.

Agent inside the reactor

The information prompted Israel to go into operational alert. The Mossad earmarked manpower and resources to verify the details provided by the Iranian general. Then-Prime Minister Ehud Olmert convened Israel's security chiefs for a special meeting; during the session they agreed that Israel must act urgently to acquire credible proof of the reactor's existence. It was clear to all that Israel could not accept the prospect of Syria, its bitter, belligerent rival, turning into a nuclear power. Within a few months, Mossad and Military Intelligence chiefs were able to present the prime minister with the incriminating evidence he sought. Five months after Askari's defection, the search took its next turn: The material uncovered in the Syrian official's computer in London. Meanwhile, Mossad registered another success: It managed to recruit one of the reactor's employees, who provided numerous photographs and a video shot inside the building gradually taking shape.

Israel made sure to update the US, in real-time, about all the material it managed to acquire, including up-to-date satellite images and tapped conversations between North Korea and Damascus. Israeli pressure also prompted the US utilize its own spy satellites. Soon, up-to-date material was accumulated including images elicited through America's advanced satellites and materials acquired via electronic means, showing that the Syrians were building the reactor rapidly.

In June 2007, PM Olmert traveled to Washington to present all the material gathered by Israel; at the conclusion of a lengthy discussion with President George W. Bush, Olmert informed the US president that he decided to strike the Syrian reactor. The Americans were still hesitant, however. Israel recommended a military strike, but the US refused. According to credible American sources, the White House eventually decided that "the US prefers not to strike." Secretary of State Condoleezza Rice and Secretary of Defense Robert Gates attempted to convince Israel to confront the Syrians, but not to attack.

In July 2007, Israel held aerial patrols above the reactor and elicited images of the activity at the site via satellite Ofek 7. The images were analyzed by American and Israeli experts, who ruled that Syria is building a nuclear reactor based on the North Korean model. In fact, the experts reached the conclusion that the reactors were identical. Meanwhile, Israel's intelligence-gathering Unit 8200 provided records of conversations between Syrian scientists and North Korea experts. This information was also handed over to Washington, but the Americans demanded unequivocal proof that the facility will be used as a nuclear reactor, and that nuclear materials are already at the site. Israel decided to supply this information as well.

### **Behind enemy lines**

The "smoking gun" was found in August 2007. The clear-cut evidence was acquired by the elite Sayeret Matkal reconnaissance unit, which headed to the site under cover of darkness on board two helicopters. Nobody spotted the troops as they landed near Dir al-Zur. Using specialized equipment, they took several soil samples that contained radioactive materials. The findings were urgently relayed to US National Security Advisor Stephen Hadley, who was stunned by the revelations. He quickly summoned top experts to draw conclusions and report to President Bush during their morning meeting.

Following the expert assessment, Hadley was convinced the matter at hand was serious. He held a lengthy discussion with Israel's Military Intelligence and Mossad chiefs, thereby reaching the conclusion that the reactor constitutes a substantive threat. The US was convinced that the reactor should be destroyed. According to the British Sunday Times, PM Olmert then convened Defense Minister Ehud Barak and Foreign Minister Tzipi

Livni; the three leaders discussed the expected implications of a military strike in Syria with top security officials. After hours of deliberations, they decided to go ahead and wipe out the reactor. Olmert informed Opposition Chairman Benjamin Netanyahu of the decision.

The strike date was set for September 5, 2007. According to the Sunday Times, elite Air Force troops were deployed in the area on September 4 to mark the targets for the jets using laser. On September 5, 2007, at 11 pm, 10 fighter jets left the Air Force base in Ramat-David and headed towards the Mediterranean. Thirty minutes later, three planes were ordered to turn back. The other seven F-15 jets were ordered to head to the Syrian-Turkish border. En route to the reactor, they bombed a radar station in order to thwart Syria's ability to identify the infiltration. A few minutes later, the jets reached the Dir al-Azur area: They fired Maverick missiles and dropped half-ton bombs at the nuclear facility, recording direct hits. Within minutes, a Syrian reactor that could have been used to produce bombs that would threaten Israel's existence was wiped out.

Officials in Israel feared a Syrian response. PM Olmert called Turkish Prime Minister Erdogan and asked that the latter relay a message to President Assad, stressing that Israel was not seeking war. The next day, great confusion prevailed in Damascus. At first, the Syrians maintained complete silence. They reported the strike only at 3 pm. According to the report, Israeli jets infiltrated Syrian airspace at 1 am. "Our Air Force forced them to withdraw after they dropped ammunition over the desert; no injuries or damages were reported," the Syrians said.

In April, 2008, some seven months after the Syrian facility was hit, the US Administration announced that the bombed site was a nuclear reactor built with the help of North Korea and was not meant for peaceful purposes. American intelligence chiefs presented Congress members with photographs highlighting the Syrian facility's similarity to the North Korean reactor, as well as satellite images and sketches. Congress members also watched another fascinating video, which according to reports from Washington was filmed by a Mossad agent inside the Syrian reactor. Israel managed to keep quiet for two weeks, refusing to admit it was behind the strike. But then came Netanyahu, who, as opposition leader, who in response to a question by TV anchor Haim Yavin said, "When the government does something for Israel's security – I support it... And here I was a partner in this matter and I supported it from the very start." Olmert's aides were furious. "We are completely shocked by this man, he is irresponsible and lacks discretion; this is the real Bibi!" one aide said.

### **Assassination in Syria**

On the evening of August 2, 2008, 11 months after the bombing of the reactor, a festive dinner was held on the terrace of a summer house in Rimal al-Zahabiya, north of the Syrian city of Tartous. The summer house was adjacent to the shore and had a magnificent view. The terrace overlooked the sea and served as a refuge from the summer's high humidity. The guests were close friends of the house's owner, General Mohammed Suleiman, who had traveled there for a weekend break.

Suleiman was President Assad's top aide on military and security matters. He was in charge of the reactor's construction and its security. Government circles in Damascus referred to him Assad's shadow. His office was located in the presidential palace, next to Assad's, and few knew him in Syria and abroad. While Suleiman's name was not mentioned in the media, Mossad and Western intelligence agencies knew him and his actions well. The 47-year-old Syrian was an engineering graduate of Damascus University. During his studies he befriended Basil Assad, then-President Hafez Assad's firstborn son and Bashar Assad's older brother. After Basil's death in a road accident, his father was sure to bring Suleiman close to himself and his heir. In 2000, Hafez Assad died and his son Bashar was elected president. With his rise to power, the young president made Suleiman his confidant and close advisor.

Suleiman played a unique role: He was a member of the Syrian research board, which dealt with the development of missiles, chemical and biological weapons and nuclear research and development. As part of his job, he was Syria's contact with North Korea. He coordinated the transfer of the reactor's parts to Syria and was

in charge of security arrangements for the North Korean scientists and technicians involved in its construction. The reactor's bombing was a serious blow for Suleiman, but not a lethal one. After overcoming the initial shock, he began to plan the construction of an alternate reactor, for which a location had yet to be determined. Suleiman's new mission was much more complex and difficult than before, since he was now aware that he was on the Israeli and American intelligence agencies' radars.

Ahead of the next phase of his secret mission, Suleiman took a few days off and traveled to his summer home. A vacation and dinner with his friends was the best medicine for the pressure he was under. From his seat by the table he watched the waves lazily crawling up the shore. But what he didn't see, at a distance of some 150 meters (165 yards) from the terrace, was two figures waiting, motionless in the dark water. They reached this point from a far off distance in a ship that dropped them off some two 2 kilometers (1.2 miles) from Suleiman's house. From there they dived until they neared his home. The two were professional snipers, possessing a wealth of experience and nerves of steel. They carried their weapons in water-proof covers. When they reached the shore they immediately spotted Suleiman's house. The information they received from their country's intelligence agency was accurate. They identified the building and the terrace, scanned the people seated at the table and focused on their target: The general sitting opposite them, among his guests.

Around 9 pm the snipers returned to test their aim and range. They watched Suleiman, sitting on a chair at the center of the table surrounded by his friends. It was crowded around the table, which forced the snipers to reset their focus and aim at the host's head. They continued to hide in the water. Then the signal was given. The two emerged from the water to the shore, moved closer to the house, aimed their rifles and shot Suleiman simultaneously. The hit was lethal. His head was first jolted back and then collapsed forward on the table. Those present did not understand what had happened, because they didn't hear a sound – the rifles were equipped with silencers. Only after they noticed the blood flowing from Suleiman's head did they realize he had been shot. A commotion broke out on the terrace, which enabled the snipers to flee via a pre-planned escape route. The Sunday Times reported a slightly different version, saying the snipers were IDF Flotilla 13 commandoes who arrived in Tartous on a luxury yacht belonging to an Israeli businessman, carried out their mission, and vanished.

Syria's official bodies were shocked. The government initially kept quiet and did not address the reports of an assassination. There was much embarrassment. How did the hit team make it to northern Syria? How did it flee the site? Was there no place left in Syria where the regime's heads could feel safe? Days after the incident a brief official statement was released saying, "Syria is holding an investigation to find those responsible for this crime." But Arab media extensively reported on the affair from day one and raised speculations about the identities of the perpetrators. Arab newspapers focused on elements that had an interest in assassinating the general, and were quick to point to Israel. They also claimed that Israel carried out the assassination because of Suleiman's involvement in the construction of the reactor Dir al-Zur. While Arab media sang Suleiman's praises, Western intelligence agencies had a completely different reaction to his death. In the capitals of the free world, no one shed a tear over the general's untimely passing.

## ISIS Reports

### **If Not Now, When? Time for an IAEA Special Inspection in Syria**

by **David Albright and Paul Brannan**

**September 6, 2010**

Glyn Davies, the United States Permanent Representative to the International Atomic Energy Agency (IAEA) in Vienna, said recently that the time for a special inspection in Syria is fast approaching. Syria was secretly building a nuclear reactor in the Dair Alzour region before it was bombed by Israeli jets in September 2007. In an August 6, 2010 Wall Street Journal report, Davies noted that it has been “years since the IAEA had its one crack at this. And it came away with more questions than answers.” Indeed, Syria continues to deny it even had a reactor under construction. Although Syria allowed the IAEA to partially inspect this site once in June 2008, it has answered very few of the IAEA’s questions. It has repeatedly denied the IAEA’s requests for additional information or access again to the reactor site and to a number of other suspect sites.

Davies added, “We as shareholders in the system need to talk about this and find the way forward for the Agency and to help the [IAEA’s] Director General.” Because of Syria’s refusal to cooperate, and the possibility that the reactor was part of a nuclear weapons effort, Davies is right. The IAEA Secretariat and its Board of Governors should start the process of calling for a special inspection. Without adequate Syrian cooperation, the November 2010 Board of Governors meeting should call for one.

#### **Why a Special Inspection**

A special inspection is necessary in order to gain a better understanding of Syria’s undeclared activities, some of which may continue. Syria has refused to sign the IAEA’s Additional Protocol, an advanced inspection agreement aimed at discovering undeclared nuclear facilities and materials. Under the traditional safeguards agreement signed by Syria under the Nuclear Non-Proliferation Treaty (NPT), one of the few tools to investigate undeclared nuclear activities is the special inspection.<sup>1</sup> The IAEA can call for this type of inspection, although in practice the Board of Governors will need to approve it.

The IAEA does not often call for a special inspection—this is reserved for extreme situations where a particularly egregious safeguards violation is suspected and where the member state has demonstrated a lack of cooperation. In 1993, concerned that North Korea had conducted undeclared plutonium reprocessing campaigns, the IAEA requested a special inspection after North Korea denied access to suspect sites. That a NPT signatory could separate plutonium in covert reprocessing campaigns and stonewall the IAEA threatened not only the international community but also the legitimacy of the IAEA and the value of verification measures that NPT parties must adhere to.

Although not as urgent as the North Korean example, the current situation with Syria also warrants a special inspection. The Syrian reactor project stands as one of the most egregious cases of nuclear proliferation. Since the IAEA began to investigate in 2008, Syria has largely refused to cooperate with the IAEA’s investigation. If the IAEA cannot make any further progress in its investigation, its credibility is eroded and verification in general is undermined.

As more time goes by, it will become inherently more difficult for the IAEA to conduct its investigations into Syria’s activities. A special inspection will prevent Syria from further hiding its activities related to the reactor construction project. The passage of time may also make Syria more comfortable stonewalling IAEA requests

for access to certain people, facilities, or documents. Syria can, for example, claim that certain individuals have left the country or died. The sooner a special inspection takes place, the fewer opportunities Syria will have to cover up evidence about the project.

Although the reactor has been destroyed, and despite the manner in which that occurred, the IAEA needs to provide the requisite international verification that Syria does not still have undeclared nuclear facilities or materials, whether of North Korean-origin or not.

### **The IAEA Remains Suspicious**

The IAEA has good reason to remain suspicious about Syria's nuclear activities and North Korea's role in supplying Syria's reactor project. The photographic evidence of the reactor site is the most compelling. However, the IAEA developed other evidence as well that points to undeclared nuclear activities and facilities.

The most striking proof is an April 2008 U.S. intelligence community video briefing on the reactor. The video shows the likely location of the reactor core and spent fuel pond. It also shows the extraordinary efforts taken by the Syrians to camouflage the building.<sup>2</sup>

The IAEA's June 2008 inspection at the reactor site uncovered traces of chemically-processed uranium, which had properties implying it could have originally been uranium metal. This form of uranium is used in a North Korean gas-graphite reactor. Syria claimed that the uranium originated from Israeli anti-armor weapons, but the IAEA found no evidence supporting this claim. The IAEA assessed that there is a low probability that the uranium was introduced by the use of missiles. It found that the isotopic and chemical composition and the morphology of the particles are all inconsistent with what would be expected from the use of uranium based munitions. Moreover, the uranium was found in an out-of-the-way place at the site, which raised questions about whether Syria had purposely cleaned the site in order to prevent the IAEA from discovering traces of materials linked to a reactor.

The IAEA also found undeclared chemically-processed uranium at Syria's Miniature Neutron Source Reactor (MNSR). Syria subsequently provided information on previously unreported small-scale uranium conversion and irradiation activities at the MNSR.

A reactor requires uranium fuel. Did North Korea provide natural uranium fuel or was Syria, with North Korean help, building its own fuel fabrication plant? Perhaps, North Korea provided the initial fuel while Syria built a fuel fabrication plant that could provide the fuel for later core loadings. The uranium particles found at the reactor site imply that some uranium had been delivered to the site. Nonetheless, the IAEA has little information about the fuel for this reactor. Kyodo news reported in February 2010 that "North Korea provided about 45 tons of 'yellowcake' uranium to Syria in September of 2007 for production of fuel for an undeclared reactor." ISIS has learned, however, that the IAEA does not have any evidence that confirms this media report.

In 2008, a member state communicated the location of three suspect sites to the IAEA. The IAEA states in its safeguards reports that these sites may be of relevance to the activities at the reactor site. ISIS learned during April 2008 briefings by U.S. government experts and officials that some U.S. intelligence information indicated that one of the suspect sites might be a fuel fabrication facility. A senior official close to the IAEA said in an interview on November 16, 2009 that the IAEA received information that showed that equipment was seen coming and going between the reactor and these three sites. ISIS has also learned that the IAEA has identified a fourth suspect site. Syria denied the IAEA's request to visit these sites. Adding to suspicions, shortly after the request for a visit, IAEA analysis of satellite imagery taken of these locations indicated that landscaping activities and the removal of large containers took place.

The IAEA's investigation of Syria's procurement activities aimed at supplying its nuclear program revealed further discrepancies. An investigation of Syrian procurement patterns can be an extremely difficult

undertaking. Based on interviews with European intelligence officials, Syria's sensitive procurements are often exceptionally difficult to ascertain. Syria has used a variety of techniques to disguise its sensitive overseas purchases. Moreover, a direct transfer of goods on North Korean ships or planes would have left few detectable traces. Nonetheless, the IAEA has uncovered suspicious information.

Regarding equipment that could be tied to the site, the IAEA discovered that Syria had told the IAEA and suppliers different versions of the equipment's end use. The IAEA also learned that Syria had procured "large quantities of barium sulphate."<sup>3</sup> This material is used to increase the effectiveness of concrete in stopping penetrating radiation from a reactor core or irradiated fuel being processed in hot cells to extract plutonium. Syria denies any intended use in a reactor or hot cells, but the size of the order remains suspicious.

The IAEA also learned of Syria's purchase of large quantities of graphite from China, but it was unable to tie this graphite to the reactor. North Korea has made large quantities of graphite for its own reactors, so perhaps North Korea supplied the graphite itself.

The IAEA detected graphite in samples taken at the reactor site but in small concentrations. It could not determine if this graphite came from the core of the reactor. But given the widespread public discussions of the importance of sampling for graphite prior to the inspection and suspicions that Syria thoroughly cleaned the site, small graphite concentrations remain inconclusive.

Three years after the bombing of the reactor, the nature of North Korean assistance to this reactor project still remains unclear, including persons involved, technical or design support given, and equipment and materials provided. North Korea is generally believed to have supplied or organized the bulk of the procurements for the reactor, but these transfers remain extremely difficult to reconstruct. North Korea may have also organized the purchase of goods for the reactor via China. A Chinese office of Namchongang Trading Corporation (NCG), a North Korean trading company subordinate to its General Bureau of Atomic Energy, was involved in purchases of sensitive material linked to the construction of the nuclear reactor in Syria.<sup>4</sup> IAEA officials have speculated that Syria depended upon direct exports from North Korea for most of the reactor components, but if it wanted higher quality equipment, it shopped elsewhere for the goods, either relying on NCG or its own procurement network.

With its investigations inconclusive, the IAEA needs greater access to sites and more cooperation from Syria in order to resolve its outstanding questions about Syria's nuclear program.

### **Nature of a Syrian Special Inspection**

The IAEA will need to address several issues before calling for a special inspection. In its effort, assistance from member states is critical. In addition, a special inspection will likely include several sites in Syria.

The IAEA needs far more satellite imagery from the time period immediately following the bombing. Member states should assist the IAEA by providing relevant satellite imagery of the destroyed building site from the morning of the bombing up until the remnants of the building were buried. Until the U.S. intelligence community's video briefing in April 2008 on the destroyed reactor building, the first publicly available satellite image of the site after the bombing came after ISIS successfully located the reactor building. ISIS released the report on October 23, 2007 and the first new satellite image was taken the next morning. In the U.S. briefing, several satellite images from before October 24, 2007, but after the bombing, show the bombed building at various stages of deconstruction.<sup>5</sup> Commercial satellite images from immediately after the bombing may exist, but governments would have most likely purchased them on an exclusive basis. If they did do so, they should now share the images with the IAEA. But these images cannot compare to the quantity and quality of U.S. imagery, and the United States should declassify additional imagery for use by the IAEA, just as it did in the case of the 1993 North Korean special inspection.

A special inspection should include excavation aimed at finding rubble at the reactor site and more sampling for evidence of a reactor project and any associated fuel cycle activities. In one of the images in April 2008 video briefing, bulldozers can be seen pushing soil excavated from a nearby hill down into the remains of the building, which likely still contained parts of the reactor and spent fuel pond.<sup>6</sup> Syria later constructed a new building overtop of the existing site.<sup>7</sup> If Syria has not performed any excavation activities under the roof of the new structure in the last two and a half years, the remains of heavy reactor structures would still remain buried at the site. A special inspection should include excavation of the earth around or possibly underneath the new building constructed after the bombing. Excavation was slated for the 1993 special inspection in North Korea, so its use in this case has a precedent. The IAEA should also insist on taking samples of the remaining debris or rubble at the site or located elsewhere. Syria did not allow the IAEA to sample any of the rubble during the June 2008 inspection.

A special focus of a special inspection should be the sites that may be associated with uranium storage, uranium conversion, or fuel fabrication. A special inspection should include visits to the three additional suspect sites, and perhaps the fourth one. At these sites, the IAEA should be able to freely take samples, interview key personnel, and order excavation as necessary.

The irradiated fuel from this type of reactor is difficult to store long-term in water. As a result, this irradiated fuel is usually chemically processed and the plutonium separated. If Syria planned to make nuclear weapons, this step is required. Little information exists about any Syrian plans for a spent fuel reprocessing facility. A special inspection should seek to clarify what Syria planned to do with the spent fuel from the reactor.

With a lack of clarity on procurements for the reactor, a special inspection can fill significant gaps in what is known about the reactor construction project and its associated fuel cycle. If Syria made purchases for the reactor in Europe or Asia, a special inspection can help identify them.

## **Conclusion**

Syria may have intended that the reactor only be for peaceful purposes and it could have ultimately planned to place it under IAEA safeguards. But this possibility appears less likely in view of Syria's lack of cooperation with the IAEA and its continual denials of any reactor project despite substantial evidence to the contrary. In the worst case, Syria's reactor was part of a nuclear weapons program that it has not abandoned. It may merely seek to outlast the international community's concern and restart its quest for nuclear weapons at some point in the future.

The time to start the process of calling for a special inspection has arrived. The first step is for member states to discuss this issue at the September Board of Governors meeting and the upcoming General Conference. These meetings should make clear to Syria that patience is running out. At the subsequent November Board of Governors meeting, full debate of a resolution calling for a special inspection in Syria should take place. If Syria still refuses to cooperate, the Board should vote for a special inspection.

<sup>1</sup> Syria has a traditional safeguards agreement with the IAEA under the Nuclear Non-Proliferation Treaty, referred to as an INFCIRC/153 safeguards agreement. Article 73 of the INFCIRC/153 agreement states: "The Agreement should provide that the Agency may make special inspections subject to the procedures laid down in paragraph 77 below: (a) In order to verify the information contained in special reports; or (b) If the Agency considers that information made available by the State, including explanations from the State and information obtained from routine inspections, is not adequate for the Agency to fulfill its responsibilities under the Agreement, An inspection shall be deemed to be special when it is either additional to the routine inspection effort provided for in paragraphs 78—82 below, or involves access to information or locations in addition to the access specified in paragraph 76 for ad hoc and routine inspections, or both."

Interview

## A Cautionary Note on Iran

Interviewee:

Matthew Fuhrmann, CFR Nuclear Security Fellow

Interviewer:

Bernard Gwertzman, Consulting Editor, CFR.org

September 8, 2010

[EXCERPTS]

Two recent reports by the International Atomic Energy Agency—one on Iran's nuclear program (PDF) and one on Syria's (PDF)—have increased concerns about Middle East nuclear proliferation. Nuclear expert Matthew Fuhrmann says that while "Iran's behavior is consistent with past behavior of proliferation," there is no definitive proof it is pursuing nuclear weapons. The United States should oppose Iran's nuclear program, Fuhrmann says, but the case of China – which became a nuclear country yet has not posed a threat to its neighbors – should temper concerns about a nuclear Iran. "[There were] claims about China becoming more aggressive, starting regional wars, causing cascades, where everyone in the region was going to build nuclear weapons—all of the things we're hearing about Iran today," says Fuhrmann. "But none of that happened, or very little of that happened once China built nuclear weapons."

[deletia]

**[CFR:] The IAEA also issued a report about Syria's program. Syria had a facility bombed by Israel in 2007, although Israel has never publically acknowledged this. The United States has issued information suggesting this was going to be a nuclear weapons facility, helped by North Korea, which already has tested nuclear weapons. How do you see that problem?**

**[Fuhrmann:]** For the agency, Syria and Iran pose different problems, and the reason is that the Israeli strike against the al-Kibar plant in September 2007 was really an indictment of the agency's safeguards regime. And the agency took that very personally and now feels obligated to get in there and do something about the problem to show that it still has some sort of institutional credibility and authority, and that countries can in fact have some confidence in the safeguards regime. Iran is also obviously a problem, because it has on a number of instances defied IAEA safeguards, but from the agency's perspective these are two related but distinct problems.

**[CFR:] In another words, Syria isn't in the business right now of making anything nuclear, since they have no obvious facility.**

**[Fuhrmann:]** Well, that we know about, right? I mean the al-Kibar facility was unknown until it was bombed. But as far as we know, you're right. There are no facilities other than a small research reactor.

## Reaching Consensus at the IAEA

Mark Hibbs Q&A

September 13, 2010

*[EXCERPTS]*

This month, the two decision-making bodies of the International Atomic Energy Agency (IAEA)—the board of governors and the general conference—will convene in Vienna for their annual fall meetings. On the agenda will be the nuclear programs of Iran, Syria, and Israel, and the goal of a nuclear-free Middle East. Following on the heels of two new IAEA reports criticizing Iran and Syria for continued lack of cooperation with the IAEA—including allegations of covert nuclear work—the two countries' nuclear programs will remain in the spotlight.

In a Q&A, Mark Hibbs explains that the lack of action expected on these major issues underscores the dysfunctional relationship between advanced, largely Western, nuclear countries, and the developing and non-aligned states that constitute the majority of the IAEA's membership.

[deletia]

### **The United States wants to launch a special investigation into Syria's activities. Is the board likely to take action?**

No. In the view of the IAEA's legal experts, the terms of Syria's safeguards agreement would legally permit IAEA Director General Yukiya Amano to request a special inspection based on the information about Syrian nuclear activities obtained from the United States and other IAEA member states. But so far Amano is not willing to make the request given the perceived political risks involved.

The last time the IAEA made a special inspection request was for North Korea in 1993. U.S. spy satellite photos conclusively demonstrated that North Korea was concealing reprocessing waste from what appeared to be a facility separating plutonium and the IAEA board reached a consensus that a special inspection was "urgent and essential," as legitimated by the terms of North Korea's safeguards agreement.

As it's widely believed that the 2007 Israeli air attack decapitated Syria's clandestine nuclear activities, there will not be a consensus that a special inspection in Syria is "urgent" today. And board members who are wary of a special inspection request point out that the request made for North Korea in 1993 led Pyongyang one month later to quit the Non-Proliferation Treaty (NPT).

Furthermore, if Syria complies with a request for a special inspection and the IAEA fails to confirm alleged clandestine nuclear activities—a concern some Vienna experts say is justified given evidence indicating that Damascus has covered its tracks in the three years since Israel bombed the suspected reactor site in Syria—that would profoundly damage the IAEA's credibility. Syria, Arab states, and other NAM members have expressed concern that should a special inspection be requested on the basis of U.S.-supplied information, the IAEA would be acting on behalf of U.S. intelligence agencies that supposedly aim to use the IAEA to obtain access to military activities in Syria even though they are not necessarily nuclear.

On the other hand, a few IAEA verification officials have argued that there is little to lose in requesting a special inspection in the light of Syria's lack of cooperation. Regardless of the political risks, they think the request would establish an important benchmark and bring the matter to the attention of the UN Security Council. But this is not the view expressed internally and in bilateral meetings with member states by Amano and his senior aides and, given their reluctance, and Amano's apparent desire to accommodate NAM concerns on the board, it's unlikely board members will force the matter during this month's meeting.

## **Is it possible that the IAEA will agree to call a special inspection in Syria in exchange for an agreement by Israel to participate in a nuclear disarmament conference?**

An agreement like this is highly unlikely. During and after a recent visit by Amano to the country, Israel underscored that it will not make any major concessions on its nuclear program.

At the 2009 general conference, Arab states, led by Egypt, succeeded in getting a resolution passed urging Israel to join the NPT and put all its nuclear activities under IAEA safeguards. A similar resolution will be floated during the 2010 conference. Still, it's likely that action on Israel's nuclear program—both in the boardroom and especially at the general conference—will be dominated by rhetoric, but not result in any decisions of substance.

At the 2010 NPT Review Conference in May, the NAM was able to extract from the United States and other Western states an endorsement of the proposal to hold a conference of all states in the Middle East in 2012 to establish a regional zone free of nuclear weapons and other weapons of mass destruction. Out of a fear that the NPT could collapse if two consecutive review conferences failed to reach a consensus conclusion, the United States and Western states agreed. Israeli officials have since warned that Israel may not attend the 2012 conference—Israel is not obligated to take part because it is not a party to the NPT.

The IAEA safeguards a limited amount of declared nuclear activity in Israel, but now and in the future the Vienna agency will have no leverage to significantly influence decision making by Israel about the future of its overall strategic nuclear policy.

## **Syria's Challenge to Nuclear Proliferation and What IAEA Could Do**

Bennett Ramberg, Ph.D.

The Huffington Post September 14, 2010

Posted: September 13, 2010 03:12 PM

"Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites."

So concludes the September 6, 2010 International Atomic Agency report revealing the nuclear investigative dead end bearing on suspect Syrian nuclear activities. Simply reissuing the conclusion, as IAEA does on a quarterly basis, marks a policy to nowhere. The time is long overdue for the nuclear watchdog to take a more assertive stand not simply to hold Damascus accountable for past and continued nuclear cheating but to use Syria as an example to buttress the flailing nonproliferation regime. IAEA can start this week at the Board of Governors meeting.

Syria's nuclear weapons ambitions came to light in September 2007 when Israeli aircraft destroyed what had been a concealed nuclear weapons reactor. Subsequent revelations by American intelligence and media uncovered a number of troubling facts. First, IAEA safeguards had failed to detect even a inkling of Syria's nuclear cheating. The failure continues a pattern found elsewhere--Iraq (in the 1980s), Libya and Iran--raising troubling questions about NPT safeguards generally. Second, even when evidence reveals a nuclear violator, Syria demonstrates IAEA impotence to force transparency or reverse behavior. Indeed, Damascus has done Tehran one better: following its sole material concession--granting inspectors access to the bombed reactor site, but only after Syrian engineers had carted away debris and placed a new building over the plant's footprint to conceal evidence--it repeatedly has said "no" to IAEA requests to provide additional information about past and current nuclear activity and gotten away with it.

The collusion of other countries in Syria's venture remains equally troubling. North Korea provided reactor technology and Iran, financing. Tehran's contribution marks the first time an NPT party helped another to develop a weapons capacity.

The implications for the region are not hard to foresee. Fast forward a decade or two. Nuclear energy has spread across the Middle East implementing plans begun in 2010 or earlier: Jordan, Turkey, Saudi Arabia, Libya, Egypt, the United Arab Emirates and others have in place the skeleton for a weapons program shrouded by "peaceful" energy reactors. Suspicions mount. Rumors spread about hidden weapons activities. IAEA either remains clueless or inspectors report concerns to a sclerotic Board of Governors. Governments and pundits express dismay: how did we get to this point?

This week IAEA's Board of Governors can act to promote a different history by confronting Syria. The Board has the ability to do so by calling for a "special inspection" of all suspect Syrian sites as provided by the safeguards agreement the Agency entered into with Damascus: "If the Agency considers that information made available by the State, including explanations from the State and information obtained from routine inspections, is not adequate for the Agency to fulfill its responsibilities under the Agreement..." it may order "special inspection." Discovery of nuclear contraband would demand elimination.

Were Syria to balk, the Board of Governors should declare Damascus in noncompliance and send the matter to the Security Council to take action including sanctions. No doubt the course will bring out the cynic in many of

us. After all, Iran's continuing sanctions defiance and North Korea's success in detonating a nuclear weapon despite economic penalties and political isolation suggest sanctions offer little.

But this may misread history. At times, sanctions worked to halt nuclear efforts. They helped defeat Iraq's inclinations after the 1991 Persian Gulf War. They stunted Libya's nuclear program. And because Syria remains economically weak, sanctioning Damascus can bring results. Swift and robust application--rather than the Council's historic incremental approach--can make the strategy work. The alternative--more toothless IAEA reports--will only set the stage for a proliferating world none of us can wish for.

## Ten Lessons from September's IAEA Diplomacy

Mark Hibbs

Proliferation Analysis,

October 7, 2010

Last month, the International Atomic Energy Agency's (IAEA) two decision-making bodies—the 35-member Board of Governors and the General Conference comprising 151 IAEA member states—held back-to-back conclaves. The meetings were routine, but some results were not.

The Board of Governors witnessed a showdown between Iran and IAEA Director General Yukiya Amano in which Iran, supported by others in the Non-Aligned Movement (NAM), overtly challenged Amano's leadership. Thereafter, at the 2010 General Conference, U.S.-led diplomacy narrowly defeated an Arab effort to try to compel Israel to give up its nuclear weapons.

The conclusions from the foregoing events are tenfold:

\* First, Amano's policy of courting the NAM, a group of 118 developing countries representing the majority of the IAEA's members, hasn't helped his approval rating. Amano succeeded Mohamed ElBaradei a year ago after winning a contentious Board election which was divided on North-South lines. Last month, the NAM and especially Arab states harshly attacked Amano's handling of Middle East-related issues, keeping Amano under pressure to heed NAM interests.

\* In 2009, Amano's election divided developing countries and advanced, mostly Western nations. Mutual suspicion in the two camps has not abated. A year ago, many observers predicted that the departure of ElBaradei and U.S. President George W. Bush would clear the air. That turned out to be wrong.

\* The NAM is now a formidable player in IAEA affairs. Until 2003, when the NAM established a chapter in Vienna, it focused on diplomacy in Geneva and New York. In Vienna, the NAM now demands that the IAEA trim its nuclear security, safety, and verification ambitions and instead focus on technical cooperation. The NAM enjoys a General Conference majority, but it aims to change the rules to secure a majority in the Board.

\* Iran's influence in the Vienna Chapter of the NAM is considerable. At the 2010 Nuclear Non-Proliferation Treaty (NPT) Review Conference, held in New York, a balance was struck between Iran and the more restrained positions of Egypt and many NAM states. In Vienna, this balance is largely absent. Iran has nuclear expertise that most NAM states do not, and Iran comes to NAM meetings well prepared to advance its views.

\* Syria is winning its battle with the IAEA over safeguards compliance. Fearing a confrontation, Amano is not willing to request from Damascus a special inspection to probe allegations raised by Western states and Israel that Syria built a clandestine reactor. Last month, Syria and its NAM/Arab allies defied calls from the European Union and the United States to cooperate with Amano. Western states complained that NAM and Arab states are ignoring safeguards compliance deficits.

\* At the General Conference, the defeat of an Arab resolution calling on Israel to subject all its nuclear activities to IAEA safeguards did not signal a change in attitudes about Israel's nuclear weapons. Rather, it resulted from concerted U.S.-led diplomacy to persuade about a dozen of the IAEA's 151 members—none of them in the Middle East—not to support the resolution, which was similar to a resolution passed in 2009. A handful of states in Africa and Asia agreed to abstain in the interest of furthering Middle East peace and disarmament initiatives embraced by U.S. President Barack Obama.

\* However, the resolution's defeat will have little impact on the Middle East peace process, which will be dominated by local issues dividing Israelis and Palestinians. Nuclear matters will hardly factor.

\* Nor does the defeat of the resolution necessarily imply that Israel will attend a Middle East nuclear disarmament conference in 2012. In May, the United States agreed to this NAM demand to assure that the 2010 five-year review of the NPT did not end without a final consensus agreement, following a failure in 2005. President Obama wants Israel to attend the conference, but Israel will pressure Obama to limit the meeting's scope to permit Israel to attend without taking political risks. Whether Israel attends will depend hugely on developments in Iran the next two years—but not on IAEA diplomacy.

\* So far, Amano has played a firm hand on Iran. Iran's boardroom war of words may have been an attempt to intimidate Amano, but it was also an act of frustration at the IAEA's resilience in raising outstanding safeguards compliance issues. Amano, however, has also made concessions to Iran in pledging to modify public information policies and protect confidential information. But some of these changes are also favored by the advanced nuclear states which supported Amano's election.

\* In the coming year, Iran and Syria will be hard-pressed to retain influence over the NAM in the boardroom. Of the NAM states that unflinchingly backed Iran and Syria, only Venezuela remains on the Board through late 2011. Six of the seven NAM states newly elected as non-permanent members last month are countries that want to develop nuclear power in cooperation with advanced states; the seventh is a leading uranium exporter. These states might not follow Iran and Syria. Egypt, currently the global leader of the NAM, is now off the IAEA Board. In 2012, Egypt's NAM role will be taken over by Iran, which has heretofore failed to win election to the Board.

For nearly a year, Amano has walked an increasingly fine line between the NAM's technical cooperation agenda and advanced states' verification concerns in the Middle East. Conflict escalated last month because Iran and Syria were supported by the NAM members of the Board and because the same states also attacked Amano's hands-off approach to Israel, a subject that preoccupied ElBaradei. Taking advantage of the IAEA's lack of leverage over Israeli policy, Arab states may continue to squeeze Amano on this issue and thereby mobilize the NAM in Iran and Syria's favor. But this outcome is not inevitable, since the NAM may also be increasingly challenged to enforce discipline among members that seek cooperation from advanced states to deploy nuclear power reactors.

A rough balance between nonproliferation and technical cooperation interests, with the IAEA at the center, has for decades governed the global system which manages nuclear technology exchange. This system could break down if either of these two objectives were to be focused on in a way that would cause serious detriment to the other. A very few states, particularly those in breach of their safeguards obligations, might favor such a development, but most others that want the benefit of nuclear cooperation will think twice before driving the system to the wall. Likewise, to obtain the cooperation of the NAM, advanced nuclear states must assure developing countries that they will be reliable, transparent, and fair.

## **Analysis: U.N. nuclear agency faces dilemma over Syria**

By Fredrik Dahl

VIENNA

Wed Oct 13, 2010 5:30am EDT

(Reuters) - The U.N. nuclear agency says Syria is stonewalling its investigation into suspected atomic activity, but it may hold back from escalating the dispute to avoid opening a new front at a time of rising tension with Iran.

It has been more than two years since Syria allowed the International Atomic Energy Agency (IAEA) to inspect the Dair Alzour desert site, where secret nuclear work may have taken place before it was bombed to rubble by Israel in 2007.

U.S. intelligence reports said it was a nascent North Korean-designed nuclear reactor intended to produce bomb fuel. Syria, like its ally Iran, denies having an atomic weapons programme.

Washington has suggested the Vienna-based U.N. agency could invoke its "special inspection" mechanism to give it the authority to look anywhere in Syria at short notice.

Damascus would probably refuse such a demand and IAEA Director-General Yukiya Amano would then have to choose between raising the stakes further or, in effect, accepting his office can do little more to make an unwilling member state cooperate.

Mark Hibbs of the Carnegie Endowment for International Peace referred in a report to inspections and other means used by the agency to make sure countries do not acquire atom bombs.

"Syria is winning its battle with the IAEA over safeguards compliance," he said.

"Fearing a confrontation, Amano is not willing to request from Damascus a special inspection to probe allegations raised by Western states and Israel that Syria built a clandestine reactor."

### URANIUM TRACES

In its latest report on Syria in September, the IAEA said the country's refusal to allow U.N. inspectors access to the area was endangering potential evidence in the investigation.

Earlier this year, it gave some weight to suspicions of illicit atomic activity by saying uranium traces found in a visit by inspectors in 2008 pointed to nuclear-related activity.

In a debate in the IAEA's 35-nation board last month, U.S. ambassador Glyn Davies said Washington would back the agency's use of all tools at its disposal to advance the investigation.

Syrian envoy Mohammed Badi Khattab said the IAEA did not need to go back to Dair Alzour because it already had ample proof it was a non-nuclear military site.

Syria has previously suggested uranium particles found at the site came from Israeli weapons used in the strike or were dropped from the air, an assertion dismissed by the West.

The Syrian case has been overshadowed by a more high-profile dispute over Iran's nuclear programme, which the West fears is aimed at making bombs and Tehran says is for producing electricity.

One important difference between the two, diplomats say, is that Iran's work is still going on while the Syrian site was destroyed.

The IAEA last resorted to special inspection powers in 1993 in North Korea, which still withheld access and later developed nuclear bomb capability in secret.

## SPECIAL INSPECTION

Shannon Kile of the Stockholm International Peace Research Institute (SIPRI) said the evidence raised questions about whether Syria was breaking legally-binding commitments.

"It seems to me that this is a case which really calls out for a special inspection," he said.

Any such move may anger Damascus, whose relations with Washington improved after Barack Obama took office in 2009.

If Syria were to reject a possible special inspection request, the IAEA board could vote to refer the issue to the U.N. Security Council, as it did with Iran four years ago.

This seems unlikely in the near future and Syria may be backed by board members from developing countries, but Western states are expected to keep up the pressure.

"We're likely to see a continued stalemate, with associated low-level tension at the (IAEA) board, for some time to come," said Andreas Persbo, Executive Director of the Verification Research, Training and Information Center (VERTIC) in London.

Syria has allowed inspectors to visit an old research reactor in Damascus where they have been checking whether there is a link with Dair Alzour after discovering unexplained particles of processed uranium at both.

Hibbs said that, as time passed, it would be easier to hide any non-declared nuclear activities. "The U.S. and other Western states are getting increasingly concerned that time is running out on the IAEA in Syria."

Kile said it would be troubling if North Korea was supplying nuclear weapon-relevant technology to a country without such arms. "I think that for many...is really a red line," he said.

## **Break the Silence on Syria's Nuclear Program**

**Three years after Israel destroyed its Al-Kibar reactor, the Bashar Assad regime continues to stonewall the IAEA.**

By GRAHAM ALLISON AND OLLI HEINONEN

**DECEMBER 4, 2010**

The United States has joined other major powers in a dangerous conspiracy of silence on Syria's nuclear program. Syria foreswore nuclear weapons when it ratified the nuclear Nonproliferation Treaty in 1969. To assure the world that it is fulfilling that commitment, Syria also signed a safeguards agreement with the International Atomic Energy Agency (IAEA) in 1992.

Yet Syria was able to secretly buy a nuclear reactor from North Korea, a country facing the most restrictive sanctions regime in the world. If Israel had not bombed the Al-Kibar reactor site in an air strike in September 2007, it would be producing plutonium by now for Syria's first nuclear bomb.

**But this violation of Syria's treaty commitments was not discovered by IAEA inspectors.** And the program was not halted by the permanent members of the United Nations Security Council. So it has been convenient for world powers to let Syria slip off the radar and to move on as if these events had not occurred.

**It is by no means certain that Damascus has given up its nuclear ambitions.** Since November 2008, nine IAEA reports (the latest released last month) have documented Syria's noncompliance with its requests for more details about its nuclear program.

Syria has not provided plausible explanations for the presence of man-made uranium particles found by the IAEA in 2008 at Dair Alzour, the site of the bombed reactor. **More worrying, the agency has discovered uranium conversion experiments at a research reactor in Damascus, which Syria had failed to report. (Uranium conversion is a necessary step toward creating weapons-grade uranium.)**

**Syria has acknowledged that it has used yellowcake (necessary to initiate uranium enrichment) in these experiments from the Homs facility, which benefited from IAEA technical assistance.** However, it has not provided access to the facility, saying it will postpone substantive discussions and verification of these materials until March or April 2011.

It is essential that the IAEA establish whether there is a link between the uranium found in Dair Alzour, Homs, and the research reactor in Damascus to ensure that all nuclear material in Syria is declared to the world's international nuclear watchman. But there has been no progress in establishing facts about the destroyed reactor or three other locations that may be functionally related to it. Syria continues to argue that due to the military and nonnuclear nature of these sites, it has no obligation to provide more information to the IAEA. But the safeguards agreement contains no such limitation on access to information, activities or sites.

The design of the Dair Alzour project appears very similar to the North Korean reactor in Yongbyon. And North Korea is capable of producing fuel for such a reactor.

We recently learned from U.S. nuclear expert Sigfried Hecker that North Korea, with Pakistan's help, has been able to build a small uranium enrichment facility. Syrian President Bashar Assad told the Austrian newspaper Die Presse in December 2007 that Pakistani nuclear proliferator A.Q. Khan had offered his nuclear technology to Syria. Many Syrian engineers and scientists would have been involved in the Dair Alzour project. What are they doing today, three years after that site was bombed?

While Syria stalls, the authority of the whole nonproliferation regime is eroding. This sets another unwelcome precedent for future proliferators.

A feasible next step is readily available. According to Syria's contract with the IAEA, the agency must be provided access to locations that have benefited from its technical support. More specifically, the safeguards agreement allows the IAEA to conduct a "special inspection" of the Dair Alzour site and other suspected sites. On Dec. 3, a bipartisan group of U.S. lawmakers called upon President Obama to press the IAEA to conduct such an inspection. Otherwise, the world risks awakening to a Syria that has become the next North Korea.

Mr. Allison is director of the Belfer Center for Science and International Affairs at Harvard University's Kennedy School and author of "Nuclear Terrorism: The Ultimate Preventable Catastrophe" (Times Books, 2004). Mr. Heinonen is a former deputy director of the IAEA and is now a senior fellow at the Belfer Center.

## **Syria's Nuclear Program Requires Stronger International Response**

Posted December 6th, 2010 at 10:00am

Although Iran and North Korea have received far more attention, Syria is belatedly becoming a prime focus of international concern over nuclear proliferation.

On December 1, the Institute for Science and International Security released satellite photos of suspected Syrian nuclear sites linked to the covert Al-Kibar nuclear reactor that Israeli warplanes bombed in 2007, shortly before it could begin operations. The CIA later confirmed that the site contained a North Korean–designed nuclear reactor that would have been capable of producing plutonium for nuclear weapons.

Syria blocked inspectors from the International Atomic Energy Agency (IAEA) from investigating the suspected nuclear facility until after it had cleaned up the bombed site to remove incriminating evidence. Under strong international pressure, it reluctantly permitted IAEA inspectors a brief visit in 2008 but since then has stonewalled IAEA efforts to investigate its nuclear program.

On Thursday, IAEA Director General Yukiya Amano said that he sent a letter to Syrian Foreign Minister Walid al-Muallem formally requesting access to suspected nuclear sites. If Syria continues to block the IAEA investigation, its failure to comply with its nonproliferation commitments can be referred to the United Nations Security Council for further action. Similar nuclear defiance by Iran led to an escalating series of U.N. sanctions.

Iran is suspected of financing the covert Syrian reactor in an end run to acquire plutonium for nuclear weapons without risking the discovery of additional nuclear facilities on its own territory. Syria, which has little oil, does not have the economic resources or technological infrastructure to independently build an expensive nuclear weapons program. The tyrannical Syrian and Iranian regimes are close allies that have developed strong ties with North Korea, an outlaw nuclear power that has provided important military and nuclear assistance to both.

In February, Western officials leaked the fact that before Israel destroyed the Syrian reactor in September 2007, North Korea had delivered 45 tons of un-enriched uranium “yellow cake” to Syria and subsequently moved it to Iran via Turkey after the Israeli strike.

Despite U.N. sanctions, North Korea has continued to provide both Iran and Syria with missiles, components, and technology, and the recently revealed North Korean uranium enrichment plant at Yongbyon poses an additional proliferation risk. The Yongbyon facility appears to have a design similar to Iran's uranium enrichment facility at Natanz. North Korea may have obtained Iranian help on uranium enrichment in exchange for its extensive assistance for Iran's ballistic missile force, which is largely based on North Korean missile technology. Or there may have been a nuclear quid pro quo in the form of a transfer of its nuclear technology or plutonium to Iran.

Whatever the arrangement is, it is clear that Tehran and Pyongyang have secretly undertaken extensive nuclear cooperation. According to a senior North Korean defector: “The nuclear power and missile research institutes in the North and Iran are effectively one body. North Korean nuclear and missile scientists are in Iran and Iranian scientists are working in the North. They share everything.”

While Iran and North Korea have been forced by sanctions to pay a growing price for their nuclear defiance, Syria has so far escaped any consequences. This should be rectified as soon as possible. Polite letters from the IAEA will have little effect unless they are strongly backed by an international coalition determined to punish Damascus if it continues to drag its feet on its nonproliferation obligations. This requires firm American leadership.

The Obama Administration could start by abandoning its diplomatic wooing of Syria and taking a harder line on Syria's nuclear violations. A bipartisan group of eight congressional leaders wrote a December 2 letter to President Obama urging him to take stronger action against Syria's nuclear program. The signers included Representatives Jeff Fortenberry (R-NE), Edward Markey (D-MA), Ed Royce (R-CA), and Brad Sherman (D-CA) and Senators John Ensign (R-NV), Kirsten Gillibrand (D-NY), Jon Kyl (R-AZ), and Joseph Lieberman (I-D-CT).

If the Obama Administration fails to provide the strong leadership needed to ensure more effective action at the IAEA and the U.N. Security Council, then Syria, a junior partner in the nuclear axis of evil, will continue to advance its illicit nuclear program with impunity.

## Special Inspections

Posted by Andreas Persbo (andreas.persbo) on Mar 04 2011

Last changed: Mar 04 2011 at 10:08 PM [*Accessed 2011-03-09T17:42Z*]

### Background

Last week's International Atomic Energy Agency (IAEA) report on Syria was widely anticipated. The country has been under suspicions of non-compliance with the 1968 Nuclear Non-Proliferation Treaty (NPT) for some time. The background is well-known. In September 2007, the Israeli Air Force suddenly and without warning bombed a facility in the middle of the Syrian desert. The Syrian and Israeli governments then remained surprisingly tight-lipped about the strike. The Israelis did not want to implicate an ally whose airspace they used for the strike. The Syrians seemingly only wanted to hush up the affair as quickly as possible.

For its part, the IAEA, faced with very little open-source information on the site itself and two member states who didn't want to talk about it, did nothing to investigate the matter further. Meanwhile, the Syrians got busy clearing up the site. As the IAEA notes in its latest report: 'by the end of October 2007, large scale clearing and levelling operations had taken place at the site which had removed or obscured the remains of the destroyed building' (GOV/2011/8). The 'destroyed building' in question was widely suspected to be an uncompleted graphite-moderated natural-uranium fuelled reactor---supplied by the North Korean government no less.

It was June 2008 before the IAEA first visited the site and took samples. Later analysis showed 'particles of anthropogenic natural uranium' nearby, indicating the processing of uranium. It could have been natural uranium fuel---or it could have been something else. The Syrians themselves said that the Israeli Air Force used the uranium in their munitions. The IAEA is not entirely convinced by this explanation.

Since then, the Agency has repeatedly requested access to information, material, equipment and locations in Syria. Their overtures, however, have been met by silence. And this silence has led some to forcefully call for a 'special inspection' to be deployed into Syria. On 26 February 2009, for instance, James Acton, Mark Fitzpatrick and Pierre Goldschmidt wrote that:

"Syria is the textbook definition of a case in which a special inspection is merited. If the IAEA fails to ask for one, it will hand future states suspected of non-compliance an extraordinarily powerful precedent to use in opposing a special inspection request. IAEA officials regularly complain about their lack of legal authority—and rightly so. But, in this instance, they will have only themselves to blame if they let the authority that they do have atrophy" (Carnegie Endowment, Proliferation Analysis, February 2009).

Over the past year, there were few references in the media about the the need to invoke this tool. Lately, however, it would seem like diplomatic pressure is increasing on the IAEA. Indeed, in the run-up to next week's meeting of the IAEA Board of Governors, several observers have speculated that the Director-General would call for a special inspection in the country. This did not happen, as the Director-General's recently issued report shows, and rumours are now circulating that several IAEA Governors will refrain from pushing the issue at next week's meeting.

### Special inspections

The special inspection tool itself has been around for a while. It features in the facility-specific safeguards agreement (INFCIRC/66) as well as the comprehensive safeguards agreement (INFCIRC/153) obligatory for all non-nuclear-weapon state parties to the NPT.

There are two principal routes to getting a special inspection agreed. First, the state itself can submit a special report, which then will have to be verified by a special inspection. Second, the IAEA may consider that information made available to it by the state (including explanations from the state as well as information gathered through routine inspections) is not adequate for it to fulfill its responsibilities under its comprehensive safeguards agreement. In the latter case, the IAEA should, in other words, have some indication that not all relevant nuclear material, or relevant facilities, in the country has been declared.

Two special inspections have been invoked to date. The first, on the invitation by the Romanian government aimed to clear up misunderstandings surrounding the country's large nuclear fuel cycle. The second was invoked against North Korea, after information had come to light that indicated that the country had not been entirely forthcoming in its initial declaration. The IAEA so has some experience in invoking special inspections using both of the two principal routes.

### **Consultation is key**

The special inspection tool is subject to any consultations between the IAEA and the inspected state. The Board of Governors, when deciding on the last special inspection in 1992 (North Korea, even though the inspection in question was blocked by the government in Pyongyang), reaffirmed the Agency's right to carry out these inspections at undeclared locations. However, the agreement itself clearly stipulates that such access should be obtained in agreement with the inspected state party. If the state doesn't agree with the Agency, paragraph 18 of INFCIRC/153 clearly lays out the procedure:

"The Agreement should provide that if the Board, upon report of the Director General, decides that an action by the State is essential and urgent in order to ensure verification that nuclear material subject to safeguards under the Agreement is not diverted to nuclear weapons or other nuclear explosive devices the Board shall be able to call upon the State to take the required action without delay, irrespective of whether procedures for the settlement of a dispute have been invoked."

It is very likely, at that point, that the state will not heed the Board's call. The Board then has the option to report this fact to the United Nations Security Council and the General Assembly. It would also notify all IAEA member states that it has been unable to verify that there has been no diversion of nuclear materials from peaceful use.

The techniques deployed during a special inspection are similar to those of routine inspections. The IAEA has a right to:

1. Examine records;
2. Make independent measurements of all nuclear materials subject to safeguards under the agreement;
3. Verify the functioning and calibration of equipment;
4. And use other objective measures which has been demonstrated to be technically feasible.

### **Calling an inspection: what to gain, what to lose?**

The problem with the special inspection is that it is likely to go unheeded unless the state itself requests it (through submitting a special report). There is only one case, of course, to base this conclusion on, and that is North Korea. It still makes sense to assume that this is the likely outcome. If the state is hiding something, it will have little incentive to invite inspectors to view the very secrets it wishes to protect. It could attempt to control the special inspection, by having an elaborate deception strategy in place. If the IAEA, for instance, requests access to installations which are irrelevant, the state could even afford this access. After the fact, it can broadcast to the world that it has done everything that the IAEA have asked for--and that the Agency found nothing. But

the risk is, of course, that the IAEA will know what it is looking for. And once the precedence of giving access has been set, it is very difficult to backtrack.

So, in most cases where an inspection is called against the will of the inspected state, it is likely to go straight to the Board of Governors for further action. Unless the state is under intense international pressure, a special inspection request is therefore likely to shut down the inspection effort before it has even started. This, naturally, doesn't progress the investigation at all. A special inspection should, from that perspective, only be called if there is a reasonable chance that the state will accommodate it.

From another perspective, however, it may be desirable to call the inspection anyway. If the Director-General of the IAEA feels that there is very little room for further progress in inspections whatsoever, he may feel inclined to draw the line under the effort by invoking the inspection tool. This would, after all, signal that the Agency is close to drawing a conclusion that it can no longer certify that all materials remain in peaceful use. The special inspection request represents 'the final offer' from the Agency, after which the issue will be raised with the UN Security Council and the General Assembly. This threat could, possibly, act as an incentive for the stalling state to cooperate with inspectors.

## **Syria and the IAEA**

Mark Hibbs Q&A,

March 6, 2011

The main decision-making body of the International Atomic Energy Agency (IAEA), the Board of Governors, meets in Vienna on Monday for the first of four quarterly meetings in 2011. In a Q&A, Mark Hibbs examines the IAEA's ongoing standoff with Syria over the country's persistent refusal to cooperate with the IAEA to probe allegations of covert nuclear activities. Recent reports have raised the possibility of additional undisclosed sites where uranium processing may have occurred. But the IAEA and its board will likely avoid escalating the conflict with Syria in part not to distract from its dispute with Iran, but also so not to endanger a possible accord between Syria and Israel which might in turn favor a political resolution of Syria's suspected clandestine nuclear activities.

- \* What is the IAEA investigating in Syria? Is Syria cooperating?
- \* What is the significance of the three undeclared sites? What is the IAEA saying about them?
- \* Will the IAEA turn up the pressure on Damascus in the wake of reports suggesting that Syria was engaged in more covert nuclear activities?
- \* Will the IAEA board pass a resolution condemning Syria, following up on discussions last month with the United States?
- \* IAEA Director General Yukiya Amano suggested in media interviews in recent weeks he would consider asking for a "special inspection" in Syria. Is he likely to do so?
- \* Will Syria continue to simply ignore the IAEA?
- \* Is there any truth to rumors that Syria has or had a covert uranium enrichment program?
- \* Will board members avoid taking action on Syria and Iran in fear of negatively impacting popular uprisings in the Middle East and North Africa?
- \* A year and a half into his term, how do board members regard Amano?

### **What is the IAEA investigating in Syria? Is Syria cooperating?**

The IAEA is continuing to investigate the claim that Syria secretly built a reactor designed for plutonium production between 2001 and 2007. For the seventh consecutive quarter since August 2009, the IAEA said in a report written for its board of governors last month that Syria has not cooperated with ongoing investigations.

The IAEA wants information from Syria about the alleged reactor site, Dair Alzour, plus three other locations which, according to intelligence information provided to the IAEA by the United States and other countries, appear related to the reactor project.

But since 2008, Syria has blocked access to these sites. Based on information from IAEA member states, plus data from environmental samples taken by IAEA inspectors during a single visit to Dair Alzour in 2008 and at a research reactor in Damascus the last three years, the IAEA has argued that Syria's explanations are both incomplete and increasingly inconsistent.

In 2009 and 2010, for example, the IAEA found out during routine oversight at the Damascus reactor that Syria had chemically processed raw uranium oxide at a heretofore undeclared location—a phosphate plant in Homs in western Syria—and did not declare that activity to the IAEA. IAEA analysis, including of open source scientific publications and explanations provided by Syria, suggests that Syria may have carried out still more undeclared nuclear processing activities. The IAEA is therefore keen to investigate whether uranium processing was carried out at these three other sites.

### **What is the significance of the three undeclared sites? What is the IAEA saying about them?**

The three sites were first referred to by the IAEA in its reports to the board in 2008, but the IAEA has said virtually nothing publicly about their possible significance. Last month, however, names, locations, photographs, and other information concerning these sites were made public by a German newspaper and a U.S.-based researcher, ostensibly with the cooperation of officials from the governments which had provided the information to the IAEA. Their appraisal concluded that at one of the sites, Marj as-Sultan near Damascus, Syria may have covertly processed uranium oxide into a uranium-fluorine compound, UF<sub>4</sub>, for the production of uranium metal fuel for the now destroyed alleged reactor at Dair Alzour.

The IAEA did not provide this information to the board, including in its most recent report written last month. We don't yet know the backstory on why the IAEA has not done this. When the IAEA drafted its most recent report to the board in February, it may not have reached a firm conclusion that the evidence pointed to specific nuclear activities. The IAEA may also have judged that making these details known would not contribute to Syria making a candid disclosure about the sites.

It is possible that the information on Marj as-Sultan was leaked to the media to give the IAEA an open-source reference upon which to justify asking Syria for an explanation of the sites. But the IAEA has requested access to these sites since 2008. It is therefore possible that the information was leaked by officials for other reasons, including rising frustration that the IAEA investigation has effectively been stonewalled by Syria for three years.

While it is true that until last month no information about the three sites had been made public, the IAEA, with help from member states, has been investigating them since 2008. Intelligence information, in particular photos of equipment said to be inside facilities at these sites, may have been leaked recently, suggesting that the findings are new. However, IAEA investigators have seen some of this intelligence evidence as early as last fall and perhaps earlier.

### **Will the IAEA turn up the pressure on Damascus in the wake of reports suggesting that Syria was engaged in more covert nuclear activities?**

Don't bet on it. Prior to and since the 2007 Israeli attack, the United States, Israel, and European states have been trying to persuade Syria to agree to a peace settlement with Israel and to abandon its political alliance with Iran. Recent signs that the sides might be considering re-launching peace talks further complicate the situation. This effort is going on behind the scenes now and board members, who otherwise are prepared to deplore Syria's lack of cooperation with the IAEA, are reluctant to provoke a crisis with Syria over its nuclear program which could torpedo talks between Syria, Israel, and other states.

Some board members believe that, in the longer term, the only conceivable favorable outcome of the Syria crisis with the IAEA would be for Damascus to cut a political deal with the West which would allow Syria—as Libya did in 2003—to terminate all undeclared nuclear activities in return for a political engagement. Without that, as long as Syria has significant current or past covert activities to hide, it has little incentive to come clean to the IAEA.

The IAEA's response toward Syria is complicated by its ongoing inquiry into Iran's nuclear program. The IAEA's investigation on Iran has been hampered in the boardroom by an acrimonious divide between advanced, mostly Western countries, which favor a tougher IAEA posture, and some developing countries, which support Tehran's claim that Iran has the right to develop sensitive nuclear capabilities.

Given this backdrop, the IAEA and many board members are wary about raising potentially explosive allegations about Syria—particularly if they are based on intelligence information obtained by the United States, European states, or Israel. The matter is further complicated by the fact that some board members are dismayed that Israel bombed the facility and that, thereafter, the United States withheld knowledge about Dair Alzour from the IAEA for more than half a year.

### **Will the IAEA board pass a resolution condemning Syria, following up on discussions last month with the United States?**

A month ago, the United States discussed with other board members bringing forth a resolution which would object to Syria's lack of cooperation with the IAEA. Some board members voiced reservations that doing so would take pressure off Iran at a time when Iran is becoming more recalcitrant. They also urged the United States to consider a resolution which would not directly condemn Syria but would, more generally, urge Syria and other states to cooperate with the IAEA.

Because of ongoing Middle East peace talks, even if the United States were to introduce a resolution on Syria, it would likely not cite Syria specifically for non-compliance, since the board would then be compelled, under the IAEA statute, to refer the non-compliance to the UN Security Council and the General Assembly.

### **IAEA Director General Yukiya Amano suggested in media interviews in recent weeks he would consider asking for a "special inspection" in Syria. Is he likely to do so?**

Likewise, the answer is no. Since 2009 the United States has been urging Amano to request a special inspection. U.S. officials warned—indirectly referring to actions by Syria since 2008 to cover-up activities at Dair Alzour and other sites—that valuable evidence would be lost if action continued to be delayed.

Because Syria is believed to have been covering its nuclear tracks, as time progresses, Amano may be less and less willing to request a special inspection. Were the IAEA to go to these sites and find nothing, Syria would be vindicated and the political credibility of the IAEA could be damaged. As he has done in the past, Amano spelled out to member states in advance of this month's board meeting that he is not eager to request a special inspection in Syria in view of the political risks. In some bilateral meetings, Amano has warned that launching a special investigation would further isolate Israel in the region.

### **Will Syria continue to simply ignore the IAEA?**

Damascus will cooperate just enough to keep the IAEA at bay. In November, Amano wrote to Syria's foreign minister urging Syria to resolve the conflict. Last month, Syria replied and once again did not agree to provide access to Dair Alzour or the three sites that were the focus of last month's media reports.

But Syria dangled what one Vienna diplomat called a "tiny carrot" by offering to permit the IAEA to inspect the Homs site. Syria and the IAEA had agreed last September on modalities for access to this and other sites, but no progress was made. Amano's report to the board concluded that Syria's February offer "could represent a step forward...to resolve all outstanding technical issues."

The Homs site, however, is not the location prompting the most IAEA concern. Far more critical are Dair Alzour and the three sites believed to be related to it. But Syria's offer to discuss access to Homs adds another reason why the board will not pass a resolution deploring Syria's lack of cooperation.

### **Is there any truth to rumors that Syria has or had a covert uranium enrichment program?**

The IAEA has investigated for several years whether Syria has been trying to enrich uranium. If Syria has produced UF<sub>4</sub>, this material could be fluorinated further to create UF<sub>6</sub>, the feedstock for enrichment plants. But if the IAEA believes that Marj as-Sultan, or another site, Masyaf, are related to uranium enrichment, it has not told the board that.

Unless the board is notified of such a finding, the governors will not take any action to investigate that allegation. Since about 2004 Western intelligence agencies have made some findings suggesting that Syria may be operating gas centrifuges. A senior Syrian official told me in 2007 that he personally rebuffed an offer by Pakistani scientist Abdul Qadeer Khan, who proliferated Pakistan's centrifuge know-how to Iran, Libya, and North Korea, to do "joint academic research" in Syria.

### **Will board members avoid taking action on Syria and Iran in fear of negatively impacting popular uprisings in the Middle East and North Africa?**

The protests have thus far had little direct impact on the thinking of board members because no one can predict the outcome of the uprisings. Some officials from board member countries said last week that the wave of political change across the greater Middle East should prompt caution by the board because none of the states with significant uprisings so far have been concerned with nuclear issues.

### **A year and a half into his term, how do board members regard Amano?**

From the outset Amano was seen by developing countries as favoring the interests of advanced, Western nuclear states. U.S. diplomatic cables from 2009 obtained by Wikileaks suggest that Western governments likewise see Amano in this light. They also view Amano as both politically astute and cautious—in step with his actions vis-à-vis Syria.

Since last fall, the board includes a group of developing countries seeking cooperation from Western states on nuclear energy development. They may see Amano more favorably than other developing states do. At a board meeting last December, these states supported the creation of an IAEA nuclear fuel bank—a project which Amano had been wary of embracing in light of criticism from many developing countries against the project. At this month's board meeting, the developing countries on the board may vote in favor of a resolution to establish another multilateral fuel assurance program involving the IAEA designed to ensure that contracts for the supply of enriched uranium reactor fuel are not broken for non-commercial reasons. The resolution will likely be tabled by the European Union, the United States, and Russia.

Amano was elected in 2009 by a narrow margin with the board divided between advanced and developing countries, and some observers predicted he would not be re-elected for a second four-year term. Pundits quip that, during the last six months, Amano reshuffled the secretariat to allow his key aides to manage the agency and let Amano concentrate on his re-election in 2013. In fact, all incoming IAEA leaders have made major personnel and organizational changes.

Amano's changes are now becoming apparent. Most significant among them was Amano's announcement to the board last month that, effective April 1, Amano will liquidate the small but—under past director general Mohammed ElBaradei—extremely influential—department called External Relations and Policy Coordination (EXPO) and combine it with the Director General's Office (DGO) to form the Director General's Office for Policy (DGOP). It will be headed by Rafael Grossi, Amano's chef de cabinet.

ElBaradei's final years were punctuated by damaging and bitter rivalries among a few key aides and deputies and Amano's reorganization was in part meant to eliminate the bureaucratic source of these conflicts. Western states which in 2009 supported Amano's candidacy did so in part because they believed that ElBaradei had run the IAEA too independently. In February Amano told the board that establishing DGOP would ensure that the agency's activities are in line with the guidance of member states. This will mean that the IAEA will be less subject to politicization of its work, but tighter control at the top might discourage transparency.

Director, Cyber and Space Operations  
Air Force Headquarters

## **"Cybersecurity: Emerging Threats"**

CyberFutures Conference  
National Harbor, Maryland

**1 April 2011**

*[EXCERPT]*

So let's look at these couple of examples here. Everyone knows what Israel did to Syria back in '06, '07. Syria had the biggest, they thought the best, Russian-made, Soviet-made air defense system. Israel turned them out, flew in, and then bombed a North Korean built nascent nuclear facility.

## ISIS Analysis of IAEA Report on Syria: IAEA Concludes Syria “Very Likely” Built a Reactor

Paul Brannan

May 24, 2011

The International Atomic Energy Agency (IAEA) has released its [May 24, 2011 report on the implementation of NPT safeguards in Syria](#). The report outlines in detail the evidence it has collected of a suspected covert nuclear reactor building under construction in Syria which was bombed by Israeli jets in September 2007. Syria has long denied that it was building a covert nuclear reactor. **Based on its analysis of the evidence, the IAEA “concludes that the destroyed building was very likely a nuclear reactor,” and that Syria should have declared it.**

This safeguards report provides strong support for the IAEA Board of Governors to recommend a referral of Syria’s case to the United Nations Security Council. Such a move would send a strong signal that the international community will not tolerate egregious acts of nuclear proliferation.

In addition to this action, member states should continue to urge the IAEA Director General to call for a special inspection in Syria. Though years have passed since Syria removed and buried remnants of the reactor building and carried out other acts of concealment, a special inspection would be valuable in uncovering further evidence and accounting for the activities that took place in support of the reactor project.

### Evidence

**While the IAEA has assessed in previous reports that the equipment and materials associated with the destroyed building were similar to what would be expected at a reactor, it did not offer a conclusion or explain the evidence in detail until now.** The report notes that the dimensions of the destroyed reactor building were similar to the dimensions of North Korea’s reactor at Yongbyon. After locating the destroyed building in commercial satellite imagery in October of 2007, ISIS noted that the dimensions of the Syrian building, as well as what would later be revealed as the top of the main reactor hall, were very similar to those of the Yongbyon reactor (see figure 1).<sup>1</sup>

The IAEA also said that imagery of the building after the bombing showed the presence of such features as a containment structure, heat exchangers and a spent fuel pond—all of which would be

<sup>1</sup> *Suspect Reactor Construction Site In Eastern Syria: The Site of the September 6 Israeli Raid?* David Albright and Paul Brannan, Institute for Science and International Security, October 23, 2007: [http://isis-online.org/uploads/isis-reports/documents/SuspectSite\\_24October2007.pdf](http://isis-online.org/uploads/isis-reports/documents/SuspectSite_24October2007.pdf)

expected in a nuclear reactor. In an April 2008 briefing, the US intelligence community presented a satellite image from after the bombing and highlighted some of these features (see figure 2).<sup>2</sup>

The IAEA report outlines the suspicious concealment activity that took place at the site of the reactor building after the bombing. It cites commercial satellite imagery showing “Syrian efforts to recover equipment and material from the destroyed building,” and notes that whatever remained of the building was “demolished and buried.” ISIS noted in an October 2007 report that Syria had used earth from a nearby hill to bury the remaining foundation of the reactor building (see figure 3).<sup>3</sup> Figure 4 is a satellite image from the US intelligence community briefing in April 2008 showing bulldozers in the process of burying the foundation.

Syria stated that the piping and pumping equipment near the reactor building was intended to supply water to a nearby water treatment facility. The Agency has assessed, however, that prior to the bombing the water pumping system was connected to the suspected reactor building, not to the water treatment facility. It found that after the bombing, Syria “reconfigured the pumping infrastructure to remove sections of the return pipe and to install a new large diameter water pipe connection from the [Dair Alzour Site Pump House] to the [Water Treatment Facility].” This activity can be seen in commercial satellite imagery in a January 2008 ISIS report (see figure 5).<sup>4</sup>

In the same report, ISIS noted that there was a faint line between the reactor building and the water treatment facility in imagery prior to the bombing and speculated that there may have been existing buried piping between the sites (see figure 6). The IAEA has assessed that there was small diameter piping between the reactor building and the water treatment facility which likely contained treated water or power lines. US government experts also assessed that there existed buried piping between the reactor building and the water treatment facility prior to the bombing, and that it contained power lines—supplying electrical power to the reactor building.<sup>5</sup>

## **The Syria Probe**

Cross-posted from VERTIC's blog.

Thursday, 26 May 2011

Director-General Amano has recently given an interview stating that Syria may indeed have built a nuclear reactor. In an interview with Reuters, he has at a minimum said that he has 'information that indicates that this is the case'. Some speculated that this means the Secretariat is preparing to have the country reported to the UN Security Council. The Agency's recently released report on the country (GOV/2011/30), however, is ambiguous.

Most in the non-proliferation community know the story by now. Israel bombed a site in September 2007. Suspicions soon arose that the site might have hosted a graphite-moderated natural-uranium fuelled reactor. Eventually, The International Atomic Energy Agency, which at first did not comment on the event, was allowed to look into the matter in June 2008. This was long after the Syrian authorities—in literal cover-up—had demolished the ruins, removed all debris, sent it off or buried it and scraped away some soil to top it all off.

The Agency's inspectors, strolling around the site in the hot Syrian summer, took samples from an area just outside the cleared site. The results were telling: particles of anthropogenic (processed) natural uranium, graphite, and stainless steel. The presence of this material strongly suggested the vanished site had been a reactor, and possibly that fuel was present. The latter is uncertain, as Syria has no known fuel fabrication plant, but possible. Israeli officials, speaking to VERTIC on condition of anonymity, have all stressed the reactor was close to operational status, and have suggested that fuel was ready to be loaded into the reactor. The Syrians have claimed the natural uranium comes from Israeli munitions.

The IAEA has tried to engage with the Syrian government. Letters have been exchanged but the country's authorities have not been forthcoming. The government has stonewalled any requests about, among other matters, technical documentation related to the construction of the building.

Syria's attempt to cover up has complicated on-site inspections. However, the overhead imagery, released several years ago, and supplemented by authenticated ground images of the site, together forms a convincing body of evidence. This body has been convincing enough for many to argue that the burden of proof now lies with the Syrian government.

The latest IAEA report now firmly puts the onus on the Syrians. A careful analysis of overhead imagery, a technical analysis of the water piping arrangement supporting the building as well as an assessment of electrical supplies, all points, in the IAEA's assessment, to the building being a clandestinely built reactor.

As for the uranium, the IAEA 'has not been able to determine the origin of the particles'. Many suggestions have been offered, including the supply of fresh fuel from North Korea. But so far, few convincing hypotheses has been brought to the table. The existence of an undeclared fuel manufacturing plant cannot be ruled out.

On balance, the IAEA infers the reactor was 'very likely' a nuclear reactor, and so should have been declared to the Agency under articles 42 and 43 of Syria's safeguards agreement.

### **The problem with very likely violations**

The language in the Director-General's report puts the Board of Governors in a difficult place. The report does not contain any firm recommendations—it does not even firmly state that the Secretariat finds itself unable to verify that all nuclear material in the country remains in peaceful use. Instead, the secretariat simply notes the 'very likely' former presence of a clandestine nuclear facility in one of its member states. Governors wishing to

argue for stronger measures against Syria will find them faced with a predictable counter-argument. A violation has not been confirmed, after all, it is simply likely. ‘And by the way’, the opposing side might argue, ‘the report contains nothing on whether nuclear material has been diverted’. Most governors will probably scratch their heads, thinking the report does not add much to the state of knowledge, or rather lack of knowledge, about Syria’s nuclear programme.

It is now up to the Board to assess the Director-General’s report and decide what to do with it. In my mind, there are three choices: call a special inspection, refer the case direct to the UN Security Council, or do nothing.

### **Calling the inspection...**

Some have been calling on the IAEA to call for a special inspection in Syria, which undoubtably would raise the diplomatic stakes (see Special Inspections, 4 March 2011).

For sure, calling a special inspection, or referring Syria to the Security Council in some other manner, would be problematic for the country, which is already facing unilateral sanctions by the United States. However, it is doubtful that the inspection call would be dealt with at once by the ministries in Damascus. The government is in all likelihood focussed on the domestic situation, which has been decaying steadily over the last few months. And even if it were not, it is not likely to play along with the request. It would first try to stall it for as long as it could. It would then either do as North Korea, break off any attempts to enforce the inspection, or engage in a piecemeal fashion, as it has already.

On the other hand, modern on-site inspection techniques (especially so environmental sampling) has yielded impressive detection rates. Syria would need to be convinced that the inspection team will not find any rouge particles, mislaid documentation, or errant memory sticks loaded with North Korean designs anywhere.

### **...going straight to the Council...**

Going straight to the Council is theoretically possible. It may also be the preferred choice for many governments seeking to increase the pressure on Damascus. Syria’s actions against its own people have made most states open to the direct action route. However, it is not without its difficulties. Some would argue that it makes no sense to go to the Council as long as the Secretariat still has authority to continue the probe. They would also reiterate that no violation has been proved, simply a likely one. Others are likely to challenge the Secretariat’s conclusions on technical grounds.

Syria still has regional friends, who would not want to see the country censored in an international forum. The question is how many friends it may have left. As the repression of the Syrian people intensifies, the country is finding itself increasingly isolated, and increasingly vulnerable. For sure, being censured by the United Nations as a country that seeks weapons of mass destruction, on top of one that violates fundamental human rights, will not be in Damascus best interests. As well as piling up the international pressure, and perhaps even fuelling domestic dissent, it will make the task to recover the country’s lost standing difficult. It may be that the Board would want to exploit this window of vulnerability. The threat of stepped up diplomatic censure may force Damascus to play along with the inspection process, at least for a while.

### **...or doing nothing.**

The final alternative would be to decide to be undecided. This is likely if the Board debate becomes exceptionally fractured and divisive. The so-called Vienna spirit has been badly damaged in later years, and attempts to rebuild it have been lackluster at best. Some governors might feel that Syria isn’t worth the row— even if the site was a nuclear reactor, and that is ‘very likely’ after all, it doesn’t pose much of a threat anymore. So why bother?

The problem, however, is not what we know, but what we don’t know. While we know that the Syrian reactor has vanished from the face of the Earth, we do not have any further understanding on what else might hide in the Syrian desert. This might be one compelling reason to act.

Another reason is more diffuse, and relates to the credibility of the non-proliferation regime as a whole. If no action is taken, it would be argued, Syria's actions will show that it is possible to openly flout the Nuclear Non-Proliferation Treaty, and to turn its back to the safeguards regime, without reaction. And this, some would argue, is not a good signal to send to other potential seekers of the Bomb.

## **The I.A.E.A. and Syria**

By BENNETT RAMBERG

Published: May 31, 2011

“The Agency concludes that the destroyed building was very likely a nuclear reactor and should have been declared by Syria” according to the safeguards agreement.

So writes the International Atomic Energy Agency’s director general, Yukiya Amano, in his May 24, 2011 report to the I.A.E.A. board of governors about the installation the Israeli Air Force bombed in September 2007. Although he does not explicitly say so, Mr. Amano’s finding places Syria in violation of the Nuclear Nonproliferation Treaty. Three years in the making, the I.A.E.A. certainly cannot be accused of a rush to judgment.

Now comes the hard part: At its meeting next week, the I.A.E.A. board of governors must decide whether to formally declare Syria in noncompliance with the nonproliferation treaty. Doing so will place the matter before the U.N. Security Council, opening the way for sanctions.

The decision will test whether responsibility overrides timidity. At stake, the agency’s reputation as the world’s nuclear watchdog. To date Damascus has gamed that reputation and succeeded.

For a decade, Syria has been an embarrassment to the I.A.E.A.’s nonproliferation policing responsibility. First the agency’s safeguards failed to detect construction of the plant designed and engineered by North Korea. Even today, the I.A.E.A. knows little about how the installation fit into Syria’s planning. Did Damascus have a secret reprocessing facility to extract weapons-useable plutonium? If not, why not? Did Syria intend to export the spent fuel to North Korea for reprocessing? The international community remains in the dark.

Second, following the Israeli strike, the I.A.E.A. proved very slow off the mark to investigate Damascus. For months, the then director general, Mohamed ElBaradei, ignored media accounts that Syria had built the reactor. Instead, he complained repeatedly that governments failed to provide information. By the time the agency began its investigation in mid-2008, Syria had demolished the remnants of the plant, carted away the debris and built a new non-nuclear structure to conceal evidence of the old.

To its credit, the I.A.E.A.’s inspectors did break the cover-up. Once Damascus refurbished the bombed site, it invited investigators to visit, confident they would find nothing. But inspectors uncovered suspicious nuclear particles.

Rather than follow up with an ultimatum that Damascus fess up or face the U.N. Security Council, the I.A.E.A. dithered, relying on a coaxing strategy to get Damascus to come clean. The Assad regime refused. This marked the third embarrassment.

The agency’s response to Syria’s stonewalling proved to be the fourth embarrassment. The I.A.E.A. froze, much like the deer in the headlights, issuing inconsequential report after inconsequential report. Its February 2011 review, for example, concluded, “Syria has not cooperated with the Agency since June 2008 in connection with the unresolved issues related to the Dair Alzour site and the other three locations allegedly functionally related to it. As a consequence, the Agency has not been able to make progress towards resolving the outstanding issues related to those sites.”

Mr. Amano’s timidity continued even in the May 2011 findings. Rather than affirmatively state that Syria had built a reactor, the director general said that it “was very likely a reactor.” An accompanying footnote said,

“Securing absolute proof of compliance” may not be possible, but “reasonable inferences must be drawn, taking to account all the available information.”

The term “reasonable inferences” downplays definitive photos of the reactor made available to the agency by the U.S. government, NGOs and the media many months prior to the May 24 report.

Finally, the agency’s reputation for timidity arguably prompted Israel’s attack. After years of watching the I.A.E.A. fret with Iran, Israel had no confidence the agency would forcefully deal with Syria.

Now that the director general has published his findings, the I.A.E.A. board of governors must decide whether to report Syria to the Security Council. There are reports that Washington and its allies plan to introduce a resolution at the June meeting. But resistance remains. Some board members argue that Israel’s successful strike makes Syria’s nuclear violations moot.

But mootness certainly does not apply to the remaining suspect sites. Furthermore, the I.A.E.A. must get to the bottom of Syria’s atomic enterprise to prevent repeats either in there or elsewhere. The agency must understand what role North Korea and possibly others played.

Unfortunately, getting the board of governors to forward Syria to the Security Council marks only the first step in holding the Assad regime accountable. The Council itself must cobble together a strategy to move Damascus, not an easy task given political divisions.

Yet failure will only encourage prospective nuclear proliferators to follow Syria’s path. If the international community believes in the nuclear nonproliferation regime, it must act with conviction. Syria is a test case.

## Syria's Nuclear Transgressions

### Mark Hibbs Q&A

June 5, 2011

Israel destroyed a building in the Syrian desert nearly four years ago that both the United States and Israel argue was a covert nuclear reactor designed to produce plutonium. The International Atomic Energy Agency (IAEA) last month shared this assessment, countering assertions by Syria.

When the IAEA's main decision-making body, the board of governors, meets in Vienna this week, Syria's nuclear activities will be front and center. In a new Q&A, Mark Hibbs says the board will likely vote in favor of a resolution—prepared by a group of Western nations, including the United States—condemning Syria's failure to cooperate with the IAEA's probe of the allegation and may declare Syria out of compliance with its bilateral safeguards agreement with the IAEA and the nonproliferation treaty. Citing Syria for noncompliance would bring the matter to the attention of the United Nations Security Council and open the door to possible future sanctions. But sanctions in the near term are unlikely.

- Why did the IAEA take so long to conclude that the facility bombed by Israeli warplanes was a nuclear reactor?

For the first six months after the Israeli attack in September 2007 the IAEA started investigating the allegations without any significant cooperation from either Israel or the United States—the two states that collected most of the intelligence justifying Israel's military strike. Before the bombing, neither the United States nor Israel informed the IAEA about what it knew because they feared that if the agency was informed and brought the matter to Syria's attention, Damascus would preempt an attack on the reactor by declaring the facility to the IAEA.

Beginning in August 2009, the IAEA noted in every quarterly report to the board of governors that Syria was not cooperating with its investigation. During this period, member states—and particularly the United States—provided the IAEA with intelligence findings supporting the claim that the bombed facility, built at a site called Dair Alzour beginning in 2001 and virtually completed in 2007, was indeed a reactor. On the basis of this information, the IAEA told the board last month that in its view the destroyed facility at Dair Alzour was very likely a reactor.

- Are the claims that the IAEA has been dithering in its response true?

Not really. Right from the outset, when news reports first asserted that Israel had attacked a clandestine nuclear facility in Syria, virtually all IAEA member states—including the United States and Israel—were in no hurry to press Syria for a clarification. Many IAEA member states felt that the matter wasn't urgent since the installation had been destroyed. The United States, Israel, and European states acted with caution because they sought to “flip” Syria and terminate its long-standing alliance with Iran. And Israel had no interest in drawing attention to its aggressive act against a regime it was trying to negotiate with.

When President Obama took office in 2009, he reassessed the Syria nuclear issue and restrained U.S. officials who sought to increase the pressure on Syria in Vienna, in the interest of bettering bilateral ties with Damascus. It's also important to note that many nations on the IAEA board were reluctant to bring the matter to a dramatic head so that pressure wasn't taken off Iran. Unlike Syria's nuclear program, which may have been nipped in the bud by the Israeli attack, the threat posed by Iran's nuclear program continues to grow. When Yukiya Amano succeeded Mohamed ElBaradei as head of the IAEA in late 2009, he chose to give Syria time to respond to the U.S. and Israeli charge before drawing an independent conclusion.

- How will the governors respond now that the IAEA has told the board that it broadly shares the American conclusion about the complex at Dair Alzour?

The board meeting will actually begin with less controversial topics—a review of the IAEA’s technical cooperation program and preparations for an upcoming international conference on the Fukushima nuclear accident—and is likely to get around to the IAEA’s Syria dossier on Wednesday, June 8. When the issues comes up, a group of largely Western states, including the United States, will press for a vote on a resolution that is now being drafted.

Draft language originally proposed by the United States cited Syria for noncompliance with its safeguards obligations for having failed to cooperate with the IAEA’s investigation of Dair Alzour. Other board members would be more comfortable with a resolution that—as in the case of Iran in 2006—implied that the board would, in a follow-on resolution, refer Syria to the Security Council for noncompliance if it did not immediately and fully cooperate with the IAEA.

To pass, the resolution requires a simple majority of 18 votes in favor. On the eve of the board meeting, enough board members are prepared to support a noncompliance resolution for it to succeed.

For several months, the United States has been urging board members to join it in launching a resolution to condemn Syria. But at the last board meeting in March, many states—including a number of U.S. allies in Europe—objected, feeling that it was still premature.

This time, the United States and enough other states are prepared to push the resolution through to a vote. In doing so, they will argue that Syrian President Assad has become increasingly threatened and isolated by popular domestic unrest. Diplomats favoring the resolution are telling reluctant board members—Russia, China, some developing countries, and Arab states—that “it is time to wipe the slate clean” on the IAEA’s Syrian file and report the matter to the Security Council.

- What would the Security Council do?

The IAEA statute requires that the board of governors “shall report any [safeguards] noncompliance to the Security Council and General Assembly of the United Nations.” But it doesn’t require the Security Council or the General Assembly to take any actions.

In 2006, the Security Council responded to an IAEA board referral of noncompliance by Iran by imposing financial and nuclear trade sanctions on Iran. But if the IAEA board reports Syria to the Security Council for noncompliance, it is very likely that Russia and China would veto any sanctions drive launched by other states. Indeed, Syria’s letter to the IAEA in late May pledging full cooperation with the IAEA will almost guarantee that, if the board cites Syria for noncompliance this week, the Security Council will not take any immediate action.

- The IAEA board traditionally makes decisions by consensus. Are there any worries that the absence of consensus in reporting Syria to the Security Council would detract from its legitimacy?

The consensus rule for nearly all decision making on the board began breaking down on key issues during the last decade of former IAEA director general Mohamed ElBaradei’s tenure. The loss of consensus can be attributed to three factors: the end of the Cold War and the rise of multipolarity; acrimony between ElBaradei and the U.S. administration under President George W. Bush; and the emergence of the Non-Aligned Movement in UN politics in the last decade.

Many states routinely deplore the erosion of consensus, but some IAEA governors argue that under Amano—whose 2009 election divided board members along North-South lines—the board is increasingly ready and willing to take non-consensual decisions on contentious issues if the absence of consensus means that no action will be taken.

Still, the United States and other Western states drafting the resolution for this week's board meeting know that they will have a stronger case if consensus is attained. Some European states and developing countries argue that, if only three of the P5 countries at the IAEA vote in favor of the resolution, and if Arab states oppose it, the resolution will have far less weight. These states may therefore propose language that gives Syria one last chance to explain itself to Amano.

- Will action by the board this week mean there will be an IAEA "special inspection" in Syria?

No. A special inspection—permitted under Syria's safeguards agreement—was for Amano a non-starter in view of the political risk should Syria not agree to it. Instead, Amano last month announced that the IAEA concluded that the evidence strongly suggests that the installation destroyed at Dair Alzour was a reactor—leaving it up to the board to decide whether Syria is out of compliance with its safeguards obligations.

In 2003, the United States went to war against Iraq having claimed wrongly that Iraq had restarted a nuclear weapons program that the IAEA concluded had been terminated. Unless the IAEA gets first hand access to Dair Alzour and other sites it wants to inspect in Syria—which so far Syria has refused to permit—Amano is unlikely to declare Dair Alzour to have been a reactor without a doubt.

IAEA Chief Inspector: Politics Interfered in IAEA Work in Syrian File

Fadi Allafi /al-Ibrahim

Jun 10, 2011

VIENNA, (SANA) – Former International Atomic Energy Agency (IAEA) Chief Inspector Yusri Abu Shadi said that referring the Syrian nuclear file to the Security Council at this time, in coincidence with an attempt by some countries to issue a resolution condemning Syria, asserts that the Syrian nuclear issue was interfered by politics.

In an interview aired on Syrian TV, Abu Shadi said he has refuted for the last three years all lies about the existence of a nuclear reactor in Syria, pointing out that he composed a book of 60 points proving that all information by US intelligence is false.

He added that the US claims that it knew 9 years ago that Syria has a nuclear reactor similar to the one in North Korea as to increase pressure on Damascus, reiterating that " the Agency is using false information about this issue".

## **Syria, GOV/40, and the UNSC: A bridge too far?**

By mark [Mark Hibbs]

11 June 2011

I left the M Building at the Vienna International Centre at the end of the day on Thursday just after 6 p.m., as the cleaning brigade arrived to pick up the debris of official statements and coffee cups scattered about the place about an hour after the IAEA's June Board of Governors meeting wrapped up. The arrival of the Putzkolonne upon my departure for the U1 metro and my hotel was appropriate because by the end of the meeting on Thursday things on the ground were certainly a lot messier than they seemed when the board began meeting on Monday.

The board meeting opened that day with a few fairly ho-hum items—the IAEA's annual report on the technical cooperation programme, and some doings concerning preparation for a pending ministerial meeting on Fukushima (which doesn't look likely to be very ministerial)—and the board members on Wednesday waded into serious verification matters beginning with Iran. We got into Syria late on Thursday morning and what transpired was duly recorded by my friends at Reuters:

<http://www.reuters.com/article/2011/06/09/us-nuclear-syria-iaea-idUSTRE7583WM20110609>

But I don't want to get ahead of myself.

When I arrived in Vienna at the beginning of the week I saw a draft resolution—GOV/2011/40—which had been sponsored by 13 countries—a bunch of Euros plus Australia, Canada, South Korea, and the U.S.—which on the face of it looked pretty straightforward.

On Tuesday evening our time in Vienna, Jeffrey posted the resolution here.

[http://lewis.armscontrolwonk.com/files/2011/06/gov2011\\_40.pdf](http://lewis.armscontrolwonk.com/files/2011/06/gov2011_40.pdf)

The bottom line is right there in operative paragraph 1.: Syria's construction of a covert nuclear reactor at Dair Alzour and its clear breach of its Code 3.1 obligation in not submitting the design information to the IAEA in advance of that fact "constitute non-compliance with its obligations under its Safeguards Agreement with the Agency in the context of Article XII.C of the Agency's Statute"

Open and shut case—right?

It might have been had the road been exceedingly carefully prepared and had things gone well. That wasn't out of the question because we began the week with a very hard fact that should have supported passage of the resolution by a wide margin: an IAEA investigation that arrived at no resolution for nearly four years because Syria didn't cooperate. Basta. Sounds like shooting fish in a barrel. Well, it wasn't.

The U.S. gave the IAEA a bunch of intelligence information which backed its claim that the site was a construction site of a plutonium production reaction that was virtually finished when Israel bombed it in August 2007. The data, we hear, looks pretty good. There are some procedural quibbles regarding some of the environmental sample data. But concerning the task of establishing something like a one-to-one spatial correlation between what was at Dair Alzour and what we know a North Korean plutonium production reactor looks like, the IAEA may have been onto something that looks like a smoking gun at least. Over the last couple of years, before the IAEA reported its findings last month, it had a satchel full of extremely close-resolution photographs of the site taken over time.

DG Yukiya Amano agrees that the data looks solid but he has got to be more than a little careful. We've been there before: In 2002, his predecessor Mohamed ElBaradei had reaffirmed the IAEA's conclusion that, Iraq, in the crosshairs then, had given up on trying to acquire nuclear weapons. President Bush and General Powell claimed they had intelligence to the contrary and went to war with Iraq. They were wrong. Before that, more generally, back in the 1990s and after the first Gulf War, the safeguards buzz in Vienna was all about empowering the IAEA to use intelligence data to look for non-declared, hidden activities. A bunch of member states—including a few important US allies—then kicked up a ruckus about how the IAEA could become hooked on data provided by big powerful countries like the United States with so-called “national technical means” to collect intelligence. So there's a little sensitivity in the VIC about intelligence information. As there should be.

So what does Amano do after he succeeds ElBaradei in late 2009 ? Two things at once. The first is, he gives Syria about a year to decide to clear the air over Dair Alzour. That's a lot of time in this business. But he's willing to give it to them because he narrowly escaped a defeat in the election to the Director-Generalship at the hands of G-77 states. At least a few of these were spoiling for a fight after South African Ambassador Abdul Minty lost the election at the hands of the same states who now want to turn up the heat on Damascus.

While Amano is giving Syria time, he's also collecting and sifting through the U.S. intelligence data which is beginning to accumulate. But he's also hunting for, and getting, data from other sources to validate findings of the super-secret stuff. For instance, the Department of Safeguards found some pretty interesting and unclassified French satellite radar information. At the end of last month, Amano tells the board the IAEA thinks that building at Dair Alzour was a reactor. The U.S. and the others then put forth a draft resolution making note of that fact, calling Syria out of compliance, and bringing the matter to the attention of the UN Security Council, which is what the IAEA Statute says is supposed to happen in such a case.

So on Monday, we see a resolution with 13 sponsors. For it to pass, according to the IAEA Statute, it needed a simple majority. I was told on Monday that, by all accounts, the simple majority was there. When it came to a vote on Friday afternoon around 4 p.m., that turned out to be the case. The sponsors had their majority. As U.S. Ambassador Glyn Davies explained to the Vienna press corps after the vote, in fact the resolution's sponsors did better than that, because “we got a result of nearly three-to-one in favor.” In fact they recorded 17 votes in favor against just five opposed. That meant that, beyond the 13 sponsors, they picked up a few more supporters. Singapore, in nuclear matters a member of the Non-Aligned Movement (NAM) with a difference; Cameroon—for reasons that escape me; the United Arab Emirates (UAE), which is working hand in glove with key resolution drafting states to set up its nuclear power program; and, finally, Japan, which didn't get on to the resolution bandwagon until late because it is understandably beset with other more immediate nuclear problems these days. The nay-sayers were Azerbaijan, China, Ecuador, Pakistan, Russia, and Venezuela.

That's where things get a little complicated. There are a bunch of wrinkles. What are they? For now I'll just list 'em, because I'm about to walk out the door and down the street and get on a bus at Schwedenplatz to take me to the Vienna airport.

- To begin with, there are 35 countries on the board. The resolution referring Syria to the UNSC passed with fewer than half the members supporting it.
- The resolution passed with just three of the P-5 countries on the board signing on. Russia and China opposed it. That wasn't a surprise, especially after NATO took a strong interest in the future of Muammar Qaddafi.
- Then there are all those abstentions—11 of them: Argentina, Brazil, Chile, India, Jordan, Kenya, Niger, Peru, South Africa, Tunisia, and Ukraine. Mongolia was absent.

- The resolution reported Syria to the UNSC without the benefit of a firm judgment from the IAEA Department of Safeguards and the DG that that thing at Dair Alzour was a reactor. Amano told the board it was “very likely” a reactor, but to some people in NAM delegations, that ain’t the same as saying you know its a reactor.
- Amano appears to have discounted for good the idea of calling a special inspection in Syria to get access to Dair Alzour and other sites. I asked a number of people in the board meeting this week whether a non-compliance citation would have had more credibility if Amano had beforehand requested a special inspection which was rejected by Syria. Some of the answers to this question, and especially after reading Ambassador Davies’ lips late on Friday afternoon, seem to have been ”yes.”
- The preambulatory language in GOV/40 also presented a problem. It’s reference to “concerns regarding the maintenance of international peace and security” is clearly aimed at the UNSC with a wink at Chapter VII of the United Nations Charter, authorizing the UNSC to use non-military and military means to ”restore international peace and security” Until now, a lot of IAEA member states have doubted whether the nuclear situation in Syria represents such a threat, since the installation in question at Dair Alzour has been destroyed.
- And that issue raised among a number of board members the concern that the Syria resolution—on the eve of a UNSC resolution brought forth by France and the U.K. concerning Syria’s action in brutally suppressing domestic dissent—was “meant to further the goal of regime change,” as one NAM country ambassador told me in the middle of the board discussion on Thursday.

It certainly wasn’t the case that, inside the closeted board meeting, Syria made an intellectually brilliant, stunning case for its shopworn claim that the facility Israel destroyed wasn’t a reactor. The Syrian ambassador in fact came close to putting a few delegates to sleep with a dirge that lasted about 50 minutes and that basically informed the board that ”we don’t see the reason why we should have had to cooperate with you for the last three years and so therefore there is no reason for tabling this resolution.”

The NAM group likewise missed a golden opportunity to raise the above objections in my bullet points. Instead, it disingenuously ignored the fact that there is a serious non-compliance issue here, and instead droned on and on in the room about its outrage in the aftermath of Israel’s air raid which in 2007 destroyed the building. And instead of getting after the indeed weighty and real issues raised by the veiled reference in the resolution to Chapter VII and the issues of consensus-formation, the Egyptian Ambassador waxed on in the boardroom about his objections about what the IAEA told or didn’t tell Syria about its findings, about Syria’s airy offer in late May to “fully cooperate” with the IAEA, and expressing solace in the—largely irrelevant—conclusion by the IAEA that particles of anthropogenic uranium found at the MNSR facility under safeguards would be further considered as a routine safeguards issue.

A few of the states making interventions and statements to the board on Thursday—South Africa, for instance—did their homework, and they got it. You don’t have to agree with their conclusions, but they raised some sticky problems on Thursday after lunch.

All in all, this resolution had its virtues. I may try to explain them on the Carnegie site over the next few days. The resolution also has its problems. Because of these, there are some people who were in the boardroom in Vienna—by no means all of them among the abstainers and that Mongolia delegation that didn’t show up to vote—who will breathe a sigh of relief that this resolution won’t fly in New York because the Russians and the Chinese will assure that outcome.

Lastly, questions will be asked about what the resolution’s’ sponsors’ expectations were this week. GOV/40 was left open for amendments until the vote was taken on Thursday afternoon. I had figured that implied that the sponsors would along the road this week decide whether it would be better off in the final analysis to put to a vote a weaker resolution, warning Syria to get on the stick in a hurry or face the collective wrath of the board in

September. That might have gotten a bigger majority. Astoundingly, however, on Thursday afternoon the text of GOV/40 was more or less the same text we saw at the top of the week. The U.S. group really wanted a non-compliance resolution from the outset, was the word from people in the boardroom. Washington was prepared to lower the pressure just a notch—by considering a text that might cite Syria for non-compliance without an immediate referral to New York—so went the explanation in some quarters—but the U.S. and others gave up on that option when it turned out after canvassing delegations that just one more country was prepared to switch its abstention into a yes vote.

## **The IAEA and Syria: A new paradigm for noncompliance?**

Mark Hibbs

Commentary

June 17, 2011

The board of governors of the International Atomic Energy Agency (IAEA), by nearly a three-to-one margin, declared Syria out of compliance with its safeguards obligations and reported the issue to the UN Security Council on June 9.

Advocates of the successful resolution said it was necessary to defend the credibility of IAEA safeguards after nearly four years of Syrian defiance. Some also claimed that it offers a new paradigm for dealing with countries that refuse to cooperate with the IAEA in addressing weighty allegations that they are secretly proliferating.

What was new? IAEA Director General Yukiya Amano first evaluated intelligence provided by the United States and then found data in the public domain that appeared to validate American analysis before concurring that a building at Dair Alzour destroyed by Israel in 2007 was a covert reactor. The board reported this as noncompliance—and it did so without IAEA inspectors verifying the findings first hand in Syria.

It is far from certain that this approach will become an accepted and effective way forward. Its credibility might be boosted if the IAEA board and secretariat cooperate to define what specifically constitutes noncompliance. But given recent increased politicization of the board, the biggest challenge is that many members of the Non-Aligned Movement (NAM) no longer trust the IAEA secretariat in matters of verification.

In the short term, Syria may be off the hook. Resolution sponsors are correct that passing it “wiped clean” the IAEA’s Syria dossier after years of no action. But because Russia and China voted no, there will also be no action in New York.

When Syria stymied the IAEA’s investigation into Dair Alzour, Washington urged Amano to request Syria to permit a “special inspection” to look for evidence of undeclared nuclear activities. Amano did not comply.

He did try to corroborate U.S. intelligence findings—primarily high-resolution aerial photographs—with other evidence available in the public domain. Amano was then willing to join the conclusion, first asserted by the United States in early 2008, that Dair Alzour was a reactor.

Is this a new paradigm? We’ll see. Three months from now, at its next routine conclave, the board may consider a resolution on North Korea’s lack of cooperation with the IAEA, supported by reporting from Amano. Three months later, toward the end of the year, the board may follow up with a noncompliance resolution on Iran, on the basis of evidence that the IAEA believes to be genuine and compelling, that Iran has been developing a nuclear weapons capability. As in the case of Syria, Iran has refused to discuss these allegations with the IAEA for three years.

In the IAEA boardroom last week, the absence of a common understanding about what constitutes noncompliance with a state’s safeguards obligations, encouraged many delegations to allow extraneous political considerations to take precedence over what should have been a safeguards judgment. Instead of contributing to a common resolve to put Syria on notice, many of these states abstained or voted no.

If the board and secretariat now set up an expert panel to draft a working definition of safeguards noncompliance, it may encourage all states in the future to report noncompliance without consideration of political agendas deterring them from meeting their responsibility to combat proliferation. But if noncompliance is too clearly defined, that might prevent the board from making a finding in an unusual or unexpected case.

Strictly defining noncompliance might also result in proliferators identifying a roadmap permitting them to cheat.

U.S. Ambassador Glyn Davies said last week that “there were a lot of reasons why states abstained.” In the view of NAM country ambassadors, most represented a vote of no confidence in Amano and IAEA safeguards.

NAM states objected that Amano’s conclusion—that Dair Alzour was “very likely” a reactor—was not strong enough to justify a noncompliance finding. But the IAEA informed these states in May that safeguards experts were virtually certain. The “very likely” qualification was tagged on by cautious IAEA lawyers.

The IAEA’s technical safeguards judgment was not accepted by many NAM states. This lack of trust and confidence in the IAEA’s verifiers is the most fundamental obstacle to any future noncompliance finding. It has no simple fix and restoring confidence will require a long time and a concerted effort by the IAEA member states and secretariat.

There is no Band-Aid solution because the board has always been—and is now—a political body. For over three decades, the two superpowers on the board enforced compliance among their client states. Most of the others had no nuclear capabilities. Today’s board reflects a multipolar world and the aspirations of developing countries, many of which set up a Vienna chapter of the NAM in 2003. Their talking points have since prevailed among many board members—including those that would not support a noncompliance resolution on Iran in 2005 and many of the states that abstained last week.

Since the 2005 Iran resolution, and again last week, the board’s Western and advanced members have been inclined to disregard the board’s tradition of consensus and to simply discount the NAM’s abstention votes to get a result. But there is also the P-5 to consider if and when the Syria resolution inspires an attempt to cite Iran for noncompliance related to charges it has been doing weapons-related work. Unlike the case made by the United States that the destroyed Dair Alzour facility represented a threat to world peace—this was viewed as problematic even by some resolution supporters—a strong case could be made that Iranian nuclear weapons research and development justifies Security Council action under Chapter VII of the UN Charter.

The Iranian threat may convince China and Russia. Behind Russia’s no vote last week stood NATO’s resolve to assist regime change in Libya and Moscow’s comfortable relationship with the Syrian regime. But before the Syria vote, Russia and China joined France, Germany, the United Kingdom, and the United States in a strong statement vowing to keep pressure on Iran to cooperate with the IAEA.

## Carlson on Syria

By Jeffrey

1 July 2011

John Carlson sent along a comment about Mark's post, A Bridge Too Far? Syria & GOV/40. It was too important to bury in the comments, so I thought I would put it here:

### **Syria and safeguards non-compliance – a “new paradigm”?**

John Carlson

In a recent article (Carnegie Commentary 17 June 2011) Mark Hibbs suggests the decision of the IAEA Board of Governors that Syria is in non-compliance with its safeguards agreement sets a “new paradigm” for non-compliance. This is because, according to Hibbs, the IAEA based its assessment on intelligence and other information without inspectors verifying the findings first hand in Syria.

This is not a correct representation of the situation. In fact IAEA inspectors did visit the Dair Alzour site, in June 2008. Despite Syrian efforts to destroy evidence of its activities at the site, inspectors found a significant number of particles of uranium, graphite and stainless steel – all consistent with information indicating there had been a natural uranium-fuelled, gas-cooled, graphite-moderated reactor at the site. The IAEA has since continued to seek access to locations where debris from the destroyed building had been moved, to locations that appeared to be functionally related to the Dair Alzour site, and to further information, but Syrian authorities have refused to cooperate.

Clearly a state's lack of cooperation cannot be allowed to obstruct the IAEA's efforts to implement safeguards agreements. Far from being a new paradigm, this non-compliance finding is consistent with previous findings where lack of cooperation with the IAEA has been a major factor, e.g. Iraq, North Korea and Iran. Readers interested in a detailed discussion of safeguards non-compliance are referred to my article NPT safeguards agreements – Defining non-compliance in Arms Control Today, May 2009.

---

John Carlson was Director General of the Australian Safeguards and Non-proliferation Office 1989-2010, and Chair of the IAEA's Standing Advisory Group on Safeguards Implementation (SAGSI) 2001-06. He is currently a consultant to NTI and a Visiting Fellow at the Lowy Institute.

## **After GOV/40: Tale of Two Narratives**

By mark [Hibbs]

3 July 2011

In comments addressed to and posted by Jeffrey on Friday, John Carlson drew attention to my omission of a 2008 IAEA visit to Syria in my Carnegie article on the IAEA board of governors' resolution GOV/2011/40, concerning IAEA access to Syria following the August, 2007 Israeli air attack which destroyed the alleged reactor at Dair Alzour.

Thanks to Jeffrey having posted Carlson's remarks about my article, I was able to read them, and afterward I modified the offending sentence in paragraph three of that article: "*The board reported [IAEA safeguards conclusions] as noncompliance—and it did so without IAEA inspectors verifying the findings first hand in Syria*" to conclude "*since June 2008.*"

That should take care of the issue at hand.

Did I not know about that June, 2008 visit to Syria? Of course I did. In 2008 and 2009 I published in *Nuclear Fuel* and *Nucleonics Week* a half-dozen articles about it. In drafting the Carnegie piece, which was intended as a very short "Commentary" on our website, I didn't explicitly refer to that early and never-repeated IAEA visit to Dair Alzour for reasons of editorial brevity.

In retrospect, I realize that not mentioning it was a mistake. That's because—as Carlson's response made clear—anything I write on the subject of Syria's safeguards compliance following the passing of GOV/40 can put me in the crossfire of competing narratives about the resolution which began unfolding even before it was passed last month, and which may well continue playing out through the end of this year.

One of those narratives—Carlson's—asserts that GOV/40 represented nothing really new or departing from previous noncompliance findings. There is a second one which was circulating among its advocates at the time the resolution was under consideration that asserted that GOV/40 was a new departure for dealing with noncompliance.

Carlson wrongly attributed to me the view that GOV/40 "sets a 'new paradigm' for noncompliance" with IAEA safeguards. That's the second narrative.

I never said or "suggested" that I supported that interpretation.

Notwithstanding the question mark in the title of my article, and the text which specifically states that the matter is unresolved, I wrote:

*"Some advocates of the successful resolution... claimed that [GOV/40] offers a new paradigm for dealing with countries that refuse to cooperate with the IAEA in addressing weighty allegations that they are secretly proliferating."*

This is not, as Carlson wrote, the view "according to Hibbs." I would argue, however, that the fact that people in the resolution sponsoring camp argued that GOV/40 was a new departure was not insignificant.

The "new paradigm" narrative goes like this:

After Syria beginning in mid-2008 barred the IAEA from Dair Alzour and other related sites, the IAEA then called on member states to corroborate its initial but inconclusive findings suggesting that the site could have

hosted a reactor. Most was provided by the U.S. The IAEA then looked for other sources—especially open sources—to corroborate the secret data, and it succeeded. After three years, the IAEA was prepared to bite the bullet and declare that in its view Dair Alzour was a reactor, regardless of the fact that it hadn't been able to actually verify that conclusion in Syria because Syria had refused to cooperate for over three years.

But is this really a new development? Didn't something like that also happen in other, previous noncompliance cases, I asked? Well, not exactly, those holding the "new paradigm" view said. They argued, for example, that Iraq was called out of compliance after IAEA inspectors themselves unearthed a clandestine nuclear program; that Iran was cited for non-compliance after it acknowledged to the IAEA that it failed to report specific nuclear activities and IAEA inspectors in Iran then independently verified that; and that Romania and Libya were found to be out of compliance after they themselves had disclosed specific activities to the IAEA.

There is another narrative on GOV/40—Carlson's—which asserts that "this non-compliance finding is consistent with previous findings where the lack of cooperation with the IAEA has been a major factor, i.e., Iraq, North Korea, and Iran." Nothing really new, no new approach or paradigm.

So which narrative is true?

Now, if I were a country that co-sponsored GOV/40 and if I were trying to convince other board member countries to join, or thereafter to get them to see GOV/40 as a kind of template for pursuing future cases, Carlson's argument is the one I would make.

Why? As I have written in previous posts and in the above Carnegie article, GOV/40 last month encountered a lot of resistance and in fact was passed by fewer than half the board's 35 members. In particular, members of the Non-Aligned Movement, which in Vienna increasingly since 2003 have taken their cues on key verification issues from Iran, have been on the lookout for anything that looks like the IAEA or the board are departing from standard verification procedures. Anything that suggests that GOV/40 represents a novel approach to noncompliance would therefore represent a political challenge for its sponsors and advocates.

Whether GOV/40 will change the tilt of the playing field is ultimately what this interchange is about—including in coming months and perhaps beyond.

### **On to DPRK and Iran**

If this was only about GOV/40 and Syria I don't think there would be any debate over this on this blog site; I don't believe Carlson would spend his valuable time writing Jeffrey a carefully-drafted response to my article; and I wouldn't waste my time writing this because GOV/40 will be dead-ended at the UN Security Council in New York.

But as I said in the Carnegie article, according to what you hear from those who argue that GOV/40 represents a new departure on noncompliance, board member states which sponsored and supported GOV/40 want to go further and in coming months raise outstanding compliance issues in North Korea and Iran.

We'll see if that develops.

If so, the DPRK might be next in line. The Republic of Korea (ROK) or Japan, for example, might in advance request Director General Yukiya Amano to prepare a report on safeguards compliance in the DPRK. The ROK (which co-sponsored GOV/40) and other like-minded states on the board might then float a resolution citing the DPRK for noncompliance with its safeguards obligations. How this would play out isn't exactly clear, since in fact for a long time the IAEA has had no access to the DPRK and, accordingly, if judged by Amano's own yardsticks, the IAEA may have very little if anything in the way of new official information on the DPRK to report to the board. (Don't forget that, two years ago, Amano had been asked by the IAEA General Conference

to report on Israel's nuclear capability, and the DG complied by submitting a one-page statement which testified that because the IAEA had no official information beyond what Israel was obliged to provide to the IAEA to fulfill Israel's Infirc-66 agreement, he had in fact virtually nothing to say).

More interesting and significant will be how the board of governors deals with Iran in the aftermath of GOV/40.

Again, according to those who say that GOV/40 is a template for a new way forward, the board could request a report from Amano on outstanding safeguards issues with Iran, and in particular, concerning the allegations of nuclear weapons-related experiments and R&D, which the IAEA Department of Safeguards has compiled in its dossier and which Iran—like Syria on Dair Alzour—has claimed are fabrications and therefore has refused to discuss with the IAEA for three years. The board might ask Amano to make a judgment as to whether the IAEA is satisfied that the allegations are supported by evidence, perhaps permitting the IAEA to conclude—as in the Syrian case concerning the reactor—that Iran “very likely” was engaged in weaponization-related activities. As in the case of the reactor allegations concerning Syria, the allegations of Iranian weaponization activities currently are based primarily upon member state intelligence information and, to a lesser extent, upon some corroborative findings that the IAEA has made in the field. As in the case of Syria, were Amano to tell the board that the IAEA deems it likely that Iran conducted weaponization activities, if the current state of affairs persists Amano would report that conclusion regardless of Iran having refused to discuss these allegations with the IAEA.

Since Carlson incorrectly associated me with the view that GOV/40 is a “new paradigm,” I feel obligated to outline what is, in fact, my very modest take on this.

It would appear that the Syria dossier is a composite of different kinds of information. Some of it was obtained in the field early, in June 2008, by the IAEA during the initial stage of its probe from Dair Alzour. It was inconclusive. The IAEA then got other information which, in its view, was consistent with the thesis that Dair Alzour was a reactor. The IAEA also took the trouble of trying to get third-party information, including open source data, to quality control the intelligence data it received from the U.S. and other member states. Some sought-for aerial reconnaissance data was missing. There were questions raised about why the building at Dair Alzour was so much smaller than its apparent prototype in the DPRK. So in the end it was a judgment call by the IAEA.

I never said GOV/40 is a “new paradigm.” Thirty-five members of the board may decide that during the next six months.

## **Tough Choices Facing the IAEA and the Non-Aligned Movement**

Matthew

Jul 05, 2011

The International Atomic Energy Agency (IAEA) and the Non-Aligned Movement (NAM) stand at a crossroads over the nuclear ambitions of Syrian president Bashar al-Assad.

On June 9, the Board of Governors at the IAEA declared Syria in noncompliance with IAEA safeguards.

Notably, the resolution was predicated not on information from unbiased IAEA inspections, but on intelligence provided by the United States and verified by data in the public domain. Eleven NAM countries chose to abstain from the vote to report Syria, in part because they were hesitant to rely on intelligence provided by the U.S. and its allies. The resolution stands no chance in New York as Russia and China, both of which possess veto power over possible sanctions as permanent members of the UN Security Council, will certainly oppose it.

India in particular faces a dilemma that typifies the choices facing the NAM. On October 1st, 2008 the U.S. Senate approved HR 7081: the United States-India Nuclear Cooperation Approval and Nonproliferation Enhancement Act. Championed by the Bush administration, the “123 agreement” elevated India to a de-facto internationally recognized nuclear weapons state despite New Delhi’s refusal to sign the Nuclear Non-Proliferation Treaty (NPT).

A “123 agreement” is a peaceful nuclear cooperation agreement that includes the transfer of U.S.-origin nuclear material; it requires Congressional approval according to nine nonproliferation criteria stipulated in Section 123 of the Atomic Energy Act. The Henry J. Hyde U.S.-India Peaceful Atomic Energy Cooperation Act of 2006 exempted the nuclear cooperation deal with India from some of these requirements. The deal therefore allows India to import nuclear materials and technology to fuel its nuclear power program without renouncing its nuclear arsenal, effectively reversing three decades of non-proliferation policies designed to punish India for the first ever illegal use of civilian nuclear facilities and materials in 1974.

As Michael Krepon has outlined in great detail, the U.S. appears to have received very little in return for the deal, while nuclear stability in South Asia and nonproliferation norms have suffered. Most recently, India was one of the eleven states on the IAEA Board of Governors that voted to abstain from referring Syria to the UN Security Council.

It is now obvious that the U.S.-India deal legitimized an expanding nuclear power, allowed New Delhi to operate outside the NPT standards fundamental to the global nonproliferation regime, and failed to win India’s cooperation on preventing the spread of nuclear weapons.

India’s noncooperation on the Syria vote illustrates the challenges facing the international non-proliferation community. The vote was complicated and politicized by wariness over an American conflict of interest in the region. Mark Hibbs, a senior associate at the Carnegie Endowment’s Nuclear Policy Program, made a perceptive assessment of the political concerns facing the NAM, which included:

1. The credibility of information was called into question, since IAEA inspectors on the ground never actually verified the suspected nuclear reactor at Dair Alzour. The NAM countries are wary of relying on superpower intelligence that operates with an inherent bias.

2. The lack of a decisive judgment by IAEA Director General Yukiya Amano exacerbated the credibility issue. Mr. Amano was only willing to assert that Dair Alzour was “very likely” a reactor, and urged that “reasonable inferences must be drawn.”
3. The destruction of the installation at Dair Alzour by an Israeli air raid in 2007 has severely reduced the urgency of a Syrian nuclear threat.
4. Non-Aligned countries continue to express their outrage over the gross breach of national sovereignty constituted by the 2007 Israeli strike.
5. The resolution for noncompliance was been presented at a time when popular uprisings threaten the stability of the Assad regime, engendering the suspicion that the resolution is motivated by a desire for regime change.

Given these extraneous political considerations, our failed attempt to purchase the cooperation of an NAM leader is crippling.

In another astute commentary, Mr. Hibbs suggests that reliance on combined U.S. and public domain intelligence could become a new paradigm for verifying noncompliance with IAEA safeguards. Given that most NAM countries remain at best skeptical and self-interested actors in the non-proliferation community, this paradigm would severely undermine IAEA credibility and trust unless a clearer definition of noncompliance is established. If the increasing politicization of the IAEA board of governors can be separated from clearly defined technical requirements for a resolution on noncompliance, then NAM countries may be more willing to overlook “biased” sources of intelligence or disregard offensive unilateral action like the 2007 Israeli air strike.

Later this year, the board of governors at the IAEA may vote on a resolution to once again declare Iran in noncompliance with IAEA safeguards. The evidence that Iran is seeking nuclear weapons capability will probably be decisively more convincing than the case against Syria. Nevertheless, the political thicket that hampered the Syria resolution may foreshadow the political impediments that will need to be surmounted vis a vis Iran.

## **IAEA Sends Syria Nuclear Case to UN**

Peter Crail

The International Atomic Energy Agency (IAEA) on June 9 referred Syria to the UN Security Council for violating its safeguards obligations, following a three-year investigation into that country's alleged secret nuclear activities.

Western governments said the agency's move was important to maintain the integrity of the nuclear nonproliferation regime, but the vote divided the 35-member IAEA Board of Governors, with several states calling into question the agency's grounds for sending the issue to the United Nations.

The board referred Syria's case to the UN in a 17-6 vote following a May 24 IAEA report concluding that a facility that Damascus had been constructing "was very likely a nuclear reactor." Israel destroyed the facility, located at a site called Dair al Zour, in a September 2007 air strike. (See ACT, October 2007.)

The June 9 board resolution found Syria in noncompliance with its safeguards obligations for failing to declare the alleged reactor to the agency and for not providing the IAEA with design information for the facility prior to construction. U.S. Permanent Representative to the IAEA Glyn Davies said during a press briefing following the board vote that Syria's action "represents one of the most serious safeguards violations possible." Washington accuses Syria of building the suspected reactor to produce plutonium for nuclear weapons. (See ACT, June 2008.)

China and Russia voted against the resolution. Both countries are veto-wielding permanent members of the UN Security Council and can block any attempted council action against Syria. Azerbaijan, Ecuador, Pakistan, and Venezuela also opposed the measure.

In a statement before the vote, Russia said that although Syria might have engaged in some wrongdoing, the issue was not one that the council needed to address.

"The site at Dair al Zour no longer exists and therefore poses no threat to international peace and security," the statement said. The resolution's preamble says that Syria's actions "have given rise to concerns regarding international peace and security," language consistent with the Security Council's responsibilities under the UN Charter.

Although the resolution received the simple majority needed to pass, 11 board members abstained, leaving the resolution with approval from roughly half of the board. One country, Mongolia, was absent for the vote.

The abstentions included three countries currently holding rotating seats on the Security Council: Brazil, India, and South Africa.

Diplomats from countries that abstained said last month that their governments did not believe that the case for referral was strong enough. They noted that the IAEA assessment concluding that the Dair al Zour facility "was very likely" a reactor was not definitive. "The legal basis was fragile," one diplomat told Arms Control Today by e-mail June 24.

The diplomat also issued a judgment similar to Russia's, saying that "if there ever was a threat, it was destroyed by the Israelis."

## IAEA's 'Best Assessment'

In his opening statement during the board's June 6-10 meeting, IAEA Director-General Yukiya Amano said, "[T]his is the best assessment of the agency, based on all the information in its possession." Although diplomats from abstaining countries did not directly dispute the IAEA technical findings on the alleged Syrian reactor, they raised concerns about the agency's reliance on intelligence information from other countries.

The United States has been a key source of information on the Dair al Zour facility. It first briefed the IAEA on the matter in April 2008, leading to the agency's investigation.

Former U.S. and IAEA officials said that the board's decision to act on the agency's "best assessment" rather than definitive proof of noncompliance was new territory for the IAEA.

Mark Fitzpatrick, former deputy assistant secretary of state for nonproliferation, said in a June 24 e-mail that the IAEA's "willingness and ability to draw reasonable conclusions in the Dair al Zour case despite Syria's refusal to cooperate with the investigation set an important precedent."

In a separate June 24 e-mail, former IAEA Deputy Director-General for Safeguards Bruno Pellaud said that the decision is "a new tool for the IAEA," but cautioned that it was not as strong as a referral based on a clear noncompliance determination.

Such a precedent may have implications for the IAEA investigation into Iran's suspected nuclear weapons program. The United States has asked the IAEA to make a determination regarding Iran's suspected work related to development of a nuclear warhead even though Iran has not cooperated with the agency's investigation into those suspicions.

"We reiterate the urgent need for the Director General to provide to the Board as soon as possible his best assessment of the information related to possible military dimensions of Iran's nuclear program," Davies said in a June 9 statement to the board.

## Special Inspection Unlikely

Diplomatic sources and former officials said that the IAEA board's decision to refer Syria's case to the UN made it unlikely the agency would call for a special inspection to require greater access to sites and information from Damascus.

IAEA safeguards agreements allow the agency to conduct a special inspection if the existing inspection mechanism "is not adequate for the agency to fulfill its responsibilities under the agreement." Amano has consistently said in his reports to the board that Syria has not provided sufficient cooperation for the agency to carry out its work.

Amano also said in his opening statement that "it is deeply regrettable that the facility was destroyed" rather than being reported to the agency.

The United States had previously said that the IAEA needed to consider calling for a special inspection in Syria. (See ACT, October 2010.) Former IAEA Deputy Director-General for Safeguards Olli Heinonen, who led the agency's investigation in Syria until last August, also has argued that the agency should make use of this authority.

"It would have been a logical step," he said in a June 27 interview, adding, "In my view, the case would have been clearer, if the [IAEA] Secretariat would have used all authorities at its disposal."

Heinonen told the U.S. House Foreign Affairs Committee on June 23, “The special inspection option should still be pursued, or the UN Security Council could also choose to provide wider authorities to the IAEA.”

Pellaud said that “a refusal of a special inspection [by Syria] would have lent much more substance to the referral.”

The special inspection provision has been used only twice: in Romania in 1992 at the Romanian government’s request, and in North Korea in 1993. Pyongyang rejected the inspection, touching off an international crisis leading to a nuclear freeze agreement with the United States a year later.

In an apparent response to the IAEA’s judgment that the Dair al Zour facility was very likely a nuclear reactor, Damascus sent a letter to Amano pledging to work with the agency to resolve the issue. According to diplomats familiar with the letter, sent two days after Amano’s May 24 report, Syria’s Atomic Energy Commission said that it was “ready to fully cooperate” with the IAEA but did not offer any details of what new information or access Damascus would provide to inspectors.

A senior Western official said during a June 3 background briefing that, on the issue of Syria’s sincerity in providing such cooperation, “the proof came yesterday” during a June 2 technical briefing by the IAEA Secretariat. When the IAEA made its case for why it had concluded the Dair al Zour facility was likely a reactor, Syria simply challenged the IAEA assessment rather than offering evidence to back its own claims, the official said.

### **Syria Already in UN Spotlight**

The board decision to refer Syria’s nuclear file to the UN came at the same time that European governments are seeking to place pressure on Damascus for its crackdown against political protests. The day before the IAEA action, France, Germany, Portugal, and the United Kingdom circulated a draft resolution with the Security Council condemning Syria for human rights abuses. Facing veto threats from China and Russia, the sponsors pulled the resolution from consideration, French Foreign Minister Alain Juppé told the French National Assembly June 14.

Some IAEA board members were wary of taking action in that political context. A Russian diplomatic source called the IAEA resolution “untimely.”

The senior Western official said June 3 that other members of the board raised concerns that a referral might inflame the political situation in Syria, a prospect the official said was unlikely. “I don’t see a link directly between this [nuclear] issue” and political developments in Syria, he said, arguing that the IAEA has a responsibility to address Syria’s nuclear program irrespective of events in the country.

## **Covert Nuclear Facility in Syria**

Ankita Shree

Research Intern, IPCS

email: [ankkita.delhi@gmail.com](mailto:ankkita.delhi@gmail.com)

#3426, 11 July 2011

Syria was recently the subject of international attention, over its suspected nuclear weapons program, after the IAEA, in its latest report, recommended the issue to the United Nations Security Council (UNSC). Syria's nuclear program first came to light following an Israeli air-strike on a suspected nuclear facility at Dair Alzour in 2007. The IAEA in its findings buttressed Western claims, concluding that Syria was indeed developing a covert nuclear facility. Attempts to punish Syria in the UNSC were thwarted by Russia and China, who argued that the facility having been destroyed, the need for punishment had become redundant. The IAEA, however, called upon Syria to sign an additional protocol to the NPT, for violating articles 41, 42, and XII C of the agency statute. These protocols would allow the agency intrusive inspections at undeclared facilities. This episode has raised important questions- First, what are the reasons behind Syria's development of covert nuclear facilities, and what are the regional and international implications of such a programme? Second, what is the relevance of the NPT in such a scenario?

While Syria is presently energy sufficient, its oil stockpiles are declining, and therefore had taken recourse to nuclear energy. Its ambitions to go nuclear will be fulfilled only by 2020, when a reactor being built with Chinese assistance goes critical. The covert weaponization program however may be dictated by the Syrian military, which has been a major stakeholder in Syria's nuclear programme since the 1970s. Though Syria has denied allegations of developing nuclear weapons, it has plausible reasons to do so. Syria's adversarial relationship with Israel is a significant one. Others include the insecurities caused by American presence in the region, and dwindling Syrian influence in the region, following its withdrawal from Lebanon. Additionally, NATO's military action against Libya would have justified Syria's nuclear ambitions, to use its nuclear programme as a survival tool.

Syria played the international community by eliciting overt nuclear assistance from the IAEA, China, Russia, and covert assistance from Iran and North Korea. Links between Iran and Syria over their nuclear program, may have formed to evade the international attention presently on Iran. According to a statement given to the Guardian newspaper, an Israeli advisor suggested that Syria could produce the plutonium desired by the Iranians. For this assistance, Syria would get reprocessing technology, which its nuclear facilities lacked. This claim was earlier reported in Der Spiegel (June 23, 2008). According to the US intelligence community, Syrian cooperation with North Korea began in 1997, with its covert reactor design matching those of North Korea's Yongbyon reactor.

The destruction of one of its nuclear facilities does not mean that Syria's nuclear capabilities have been eroded. According to the IAEA report, Syria has three more secret sites, similar to Dair Alzour, where its weaponization developments are taking place. While the report did not give details of the facilities or of their locations, the US think tank, Institute for Science and International Security (ISIS) released satellite images of three additional sites which are functionally related to Al-Kibar. These are located near the cities of Maysaf, Marj as-Sultan, and Iskandariyah, and all three are situated in naturally secure locations, or have added security elements, according to imagery analysis.

Syria's nuclear ambitions have serious regional and international implications. The Middle East has traditionally been a zone of instability, and the presence of an additional nuclear weapon state will only aggravate its volatility. Owing to the symbiotic nature of Syria and Iran's nuclear program to, it raises the spectre of a conjoined nuclear umbrella, which enhances the chances of direct confrontation with the international

community. Failure to halt such a programme will be a setback for the international communities' efforts towards non-proliferation.

This raises concerns about the relevance of the NPT, especially when the signatories are violating the treaty, by developing secret nuclear facilities, as seen in the preceding cases of Libya, North Korea and Iran. These fears are accentuated by the lowering of the technology threshold and the connivance of proliferators, such as Pakistan, Iran and North Korea, which lends them to becoming business models for nuclear weapons. The NPT in such a scenario loses its relevance both as a security mechanism as well as being a move towards nuclear non-proliferation. The treaty needs to be revisited and revised to emerge as an effective mechanism towards international security.

With Syria presently battling a domestic crisis; international pressure on President Assad, has forced Damascus to take a moderate approach with the IAEA. While Syria has ducked a UNSC censure, the crisis possesses characteristics which can worsen matters in the future. With serious ramifications for both Middle East and international security, the Syrian nuclear case needs to be addressed before it turns into another unstable nightmare like North Korea or Pakistan.

## **A still-open nuclear file**

By Emanuele Ottolenghi

Published 06:00 26.08.11

Latest update 06:00 26.08.11

On September 6, 2007, Israel bombed the al-Kibar site, a small industrial complex in north eastern Syria, near the town of Deir al-Zour. What precipitated Israel's daring operation was, apparently, the looming delivery of nuclear fuel to a clandestine reactor on the site, designed to produce weapons-grade plutonium, and which by then was almost operational.

Details about the compound's real purpose became public knowledge in April 2008, when a U.S. intelligence briefing revealed that al-Kibar was a North Korean-built, gas-cooled, graphite-moderated reactor almost identical to the one North Korea built in its own Yongbyon facility to produce weapons-grade plutonium. The briefing offered conclusive evidence of collusion between North Korean and Syrian scientists, confirmed that North Korea had built the Syrian reactor, for cash, and hinted at the trigger for Israel's raid - the reactor's readiness.

More than three years later, this past spring, the International Atomic Energy Agency confirmed that al-Kibar was a nuclear reactor similar to that at Yongbyon and declared Syria to be in noncompliance with the Nuclear Non-Proliferation Treaty. It is now up to the UN Security Council to decide whether to punish Syria for its failure to declare the reactor's existence and for its cover-up both before and after the raid, which did "irreparable damage" to the facility.

Israeli security sources speaking off-the-record say that the Syria nuclear file is not a closed case. There are good reasons to agree.

Syria's ability to quickly develop a nuclear program on its own soil was surprising. The late Hafez Assad never pursued nuclear weapons as a deterrent against Israel because he knew his country lacked the financial resources, the industrial infrastructure, the intellectual prowess and the wherewithal to develop such a program. Instead, Assad relied for most of his career on other nonconventional weapons for deterrence. Hence, his change of course, which took place in 1997, and which was vigorously pursued by his son and heir Bashar after the father's death, raises questions. After all, the basic facts of Syria's scientific and industrial backwardness have not changed significantly of late. A Syrian nuclear program could come online only because it was a turnkey project: built, fueled and possibly operated by North Korea.

But nuclear weapons need more than weapons-grade fissile material. And while in April 2008, U.S. intelligence was adamant that the reactor's purpose was "to create fuel for a nuclear weapons program," it had no conclusive evidence of the kind of additional components needed to weaponize plutonium - namely, a reprocessing facility and a weapons-design program. Nor does Syria have indigenous supplies of uranium.

This elicits several questions:

- Where was the reactor's fuel supposed to come from?
- If Syria was about to start producing weapons-grade plutonium, why is there no trace of the other pieces of a nuclear jigsaw puzzle?
- Why take the risk and incur the costs of such a project, if there is no way to dispose of the nuclear fuel?

In short, if this reactor was built in Syria for Syria, where was the rest of the program?

One possible answer to all these questions is that the program was built in Syria for Iran. Ronen Bergman's 2008 book, "The Secret War with Iran," suggests that al-Kibar was clandestinely developed with Iran's financial support. A 2009 Spiegel piece, quoting diplomatic sources in Vienna, agreed, citing revelations by Iran's Islamic Revolutionary Guards Corps' former general Ali Reza Asgari to Western intelligence agencies. Asgari, a former deputy defense minister, disappeared in Istanbul in February 2007 after a visit to Syria, possibly defected to the West, and may have revealed Iran's funding of al-Kibar.

According to the same article, in 2005, Mohsen Fakrizaheh, the shadowy IRGC official in charge of Iran's nuclear military program, visited Damascus, very likely in order to forge an agreement on the terms of Iranian funding for Syria's nuclear program. That may explain why there is no trace of Syrian reprocessing activities: Al-Kibar was built by North Korea and financed by Iran, in order to sustain Iran's plausible deniability about its nuclear program.

Skeptics could rightly object that Iran does not have known reprocessing facilities either, but it has a reactor in Arak designed for plutonium production - so why the need for surrogate production lines elsewhere? The answer may be that, with its covert nuclear activities in Arak exposed in 2002, Iran may have sought an alternative that could ensure a supply of weapons-grade plutonium even under the increased scrutiny of the international community. Besides, Iran's program hit many technical hurdles. According to the U.S. 2007 National Intelligence Estimate on Iran's program, "Iran will not be technically capable of producing and reprocessing enough plutonium for a weapon before about 2015."

With such a lengthy timetable, IAEA inspectors roaming Iran, and American troops in Afghanistan and Iraq, Tehran may have chosen to outsource plutonium production to Syria - a safer option, because al-Kibar was still undetected, and a faster one, because by then North Korea was technologically ahead of the game.

Syria's violations would be grave enough if al-Kibar reflected a Syrian attempt to build nuclear weapons for its own arsenal. They would be even graver if Syria did it to share the plutonium with Iran. And they constitute a threat, given that Assad, earlier this week, threatened "surprises" if Syria was attacked by foreign forces, in reference to Syrian military capabilities.

Though the Security Council is currently deadlocked on how to respond to Syria's ferocious domestic repression, come September, it must punish Syria's proliferating activities.

Whether Iran's involvement can be proven is immaterial: Syria's nuclear file is far from closed, and leaving it open is a risk the international community, mindful of the cruelty of the regime in Damascus, cannot afford to take.

## **Column: This is no time to slash defense spending, Kyl says**

by Jon Kyl

Sept. 9, 2011 02:23 PM

*[EXCERPTS]*

On this day seared eternally in the American consciousness, we pause to consider nearly 3,000 lives lost and families forever affected.

In cities and towns across the United States, we offer prayers, moments of silence and heartfelt remembrances for loved ones, co-workers, acquaintances and fellow Americans taken abruptly from us 10 years ago, as well as those who have sacrificed to secure our safety since. These rituals are a natural and fitting way to honor the innocent victims of the terrorist attacks of Sept. 11, 2001.

Yet the greatest tribute we can pay is to confront head-on the terrorists and rogue regimes seeking to do us harm. Some scholars refer to this conflict as the Long War because the struggle against the radical political Islamists will likely take a very long time to conclude.

*[deletia]*

We must continue to pursue economic and political sanctions against states and terrorists seeking illicit biological, chemical and nuclear weapons. In addition to Iran, we remain concerned about the proliferation activities of North Korea, Syria and Myanmar (Burma). And we know that al-Qaida affiliates continue to seek to acquire materials to produce deadly poisons such as ricin and cyanide.

*[deletia]*

## **In Cheney's memoir, it's clear Iraq's lessons didn't sink in**

By Bob Woodward

Sunday, September 11, 6:18 PM

A key lesson of the 9/11 decade for presidents and other national security decision makers is the importance of rigorously testing intelligence evidence: poking holes in it, setting out contradictions, figuring out what may have been overlooked or left out. It is essential to distinguish between hard facts and what is an assessment or judgment.

The so-called slam-dunk case that Iraq had weapons of mass destruction illustrates the failure. If anyone should have learned this, it is former president George W. Bush and former vice president Dick Cheney.

Yet in his new memoir, "In My Time," Cheney shows he has not fully absorbed that lesson when he writes about the administration's response to the 2007 discovery of a nuclear reactor in Syria that the North Koreans had helped build.

In Cheney's telling, the evidence showed "a clandestine nuclear reactor, built by two terrorist-sponsoring states." Given the potential threat, he argued privately to Bush, and later to top national security officials, that the United States should destroy the reactor.

In a National Security Council session that June, he writes, "I again made the case for U.S. military action against the reactor. Not only would it make the region and the world safer, but it would also demonstrate our seriousness with respect to non-proliferation. It would enhance our credibility in that part of the world . . . . But I was the lone voice. After I finished, the president asked, 'Does anyone here agree with the vice president?' Not a single hand went up around the room. I had done all I could, and I'm not sure the president's mind would have been changed if the others had agreed with me."

He notes with some relish that two months later the Israelis took unilateral action and destroyed the reactor. The clear implication is that Bush and the others had lost their nerve, that they lacked the necessary spine to act as he had recommended.

But accounts from others in these meetings, a public briefing and Bush's own memoir present a dramatically different picture of the intelligence on the Syrian reactor.

Cheney does not reveal that then-CIA Director Michael V. Hayden had a team working for months to examine the intelligence on the Syrian reactor. Participants at the meetings say that Hayden presented his findings to Bush, Cheney and the others before Cheney made his arguments for a military strike.

According to a principal participant, Hayden made four points, saying: "That's a reactor. I have high confidence. That Syria and North Korea have been cooperating for 10 years on a nuclear reactor program, I have high confidence. North Korea built that reactor? I have medium confidence. On it is part of a nuclear weapons program, I have low confidence."

Hayden emphasized the last sentence to underscore his uncertainty. He later told others that he stuck to the intelligence facts and intentionally shaped his presentation that way to discourage a preemptive strike because the intelligence was weak.

According to the CIA, there was no evidence of plutonium reprocessing capability at the site or nearby in that region of Syria, though a reactor of that type would be capable of producing plutonium for nuclear weapons. In addition, there was no identifiable means to manufacture uranium fuel.

Hayden's declaration of low confidence was, in effect, his anti-slam dunk.

On April 24, 2008, two senior U.S. intelligence officials and a senior White House official briefed reporters on the Syrian reactor after extensive testimony to congressional committees on the issue. One of the briefers restated Hayden's conclusions and said there was not much physical evidence the reactor was part of a weapons program, so they had only "low confidence" that it was.

His assessment, he said, was that the reactor was planned to be part of a weapons program, but in an apparent reference to the Iraq WMD mistake, the briefer said, "There are lessons learned that are — that came out of previous experience about how to put more rigor into our process. So there's a difference between evidence and an assessment."

In his memoir, Bush described the debate about the Syrian reactor, writing that Hayden and the other intelligence experts "had only low confidence of a Syrian nuclear weapons program."

"Mike [Hayden]'s report clarified my decision," Bush wrote, adding that he called then-Israeli Prime Minister Ehud Olmert, who wanted the United States to destroy the reactor. Bush says he told Olmert, "I cannot justify an attack on a sovereign nation unless my intelligence agencies stand up and say it's a weapons program."

Bush didn't reveal, however, that his vice president wanted a military strike in the face of "low confidence" intelligence that the reactor was part of a nuclear weapons program. Cheney said he wanted the United States to commit an act of war to send a message, demonstrate seriousness and enhance credibility — a frightening prospect given the doubts.

Two participants in the key National Security Council meeting in June 2007 said that after Cheney, the "lone voice," made his arguments, Bush rolled his eyes.

At the CIA afterward, the group of specialists who had worked for months on the Syrian reactor issue were pleased they had succeeded in avoiding the overreaching so evident in the Iraq WMD case. So they issued a very limited-circulation memorial coin. One side showed a map of Syria with a star at the site of the former reactor. On the other side the coin said, "No core/No war."

## The right call on the Syrian threat

By Elliott Abrams, Eliot Cohen, Eric Edelman and John Hannah,

[2011-09-15]

Bob Woodward wrote a curious op-ed this week about the Bush administration's response to the secret al-Kibar nuclear reactor built by Syria and North Korea. As officials who participated in the administration's deliberations, we believe that Woodward's account — and that of the anonymous sources who gave him background information — represents a revisionist and misleading history. Woodward's op-ed purports to demonstrate that then-Vice President Dick Cheney, who advocated a U.S. strike to destroy the Syrian reactor, failed to learn important lessons from intelligence failures in Iraq. In fact, it is Woodward who misunderstands the reality of al-Kibar.

First, Woodward's account of the intelligence about Syria's nuclear program is woefully incomplete. He neglects to mention three other sites in Syria that the CIA suspected were related to al-Kibar. In the four years since Israel destroyed the reactor, Syria has refused access to these sites, despite repeated requests from the International Atomic Energy Agency. Together, these activities indicated a broad-based covert nuclear program that had been underway for nearly a decade. As for the reactor itself, it was in the middle of the desert and — according to the CIA — “was not configured to produce electricity.” For what likely purpose was it built, then, if not to produce fissile material for nuclear weapons?

As a signatory to the Non-Proliferation Treaty, Syria could have legitimately built a civilian nuclear power plant under the auspices of the IAEA. Instead, it chose to violate its international treaty obligations by secretly cooperating with North Korea to build a reactor well-suited for producing plutonium for nuclear weapons. At no point during our deliberations were U.S. intelligence analysts able to identify a reprocessing facility to turn the spent fuel into weapons-grade plutonium, and everyone was mindful of the debacle surrounding the bad intelligence in Iraq. But we also knew that in 1991, the world had dramatically underestimated how close Saddam Hussein was to a nuclear device. More often than not, history teaches that foolproof evidence becomes available only when it is too late. At al-Kibar, no intelligence analysts were able to alert policymakers that a reactor even existed until irrefutable evidence emerged in April 2007.

As Cheney relates in his memoir, he asked repeatedly over a period of years before 2007 about reports of North Korean nuclear officials traveling to Syria. U.S. intelligence analysts acknowledged the reports but had low confidence that any nuclear cooperation existed because of a lack of hard evidence. It was only when the Israelis produced photos of a nearly completed reactor in mid-2007 that low-confidence judgments switched to high-confidence judgments. Still, because we had no photos of a reprocessing facility, the analysts stuck to their low-confidence judgment about a weapons program.

Woodward's benign view aside, advisers to President George W. Bush had few doubts about the true nature of Syria's nuclear cooperation with North Korea and treated it as a deadly threat. Senior policymakers, including CIA Director Michael Hayden, reached consensus early on about Syria's intentions. In meetings with the president's top advisers, Hayden made it clear that he believed the facility was connected to the proliferation of nuclear weapons. The New York Times reported in April 2008 that, despite having failed to identify a reprocessing facility, the intelligence community “had told President Bush . . . they could think of no other explanation for the reactor” than developing nuclear weapons.

The real dispute was what to do about the most brazen nuclear proliferation case in history. Despite Bush's October 2006 threat of serious consequences if North Korea proliferated nuclear technology, Pyongyang and Damascus persisted with the reactor. Here was the world's worst proliferator providing nuclear assistance to one of the world's worst state sponsors of terrorism — which also happened to be facilitating attacks on American

troops in Iraq. It is hard to imagine a more egregious challenge to the Bush Doctrine and America's war against terrorism.

There were legitimate policy arguments for and against destroying the reactor, and the president's advisers made them. Some were concerned, for example, about sparking a wider war with Syria. Some believed that the threat could be handled diplomatically. Cheney cast valid doubt on the international community's meager record in preventing rogue states from acquiring nuclear weapons.

Some of us believed the United States should attack the reactor. Some believed Israel should act. Others were sympathetic, in principle, to a U.S.-led diplomatic initiative. Whatever our individual views, Woodward is dead wrong to present the vice president's arguments as unreasonable. His advice was seriously considered at the time, and his claims look even more prescient in hindsight.

Ultimately, when President Bush decided against military action, the Israelis took it upon themselves to destroy the reactor. Syria then spent months trying to sanitize the site and stonewall the IAEA — confirmation of its non-peaceful intentions. The Israeli attack in September 2007 was flawless, Syria and North Korea did not lash out, and a dire proliferation threat was eliminated for good. America and the world are safer for it.

Elliott Abrams, senior fellow for Middle Eastern studies at the Council on Foreign Relations, was deputy national security adviser in 2007. Eliot Cohen, a professor of strategic studies at Johns Hopkins University's School of Advanced International Studies, was counselor of the State Department in 2007. Eric Edelman, the Hertog practitioner in residence at SAIS, was undersecretary of defense for policy in 2007. John Hannah, a senior fellow at the Foundation for the Defense of Democracies, was national security adviser to the vice president in 2007.

Revisiting Bush's Decision on Al Kibar

By Jeffrey | 12 September 2011 | 38 Comments

Something about the whole Syria nuclear reactor story has never seemed quite right to me. When anonymous US officials began to hint that the facility struck by Israel was in some way nuclear, I wondered how solid that intelligence was. Why couldn't they just call the damned thing a reactor?

I noted that "we haven't heard from the people who ... were 'cautious about fully endorsing Israeli warnings' or 'remain unconvinced that a nascent Syrian nuclear program could pose an immediate threat.' They might have important information to add, were they willing to leak it."

Now, thanks to Bob Woodward, we have the beginnings of the other side of the story from those who successfully opposed a strike on the reactor building — but it just deepens the mystery.

In their memoirs, both George Bush (Decision Points) and Dick Cheney (In My Time) recount the crucial meeting on the question of whether or not to strike the reactor under construction at Al Kibar.

Cheney's book, with its implicit criticism of everyone else in the room, has reignited that debate, leading Woodward to recount the opposition to a strike in light detail:

But accounts from others in these meetings, a public briefing and Bush's own memoir present a dramatically different picture of the intelligence on the Syrian reactor.

Cheney does not reveal that then-CIA Director Michael V. Hayden had a team working for months to examine the intelligence on the Syrian reactor. Participants at the meetings say that Hayden presented his findings to Bush, Cheney and the others before Cheney made his arguments for a military strike.

According to a principal participant, Hayden made four points, saying: "That's a reactor. I have high confidence. That Syria and North Korea have been cooperating for 10 years on a nuclear reactor program, I have high confidence. North Korea built that reactor? I have medium confidence. On it is part of a nuclear weapons program, I have low confidence."

Hayden emphasized the last sentence to underscore his uncertainty. He later told others that he stuck to the intelligence facts and intentionally shaped his presentation that way to discourage a preemptive strike because the intelligence was weak.

According to the CIA, there was no evidence of plutonium reprocessing capability at the site or nearby in that region of Syria, though a reactor of that type would be capable of producing plutonium for nuclear weapons. In addition, there was no identifiable means to manufacture uranium fuel.

[snip]

Two participants in the key National Security Council meeting in June 2007 said that after Cheney, the "lone voice," made his arguments, Bush rolled his eyes.

At the CIA afterward, the group of specialists who had worked for months on the Syrian reactor issue were pleased they had succeeded in avoiding the overreaching so evident in the Iraq WMD case. So they issued a very limited-circulation memorial coin. One side showed a map of Syria with a star at the site of the former reactor. On the other side the coin said, "No core/No war."

First, some house-keeping. Most of the details in Woodward's account have been reported elsewhere. Woodward relies both on Bush's memoir, as well as the not-for-attribution briefing given to reporters by senior intelligence officials 1 and 2 ("Ace" and "Deuce" were McConnell and Hayden as far as I can tell). And the detail about the coin stamped "No Core, No War" previously appeared (with slightly different punctuation) in US News and World Report's Washington Whispers by Paul Bedard and an Associated Press story by Deb Riechmann. What is new in Woodward's reporting is the pair of first person accounts of the President rolling his eyes at Cheney.

Second, "no core, no war" needs some explanation. This is not "If it does not fit, you must acquit." Rather, the phrase expresses the two high-level political goals that the intelligence community supported: (1) "No core," ie do not allow the reactor to become operational and (2) "No war," ie that efforts to stop the reactor from becoming operational should not lead to a wider conflict in the Middle East. Hayden explained the coin in the context of the trade-off between better analysis and maintaining secrecy necessary to control escalation, during a talk at Georgetown.

So, the big question: Why did Bush roll his eyes at Cheney?

Syria was building a clandestine nuclear reactor in a manner that was inconsistent with any explanation other than a nuclear weapons program, something all the principals appear to agree on. For some reason, the inability of the intelligence community to find a reprocessing or a fuel fabrication facility was dispositive for all the other parties other than the Vice-President.

But what if the intelligence community simply didn't know the location of either site? Bush is extraordinarily clear that he believes Syria intended to use the reactor to produce nuclear weapons. The little video the IC released, which ought to have cleared text, stated that "start of operations could have begun at any time although additional weeks to months of testing were likely." If there was a time to strike the reactor, it was before it went hot. In other words, the decision to wait could have resulted in the operation of the reactor had Israel not destroyed it.

I just don't understand why the failure to find fuel fabrication or reprocessing facilities was reassuring to anyone. One of the core reasons for my initial skepticism that the box was a reactor was my conviction that any American president, when presented with unequivocal evidence that a state-sponsor of terrorism was building a covert nuclear reactor, would act decisively to eliminate that reactor before it began operations. I have always assumed, for example, that no President would allow the Iranian reactor at Arak to come online. If the standard is actually "no covert reprocessing facilities," then I am really at a loss. Maybe I've been too warped by *Quick and Secret Construction of Plutonium Reprocessing Plants: A Way to Nuclear Weapons Proliferation?* (General Accounting Office, October 6, 1978).

I can't help but wonder whether there is some sort of technical detail that the principals are leaving out of the account. Something like the intelligence community concluding that not only did Syria not have a core for the reactor but that it had no reasonable prospect of acquiring one. But how could one have confidence in a judgment like that?

Anyway, as I say, I find the whole episode a continuing mystery. I am genuinely interested in hearing the opinions of others. And seeing a picture of one of those medals!

Jeffrey | September 12, 2011

Here is the relevant passage from Decision Points:

Iran was not the only nation endangering the freedom agenda by seeking nuclear weapons. In the spring of 2007, I received a highly classified report from a foreign intelligence partner. We pored over photographs of a suspicious, well-hidden building in the eastern desert of Syria.

The structure bore a striking resemblance to the nuclear facility at Yongbyon, North Korea. We concluded that the structure contained a gas-cooled, graphite-moderated reactor capable of producing weapons-grade plutonium. Since North Korea was the only country that had built a reactor of that model in the past thirty-five years, our strong suspicion was that we had just caught Syria red-handed trying to develop a nuclear weapons capability with North Korean help.

That was certainly the conclusion of Prime Minister Olmert. “George, I’m asking you to bomb the compound,” he said in a phone call shortly after I received the report.

“Thank you for raising this matter,” I told the prime minister. “Give me some time to look at the intelligence and I’ll give you an answer.”

I convened the national security team for a series of intense discussions. As a military matter, the bombing mission would be straightforward. The Air Force could destroy the target, no sweat. But bombing a sovereign country with no warning or announced justification would create severe blowback.

A second option would be a covert raid. We studied the idea seriously, but the CIA and the military concluded that it would be too risky to slip a team into and out of Syria with enough explosives to blow up the facility.

The third option was to brief our allies on the intelligence, jointly expose the facility, and demand that Syria shutter and dismantle it under the supervision of the IAEA. With the regime’s duplicity exposed, we could use our leverage to press Syria to end its support for terror and meddling in Lebanon and Iraq. If Syria refused to dismantle the facility, we would have a clear public rationale for military action.

Before I made a decision, I asked CIA Director Mike Hayden to conduct an intelligence assessment.

He explained that the analysts had high confidence that the plant housed a nuclear reactor. But because they could not confirm the location of the facilities necessary to turn the plutonium into a weapon, they had only low confidence of a Syrian nuclear weapons program.

Mike’s report clarified my decision. “I cannot justify an attack on a sovereign nation unless my intelligence agencies stand up and say it’s a weapons program,” I said to Olmert. I told him I had decided on the diplomatic option backed by the threat of force. “I believe the strategy protects your interests and your state, and makes it more likely we can achieve our interests as well.”

The prime minister was disappointed. “This is something that hits at the very serious nerves of this country,” he said. He told me the threat of a nuclear weapons program in Syria was an “existential” issue for Israel, and he worried diplomacy would bog down and fail. “I must be honest and sincere with you. Your strategy is very disturbing to me.” That was the end of the call.

On September 6, 2007, the facility was destroyed.

The experience was revealing on multiple fronts. It confirmed Syria’s intention to develop nuclear weapons. It also provided another reminder that intelligence is not an exact science. While I was told that our analysts had only low confidence that the facility was part of a nuclear weapons program, surveillance after the bombing showed Syrian officials meticulously covering up the remains of the building. If the facility was really just an innocent research lab, Syrian President Assad would have been screaming at the Israelis on the floor of the United Nations. That was one judgment I could make with high confidence.

Prime Minister Olmert's execution of the strike made up for the confidence I had lost in the Israelis during the Lebanon war. I suggested to Ehud that we let some time go by and then reveal the operation as a way to isolate the Syrian regime. Olmert told me he wanted total secrecy. He wanted to avoid anything that might back Syria into a corner and force Assad to retaliate. This was his operation, and I felt an obligation to respect his wishes. I kept quiet, even though I thought we were missing an opportunity.

Finally, the bombing demonstrated Israel's willingness to act alone. Prime Minister Olmert hadn't asked for a green light, and I hadn't given one. He had done what he believed was necessary to protect Israel.

I am not a lawyer but I have a related legalistic question: if countries can be sanctioned via Chapter 7 of the UN Charter for being a "threat to the peace or a breach of peace or an act of war" for having an alleged nuclear weapons program, can other nations who attack said nations also be sanctioned via Chapter 7 of the UN Charter for being a "threat to the peace or a breach of peace or an act of war" ?

Reply

Nick | September 12, 2011

No, they can't be sanctioned.

As Bolton has mentioned before, under the auspices of Article 51, P5 and their friends can destroy sites that could pose harm to them in the near future. This includes heavy water reactors, enrichment plants, and reprocessing facilities. One may include PWRs as well, since again Bolton opined not too long ago that spent uranium fuel rods could easily be reprocessed into pure PU 239 for bomb making.

"The truth that survives is simply the lie that is pleasantest to believe." ~ H.L.Mencken

Reply

kme | September 12, 2011

I am not so sure that the secrecy itself is particularly convincing evidence of the reactor being part of a weapons program – after all, ask yourself if you were the President of Syria and did hypothetically want to build a non-weapons-related nuclear reactor, would you announce it widely or would you try and keep it secret for as long as possible?

Much more damning is the design of the reactor itself.

Reply

blowback | September 13, 2011

What is so damning about the alleged design of the alleged reactor. It is the British Magnox design which my government in a fit of benevolence/stupidity released into the public domain many years ago. An obvious choice if you are a poor technically-backward country that wants to establish a successful nuclear programme.

BTW, is there any evidence that the US passed its or rather Israel's "intelligence" by some of the people from the UKAEA and the like who were actually involved in building these things originally? Maybe the reason Bush was rolling his eyes was that someone had done so and the word had come back that the intelligence was fake but Bush didn't want to say so because he didn't want the scheissesturm that would come his way for being an "existential threat" to Israel.

Reply

rwendland | September 13, 2011

blowback, the "fit of benevolence/stupidity" you refer to was of course Eisenhower's Atoms for Peace. I think the Calder Hall design was declassified for the Atoms for Peace conference, though there had already been considerable description in journals.

krepon | September 13, 2011

Good eye, Jeffrey.

Until more information is revealed, I'm inclined to suspect that President Bush and those around him (with the exception of the Vice President) much preferred that Israel do the deed, and conveyed indirect messages that increased this likelihood.

One of the so called functionally related sites, the one referred to as Marj as-Sultan, appears to have been a uranium conversion facility. That points to fuel production...

With regard to reprocessing the only reference I am aware of is in the last book by Collins/Frantz ("Fallout", p. 206). They mention that Jacques Baute, sifting through the Tinner files in Switzerland, came across "a set of files that described Syria's attempted purchase of type of remote manipulator devices for handling radioactive material, almost never used outside a plutonium reprocessing facility".

Reply

Mark Lincoln | September 13, 2011

Why do North Korean graphite moderated, gas cooled, magnox, plutonium production reactors require stacks to vent gases and North Korean built graphite moderated, gas cooled, magnox, plutonium, production reactors in Syria not?

Reply

Cheryl Rofer | September 13, 2011

Hi Jeffrey –

Of course I have an opinion on this, but it's a little long for a comment.

So here's a link.

The short version is that I don't think there's much to learn in the Bush, Cheney, and Woodward versions.  
Reply

Anon | September 13, 2011

Thanks.

There's any number of bad things that the Syrians could have been doing with the NKs that would not be nuclear weapons-related: missiles, bio, chem, game-boy modifications.

Even if it was a reactor: how do you go from that to a weapon? Not all things Nuc-cu-ler are weapons, as most people on this blog surely can confirm.

So their covert behavior and NK connection and elusive answers do not \*NUCLEAR WEAPONS\*.

In any case, Reuters is reporting that the Syrians are going to cooperate with the IAEA on this today.

Anon | September 13, 2011

What the UNSC says w/r/t Iran seems very important these days and is reported far and wide.

Here is what this super-important international body said post-Osirik:

FYI — UN Security Council resolution 487:

2. \*\*\*\*\*Calls upon Israel to refrain in the future from any such acts or threats thereof;\*\*\*\*\*
3. Further considers that the said attack constitutes a serious threat to the entire IAEA safeguards regime which is the foundation of the non-proliferation Treaty;
4. Fully recognises the inalienable sovereign right of Iraq, and all other States, especially the developing countries, to establish programmes of technological and nuclear development to develop their economy and industry for peaceful purposes in accordance with their present and future needs and consistent with the internationally accepted objectives of preventing nuclear-weapons proliferation;
5. \*\*\*\*\*Calls upon Israel urgently to place its nuclear facilities under IAEA safeguards; \*\*\*\*\*

---

---

And you wonder why NAM nations are pissed off.

Reply

rwendland | September 13, 2011

Jeffrey, the absence of reprocessing plant development for a Magnox-type reactor is (I think) more significant than for a heavy water reactor, as at Arak. Spent Magnox-type fuel cannot be stored indefinitely (wet or dry stored[\*]), so it would be technically stupid to startup a Magnox-type reactor without assured access to a working reprocessing plant within 5 years. And if you don't already have experience of reprocessing chemistry,

it would be foolish not to get at least a small-scale prototype reprocessing plant in trials before first criticality (or plan to export the spent fuel as per Italy & Japan).

So the absence of any sign of a reprocessing plant does strongly suggest startup was not imminent (or perhaps it was not a reactor).

Do you know if there are storage time limits on spent zirconium clad fuel from heavy water reactors? I suspect it can be stored for a long time, similar to LWR fuel, so startup of a HWR does not put you onto a non-stop express train to reprocessing.

[\*] The UK Magnox dry stores at Wylfa worked fairly well, but water penetration did corrode some of the fuel, which created a very difficult fuel extraction problem, and as I recall a priority path to the reprocessing plant. A dry-store would not be easy to hide anyway, as it has significant similarities to a reactor – 2 metre concrete shielding and a large fault tolerant gas cooling system.

krepon said,

> Until more information is revealed, I'm inclined to suspect that President Bush and those around him (with the exception of the Vice President) much preferred that Israel do the deed, and conveyed indirect messages that increased this likelihood.

That's certainly my reading. The available evidence persuades me that the US really did believe, courtesy of Israeli intelligence delivered in the Spring of 2007, that Syria was within months of putting a plutonium production reactor into operation. And, due to the embarrassments of 2003, the US really didn't want to bomb another Arab/Muslim state on a WMD pretext if it could help it. Israel, which was also apparently convinced of the basic story line, would do the deed if the US couldn't be persuaded and that was what the US, minus Cheney, went with.

P.S.: I think Trey was Hadley.

P.P.S.: Low confidence in a weapons program coupled with high confidence in a plutonium production reactor is obviously nonsensical and points to other considerations at work in the IC (c.f. 2003). If you see a plant producing tank turrets, you can be fairly sure there's a tank program somewhere, even if you have no other evidence.

Reply

Andy | September 13, 2011

Allen,

I agree with your take.

Regarding your PPS, however, the IC was making a distinction between what it deduced or inferred based on its conclusion that the facility was a reactor, and actual evidence indicating a weapons program. On the latter there was little to no evidence, but at the same time the implications of the reactor were clear. Here's how administration officials put it in the non-for-attribution briefing Jeffrey linked to in his post:

“SENIOR INTELLIGENCE OFFICIAL 2: No, you need to understand. I'm sorry to dwell on the point. This is very, very important.

“SENIOR INTELLIGENCE OFFICIAL 1: This is very important.

“SENIOR INTELLIGENCE OFFICIAL 2: We told our President four things: This is a reactor; the North Koreans and the Syrians are cooperating on nuclear activities; the North Koreans and Syrians are cooperating on the construction of this reactor; and this reactor – its purpose – is to create fuel for a nuclear weapons program. Those are the things we concluded.

“Now, when you look at the body of evidence of those four sentences and begin to sort out how much of that is based on an overwhelming body of evidence as opposed to a more limited body of evidence and therefore more reliant on assessment, the fact that it was a nuclear reactor – absolutely high confidence; the fact of Syrian-Korean nuclear cooperation spanning a decade at an intense level, high confidence. At the time of the strike, fact of North Korean-Syrian cooperation in the building of that reactor, medium confidence that then got higher because of events, some of which we have alluded to in the briefing, okay. The fact that that material was going to be used for a weapons program – we believe that to be true, but because we did not have, as [Senior Intelligence Official 1] points out, additional clinical evidence of other activities, we could only give it a low confidence level. But you need to – and I think you understand what I’m trying to say. That’s not more or less sure; it’s just that it’s a way of communicating that for which you have a large body of evidence and that for which you may not.”

Also, there is this tibit from the same briefing discussing the decision of what to do about the reactor:

“SENIOR ADMINISTRATION OFFICIAL: We obviously were looking very closely at options, and we had looked at some approaches that involved a mix of diplomacy and the threat of military force with the goal of trying to ensure that the reactor was either dismantled or permanently disabled, and therefore never became operational.

“We looked at those options. There were, as I mentioned to you, conversations with the Israelis. Israel felt that this reactor posed such an existential threat that a different approach was required. And as a sovereign country, Israel had to make its own evaluation of the threat and the immediacy of the threat, and what actions it should take. And it did so.”

Jeffrey | September 14, 2011

Yes, my notes suggest that Trey was Hadley. What I cannot remember is who told me that. I think it was a reporter at the briefing.

Anon | September 14, 2011

Thank you Dan!

You will see my quote from UNSCR487 above told Israel not to repeat the Osirak-type attack AND told Israel to place its facilities under IAEA safeguards.

From a lawyerly perspective, do you think it is appropriate that Iran has Ch. 7 sanctions when there has been no breach of the peace but Israel does not when it has done so at least twice (over nuclear matters that we know of, not including assassinations and cyberattacks)?

Do cyberattacks count as a breach of the peace or a threat to the peace?

If Israel attacks Iran physically, do you think there will be a strong case for Ch 7 sanctions on Israel?

UN Security Council resolution 487:

2. \*\*\*\*\*Calls upon Israel to refrain in the future from any such acts or threats thereof;\*\*\*\*\*

3. Further considers that the said attack constitutes a serious threat to the entire IAEA safeguards regime which is the foundation of the non-proliferation Treaty;

...

5. \*\*\*\*\*Calls upon Israel urgently to place its nuclear facilities under IAEA safeguards; \*\*\*\*\*  
Reply

Dan Joyner | September 14, 2011

The UNSC is at its essence a political body. It was structured to be that way. The fact that Iran has been sanctioned by the UNSC and Israel has not is, in my opinion, completely a product of the identity of the permanent members of the UNSC, all of whom have veto power over any Council decision. But only one such member really matters on this question – the US. The US has consistently vetoed any UNSC resolution that would condemn or even speak negatively about Israeli actions, with very few exceptions. Its all there in the UNSC record.

Anon | September 14, 2011

>Why do North Korean graphite moderated, gas cooled, magnox, plutonium production reactors require stacks to vent gases and North Korean built graphite moderated, gas cooled, magnox, plutonium, production reactors in Syria not?

Mark,

Interesting observation. The stack seen on Calder Hall-type Magnox reactors are to exhaust cooling air from between the steel reactor pressure vessel and the concrete shielding.

This isn't present on later Magnox designs which use an all concrete pressure vessel. The earlier design has the interesting feature that they neutron activate things in this cooling air and thus emit copious amounts of Ar-41.

It's enough that when these things were operating in the UK, the operators environmental monitoring teams had to make a plan based on wind direction, as you really can't do useful work in the "argon plume".

As an update, I'd think it was pretty simple to engineer, especially if the original operating pressure (~7 bar) is kept.

Reply

Andy | September 14, 2011

Ok, here's my take on your questions:

The eye-rolling. Obviously we can't read the man's mind, so anything is just a guess. My guess is that Bush (and everyone else) already knew the VP was going to advocate bombing and already knew that the VP would be alone in his advocacy. I also suspect the VP also knew he'd be alone and so his advocacy was simply to register his dissent to something that had already been decided. "Yes, yes, Dick, we already know you want to bomb Syria and you already know it ain't gonna happen."

Secondly, I don't share your assumptions about what Presidents will do in the face of an al Kibar or Arak. In this case, I think the President and his advisers knew that Israel had both the capability and will to take the

reactor out. Israel, perhaps predictably, came knocking hoping to get the US to do its dirty work. The President thankfully declined and uncertainty in the intelligence became the excuse.

Additionally, let's consider what else was going on in the spring/summer of 2007. US policy was completely focused on the "Surge" in Iraq and the President had just taken a big risk by doubling-down there. It doesn't make sense for him to increase that risk by bombing Syria, especially considering there was a completely viable (and completely superior, in my view) option of diplomacy backed by the threat of force. Not only that, but Syria certainly had the capability to cause more trouble in Iraq and bombing al Kibar could well have caused Syria to take the gloves off and more actively oppose the US there.

So what are the upsides to the US taking action and bombing the reactor? I don't really see any.

On the Arak reactor, absent something else going on, I don't think a President will bomb it as long as it remains under safeguards.

Reply

Malenki Sasha | September 14, 2011

I think we are missing the bigger picture here.

There is no way that the US would be able to get away with bombing Syria and it is absolutely shocking that Cheney ever said it was on the table.

Keep in mind up until the recent uprising, Syria was an extremely useful ally in the War on Terror and the Iraq war, and never mind that this was coming at the heels of the surge. The last thing the US needs is the very active participation of the Syrian government in supporting Iraq insurgents during one of the most critical times of the war.

Reply

Malenki Sasha | September 14, 2011

This is an instance of a preventive strike. Preemptive attacks are far easier to identify and legally support as where preventive strikes are murky at best.

This was an instance of a preventive strike which lacks the legal framework in which to effectively argue. The problem with nuclear weapons is that unlike conventional war, there is far too little time between identifying an imminent attack and annihilation. With a conventional armies intelligence can intercept plans, movements can be observed well in advance as where a leader's decision and the actual launch of a nuclear weapon can be done within moments of each other. Even if intelligence were to discover the leaders decision it will most likely be too late to react.

This is the dilemma that international legal framework is unprepared to deal with. By constructing a clandestine nuclear weapons program it is easy for a state to exploit this dilemma. They can simply claim it is for peaceful purposes while obscuring facilities and operations. Keeping stuff secret usually doesn't result in being bombed. Although it does happen every now and then.

What is particularly unnerving about al Kibar is that Syria denied being bombed along with the scramble to bury evidence of the facility. While signs of guilt don't warrant 100% certainty it is obvious they were up to something and that nipping their program in its infancy was the best course of action.

Reply

Dan Joyner | September 14, 2011

No you are quite right that calls upon language in one resolution has equal legal weight (i.e. pretty much none) to calls upon language in another resolution.

Reply

Mark Gubrud | September 17, 2011

I've previously speculated here that the reason the US didn't bomb the Syrian reactor is that the US had long known about it and the project had been halted, along with the Iranian nuclear weapon program, possibly in response to a direct American threat. North Korea, hoping for a deal with the US and sensing that the game was over in any case, may have sold out its customer. Or some North Korean may have sold out for asylum and cash.

This is a pure guess on my part, but I still don't see any solid facts that don't fit in this picture. It would explain the absence of a reprocessing plant and the IC's peculiar "confidence," as you put it, in "no core, no war."

I think what happened in 2007 is that although the Syrians had put the program on ice, they hadn't dismantled the building, and the Israelis sent a bunch of stuff Bush's way in another effort to gin up a case for endless war and to take the heat off themselves on Palestine. The CIA was not impressed, and prevailed as per Bush's account, although he's leaving out the part that this was nothing new. But it was okay if the Israelis went ahead and bombed the site, mainly for their own political purposes, and to send a message to Syria and Iran on behalf of both Israel and the US.

I'm puzzled by your statement that you assume "that no President would allow the Iranian reactor at Arak to come online." The Iranians have made a considerable investment in the heavy water production plant and in the reactor. I was not aware that they were doing anything on that project other than moving forward with it. Assuming Obama is still president when they are ready to activate the reactor, what do you think he will do?

Reply

Jeffrey | September 18, 2011

I would have expected an air strike. I am still surprised that Bush did not authorize one against Al Kibar.

kme | September 21, 2011

Is a (presumably safeguarded) HWR any more concerning than safeguarded uranium enrichment cascades? (As I understand it, your position is that in the latter case the real worry is hidden non-safeguarded sites – doesn't the same apply in the former case too, with the added factor that it's difficult to hide a sizeable reactor?)

Anon | September 12, 2011

What is important to note is that the US properly kept out of this and did not (evidently) see any proof of a connection to a weapons program even if it was a reactor, whatever snake-oil the Israelis may have been pedaling.

What is also important to note is that Israel was not sanctioned by the UNSC for a clear "threat to the peace, breach of the peace or an act of aggression" even though its actions probably much more clearly satisfied these conditions as compared to other middle eastern countries who have nuclear programs, and whose low-level weaponization research (such as it ever probably was) was wrapped up in 2003 according to our own DNI.

It ought not be UNSC policy to only sanction NPT members.

Does Israel have a right to pre-emptively bomb whomever it feels like without so much as a slap on the hand from international bodies? Debatable.

But a couple of things are crystal clear: there may be, well, asymmetrical blowback when this happens; and, the attack on Iraq (Osirak) actually kicked off Iraq's weaponization work, in earnest; and, the perception of even-handedness and lack of double-standards by international bodies is important else others will properly thumb their nose at said bodies. Note I speak not only of the IAEA but of the UNSC itself.

Reply

Dan Joyner | September 13, 2011

A couple of comments here have raised questions about the legal issues related to the Israeli strike. I wrote a short piece for the American Society of International Law on this precise question in 2008. Here is an excerpt from the piece:

“Whether the activity at the Syrian site was weapons related or civilian in character, Israel's action in attacking and destroying the site was almost certainly a breach of international law. Article 2(4) of the United Nations Charter, of which Israel is a member, prohibits uses of force “against the territorial integrity” of any other state. States retain the inherent right of self-defense as defined in Article 51 of the Charter. Article 51 allows unilateral acts of force in self-defense on a temporary basis “if an armed attack occurs” against a member of the United Nations. As Syria had not yet attacked Israel, any justification for Israel's use of force pursuant to Article 51 must be found, if at all, by resort to the principle of anticipatory self-defense.

Anticipatory self-defense was part of pre-Charter customary law, and many argue that states are still entitled to rely upon the principle. However, even if this contention is correct, anticipatory self-defense must be understood to be limited in its applicability to situations of imminent threat. As observed by U.S. Secretary of State Daniel Webster during the 1841 Caroline controversy, in order for the principle of anticipatory self-defense to apply, there must be a “necessity of self-defense, instant, overwhelming, leaving no choice of means, and no moment for deliberation.” Even if such a situation of imminence arises, a use of force in anticipatory self defense may only be carried out in accordance with the customary international law principles of necessity and proportionality.

There are no facts alleged against Syria which would meet the required test of imminence under the principle of anticipatory self-defense. Again, there are no allegations or evidence that the site served a weapons development purpose. The sort of imminence of threat demanded by the doctrine of anticipatory self-defense is clearly not presented by the simple fact of the construction and maintenance of a nuclear reactor in Syria. Neither Syria's breach of its IAEA safeguards agreement, nor its breach of U.N. Security Council Resolution 1718, have any bearing on this analysis. Israel's attack on Syrian territory thus constitutes a breach of Article 2(4) of the United Nations Charter.

The September 2007 action by Israel is reminiscent of its 1981 attack on an Iraqi nuclear reactor under construction at Osirak. On that occasion as well, the reactor was destroyed. However, in the aftermath of the attack, the U.N. Security Council unanimously passed Resolution 487, which denounced the incident as a “clear violation of the Charter of the United Nations.”[17]

Though a subject of ongoing debate, it is doubtful that the substance of international use of force law regarding anticipatory self-defense has changed in any material respect since 1981. However, the Israeli attack upon Syria will no doubt stimulate renewed discussion on this point.”

Reply

Scott Monje | September 13, 2011

“However, the Israeli attack upon Syria will no doubt stimulate renewed discussion on this point.”

And did it?

Reply

Dan Joyner | September 14, 2011

There has certainly been no end of discussion about it in legal literature since then. I wrote extensively on the topic of counterproliferation uses of force in my 2009 book. One problem is that there are so few data points in this area – I.e. Relatively few instances of counterpro use of force like in Syria – that it's difficult to say convincingly that new patterns of state practice are emerging to effectively change the classical rules. I think the best assessment is that the basic rules have not changed.

Reply

Anon | September 14, 2011

Dan, thanks for your very useful input. Do you think UNSCR 487's statement:

\*\*\*\*\*Calls upon Israel to refrain in the future from any such acts or threats thereof;\*\*\*\*\*

carries any real weight?

Reply

Dan Joyner | September 14, 2011

“Calls upon” language in UNSCR’s is nonbinding. However, the importance of UNSCR 487 was to show the UNSC’s judgment that the attack on Osirak was unlawful.

Reply

Anon | September 14, 2011

Dan, thank you again — that is what I thought.

But now I have another related question: since Israel ignored UNSCR487 and bombed Syria AFTER Osirak, and because the UNSC resolution calling for sanctions on Iran also contain the same phrase “calls upon” Iran repeatedly — is it also OK for Iran to thumb its nose at the UNSC, just as Israel has done; or, in your view, does this constitute double-standards?

TEXT of UNSC sanction resolution on Iran:

<http://www.bicc.org.uk/downloads/UN%20Resolution%201929.pdf>

e.g.

“..calls upon

Iran to confirm, as requested by the IAEA, that it has not taken a decision to construct, or authorize construction of, any other nuclear facility which has as yet not been declared to the IAEA,”

“calls upon Iran to act strictly in accordance with the provisions of the Additional Protocol to its IAEA Safeguards Agreement that it signed on 18 December 2003, calls upon Iran to ratify promptly the Additional Protocol”

“calls upon all States to exercise vigilance over those transactions involving the IRGC that could contribute to Iran’s proliferation-sensitive nuclear activities or the

development of nuclear weapon delivery systems;”

“Calls upon all States to inspect, in accordance with their national authorities and legislation and consistent with international law, in particular the law of the sea and relevant international civil aviation agreements,

all cargo to and from Iran, in their territory, including seaports and airports, if the State concerned has information that

provides reasonable grounds to believe the cargo contains items the supply, sale, transfer, or export of which is prohibited by paragraphs 3, 4 or 7 of resolution 1737 (2006), paragraph 5 of resolution 1747 (2007), paragraph 8 of

resolution 1803 (2008) or paragraphs 8 or 9 of this resolution, for the purpose of ensuring strict implementation of those provisions;”

“Calls upon all States, in addition to implementing their obligations pursuant to resolutions 1737 (2006), 1747 (2007), 1803 (2008) and this resolution, to prevent the provision of financial services, including insurance or reinsurance,

or the transfer to, through, or from their territory, or to or by their nationals or entities organized under their laws (including branches abroad), or persons or financial institutions in their territory, of any financial or other assets or

resources if they have information that provides reasonable grounds to believe that such services, assets or resources

could contribute to Iran’s proliferation-sensitive nuclear activities, or the development of nuclear weapon delivery

systems, including by freezing any financial or other assets or resources on their territories or that hereafter come within

their territories, or that are subject to their jurisdiction or that hereafter become subject to their jurisdiction, that are

related to such programmes or activities and applying enhanced monitoring to prevent all such transactions in accordance with their national authorities and legislation;”

ETC. Etc.

Is it OK for Iran and all other nations to thumb their collective noses at the litany of UNSC “calls upon” just like Israel did in bombing Syria?

Reply

Dan Joyner | September 14, 2011

The difference from a legal perspective is that in Resolutions 1737 and 1929, the UNSC has acted under Chapter VII and “Decided” that Iran shall cease uranium enrichment, etc. “Decides” is the word the UNSC uses to make a binding decision, which all members have agreed to comply with in UN Charter Article 25. So Iran is in violation of UNSC decisions, which under Article 25 are legally binding.

Reply

Anon | September 14, 2011

Yes, thank you — OK I see.

But as the quote from the UNSC resolution above shows there are some “decided” ’s and plenty of “calls upon”.

I am perhaps wrong but it seems that the “calls upon” parts in the sanctions’ resolutions are as optional as Israel not stopping bombing nations when being “called upon” to do so. Also Israel was called upon to place its nuclear program under IAEA safeguards.

Please feel free to correct me if I am wrong — I’m no lawyer after all.

## Correcting the record about that Syrian nuclear reactor

By Michael V. Hayden,

[2011-09-23]

Intelligence estimates about foreign nuclear programs seem to lead unhappy, often controversial, lives.

There was the 2002 National Intelligence Estimate that Iraq had reconstituted its nuclear weapons program. That was wrong, of course. But there is a body of thought, built up on the American left, that the estimate was beyond wrong. It holds that there was a conspiracy to cook the intelligence to support a preconceived course of action; that the Bush administration, especially the vice president, pressured intelligence workers to reach the conclusions they did. “Bush lied, Americans died” was the commonly heard mantra.

In fact, we just got it wrong. In one of my last meetings with Leon Panetta when he was taking over as director of the CIA, I cautioned against accepting the left’s urban legend and said, “Leon, this was our fault. It was a clean swing and a miss.”

To be clear about the last point: I told the president that al-Kibar was part of a nuclear weapons program. Why else would the Syrians take such a risk if they were not gambling on such a game-changer? And, besides, we could conceive of no alternative uses for the facility. But since we could not identify the other essentials of a weapons program (a reprocessing plant, work on a warhead, etc.), we cautiously characterized this finding as “low confidence.”

Woodward describes the intelligence as fact-based but then says it was shaped to discourage a preemptive U.S. strike.

That’s not what intelligence does, and confusion on that point may have been generated by a coin, mentioned by Woodward, that CIA folks working on al-Kibar made after the facility was destroyed. On that coin, emblazoned across a map of Syria, were the four words that had been the rallying cry of this effort: “No core, no war.”

Except that “no war” was never taken to mean no kinetic option against al-Kibar. Rather, it referred to the overall policy direction we were following: Whatever we did to make this reactor go away (“no core”), it could not lead to a generalized conflict in the Eastern Mediterranean (“no war”).

Hence, knowledge of the facility was closely held within the U.S. government. Congressional notifications were limited. Even within the executive branch, the data were compartmentalized. All of this was designed to prevent a leak and preclude a circumstance in which we put Syrian President Bashar al-Assad in a position where he felt publicly humiliated and thought he had to respond if the facility were attacked.

As it happened, the plutonium plant at al-Kibar was destroyed by the Israelis in September 2007. Neither the Syrian, U.S. nor Israeli governments said much about it. Assad let the facility’s destruction pass. “No core, no war.”

It’s puzzling to me why al-Kibar has been resurrected. We were wrong about Iraq’s nuclear program. Fair enough. History will tell how right or wrong we were about Iran. I can accept that.

But we got al-Kibar right. And the debate in the U.S. government over its fate was informed by hard facts. The debate reflected differing views, differing approaches. They were aired. Decisions were made. Isn’t that how it’s supposed to work?

The writer was director of the CIA from 2006 to 2009.

## Revisiting Bush's Decision on Al Kibar

By Jeffrey

12 September 2011

38 Comments

Something about the whole Syria nuclear reactor story has never seemed quite right to me. When anonymous US officials began to hint that the facility struck by Israel was in some way nuclear, I wondered how solid that intelligence was. Why couldn't they just call the damned thing a reactor?

I noted that "we haven't heard from the people who ... were 'cautious about fully endorsing Israeli warnings' or 'remain unconvinced that a nascent Syrian nuclear program could pose an immediate threat.' They might have important information to add, were they willing to leak it."

Now, thanks to Bob Woodward, we have the beginnings of the other side of the story from those who successfully opposed a strike on the reactor building — but it just deepens the mystery.

In their memoirs, both George Bush (Decision Points) and Dick Cheney (In My Time) recount the crucial meeting on the question of whether or not to strike the reactor under construction at Al Kibar.

Cheney's book, with its implicit criticism of everyone else in the room, has reignited that debate, leading Woodward to recount the opposition to a strike in light detail:

But accounts from others in these meetings, a public briefing and Bush's own memoir present a dramatically different picture of the intelligence on the Syrian reactor.

Cheney does not reveal that then-CIA Director Michael V. Hayden had a team working for months to examine the intelligence on the Syrian reactor. Participants at the meetings say that Hayden presented his findings to Bush, Cheney and the others before Cheney made his arguments for a military strike.

According to a principal participant, Hayden made four points, saying: "That's a reactor. I have high confidence. That Syria and North Korea have been cooperating for 10 years on a nuclear reactor program, I have high confidence. North Korea built that reactor? I have medium confidence. On it is part of a nuclear weapons program, I have low confidence."

Hayden emphasized the last sentence to underscore his uncertainty. He later told others that he stuck to the intelligence facts and intentionally shaped his presentation that way to discourage a preemptive strike because the intelligence was weak.

According to the CIA, there was no evidence of plutonium reprocessing capability at the site or nearby in that region of Syria, though a reactor of that type would be capable of producing plutonium for nuclear weapons. In addition, there was no identifiable means to manufacture uranium fuel.

[snip]

Two participants in the key National Security Council meeting in June 2007 said that after Cheney, the "lone voice," made his arguments, Bush rolled his eyes.

At the CIA afterward, the group of specialists who had worked for months on the Syrian reactor issue were pleased they had succeeded in avoiding the overreaching so evident in the Iraq WMD case. So they issued a very limited-circulation memorial coin. One side showed a map of Syria with a star at the site of the former reactor.

On the other side the coin said, “No core/No war.”

First, some house-keeping. Most of the details in Woodward’s account have been reported elsewhere. Woodward relies both on Bush’s memoir, as well as the not-for-attribution briefing given to reporters by senior intelligence officials 1 and 2 (“Ace” and “Deuce” were McConnell and Hayden as far as I can tell). And the detail about the coin stamped “No Core, No War” previously appeared (with slightly different punctuation) in US News and World Report’s Washington Whispers by Paul Bedard and an Associated Press story by Deb Riechmann. What is new in Woodward’s reporting is the pair of first person accounts of the President rolling his eyes at Cheney.

Second, “no core, no war” needs some explanation. This is not “If it does not fit, you must acquit.” Rather, the phrase expresses the two high-level political goals that the intelligence community supported: (1) “No core,” ie do not allow the reactor to become operational and (2) “No war,” ie that efforts to stop the reactor from becoming operational should not lead to a wider conflict in the Middle East. Hayden explained the coin in the context of the trade-off between better analysis and maintaining secrecy necessary to control escalation, during a talk at Georgetown.

So, the big question: Why did Bush roll his eyes at Cheney?

Syria was building a clandestine nuclear reactor in a manner that was inconsistent with any explanation other than a nuclear weapons program, something all the principals appear to agree on. For some reason, the inability of the intelligence community to find a reprocessing or a fuel fabrication facility was dispositive for all the other parties other than the Vice-President.

But what if the intelligence community simply didn’t know the location of either site? Bush is extraordinarily clear that he believes Syria intended to use the reactor to produce nuclear weapons. The little video the IC released, which ought to have cleared text, stated that “start of operations could have begun at any time although additional weeks to months of testing were likely.” If there was a time to strike the reactor, it was before it went hot. In other words, the decision to wait could have resulted in the operation of the reactor had Israel not destroyed it.

I just don’t understand why the failure to find fuel fabrication or reprocessing facilities was reassuring to anyone. One of the core reasons for my initial skepticism that the box was a reactor was my conviction that any American president, when presented with unequivocal evidence that a state-sponsor of terrorism was building a covert nuclear reactor, would act decisively to eliminate that reactor before it began operations. I have always assumed, for example, that no President would allow the Iranian reactor at Arak to come online. If the standard is actually “no covert reprocessing facilities,” then I am really at a loss. Maybe I’ve been too warped by *Quick and Secret Construction of Plutonium Reprocessing Plants: A Way to Nuclear Weapons Proliferation?* (General Accounting Office, October 6, 1978).

I can’t help but wonder whether there is some sort of technical detail that the principals are leaving out of the account. Something like the intelligence community concluding that not only did Syria not have a core for the reactor but that it had no reasonable prospect of acquiring one. But how could one have confidence in a judgment like that?

Anyway, as I say, I find the whole episode a continuing mystery. I am genuinely interested in hearing the opinions of others. And seeing a picture of one of those medals!

Jeffrey | September 12, 2011

Here is the relevant passage from Decision Points:

Iran was not the only nation endangering the freedom agenda by seeking nuclear weapons. In the spring of 2007, I received a highly classified report from a foreign intelligence partner. We pored over photographs of a suspicious, well-hidden building in the eastern desert of Syria.

The structure bore a striking resemblance to the nuclear facility at Yongbyon, North Korea. We concluded that the structure contained a gas-cooled, graphite-moderated reactor capable of producing weapons-grade plutonium. Since North Korea was the only country that had built a reactor of that model in the past thirty-five years, our strong suspicion was that we had just caught Syria red-handed trying to develop a nuclear weapons capability with North Korean help.

That was certainly the conclusion of Prime Minister Olmert. “George, I’m asking you to bomb the compound,” he said in a phone call shortly after I received the report.

“Thank you for raising this matter,” I told the prime minister. “Give me some time to look at the intelligence and I’ll give you an answer.”

I convened the national security team for a series of intense discussions. As a military matter, the bombing mission would be straightforward. The Air Force could destroy the target, no sweat. But bombing a sovereign country with no warning or announced justification would create severe blowback.

A second option would be a covert raid. We studied the idea seriously, but the CIA and the military concluded that it would be too risky to slip a team into and out of Syria with enough explosives to blow up the facility.

The third option was to brief our allies on the intelligence, jointly expose the facility, and demand that Syria shutter and dismantle it under the supervision of the IAEA. With the regime’s duplicity exposed, we could use our leverage to press Syria to end its support for terror and meddling in Lebanon and Iraq. If Syria refused to dismantle the facility, we would have a clear public rationale for military action.

Before I made a decision, I asked CIA Director Mike Hayden to conduct an intelligence assessment.

He explained that the analysts had high confidence that the plant housed a nuclear reactor. But because they could not confirm the location of the facilities necessary to turn the plutonium into a weapon, they had only low confidence of a Syrian nuclear weapons program.

Mike’s report clarified my decision. “I cannot justify an attack on a sovereign nation unless my intelligence agencies stand up and say it’s a weapons program,” I said to Olmert. I told him I had decided on the diplomatic option backed by the threat of force. “I believe the strategy protects your interests and your state, and makes it more likely we can achieve our interests as well.”

The prime minister was disappointed. “This is something that hits at the very serious nerves of this country,” he said. He told me the threat of a nuclear weapons program in Syria was an “existential” issue for Israel, and he worried diplomacy would bog down and fail. “I must be honest and sincere with you. Your strategy is very disturbing to me.” That was the end of the call.

On September 6, 2007, the facility was destroyed.

The experience was revealing on multiple fronts. It confirmed Syria's intention to develop nuclear weapons. It also provided another reminder that intelligence is not an exact science. While I was told that our analysts had only low confidence that the facility was part of a nuclear weapons program, surveillance after the bombing showed Syrian officials meticulously covering up the remains of the building. If the facility was really just an innocent research lab, Syrian President Assad would have been screaming at the Israelis on the floor of the United Nations. That was one judgment I could make with high confidence.

Prime Minister Olmert's execution of the strike made up for the confidence I had lost in the Israelis during the Lebanon war. I suggested to Ehud that we let some time go by and then reveal the operation as a way to isolate the Syrian regime. Olmert told me he wanted total secrecy. He wanted to avoid anything that might back Syria into a corner and force Assad to retaliate. This was his operation, and I felt an obligation to respect his wishes. I kept quiet, even though I thought we were missing an opportunity.

Finally, the bombing demonstrated Israel's willingness to act alone. Prime Minister Olmert hadn't asked for a green light, and I hadn't given one. He had done what he believed was necessary to protect Israel.

---

Anon | September 12, 2011

I am not a lawyer but I have a related legalistic question: if countries can be sanctioned via Chapter 7 of the UN Charter for being a "threat to the peace or a breach of peace or an act of war" for having an alleged nuclear weapons program, can other nations who attack said nations also be sanctioned via Chapter 7 of the UN Charter for being a "threat to the peace or a breach of peace or an act of war" ?

---

Nick | September 12, 2011

No, they can't be sanctioned.

As Bolton has mentioned before, under the auspices of Article 51, P5 and their friends can destroy sites that could pose harm to them in the near future. This includes heavy water reactors, enrichment plants, and reprocessing facilities. One may include PWRs as well, since again Bolton opined not too long ago that spent uranium fuel rods could easily be reprocessed into pure PU 239 for bomb making.

Anon | September 12, 2011

“The truth that survives is simply the lie that is pleasantest to believe.” ~ H.L.Mencken

---

kme | September 12, 2011

I am not so sure that the secrecy itself is particularly convincing evidence of the reactor being part of a weapons program – after all, ask yourself if you were the President of Syria and did hypothetically want to build a non-weapons-related nuclear reactor, would you announce it widely or would you try and keep it secret for as long as possible?

Much more damning is the design of the reactor itself.

---

blowback | September 13, 2011

What is so damning about the alleged design of the alleged reactor. It is the British Magnox design which my government in a fit of benevolence/stupidity released into the public domain many years ago. An obvious choice if you are a poor technically-backward country that wants to establish a successful nuclear programme.

BTW, is there any evidence that the US passed its or rather Israel’s “intelligence” by some of the people from the UKAEA and the like who were actually involved in building these things originally? Maybe the reason Bush was rolling his eyes was that someone had done so and the word had come back that the intelligence was fake but Bush didn’t want to say so because he didn’t want the scheissesturm that would come his way for being an “existential threat” to Israel.

---

rwendland | September 13, 2011

blowback, the “fit of benevolence/stupidity” you refer to was of course Eisenhower’s Atoms for Peace. I think the Calder Hall design was declassified for the Atoms for Peace conference, though there had already been considerable description in journals.

---

krepon | September 13, 2011

Good eye, Jeffrey.

Until more information is revealed, I’m inclined to suspect that President Bush and those around him (with the exception of the Vice President) much preferred that Israel do the deed, and conveyed indirect messages that increased this likelihood.

MK

---

pkp | September 13, 2011

One of the so called functionally related sites, the one referred to as Marj as-Sultan, appears to have been a uranium conversion facility. That points to fuel production...

With regard to reprocessing the only reference I am aware of is in the last book by Collins/Frantz (“Fallout”, p. 206). They mention that Jacques Baute, sifting through the Tinner files in Switzerland, came across “a set of

files that described Syria's attempted purchase of type of remote manipulator devices for handling radioactive material, almost never used outside a plutonium reprocessing facility".

---

Mark Lincoln | September 13, 2011

Why do North Korean graphite moderated, gas cooled, magnox, plutonium production reactors require stacks to vent gases and North Korean built graphite moderated, gas cooled, magnox, plutonium, production reactors in Syria not?

---

Cheryl Rofer | September 13, 2011

Hi Jeffrey –

Of course I have an opinion on this, but it's a little long for a comment.

So here's a link.

The short version is that I don't think there's much to learn in the Bush, Cheney, and Woodward versions.

---

Anon | September 13, 2011

Thanks.

There's any number of bad things that the Syrians could have been doing with the NKs that would not be nuclear weapons-related: missiles, bio, chem, game-boy modifications.

Even if it was a reactor: how do you go from that to a weapon? Not all things Nuc-cu-ler are weapons, as most people on this blog surely can confirm.

So their covert behavior and NK connection and elusive answers do not \*NUCLEAR WEAPONS\*.

In any case, Reuters is reporting that the Syrians are going to cooperate with the IAEA on this today.

---

Anon | September 13, 2011

What the UNSC says w/r/t Iran seems very important these days and is reported far and wide.

Here is what this super-important international body said post-Osirak:

FYI — UN Security Council resolution 487:

2. \*\*\*\*\*Calls upon Israel to refrain in the future from any such acts or threats thereof;\*\*\*\*\*
3. Further considers that the said attack constitutes a serious threat to the entire IAEA safeguards regime which is the foundation of the non-proliferation Treaty;
4. Fully recognises the inalienable sovereign right of Iraq, and all other States, especially the developing countries, to establish programmes of technological and nuclear development to develop their economy and

industry for peaceful purposes in accordance with their present and future needs and consistent with the internationally accepted objectives of preventing nuclear-weapons proliferation;

5. \*\*\*\*Calls upon Israel urgently to place its nuclear facilities under IAEA safeguards; \*\*\*\*

---

And you wonder why NAM nations are pissed off.

---

rwendland | September 13, 2011

Jeffrey, the absence of reprocessing plant development for a Magnox-type reactor is (I think) more significant than for a heavy water reactor, as at Arak. Spent Magnox-type fuel cannot be stored indefinitely (wet or dry stored[\*]), so it would be technically stupid to startup a Magnox-type reactor without assured access to a working reprocessing plant within 5 years. And if you don't already have experience of reprocessing chemistry, it would be foolish not to get at least a small-scale prototype reprocessing plant in trials before first criticality (or plan to export the spent fuel as per Italy & Japan).

So the absence of any sign of a reprocessing plant does strongly suggest startup was not imminent (or perhaps it was not a reactor).

Do you know if there are storage time limits on spent zirconium clad fuel from heavy water reactors? I suspect it can be stored for a long time, similar to LWR fuel, so startup of a HWR does not put you onto a non-stop express train to reprocessing.

[\*] The UK Magnox dry stores at Wylfa worked fairly well, but water penetration did corrode some of the fuel, which created a very difficult fuel extraction problem, and as I recall a priority path to the reprocessing plant. A dry-store would not be easy to hide anyway, as it has significant similarities to a reactor – 2 metre concrete shielding and a large fault tolerant gas cooling system.

Allen Thomson | September 13, 2011

krepon said,

> Until more information is revealed, I'm inclined to suspect that President Bush and those around him (with the exception of the Vice President) much preferred that Israel do the deed, and conveyed indirect messages that increased this likelihood.

That's certainly my reading. The available evidence persuades me that the US really did believe, courtesy of Israeli intelligence delivered in the Spring of 2007, that Syria was within months of putting a plutonium production reactor into operation. And, due to the embarrassments of 2003, the US really didn't want to bomb another Arab/Muslim state on a WMD pretext if it could help it. Israel, which was also apparently convinced of the basic story line, would do the deed if the US couldn't be persuaded and that was what the US, minus Cheney, went with.

P.S.: I think Trey was Hadley.

P.P.S.: Low confidence in a weapons program coupled with high confidence in a plutonium production reactor is obviously nonsensical and points to other considerations at work in the IC (c.f. 2003). If you see a plant producing tank turrets, you can be fairly sure there's a tank program somewhere, even if you have no other evidence.

---

Andy | September 13, 2011

Allen,

I agree with your take.

Regarding your PPS, however, the IC was making a distinction between what it deduced or inferred based on its conclusion that the facility was a reactor, and actual evidence indicating a weapons program. On the latter there was little to no evidence, but at the same time the implications of the reactor were clear. Here's how administration officials put it in the non-for-attribution briefing Jeffrey linked to in his post:

“SENIOR INTELLIGENCE OFFICIAL 2: No, you need to understand. I'm sorry to dwell on the point. This is very, very important.

“SENIOR INTELLIGENCE OFFICIAL 1: This is very important.

“SENIOR INTELLIGENCE OFFICIAL 2: We told our President four things: This is a reactor; the North Koreans and the Syrians are cooperating on nuclear activities; the North Koreans and Syrians are cooperating on the construction of this reactor; and this reactor – its purpose – is to create fuel for a nuclear weapons program. Those are the things we concluded.

“Now, when you look at the body of evidence of those four sentences and begin to sort out how much of that is based on an overwhelming body of evidence as opposed to a more limited body of evidence and therefore more reliant on assessment, the fact that it was a nuclear reactor – absolutely high confidence; the fact of Syrian-Korean nuclear cooperation spanning a decade at an intense level, high confidence. At the time of the strike, fact of North Korean-Syrian cooperation in the building of that reactor, medium confidence that then got higher because of events, some of which we have alluded to in the briefing, okay. The fact that that material was going to be used for a weapons program – we believe that to be true, but because we did not have, as [Senior Intelligence Official 1] points out, additional clinical evidence of other activities, we could only give it a low confidence level. But you need to – and I think you understand what I'm trying to say. That's not more or less sure; it's just that it's a way of communicating that for which you have a large body of evidence and that for which you may not.”

Also, there is this tibit from the same briefing discussing the decision of what to do about the reactor:

“SENIOR ADMINISTRATION OFFICIAL: We obviously were looking very closely at options, and we had looked at some approaches that involved a mix of diplomacy and the threat of military force with the goal of trying to ensure that the reactor was either dismantled or permanently disabled, and therefore never became operational.

“We looked at those options. There were, as I mentioned to you, conversations with the Israelis. Israel felt that this reactor posed such an existential threat that a different approach was required. And as a sovereign country, Israel had to make its own evaluation of the threat and the immediacy of the threat, and what actions it should take. And it did so.”

---

Jeffrey | September 14, 2011

Yes, my notes suggest that Trey was Hadley. What I cannot remember is who told me that. I think it was a reporter at the briefing.

---

Anon | September 14, 2011

Thank you Dan!

You will see my quote from UNSCR487 above told Israel not to repeat the Osirak-type attack AND told Israel to place its facilities under IAEA safeguards.

From a lawyerly perspective, do you think it is appropriate that Iran has Ch. 7 sanctions when there has been no breach of the peace but Israel does not when it has done so at least twice (over nuclear matters that we know of, not including assassinations and cyberattacks)?

Do cyberattacks count as a breach of the peace or a threat to the peace?

If Israel attacks Iran physically, do you think there will be a strong case for Ch 7 sanctions on Israel?

UN Security Council resolution 487:

2. \*\*\*\*\*Calls upon Israel to refrain in the future from any such acts or threats thereof;\*\*\*\*\*
  3. Further considers that the said attack constitutes a serious threat to the entire IAEA safeguards regime which is the foundation of the non-proliferation Treaty;  
...
  5. \*\*\*\*\*Calls upon Israel urgently to place its nuclear facilities under IAEA safeguards; \*\*\*\*\*
- 

Dan Joyner | September 14, 2011

The UNSC is at its essence a political body. It was structured to be that way. The fact that Iran has been sanctioned by the UNSC and Israel has not is, in my opinion, completely a product of the identity of the permanent members of the UNSC, all of whom have veto power over any Council decision. But only one such member really matters on this question – the US. The US has consistently vetoed any UNSC resolution that would condemn or even speak negatively about Israeli actions, with very few exceptions. Its all there in the UNSC record.

---

Anon | September 14, 2011

>Why do North Korean graphite moderated, gas cooled, magnox, plutonium production reactors require stacks to vent gases and North Korean built graphite moderated, gas cooled, magnox, plutonium, production reactors in Syria not?

Mark,

Interesting observation. The stack seen on Calder Hall-type Magnox reactors are to exhaust cooling air from between the steel reactor pressure vessel and the concrete shielding.

This isn't present on later Magnox designs which use an all concrete pressure vessel. The earlier design has the interesting feature that they neutron activate things in this cooling air and thus emit copious amounts of Ar-41.

It's enough that when these things were operating in the UK, the operators environmental monitoring teams had to make a plan based on wind direction, as you really can't do useful work in the "argon plume".

As an update, I'd think it was pretty simple to engineer, especially if the original operating pressure (~7 bar) is kept.

---

Andy | September 14, 2011

Ok, here's my take on your questions:

The eye-rolling. Obviously we can't read the man's mind, so anything is just a guess. My guess is that Bush (and everyone else) already knew the VP was going to advocate bombing and already knew that the VP would be alone in his advocacy. I also suspect the VP also knew he'd be alone and so his advocacy was simply to register his dissent to something that had already been decided. "Yes, yes, Dick, we already know you want to bomb Syria and you already know it ain't gonna happen."

Secondly, I don't share your assumptions about what Presidents will do in the face of an al Kibar or Arak. In this case, I think the President and his advisers knew that Israel had both the capability and will to take the reactor out. Israel, perhaps predictably, came knocking hoping to get the US to do its dirty work. The President thankfully declined and uncertainty in the intelligence became the excuse.

Additionally, let's consider what else was going on in the spring/summer of 2007. US policy was completely focused on the "Surge" in Iraq and the President had just taken a big risk by doubling-down there. It doesn't make sense for him to increase that risk by bombing Syria, especially considering there was a completely viable (and completely superior, in my view) option of diplomacy backed by the threat of force. Not only that, but Syria certainly had the capability to cause more trouble in Iraq and bombing al Kibar could well have caused Syria to take the gloves off and more actively oppose the US there.

So what are the upsides to the US taking action and bombing the reactor? I don't really see any.

On the Arak reactor, absent something else going on, I don't think a President will bomb it as long as it remains under safeguards.

---

Malenki Sasha | September 14, 2011

I think we are missing the bigger picture here.

There is no way that the US would be able to get away with bombing Syria and it is absolutely shocking that Cheney ever said it was on the table.

Keep in mind up until the recent uprising, Syria was an extremely useful ally in the War on Terror and the Iraq war, and never mind that this was coming at the heels of the surge. The last thing the US needs is the very active participation of the Syrian government in supporting Iraq insurgents during one of the most critical times of the war.

---

Malenki Sasha | September 14, 2011

This is an instance of a preventive strike. Preemptive attacks are far easier to identify and legally support as where preventive strikes are murky at best.

This was an instance of a preventive strike which lacks the legal framework in which to effectively argue. The problem with nuclear weapons is that unlike conventional war, there is far too little time between identifying an imminent attack and annihilation. With a conventional armies intelligence can intercept plans, movements can be observed well in advance as where a leader's decision and the actual launch of a nuclear weapon can be done within moments of each other. Even if intelligence were to discover the leaders decision it will most likely be too late to react.

This is the dilemma that international legal framework is unprepared to deal with. By constructing a clandestine nuclear weapons program it is easy for a state to exploit this dilemma. They can simply claim it is for peaceful purposes while obscuring facilities and operations. Keeping stuff secret usually doesn't result in being bombed. Although it does happen every now and then.

What is particularly unnerving about al Kibar is that Syria denied being bombed along with the scramble to bury evidence of the facility. While signs of guilt don't warrant 100% certainty it is obvious they were up to something and that nipping their program in its infancy was the best course of action.

---

Dan Joyner | September 14, 2011

No you are quite right that calls upon language in one resolution has equal legal weight (i.e. pretty much none) to calls upon language in another resolution.

---

Mark Gubrud | September 17, 2011

I've previously speculated here that the reason the US didn't bomb the Syrian reactor is that the US had long known about it and the project had been halted, along with the Iranian nuclear weapon program, possibly in response to a direct American threat. North Korea, hoping for a deal with the US and sensing that the game was over in any case, may have sold out its customer. Or some North Korean may have sold out for asylum and cash.

This is a pure guess on my part, but I still don't see any solid facts that don't fit in this picture. It would explain the absence of a reprocessing plant and the IC's peculiar "confidence," as you put it, in "no core, no war."

I think what happened in 2007 is that although the Syrians had put the program on ice, they hadn't dismantled the building, and the Israelis sent a bunch of stuff Bush's way in another effort to gin up a case for endless war and to take the heat off themselves on Palestine. The CIA was not impressed, and prevailed as per Bush's account, although he's leaving out the part that this was nothing new. But it was okay if the Israelis went ahead and bombed the site, mainly for their own political purposes, and to send a message to Syria and Iran on behalf of both Israel and the US.

I'm puzzled by your statement that you assume "that no President would allow the Iranian reactor at Arak to come online." The Iranians have made a considerable investment in the heavy water production plant and in the reactor. I was not aware that they were doing anything on that project other than moving forward with it. Assuming Obama is still president when they are ready to activate the reactor, what do you think he will do?

---

Jeffrey | September 18, 2011

I would have expected an air strike. I am still surprised that Bush did not authorize one against Al Kibar.

kme | September 21, 2011

Is a (presumably safeguarded) HWR any more concerning than safeguarded uranium enrichment cascades? (As I understand it, your position is that in the latter case the real worry is hidden non-safeguarded sites – doesn't the same apply in the former case too, with the added factor that it's difficult to hide a sizeable reactor?)

Anon | September 12, 2011

What is important to note is that the US properly kept out of this and did not (evidently) see any proof of a connection to a weapons program even if it was a reactor, whatever snake-oil the Israelis may have been pedaling.

What is also important to note is that Israel was not sanctioned by the UNSC for a clear “threat to the peace, breach of the peace or an act of aggression” even though its actions probably much more clearly satisfied these conditions as compared to other middle eastern countries who have nuclear programs, and whose low-level weaponization research (such as it ever probably was) was wrapped up in 2003 according to our own DNI.

It ought not be UNSC policy to only sanction NPT members.

Does Israel have a right to pre-emptively bomb whomever it feels like without so much as a slap on the hand from international bodies? Debatable.

But a couple of things are crystal clear: there may be, well, asymmetrical blowback when this happens; and, the attack on Iraq (Osirak) actually kicked off Iraq's weaponization work, in earnest; and, the perception of even-handedness and lack of double-standards by international bodies is important else others will properly thumb their nose at said bodies. Note I speak not only of the IAEA but of the UNSC itself.

---

Dan Joyner | September 13, 2011

A couple of comments here have raised questions about the legal issues related to the Israeli strike. I wrote a short piece for the American Society of International Law on this precise question in 2008. Here is an excerpt from the piece:

“Whether the activity at the Syrian site was weapons related or civilian in character, Israel's action in attacking and destroying the site was almost certainly a breach of international law. Article 2(4) of the United Nations Charter, of which Israel is a member, prohibits uses of force “against the territorial integrity” of any other state. States retain the inherent right of self-defense as defined in Article 51 of the Charter. Article 51 allows unilateral acts of force in self-defense on a temporary basis “if an armed attack occurs” against a member of the United Nations. As Syria had not yet attacked Israel, any justification for Israel's use of force pursuant to Article 51 must be found, if at all, by resort to the principle of anticipatory self-defense.

Anticipatory self-defense was part of pre-Charter customary law, and many argue that states are still entitled to rely upon the principle. However, even if this contention is correct, anticipatory self-defense must be understood to be limited in its applicability to situations of imminent threat. As observed by U.S. Secretary of State Daniel Webster during the 1841 Caroline controversy, in order for the principle of anticipatory self-defense to apply,

there must be a “necessity of self-defense, instant, overwhelming, leaving no choice of means, and no moment for deliberation.” Even if such a situation of imminence arises, a use of force in anticipatory self defense may only be carried out in accordance with the customary international law principles of necessity and proportionality.

There are no facts alleged against Syria which would meet the required test of imminence under the principle of anticipatory self-defense. Again, there are no allegations or evidence that the site served a weapons development purpose. The sort of imminence of threat demanded by the doctrine of anticipatory self-defense is clearly not presented by the simple fact of the construction and maintenance of a nuclear reactor in Syria. Neither Syria’s breach of its IAEA safeguards agreement, nor its breach of U.N. Security Council Resolution 1718, have any bearing on this analysis. Israel’s attack on Syrian territory thus constitutes a breach of Article 2(4) of the United Nations Charter.

The September 2007 action by Israel is reminiscent of its 1981 attack on an Iraqi nuclear reactor under construction at Osirak. On that occasion as well, the reactor was destroyed. However, in the aftermath of the attack, the U.N. Security Council unanimously passed Resolution 487, which denounced the incident as a “clear violation of the Charter of the United Nations.”[17]

Though a subject of ongoing debate, it is doubtful that the substance of international use of force law regarding anticipatory self-defense has changed in any material respect since 1981. However, the Israeli attack upon Syria will no doubt stimulate renewed discussion on this point.”

---

Scott Monje | September 13, 2011

“However, the Israeli attack upon Syria will no doubt stimulate renewed discussion on this point.”

And did it?  
Reply

Dan Joyner | September 14, 2011

There has certainly been no end Of discussion about it in legal literature since then. I wrote extensively on the topic of counterproliferation uses of force in my 2009 book. One problem is that there are so few data points in this area – I.e. Relatively few instances of counterpro use of force like in Syria – that it’s difficult to say convincingly that new patterns of state practice are emerging to effectively change the classical rules. I think the best assessment is that the basic rules have not changed.

---

Anon | September 14, 2011

Dan, thanks for your very useful input. Do you think UNSCR 487’s statement:

\*\*\*\*\*Calls upon Israel to refrain in the future from any such acts or threats thereof;\*\*\*\*\*

carries any real weight?

---

Dan Joyner | September 14, 2011

“Calls upon” language in UNSCR’s is nonbinding. However, the importance of UNSCR 487 was to show the UNSC’s judgment that the attack on Osirak was unlawful.

---

Anon | September 14, 2011

Dan, thank you again — that is what I thought.

But now I have another related question: since Israel ignored UNSCR487 and bombed Syria AFTER Osirak, and because the UNSC resolution calling for sanctions on Iran also contain the same phrase “calls upon” Iran repeatedly — is it also OK for Iran to thumb its nose at the UNSC, just as Israel has done; or, in your view, does this constitute double-standards?

TEXT of UNSC sanction resolution on Iran:

<http://www.bicc.org.uk/downloads/UN%20Resolution%201929.pdf>

e.g.

“..calls upon Iran to confirm, as requested by the IAEA, that it has not taken a decision to construct, or authorize construction of, any other nuclear facility which has as yet not been declared to the IAEA,”

“calls upon Iran to act strictly in accordance with the provisions of the Additional Protocol to its IAEA Safeguards Agreement that it signed on 18 December 2003, calls upon Iran to ratify promptly the Additional Protocol”

“calls upon all States to exercise vigilance over those transactions involving the IRGC that could contribute to Iran’s proliferation-sensitive nuclear activities or the development of nuclear weapon delivery systems;”

“Calls upon all States to inspect, in accordance with their national authorities and legislation and consistent with international law, in particular the law of the sea and relevant international civil aviation agreements, all cargo to and from Iran, in their territory, including seaports and airports, if the State concerned has information that provides reasonable grounds to believe the cargo contains items the supply, sale, transfer, or export of which is prohibited by paragraphs 3, 4 or 7 of resolution 1737 (2006), paragraph 5 of resolution 1747 (2007), paragraph 8 of resolution 1803 (2008) or paragraphs 8 or 9 of this resolution, for the purpose of ensuring strict implementation of those provisions;”

“Calls upon all States, in addition to implementing their obligations pursuant to resolutions 1737 (2006), 1747 (2007), 1803 (2008) and this resolution, to prevent the provision of financial services, including insurance or reinsurance, or the transfer to, through, or from their territory, or to or by their nationals or entities organized under their laws (including branches abroad), or persons or financial institutions in their territory, of any financial or other assets or resources if they have information that provides reasonable grounds to believe that such services, assets or resources could contribute to Iran’s proliferation-sensitive nuclear activities, or the development of nuclear weapon delivery systems, including by freezing any financial or other assets or resources on their territories or that hereafter come within their territories, or that are subject to their jurisdiction or that hereafter become subject to their jurisdiction, that are related to such programmes or activities and applying enhanced monitoring to prevent all such transactions in accordance with their national authorities and legislation;”

ETC. Etc.

Is it OK for Iran and all other nations to thumb their collective noses at the litany of UNSC “calls upon” just like Israel did in bombing Syria?

---

Dan Joyner | September 14, 2011

The difference from a legal perspective is that in Resolutions 1737 and 1929, the UNSC has acted under Chapter VII and “Decided” that Iran shall cease uranium enrichment, etc. “Decides” is the word the UNSC uses to make a binding decision, which all members have agreed to comply with in UN Charter Article 25. So Iran is in violation of UNSC decisions, which under Article 25 are legally binding.

---

Anon | September 14, 2011

Yes, thank you — OK I see.

But as the quote from the UNSC resolution above shows there are some “decided” ‘s and plenty of “calls upon”.

I am perhaps wrong but it seems that the “calls upon” parts in the sanctions’ resolutions are as optional as Israel not stopping bombing nations when being “called upon” to do so. Also Israel was called upon to place its nuclear program under IAEA safeguards.

Please feel free to correct me if I am wrong — I’m no lawyer after all.

## Al-Kibar

Last Modified: Aug. 14, 2012

Other Name: Dair Alzour

Location: Dayr Az Zawr region, 140 km from Iraqi border, 10 km north of At Tibnah

Subordinate To: n/a

Size: 20-25MWt

Facility Status: Alleged reactor destroyed

On 6 September 2007, Israeli warplanes destroyed a building near the Euphrates River in northeastern Syria. The structure is alleged to have been a gas-cooled graphite-moderated nuclear reactor under construction, capable of producing enough plutonium for one or two weapons per year.[1] Syria has consistently denied these allegations. In the days and weeks after the raid, Israel maintained official silence; Syria quietly protested the violation of its airspace, but also largely refrained from comment.[2] An explanation for the September operation took shape chiefly through leaks from officials inside the U.S. and Israeli governments. In broad strokes, the narrative was that North Korea had helped Syria construct a reactor modeled on its 25MWt research reactor at Yongbyon. Israel, convinced the Syrian reactor was intended for plutonium production, consulted the United States and then attacked the facility before it could be completed.[3] The Institute for Science and International Security (ISIS) publicized satellite photographs of the site in October and offered cautious support for the idea that Al-Kibar had been a reactor.[4] Other nonproliferation experts, including Joseph Cirincione and IAEA Director General Mohamed El-Baradei, were skeptical.[5] ISIS released further photographs showing that Syria had razed the ruined facility shortly after the bombing and erected a new building in its place.[6]

More information was revealed in 2008. U.S. intelligence officials provided a background briefing to Congress on the suspected nuclear facility in April, presenting ground-level photographs reportedly taken at Al-Kibar before its destruction.[7] The photographs show apparent reactor components and the construction of additional outer walls to conceal the shape of a building which resembled North Korea's Magnox design reactor at Yongbyon. [8] U.S. officials expressed high confidence in their assessment that the facility had been a nuclear reactor under construction. They also alleged that Syria and North Korea had cooperated for more than a decade in the nuclear field, and had medium confidence that North Korea was involved in the construction of the facility at Al-Kibar.[9] Finally, the U.S. officials assessed that the purpose of the reactor was to create fuel for a nuclear weapons program; this judgment was made with less confidence because although they found the reactor to be unsuitable for research or power generation, the officials did not have any evidence of a reprocessing facility to separate plutonium from the spent fuel.[10]

Syria disputed the allegations, pointing to U.S. claims about Iraqi weapons prior to the 2003 invasion of Iraq.[11] But Syria relented to an IAEA request to visit the Al-Kibar site, allowing one inspection on 23 June 2008.[12] By the time IAEA inspectors arrived, the Syrians had bulldozed much of an adjacent hill over the reactor remains and constructed a new building on top.[13] Despite these concealment efforts, the IAEA released a report in November revealing that a significant number of chemically processed natural uranium particles had been found during the inspection, warranting continued investigation. [14] Agency requests to visit related sites were denied.

In February 2009, the IAEA issued a follow-up report on Al-Kibar, requesting more cooperation from Syria and revealing that additional examination of environmental samples had yielded further traces of uranium. According to the report, characteristics of the uranium particles found at the site made it unlikely the uranium came from Israeli munitions, as Syria had previously suggested.[15] Syria reiterated its claim that the destroyed structure had a conventional military function and therefore was not subject to its safeguards agreement, to which the IAEA responded that the safeguards agreement "places no limitation on Agency access to information,

activities or locations simply because they may be military related." [16] Syria also informed the agency that reported procurement efforts of graphite, barium sulphate, as well as water pumping equipment observed at the Al-Kibar site were civilian and non-nuclear in nature.[17]

Throughout 2010 the IAEA repeatedly requested that Syria provide further documentation about the infrastructure and construction of the destroyed building, and that the country grant access to the Al-Kibar site, the storage location of any debris from the site, and three other locations "allegedly functionally related" to Al-Kibar. [18] According to the Institute for Science and International Security, these three locations were at Masyaf, Marj as-Sultan, and Iskandariyah. [19] However, Syrian officials have not provided any further information, and have not responded to any of the IAEA's letters since August 2009. [20] On 24 May 2011, the IAEA concluded that "the destroyed building was very likely a nuclear reactor" and therefore should have been declared to the Agency.[21] This assessment was based on the dimensions of the building seen in ground photographs and satellite imagery, the layout of the site and its water pumping facilities, the presence of nuclear materials found in environmental samples, and the inconsistencies with Syria's stated function of the site.[22] Despite referring Syria to the United Nations Security Council, the IAEA has not made any further progress in clarifying the nature of the facility, and the passage of time and Syria's cover-up activities at the site make it increasingly difficult to do so.[23]

IAEA Board of Governors Meeting  
March 4-8, 2013

Agenda Item 5(e)

**Implementation of the NPT Safeguards Agreement in the Syrian Arab Republic**  
**U.S. Statement**  
**Ambassador Joseph Macmanus**  
**Permanent U.S. Representative to the IAEA**

Mr. Chairman,

We thank the Director General for his remarks underscoring the serious and unresolved issue of Syria's safeguards noncompliance. The United States deeply regrets that the Asad regime continues in its refusal to engage the Agency substantively, or to provide any of the cooperation necessary to remedy Syria's noncompliance. Instead, the regime continues to focus on a brutal repression of the Syrian people. As we have said previously, we categorically reject any suggestion that the instability caused by the regime's own violent and reprehensible actions could somehow serve as justification for its failure to meet Syria's NPT and IAEA safeguards obligations.

It has been nearly two years since the Board of Governors found Syria in noncompliance with its Safeguards Agreement for the clandestine construction of a nuclear reactor at Dair Alzour. In June 2011, the Board called on Syria urgently to remedy its noncompliance and to bring into force an Additional Protocol. The Board also requested that the Director General report the matter to the UN Security Council. Since that time, the Asad regime has shown no interest whatsoever in addressing Syria's noncompliance. It has instead fully disregarded Syria's international obligations, and has displayed nothing but contempt for this Board.

It remains essential that Syria cooperate with the Agency to remedy its noncompliance. That cooperation must include access to all relevant locations, materials, and persons, including the three sites suspected of having a functional relationship to Dair Alzour. Until the Agency is able to resolve all outstanding questions about the exclusively peaceful nature of Syria's nuclear program, Syria's noncompliance will remain a matter of serious concern to the international community.

The Board must remain seized of the matter, and should be prepared to consider further action if necessary. We will continue to look forward to further reporting from the Director General on this issue.

Thank you, Mr. Chairman.

UNITED STATES MISSION TO THE  
**INTERNATIONAL ORGANIZATIONS  
IN VIENNA**

IAEA Board of Governors Meeting  
September 9-13, 2013

Agenda Item 6(e):

**Implementation of the NPT safeguards agreement in the Syrian Arab Republic**  
**U.S. statement as delivered by Ambassador Macmanus**  
**U.S. Permanent Representative to the International Atomic Energy Agency**

We thank the Director General for his latest report concerning the serious and long-standing issue of Syria's safeguards noncompliance. The United States regrets deeply that this issue remains unresolved, and that as the Director General reports, the Asad regime has not engaged substantively with the Agency on the nature of the Dair Alzour site, or the three other locations cited in the Director General's reports, since 2008. Such cooperation remains essential to remedying Syria's noncompliance. Instead, the regime has intensified its brutal suppression of the Syrian people, resorting to indiscriminate and unconscionable tactics, including the use of chemical weapons. As we have made clear, the regime's own violent and reprehensible actions, and the instability it has wrought, are no justification for its failure to meet Syria's NPT and IAEA safeguards obligations.

Over two years ago, the Board of Governors found Syria in noncompliance with its Safeguards Agreement for the clandestine construction of an undeclared nuclear reactor at Dair Alzour. At that time, the Board called on Syria to urgently remedy its noncompliance, and to bring into force an Additional Protocol. Shortly thereafter, and at the Board's request, the Director General reported the matter to the UN Security Council. In over two years since that time, the Asad regime has demonstrated no serious intent whatsoever of addressing Syria's noncompliance. It has instead ignored Syria's international obligations, and has disregarded the decisions of this Board.

It remains essential that Syria fully cooperate with the Agency to remedy its noncompliance. That cooperation must include access to all relevant locations, materials, and persons, including the three sites suspected of having a functional relationship to the reactor at Dair Alzour. Until the Agency is able to resolve all outstanding questions about the exclusively peaceful nature of Syria's nuclear program, Syria's noncompliance will remain a matter of serious concern.

The Board must remain seized of this matter, and should be prepared to consider further action if necessary. We again thank the Director General for his continued efforts to resolve Syria's safeguards noncompliance, and look forward to further reporting from the Director General on this issue.

Thank you, Mr. Chairman.

## U.S. also demands Syrian transparency on nuclear research

By Joby Warrick,

Published: September 12 [2013]

The Obama administration urged Syria on Thursday to come clean about its past nuclear research as well as its chemical arsenal, accusing President Bashar al-Assad of blocking access to facilities linked to a Syrian nuclear reactor destroyed by Israel in 2007.

The top U.S. diplomat to the International Atomic Energy Agency (IAEA) said Syria's two-year-old civil war was no excuse for its failure to answer questions about its alleged nuclear program, which Western intelligence officials believe was on a path toward making nuclear weapons.

"It remains essential that Syria fully cooperate," Ambassador Joseph Macmanus told a meeting of the U.N. watchdog agency's 35-nation governing board in Vienna.

Macmanus specifically pressed for access to three sites inside Syria that he said were suspected of having a "functional relationship" to the Deir al-Zour reactor destroyed by Israeli warplanes six years ago. One of the sites has been described by U.S. officials as a pilot plant for making the reactor's uranium fuel.

The three facilities have long been a focal point of an IAEA investigation into the size and scope of Syria's nuclear program, which is believed to have been halted by the 2007 Israeli air raid dubbed Operation Orchard. The presumed cornerstone of the program was the plutonium reactor built with North Korean help on the banks of the Euphrates River in Syria's eastern desert.

A report [[http://isis-online.org/uploads/isis-reports/documents/Marj\\_as\\_Sultan\\_12sept2013.pdf](http://isis-online.org/uploads/isis-reports/documents/Marj_as_Sultan_12sept2013.pdf)] Thursday by independent nuclear researchers said ancillary facilities built to support the Syrian reactor could still contain uranium and other material of potential value to terrorist groups or black-market profiteers. The Deir al-Zour reactor was still under construction at the time of the 2007 attack, and it is unclear what became of the hundreds of uranium fuel rods that would have been required to operate the facility.

"The uranium could be anywhere within government controlled areas today, if it even remains in Syria," warned the report by the Institute for Science and International Security, a Washington-based nonprofit group. "Determining its fate must be a priority."

The report acknowledged that any uranium fuel remaining in Syria is not weapons-grade and could not be used in nuclear bombs without further processing. While Syria's thousands of chemical weapons remain a higher priority, its nuclear assets "deserve significant attention," the study said.

The ISIS report included satellite photographs of one of the suspected ancillary sites, a large compound in Marj as-Sultan, east of Damascus. The facility was first identified two years ago in a German newspaper, Süddeutsche Zeitung, which also obtained what was purported to be photographs of equipment inside the facility as well as a large stack of metallic rods that resembled uranium fuel.

A technical expert who reviewed the images for ISIS said they appear to depict reaction vessels, manifolds and other machines commonly used in processing uranium fuel. ISIS acknowledged that it could not independently verify where, when and by whom the photographs were taken.

The collapse of government control over parts of Syria has brought new urgency to long-standing questions about the security of Syria's remaining nuclear assets. In February, Islamist rebel militias swept through the town of Deir al-Zour and posted videos of gun-toting fighters clambering over the site where the reactor had stood. The Marj as-Sultan region also has seen fighting between rebels and government forces in recent weeks.

"If the United Nations Security Council places Syria's stocks of chemical weapons under international control, it should also address Syria's undeclared nuclear assets," the ISIS study said. "The goal should be to verifiably determine that the undeclared program and its assets are fully understood, rendered harmless, and dismantled."

## **Five nuclear engineers, one of them Iranian, killed in Syria: monitor**

By Rasha Ellass and Fredrik Dahl

BEIRUT/VIENNA Mon **Nov 10, 2014** 9:49am EST

(Reuters) - Gunmen killed five nuclear engineers, four of them Syrian and one Iranian, on the outskirts of Damascus on Sunday, a monitoring group said on Monday.

No one claimed responsibility and Syrian and Iranian state media did not mention the attack, which occurred in an area controlled by forces loyal to President Bashar al-Assad.

It was not clear in what capacity the Iranian nuclear engineer was in Syria, if his presence were to be confirmed.

The Syrian Observatory for Human Rights said the engineers were shot dead while traveling in a small convoy to a research center near the northeastern district of Barzeh.

Iran has supported Assad throughout Syria's three-year civil war and Iranian military advisers are working with Syrian forces throughout the country, which is partly under insurgent control.

Both Iran and Syria are under investigation by the U.N. nuclear watchdog, the IAEA. Both countries have repeatedly denied ever having any nuclear weapons ambitions.

The IAEA said last year that Syria declared a "small amount of nuclear material" at a Miniature Neutron Source Reactor (MNSR), a type of research reactor usually fueled by highly enriched uranium, near Damascus.

Former IAEA chief inspector Olli Heinonen said there are two nuclear centers on the outskirts of Damascus and that the MNSR is one of them. Heinonen, now at Harvard University's Belfer Center, said that the centers do not appear to have had extensive nuclear fuel cycle activities.

The IAEA used to visit the MNSR about once a year to check nuclear material there but canceled such inspections last year due to the violence in the country. The MNSR is believed to hold less than a kilogram of highly-enriched uranium, well below the roughly 25 kg which experts say would be needed for any bomb.

IAEA inspectors in mid-2008 examined a site in the eastern province Deir al-Zor that U.S. intelligence reports say was a nascent, North Korean-designed reactor geared to making plutonium for nuclear bombs. Israel bombed it in 2007.

But Syrian authorities later repeatedly rebuffed IAEA requests to revisit the site to gather evidence, saying it had been a conventional military base only. The Deir al-Zor region is now largely under the control of Islamist insurgents.

Iran, the United States and European Union began a second day of talks in Oman on Monday to discuss ways to resolve a confrontation over Tehran's nuclear program.

## **It's the Proliferation, Stupid**

By John Hannah

April 25, 2016 - 1:05 pm

[EXCERPT]

I well remember the day in spring 2007 when I got an urgent call from Vice President Cheney to drop everything and get over to his White House office. The head of Israel's Mossad, the late Meir Dagan, had just been in to brief Cheney and President Bush. What he revealed was chilling: compelling evidence that in the Syrian desert east of Damascus, near the town of Al-Kibar, North Korea was covertly building a plutonium-producing nuclear reactor. It was more or less a replica of the North's own reactor at Yongbyon, which formed the centerpiece of its weapons program.

Making matters worse, Al-Kibar was perilously close to completion. Options for getting rid of it would narrow considerably once operations began and the reactor went "hot." At that point, any effort to destroy it through military strike or covert action would run a high risk of dispersing deadly radioactive materials that could poison thousands of innocent civilians.

For its part, the U.S. intelligence community had totally missed Al-Kibar. It was completely taken aback by Dagan's stunning revelations. Indeed, since the early days of the Bush administration, senior officials like Cheney and Undersecretary of State John Bolton had repeatedly queried the CIA about indications that Syria was pursuing nuclear weapons, including via cooperation with North Korea. After all, ample evidence existed that Pyongyang had for years assisted Syria's ballistic missile efforts. Government officials with connections to the North's WMD programs were regular visitors to Damascus. Yet until the day in 2007 that Dagan showed up at the White House, the CIA's answer never changed: The evidence was insufficient to suggest that the Assad regime might be seeking nukes. In fact, when Bolton raised his suspicions publicly in a 2003 congressional hearing, the intelligence community went berserk, launching a furious campaign of leaks to undermine Bolton's credibility.

The fact is that the United States dodged a bullet in Syria — and, it's worth stressing, all courtesy of the Israelis. Not only did they discover Al-Kibar in the nick of time. They also carried out the attack that was almost certainly the only means of ensuring the reactor never went hot.

*John Hannah is a senior fellow at the Foundation for Defense of Democracies, focusing on U.S. strategy. During the presidency of George W. Bush, he served for eight years on the staff of Vice President Cheney, including as the vice president's national security advisor.*

## Israel's Ploy Selling a Syrian Nuke Strike

November 18, 2017

By Gareth Porter

In September 2007, Israeli warplanes bombed a building in eastern Syria that the Israelis claimed held a covert nuclear reactor that had been built with North Korean assistance. Seven months later, the CIA released an extraordinary 11-minute video and mounted press and Congressional briefings that supported that claim.

But nothing about that alleged reactor in the Syrian desert turns out to be what it appeared at the time. The evidence now available shows that there was no such nuclear reactor, and that the Israelis had misled George W. Bush's administration into believing that it was in order to draw the United States into bombing missile storage sites in Syria. Other evidence now suggests, moreover, that the Syrian government had led the Israelis to believe wrongly that it was a key storage site for Hezbollah missiles and rockets.

The International Atomic Agency's top specialist on North Korean reactors, Egyptian national Yousry Abushady, warned top IAEA officials in 2008 that the published CIA claims about the alleged reactor in the Syrian desert could not possibly have been true. In a series of interviews in Vienna and by phone and e-mail exchanges over several months Abushady detailed the technical evidence that led him to issue that warning and to be even more confident about that judgment later on. And a retired nuclear engineer and research scientist with many years of experience at Oak Ridge National Laboratory has confirmed a crucial element of that technical evidence.

Published revelations by senior Bush administration officials show, moreover, that principal U.S. figures in the story all had their own political motives for supporting the Israeli claim of a Syrian reactor being built with North Korean help.

Vice President Dick Cheney hoped to use the alleged reactor to get President George W. Bush to initiate U.S. airstrikes in Syria in the hope of shaking the Syrian-Iranian alliance. And both Cheney and then CIA Director Michael Hayden also hoped to use the story of a North Korean-built nuclear reactor in Syria to kill a deal that Secretary of State Condoleezza Rice was negotiating with North Korea on its nuclear weapons program in 2007-08.

### Mossad Chief's Dramatic Evidence

In April 2007 the chief of Israel's Mossad foreign intelligence agency, Meir Dagan, presented Cheney, Hayden and National Security Adviser Steven Hadley with evidence of what he said was a nuclear reactor being constructed in eastern Syria with the help of the North Koreans. Dagan showed them nearly a hundred hand-held photographs of the site revealing what he described as the preparation for the installation of a North Korean reactor and claimed that it was only a few months from being operational.

The Israelis made no secret of their desire to have a U.S. airstrike destroy the alleged nuclear facility. Prime Minister Ehud Olmert called President Bush immediately after that briefing and said, "George, I'm asking you to bomb the compound," according to the account in Bush's memoirs.

Cheney, who was known to be a personal friend of Olmert, wanted to go further. At White House meetings in subsequent weeks, Cheney argued forcefully for a U.S. attack not only on the purported reactor building but on Hezbollah weapons storage depots in Syria. Then-Secretary of Defense Robert Gates, who participated in those meetings, recalled in his own memoirs that Cheney, who was also looking for an opportunity to provoke a war with Iran, hoped to “rattle Assad sufficiently so as to end his close relationship with Iran” and “send a powerful warning to the Iranians to abandon their nuclear ambitions.”

CIA Director Hayden aligned the agency clearly with Cheney on the issue, not because of Syria or Iran but because of North Korea. In his book, *Playing to the Edge*, published last year, Hayden recalls that, at a White House meeting to brief President Bush the day after Dagan’s visit, he whispered in Cheney’s ear, “You were right, Mr. Vice-President.”

Hayden was referring to the fierce political struggle within the Bush administration over North Korea policy that had been underway ever since Condoleezza Rice had become Secretary of State in early 2005. Rice had argued that diplomacy was the only realistic way to get Pyongyang to retreat from its nuclear weapons program. But Cheney and his administration allies John Bolton and Robert Joseph (who succeeded Bolton as the key State Department policymaker on North Korea after Bolton became U.N. Ambassador in 2005) were determined to end the diplomatic engagement with Pyongyang.

Cheney was still maneuvering to find a way to prevent the successful completion of the negotiations, and he saw the story of a Syrian nuclear reactor built secretly in the desert with help from the North Koreans as bolstering his case. Cheney reveals in his own memoirs that in January 2008, he sought to sandbag Rice’s North Korea nuclear deal by getting her to agree that a failure by North Korea to “admit they’ve proliferating to the Syrians would be a deal killer.”

Three months later, the CIA released its unprecedented 11-minute video supporting the entire Israeli case for a North-Korean-style nuclear reactor that was nearly completed. Hayden recalls that his decision to release the video on the alleged Syrian nuclear reactor in April 2008 was “to avoid a North Korean nuclear deal being sold to a Congress and a public ignorant of this very pertinent and very recent episode.”

The video, complete with computer reconstructions of the building and photographs from the Israelis made a big splash in the news media. But one specialist on nuclear reactors who examined the video closely found abundant reason to conclude that the CIA’s case was not based on real evidence.

#### Technical Evidence against a Reactor

Egyptian national Yousry Abushady was a PhD in nuclear engineering and 23-year veteran of the IAEA who had been promoted to section head for Western Europe in the operations division of agency’s Safeguards Department, meaning that he was in charge of all inspections of nuclear facilities in the region. He had been a trusted adviser to Bruno Pellaud, IAEA Deputy Director General for Safeguards from 1993 to 1999, who told this writer in an interview that he had “relied on Abushady frequently.”

Abushady recalled in an interview that, after spending many hours reviewing the video released by the CIA in April 2008 frame by frame, he was certain that the CIA case for a nuclear reactor at al-Kibar in the desert in eastern Syria was not plausible for multiple technical reasons. The Israelis and the CIA had claimed the alleged reactor was modeled on the type of reactor the North Koreans had installed at Yongbyon called a gas-cooled graphite-moderated (GCGM) reactor.

But Abushady knew that kind of reactor better than anyone else at the IAEA. He had designed a GCGM reactor for his doctoral student in nuclear engineering, had begun evaluating the Yongbyon reactor in 1993, and from 1999 to 2003 had headed the Safeguards Department unit responsible for North Korea.

Abushady had traveled to North Korea 15 times and conducted extensive technical discussions with the North Korean nuclear engineers who had designed and operated the Yongbyon reactor. And the evidence he saw in the video convinced him that no such reactor could have been under construction at al-Kibar.

On April 26, 2008, Abushady sent a “preliminary technical assessment” of the video to IAEA Deputy Director General for Safeguards Olli Heinonen, with a copy to Director General Mohamed ElBaradei. Abushady observed in his memorandum that the person responsible for assembling the CIA video was obviously unfamiliar with either the North Korean reactor or with GCGM reactors in general.

The first thing that struck Abushady about the CIA’s claims was that the building was too short to hold a reactor like the one in Yongbyon, North Korea.

“It is obvious,” he wrote in his “technical assessment” memo to Heinonen, “that the Syrian building with no UG [underground] construction, can not hold a [reactor] similar [to] NK GCR [North Korean gas-cooled reactor].”

Abushady estimated the height of the North Korean reactor building in Yongbyon at a 50 meters (165 feet) and estimated that the building at al-Kibar at a little more than a third as tall.

Abushady also found the observable characteristics of the al-Kibar site inconsistent with the most basic technical requirements for a GCGM reactor. He pointed out that the Yongbyon reactor had no less than 20 supporting buildings on the site, whereas the satellite imagery shows that the Syrian site did not have a single significant supporting structure.

The most telling indication of all for Abushady that the building could not have been a GCGM reactor was the absence of a cooling tower to reduce the temperature of the carbon dioxide gas coolant in such a reactor.

“How can you work a gas-cooled reactor in a desert without a cooling tower?” Abushady asked in an interview.

IAEA Deputy Director Heinonen claimed in an IAEA report that the site had sufficient pumping power to get river water from a pump house on the nearby Euphrates River to the site. But Abushady recalls asking Heinonen, “How could this water be transferred for about 1,000 meters and continue to the heat exchangers for cooling with the same power?”

Robert Kelley, a former head of the U.S. Department of Energy’s Remote Sensing Laboratory and former senior IAEA inspector in Iraq, noticed another fundamental problem with Heinonen’s claim: the site had no facility for treating the river water before it reached the alleged reactor building.

“That river water would have been carrying debris and silt into the reactor heat exchangers,” Kelley said in an interview, making it highly questionable that a reactor could have operated there.

Yet another critical piece that Abushady found missing from the site was a cooling pond facility for spent fuel. The CIA had theorized that the reactor building itself contained a “spent fuel pond,” based on nothing more than an ambiguous shape in an aerial photograph of the bombed building.

But the North Korean reactor at Yongbyon and all 28 other GCGM reactors that had been built in the world all have the spent fuel pond in a separate building, Abushady said. The reason, he explained, was that the magnox cladding surrounding the fuel rods would react to any contact with moisture to produce hydrogen that could explode.

But the definitive and irrefutable proof that no GCGM reactor had been present at al-Kibar came from the environmental samples taken by the IAEA at the site in June 2008. Such a reactor would have contained nuclear-grade graphite, Abushady explained, and if the Israelis had actually bombed a GCGM reactor, it would have spread particles of nuclear-grade graphite all over the site.

Behrad Nakhai, a nuclear engineer at Oak Ridge National Laboratory for many years, confirmed Abushady’s observation in an interview. “You would have had hundreds of tons of nuclear-grade graphite scattered around the site,” he said, “and it would have been impossible to clean it up.”

IAEA reports remained silent for more than two years about what the samples showed about nuclear-grade graphite, then claimed in a May 2011 report that the graphite particles were “too small to permit an analysis of the purity compared to that normally required for use in a reactor.” But given the tools available to laboratories, the IAEA claim that they couldn’t determine whether the particles were nuclear grade or not “doesn’t make sense,” Nakhai said.

Hayden acknowledged in his 2016 account that “key components” of a nuclear reactor site for nuclear weapons were “still missing.” The CIA had tried to find evidence of a reprocessing facility in Syria that could be used to obtain the plutonium for a nuclear bomb but had been unable to find any trace of one.

The CIA also had found no evidence of a fuel fabrication facility, without which a reactor could not have gotten the fuel rods to be reprocessed. Syria could not have gotten them from North Korea, because the fuel fabrication plant at Yongbyon had produced no fuel rods since 1994 and was known to have fallen into serious disrepair after the regime had agreed to scrap its own plutonium reactor program.

### Manipulated and Misleading Photographs

Hayden’s account shows that he was ready to give the CIA’s stamp of approval to the Israeli photographs even before the agency’s analysts had even begun analyzing them. He admits that when he met Dagan face-to-face he didn’t ask how and when Mossad had obtained the photographs, citing “espionage protocol” among cooperating intelligence partners. Such a protocol would hardly apply, however, to a government sharing intelligence in order to get the United States to carry out an act of war on its behalf.

The CIA video relied heavily on the photographs that Mossad had given to Bush administration in making its case. Hayden writes that it was “pretty convincing stuff, if we could be confident that the pictures hadn’t been altered.”

But by his own account Hayden knew Mossad had engaged in at least one deception. He writes that when CIA experts reviewed the photographs from Mossad, they found that one of them had been photo-shopped to remove the writing on the side of a truck.

Hayden professes to have had no concern about that photo-shopped picture. But after this writer asked how CIA analysts interpreted Mossad's photo shopping of the picture as one of the questions his staff requested in advance of a possible interview with Hayden, he declined the interview.

Abushady points out that the main issues with the photographs the CIA released publicly are whether they were actually taken at the al-Kibar site and whether they were consistent with a GCGM reactor. One of the photographs showed what the CIA video called "the steel liner for the reinforced-concrete reactor vessel before it was installed." Abushady noticed immediately, however, that nothing in the picture links the steel liner to the al-Kibar site.

Both the video and CIA's press briefing explained that the network of small pipes on the outside of the structure was for "cooling water to protect the concrete against the reactor's intense heat and radiation." But Abushady, who specializes in such technology, pointed out that the structure in the picture bore no resemblance to a Gas-Cooled Reactor vessel. "This vessel cannot be for a Gas-Cooled Reactor," Abushady explained, "based on its dimensions, its thickness and the pipes shown on the side of the vessel."

The CIA video's explanation that the network of pipes was necessary for "cooling water" made no sense, Abushady said, because gas-cooled reactors use only carbon dioxide gas — not water — as a coolant. Any contact between water and the Magnox-cladding used in that type of reactor, Abushady explained, could cause an explosion.

A second Mossad photograph showed what the CIA said were the "exit points" for the reactor's control rods and fuel rods. The CIA juxtaposed that photograph with a photograph of the tops of the control rods and fuel rods of the North Korean reactor at Yongbyon and claimed a "very close resemblance" between the two.

Abushady found major differences between the two pictures, however. The North Korean reactor had a total of 97 ports, but the picture allegedly taken at al-Kibar shows only 52 ports. Abushady was certain that the reactor shown in the photograph could not have been based on the Yongbyon reactor. He also noted that the picture had a pronounced sepia tone, suggesting that it was taken quite a few years earlier.

Abushady warned Heinonen and ElBaradei in his initial assessment that the photo presented as taken from inside the reactor building appeared to an old photo of a small gas-cooled reactor, most likely an early such reactor built in the U.K.

### A Double Deception

Many observers have suggested that Syria's failure to protest the strike in the desert loudly suggests that it was indeed a reactor. Information provided by a former Syrian air force major who defected to an anti-Assad military command in Aleppo and by the head of Syria's atomic energy program helps unlock the mystery of what was really in the building at al-Kibar.

The Syrian major, “Abu Mohammed,” told The Guardian in February 2013 that he was serving in the air defense station at Deir Azzor, the city nearest to al-Kibar, when he got a phone call from a Brigadier General at the Strategic Air Command in Damascus just after midnight on Sept. 6, 2007. Enemy planes were approaching his area, the general said, but “you are to do nothing.”

The major was confused. He wondered why the Syrian command would want to let Israeli fighter planes approach Deir Azzor unhindered. The only logical reason for such an otherwise inexplicable order would be that, instead of wanting to keep the Israelis away from the building at al-Kibar, the Syrian government actually wanted the Israelis to attack it. In the aftermath of the strike, the Damascus issued only an opaque statement claiming that the Israeli jets had been driven away and remaining silent on the airstrike at al-Kibar.

Abushady told this writer he learned from meetings with Syrian officials during his final year at the IAEA that the Syrian government had indeed originally built the structure at al-Kibar for the storage of missiles as well as for a fixed firing position for them. And he said Ibrahim Othman, the head of Syria’s Atomic Energy Commission, had confirmed that point in a private meeting with him in Vienna in September 2015.

Othman also confirmed Abushady’s suspicion from viewing satellite photographs that the roof over the central room in the building had been made with two movable light plates that could be opened to allow the firing of a missile. And he told Abushady that he had been correct in believing that what had appeared in a satellite image immediately after the bombing to be two semi-circular shapes was what had remained of the original concrete launching silo for missiles.

In the wake of the Israel’s 2006 invasion of Southern Lebanon, the Israelis were searching intensively for Hezbollah missiles and rockets that could reach Israel and they believed many of those Hezbollah weapons were being stored in Syria. If they wished to draw the attention of the Israelis away from actual missile storage sites, the Syrians would have had good reason to want to convince the Israelis that this was one of their major storage sites.

Othman told Abushady that the building had been abandoned in 2002, after the construction had been completed. The Israelis had acquired ground-level pictures from 2001-02 showing the construction of outer walls that would hide the central hall of the building. The Israelis and the CIA both insisted in 2007-08 that this new construction indicated that it had to be a reactor building, but it is equally consistent with a building designed to hide missile storage and a missile-firing position.

Although Mossad went to great lengths to convince the Bush administration that the site was a nuclear reactor, what the Israelis really wanted was for the Bush administration to launch U.S. airstrikes against Hezbollah and Syrian missile storage sites. Senior officials of the Bush administration didn’t buy the Israeli bid to get the United States do the bombing, but none of them ever raised questions about the Israeli ruse.

So both the Assad regime and the Israeli government appear to have succeeded in carrying out their own parts in a double deception in the Syrian desert.

## How Syrian-Nuke Evidence Was Faked

November 19, 2017

By Gareth Porter

When Yousry Abushady studied the highly unusual May 2008 CIA video on a Syrian nuclear reactor that was allegedly under construction when Israeli jet destroyed it seven months earlier, the senior specialist on North Korean nuclear reactors on the International Atomic Energy Agency's staff knew that something was very wrong.

Abushady quickly determined that the CIA had been seriously misled by Israeli intelligence and immediately informed the two highest officials of the Vienna-based IAEA, Director General Mohamed ElBaradei and Deputy Director for Safeguards, Olli Heinonen, that the CIA's conclusions were not consistent with the most basic technical requirements for such a reactor.

But it did not take long for Abushady to realize that the top IAEA officials were not interested in drawing on his expertise in regard to the alleged Syrian reactor. In fact, the IAEA cited nonexistent evidence linking the site to a Syrian nuclear program while covering up real evidence that would have clearly refuted such a claim, according to Abushady and other former senior IAEA officials.

When Abudhsady met with Heinonen to discuss his analysis of the CIA's case in May 2008, Abushady asked to be included on the team for the anticipated inspection of the al-Kibar site because of his unique knowledge of that type reactor.

But Heinonen refused his request, citing an unwritten IAEA rule that inspectors are not allowed to carry out inspections in their countries of origin. Abushady objected, pointing out that he is Egyptian, not Syrian, to which Heinonen responded, "But you are an Arab and a Muslim!" according to Abushady. Heinonen declined a request for his comment on Abushady's account of the conversation.

### A Curious Inspection

In June 2008, an IAEA team consisting of Heinonen and two other inspectors took environmental samples at the al-Kibar site. In November 2008, the IAEA issued a report saying that laboratory analysis of a number of natural uranium particles collected at the site "indicates that the uranium is anthropogenic," meaning that it had been processed by humans.

The implication was clearly that this was a reason to believe that the site had been connected with a nuclear program. But former IAEA officials have raised serious questions about Heinonen's handling of the physical evidence gathered from the Syrian site as well as his characterization of the evidence in that and other IAEA reports.

Tariq Rauf who headed the IAEA's Verification and Security Policy Coordination Office until 2011, has pointed out that one of the IAEA protocols applicable to these environmental samples is that "the results from all three or four labs to have analyzed the sample must match to give a positive or negative finding on the presence and isotopes of uranium and/or plutonium."

However, in the Syrian case the laboratories to which the samples had been sent had found no evidence of such man-made uranium in the samples they had tested. ElBaradei himself had announced in late September, three months after the samples had originally been taken but weeks before the report was issued, “So far, we have found no indication of any nuclear material.” So the November 2008 IAEA report claiming a positive finding was not consistent with its protocols.

But the samples had been sent to yet another laboratory, which had come up with a positive test result for a sample, which had then touted as evidence that the site had held a nuclear reactor. That in itself is an indication that a fundamental IAEA protocol had been violated in the handling of the samples from Syria.

One of the inspectors involved in the IAEA inspection at al-Kibar later revealed to a fellow IAEA inspector what actually happened in the sample collection there. Former senior IAEA inspector Robert Kelley recalled in an interview that, after the last results of the samples from the al-Kibar inspection had come back from all the laboratories, the inspector, Mongolian national Orlokh Dorjkhaidav, came to see him because he was troubled by the results and wanted to tell someone he trusted.

### Negative Results

Dorjkhaidav told Kelley that all the samples taken from the ground in the vicinity of the bombed building had tested negative for man-made uranium and that the only sample that had tested positive had been taken in the toilet of the support building.

Dorjkhaidav later left the IAEA and returned to Mongolia, where he died in December 2015. A video obituary for Dorjkhaidav confirmed his participation in the inspection in Syria. Kelley revealed the former inspector’s account to this writer only after Dorjkhaidav’s death.

In an e-mail response to a request for his comment on Kelley’s account of the Syrian environmental samples, Heinonen would neither confirm nor deny that the swipe sample described by Dorjkhaidav had been taken inside the support building. But in January 2013, David Albright, Director of the Institute for Science and International Security in Washington, D.C., who has co-authored several articles with Heinonen, acknowledged in a commentary on his think tank’s website that the al-Kibar uranium particles had been “found in a changing room in a building associated with the reactor.”

Given the dispersal of any nuclear material around the site by the Israeli bombing, if man-made uranium was present at the site, it should not have shown up only inside the support facility but should have been present in the samples taken from the ground outside.

Former IAEA senior inspector Kelley said in an e-mail that a “very likely explanation” for this anomaly is that it was a case of “cross contamination” from the inspector’s own clothing. Such cross contamination had occurred in IAEA inspections on a number of occasions, according to both Kelley and Rauf.

Kelley, who had been in charge of inspections in Iraq in the early 1990s, recalled that a set of environmental swipes taken from nuclear facilities that the United States had bombed in Iraq had appeared to show that that Iraq had enriched uranium to 90 percent. But it turned out that they had been taken with swipe paper that had been contaminated accidentally by particles from the IAEA laboratory.

But what bothered Abushady the most was that the IAEA report on Syria had remained silent on the crucial fact that none of the sample results had shown any trace of nuclear-grade graphite.

Abushady recalled that when he challenged Heinonen on the absence of any mention of the nuclear graphite issue in the draft report in a Nov. 13, 2008 meeting, Heinonen said the inspectors had found evidence of graphite but added, “We haven’t confirmed that it was nuclear-grade.”

Abushady retorted, “Do you know what nuclear-grade graphite is? If you found it you would know it immediately.”

Heinonen was invited to comment on Abushady’s account of that meeting for this article but declined to do so.

After learning that the report scheduled to be released in November would be silent on the absence of nuclear graphite, Abushady sent a letter to ElBaradei asking him not to release the report on Syria as it was currently written. Abushady protested the report’s presentation of the environmental sampling results, especially in regard to nuclear-grade graphite.

“In my technical view,” Abushady wrote, “these results are the basis to confirm the contrary, that the site cannot [have been] actually a nuclear reactor.”

But the report was published anyway, and a few days later, ElBaradei’s Special Assistant Graham Andrew responded to Abushady’s message by ordering him to “stop sending e-mails on this subject” and to “respect established lines of responsibility, management and communication.”

### A Clear Message

The message was clear: the agency was not interested in his information despite the fact that he knew more about the issue than anyone else in the organization.

At a briefing for Member States on the Syria reactor issue on Feb. 26, 2009, the Egyptian representative to the IAEA confronted Heinonen on the absence of nuclear-grade graphite in the environmental samples. This time, Heinonen had a different explanation for the failure to find any such graphite. He responded that it was “not known whether the graphite was in the building at the time of the destruction,” according to the diplomatic cable reporting on the briefing that was later released by WikiLeaks.

But that response, too, was disingenuous, according to Abushady. “Graphite is a structural part of the reactor core in the gas-cooled reactor,” he explained. “It is not something you add at the end.”

The IAEA remained silent on the question of graphite in nine more reports issued over more than two years. When the IAEA finally mentioned the issue for the first time officially in a May 2011 report, it claimed that the graphite particles were “too small to permit an analysis of the purity compared to that normally required for use in a reactor.”

But American nuclear engineer Behrad Nakhai, who worked at Oak National Laboratories for many years, said an interview that the laboratories definitely have the ability to determine whether the particles were nuclear grade or not, so the claim “doesn’t make sense.”

News outlets have never reported on the IAEA's role in helping to cover up the false CIA claim of a North-Korean-style nuclear reactor in the desert by a misleading portrayal of the physical evidence collected in Syria and suppressing the evidence that would have made that role clear.

Heinonen, who was directly responsible for the IAEA's role in the Syria cover-up, left the IAEA in August 2010 and within a month was given a position at Harvard University's Belfer Center for Science and International Affairs. He has continued to take positions on the Iran nuclear negotiations that were indistinguishable from those of the Netanyahu government. And he is now senior adviser on science and non-proliferation at the Foundation for the Defense of Democracies, a think tank whose positions on the Iran nuclear issues have closely followed those of the Likud governments in Israel.

Analysis Israel's 2007 Strike on Syrian Nuclear Reactor: Lessons Learned for Iran  
Michael Herzog

Apr 25, 2018 6:14 AM

The destruction of the Syrian nuclear reactor in 2007 contains lessons that have been overwhelmed by the battle over who gets the credit. As the defense minister's chief of staff at the time, I followed the decision-making process closely. I would like to illuminate three major dimensions.

### The Intelligence

The fact is that a neighboring state hostile to Israel had been building a nuclear reactor for military purposes for about five years before Israel discovered it, close to it becoming "hot." From a result-oriented point of view, Israeli intelligence did succeed in discovering it in time, but it certainly needs some soul-searching with regard to the process. In my judgment, during the years preceding the reactor's discovery, Israeli intelligence subscribed to the mistaken conception that it was unreasonable for Syrian President Bashar Assad to try to develop nuclear military capabilities. As a result, proper collection efforts were not directed at this issue and relevant information was misinterpreted.

This conception had been correct for the era of Hafez Assad, Bashar's father. But after the younger Assad assumed power in 2000, there should have been intelligence attention focused on whether the new, inexperienced player would be tempted to go in new directions, first and foremost the nuclear one. However, due to inertia, Israel's intelligence remained mired in the old conception for several years.

That's how in 2004, when I was the defense minister's military secretary, we received an intelligence report to the effect that the Syrian regime was dealing with nuclear military issues. I asked the director of Military Intelligence to address the report in a meeting with the defense minister. The director rejected this possibility, both for lack of supporting evidence and on grounds it was "illogical." As we know, by then Syria was vigorously proceeding with the project, with strict compartmentalization within the Syrian government echelons themselves (and vis-à-vis their Iranian allies). Our intelligence missed the younger Assad's logic and the fact that rather than build local nuclear infrastructure, he had decided to buy the whole thing "off the shelf" from North Korea.

The methodology lesson here is that Israeli intelligence must constantly give real, practical priority to the acquisition of nuclear capabilities by countries in the region, given the strategic significance of this issue. Moreover, it must always check the validity of its assumptions when the leader of a country changes. The younger Assad was a relatively unknown quantity during his first years, but one could increasingly discern an adventurous side to his unbaked personality.

Israel's intelligence is worthy of praise for coming up with the critical information in time and for the precise accompaniment of the operation, including its assessments of possible responses to it. But along with patting itself on the back, it must investigate this case and learn its lessons, just as the Israel Air Force investigates "near misses" as if they were actual hits on its planes.

### The decision-making process

From my years at the nexus of decision-making, I cannot recall a decision-making process that was as thorough and orderly as in this case. For months, a small forum of security establishment heads met every Friday in the Prime Minister's Residence to discuss each and every aspect of the attack and its ramifications.

During these discussions it was decided to provide Assad with a "zone of deniability" that would allow him to restrain himself from retaliating for the destruction of the reactor. Among other things, this decision was based on an assessment of the Syrian leader prepared by a designated group of psychologists. Throughout the process there was a fruitful dialogue between Israeli and American leaders and there was a series of secret cabinet debates before the decision was made. Israel exploited the advantage it had – that Assad didn't know that we knew – to work through a detailed process that also managed to maintain secrecy.

Weighing on this orderly course was the high tension between Prime Minister Ehud Olmert and Defense Minister Ehud Barak, which combined a personal struggle with real differences in approach.

Barak believed that Olmert lacked the appropriate background and skills to make such fateful decisions. We often heard him criticize the problematic management of the Second Lebanon War the preceding year, and especially how the war was launched without considering all dimensions and calculating a few steps ahead.

When Barak assumed the defense post in June 2007, he found that the main operating plan to attack the reactor would leave a heavy footprint that would be liable to demand a Syrian response. Moreover, he argued that since the operation carried a risk – however low – of an escalation into war, Israel had to be prepared so that if war would break out, the military would pursue unequivocal victory and not an ambiguous end, as in the Second Lebanon War. The Israel Defense Forces was in the midst of a significant process of rehabilitating itself from that war; Barak thought more time was needed in order to prepare for another possible major conflict, and that Israel had the necessary months at its disposal.

Barak definitely had a point in his assertions and his input inserted a dimension of depth to the decision-making process. The plan that was eventually executed indeed left a small footprint and the IDF took good advantage of the time provided to improve its readiness. Nevertheless, at some point during the summer it was no longer clear why Barak was continuing to delay the operation. Many in the decision-making circle wondered whether he had some hidden motive. Barak has considerable knowledge and experience in the real diplomatic-security realm, but it's often hard to know at any given time what his primary motive is among the ensemble of motives that coexist in his complex personality.

Ironically, the synthesis of the contrasts represented by Olmert and Barak contributed to the successful outcome, despite the obstacles along the way. But the ultimate responsibility rests on the prime minister's shoulders, and just as Olmert was justifiably criticized for the management of the Second Lebanon War, he deserves the credit for the destruction of the Syrian reactor.

#### A challenge to the Begin Doctrine

The destruction of the reactor reflects the deep assimilation of the Begin Doctrine – that is, not allowing the development of any threatening nuclear capabilities in our region. Among those involved, there was broad consensus that there was no choice but to destroy the reactor in a military operation, even at the risk of a possible escalation.

Therefore, no other option was seriously considered suitable, including U.S. President George W. Bush's suggestion to Olmert to issue Assad an ultimatum: allow international inspectors to visit the reactor within a short, defined time or it would be attacked. There was a reasonable concern that under the "diplomacy first" option, Assad would take immediate steps to conceal and protect the reactor so as to make it impossible to destroy. Deep in the minds of decision-makers there was the view that Israel must not place the keys to critical parts of its national security in the hands of outside parties, as friendly as they might be. This principle remains valid.

The Iranian nuclear program presents a far more significant challenge to the Begin Doctrine than the programs destroyed in Iraq and Syria. The Iranian project is not built around a single reactor, but rather combines the uranium and plutonium tracks within a broad framework of human capital, know-how, facilities and infrastructures, in a country that's farther away and which is building a substantial regional array – some of it close to us – and which has the ability to respond and cause significant damage to Israel, by acting either directly or through proxies like Hezbollah.

Unlike Assad at the time, Iran knows that Israel and the world are closely following its nuclear program and act accordingly. Moreover, the Iranian nuclear program has a broad and deep international context, and any action against it will necessarily influence and be influenced by this context. The nuclear agreement between Iran and the leading countries in the international community bought precious time, but did not take Iran's nuclear ambitions off the table, did not deprive Iran of its nuclear infrastructure and will eventually allow it to become a nuclear threshold state. To this must we must add the ties between Iran and North Korea and the apparent mutual influence of each country's progress or regression in the nuclear realm.

In light of all this, the major questions facing Israeli decision-makers relate mainly to the effectiveness of an Israeli military thwarting initiative and its potential impact on the chances of preventing Iran's accelerated return to the nuclear path "the day after," this time going underground and rushing to the weapon.

This is a challenge of a different magnitude. It requires close and continuous monitoring and thorough and complex strategic thinking. We must not be passive because of the time bought by the nuclear agreement, which could be shortened if U.S. President Donald Trump decides to abandon it. We must begin preparing today for the time a concrete decision might be necessary; this includes focused intelligence, preparation of operational options, a close dialogue with the United States and the creation of regional partnerships to the extent possible.

The challenge to Israel may be exacerbated by the possibility that some of the civilian nuclear programs now proliferating in the region will lay a foundation for future military programs. Saudi Arabia, which has issued an international tender to build two of 16 planned reactors, is demanding that the U.S. government deviate from the "Golden Standard" it applies to civilian nuclear programs and allow it to have nuclear fuel facilities in its territory as was permitted to Iran, with its crown prince warning that if Iran acquires military nuclear capability, his country will as well.

The bottom line is that while preparing options and laying the ground for the continued implementing the Begin Doctrine, Israel must constantly ask itself whether the conditions for enforcing this doctrine effectively still exist and if not, what the alternative may be.

Brig. Gen. (res.) Michael (Mike) Herzog was head of the strategic planning division of the IDF's Planning Branch, military secretary and chief of staff for four defense ministers. He is currently an international fellow at the Washington Institute for Near East Policy and a senior fellow at the Jewish People Policy Institute and BICOM.

<http://www.jewishpress.com/indepth/interviews-and-profiles/exclusive-interview-general-eli-ben-meir-meet-the-man-who-took-out-a-syrian-nuclear-reactor/2018/04/25/>

Exclusive Interview: General Eli Ben Meir: Meet the Man Who Took Out a Syrian Nuclear Reactor  
By David Israel -  
11 Iyyar 5778 – April 25, 2018

Recently retired, General Eli Ben Meir was the intelligence officer who, in 2006, overcame resistance from both Israeli and Bush administration intelligence officials—led by then Director of National Intelligence John Negroponte—to advocate for the bombing of a Syrian nuclear facility developed by North Korean scientists.

Just after midnight on September 6, 2007, Israel launched operation Outside the Box, an airstrike against the nuclear reactor in the Deir ez-Zor region of Syria. Israeli F-15I fighter jets armed with laser-guided 500-pound bombs, escorted by F-16I fighter jets and signal intelligence aircraft, raided and destroyed the Syrian radar site in Tall al-Abuad, followed by the demolition of the nuclear reactor. Israeli special-forces had arrived at the nuclear site the day before to highlight the target with laser designators.

General Ben Meir was appointed head of the Technological Intelligence Department at the IDF Military Intelligence in 2005. “Signs of nuclear activity were evident at the beginning of 2000, before I dealt with this issue,” he told The Jewish Press this week. “However, many signs had been proven false or could be shown to be related to something else entirely.”

“By the end of 2005 and the beginning of 2006, my suspicions regarding a Syrian nuclear covert activity increased, and I decided that there was enough evidence to prove its existence, and that something should be done about it,” Ben Meir said. He called for additional resources and manpower to focus on the reactor, “and the more people that dealt with it the more information we found,” he recalled.

At that point, Israeli and American intelligence officials began to push back against the newly appointed head of tech intel’s hyper interest in the alleged Syrian reactor. “Even within my own unit, many thought that there wasn’t a case to be made that this was a nuclear reactor, or even that there was any nuclear activity,” Ben Meir recalled. “They studied the same information and provided a different logical explanation to what had been discovered. My unit and I were pretty much alone in trying to find more evidence for the nuclear reactor, and also in getting everyone else to understand that there is something going on there.”

“Once all the necessary people were convinced that there was a Syrian nuclear reactor, and leading up to the attack in 2007, my team’s main role was to provide the relevant information for the military discussions,” Ben Meir said. “This included the decision of what level of damage needed to be caused so that the facility was no longer operational. We prepared the operational intelligence for an aerial attack and we were responsible for providing an assessment of how much time was left before the plant became operational, because the moment the nuclear plant became operational you could no longer attack it, it would have been like diffusing a nuclear bomb.”

According to 2018 Israeli media accounts, the debate over striking before or after the Syrian nuclear reactor had gone live was conducted between outgoing PM Ehud Olmert and his incoming

replacement, Ehud Barak. Barak, according to those reports, did not have a problem striking the facility after it had gone online, because he insisted on not being rushed into executing his predecessor's plan. Ben Meir was asked to brief Olmert on a weekly basis, and the PM, who was being forced to resign under suspicion of corruption, was eager to get the credit for the attack.

The retired general sums up the impact of operation Outside the Box: "Everyone knows about the situation in Syria over the last 10 years, and especially in the last five years. The situation in the Middle East would have been completely different had Syria possessed nuclear capabilities – not only because of developments in Syria, but even more alarmingly, because of the way Hezbollah and Iran would have used the Syrian nuclear capability as an umbrella for their terror activities and the spread of their revolution. Destroying the Syrian nuclear weapons capability was one of the most important actions that the Israeli leadership has carried out. It didn't solve all the problems in the Middle East, but it certainly helped lessen the severity of the situation today."

General Ben Meir is convinced Iran is "by far" Israel's biggest threat. "It is a direct threat via their missile capabilities when and if they have nuclear capabilities, but we are not there yet," he said. "Iran is the biggest engine in the world for terror activity and unrest in countries like Syria, Lebanon, Iraq, Libya and Yemen. All of them are directed against the Sunni world but also against Western interests, including Israel."

"They are directly involved in open and covert activities, especially in Syria and Lebanon. They are the financier, trainer and arms supplier for Hezbollah – everything that they have and will have comes from Iran. It is the only country in the world that says openly that they want to destroy Israel and erase it from the map," he concludes.

General Ben Meir has been involved with Migdal Ohr (Hebrew: Lighthouse), a group providing education and social guidance to children from underprivileged and troubled homes across Israel. Thousands of children come to the group's programs from overcrowded apartments, single-parent families, homes with drug problems, impoverished and crime-ridden families. They are enrolled in all areas of the educational spectrum, and the charity's goal is to transform them students into proud and productive citizens of Israel.

"A lot of Israeli citizens know about Migdal Ohr and their wonderful activities," said the retired general. "During my military career I came across soldiers who were graduates of Migdal Ohr programs. Migdal Ohr is involved with the army, and it very much speaks to me."

These days, according to Ben Meir, Migdal Ohr is starting a new program to prepare and supports their students before, during and after their service in the IDF.

"Now that I have reentered civilian life, I want to be more involved in helping strengthen Migdal Ohr with my connections in the army, and to support their new program by sharing my experiences," he said.

## Trump Greets Plans for North Korea-Syria Meeting With Deafening Silence

By David E. Sanger and Mark Landler

June 4, 2018

*[EXCERPTS]*

WASHINGTON — When Kim Jong-un, the North Korean leader, met with top Chinese and Russian officials before a planned summit meeting with President Trump, the American leader raised a red flag. But North Korea's announcement that Mr. Kim is also planning to meet President Bashar al-Assad of Syria has brought no similar protest from Mr. Trump — even though Syria and North Korea have a longstanding shared history of nuclear proliferation.

The last time Mr. Assad did business with the Kim family, the result was one of the most brazen cases of proliferation in history: North Korean engineers built a replica of their main nuclear reactor in the Syrian desert. It was the beginnings of a nuclear program that ended in fiery ruins in September 2007, when the building was destroyed in a secret Israeli bombing run.

At the time, Vice President Dick Cheney and others in the George W. Bush administration argued that the United States should have bombed the reactor itself, to make a point about its seriousness in stopping the export of bomb-making technology.

Now North Korea says it is resuming the relationship, and is expecting a visit to Pyongyang by Mr. Assad — who has rarely left Damascus since the uprising against his government began seven years ago.

*[deletia]*

The sale of the reactor to Syria was the first, and only, time North Korea has been caught selling a complete nuclear facility. It was an exact replica of the plutonium reactor at Yongbyon.

The chief of Israel's Mossad intelligence service at the time, Meir Dagan, visited Washington and showed pictures of the reactor to the C.I.A. chief at the time, Michael V. Hayden, and the national security adviser to Mr. Bush, Stephen J. Hadley. That touched off a lengthy debate over whether the United States should destroy the facility.

Mr. Bush ultimately overruled Mr. Cheney and said the United States would go to the United Nations before intervening. Instead, the Israelis acted to destroy the reactor. All involved kept the action secret, in hopes of keeping Mr. Assad from retaliating, but it was revealed, by The New York Times and others, a few weeks later.

MKs warned about Syria's nuke plans years before 2007 reactor strike – report  
Committee headed by Yuval Steinitz sent PM Sharon a memo in 2004 saying that Damascus was working on a nuclear program

By TOI staff

Today, 6:12 am [Accessed 2018-06-06T18:25Z]

[EXCERPT]

A Knesset committee warned of Syria's nuclear ambitions two years before Israeli spies found evidence a reactor was being built, leading to its eventual destruction in an air raid, according to a report Tuesday.

In March, the State of Israel officially confirmed it was responsible for a September 6, 2007 airstrike that blew up the reactor near Deir Ezzor, ending a 10-and-a-half-year policy of silence about the operation.

According to officials, Israeli spies only received definitive proof of the reactor's existence in mid-2006, when it was well underway, in what was described as a major intelligence failure. Both the Mossad and Military Intelligence took credit for uncovering the reactor's existence.

However, documents aired by the Hadashot TV news outlet Tuesday show that a small team of lawmakers flagged what looked like a possible Syrian nuclear program in 2004.

“Analysis of all intelligence information indicates with a high level of probability that a Syrian military nuclear project is going on,” a commission of inquiry wrote in a top secret, emergency memo to then-prime minister Ariel Sharon. “Since the issue is of the utmost strategic importance, I request that the prime minister urgently hold a comprehensive discussion on the subject.”

Energy Minister Yuval Steinitz, then the head of the Knesset's powerful Foreign Affairs and Defense Committee, had set up the commission of inquiry with the goal of making sure Israel knew if any country in the region was pursuing nuclear capabilities.

The official *raison d'être* for the panel was to examine the intelligence failures that led to Libyan leader Muammar Gaddafi pursuing a nuclear program without Israel being able to thwart him.

“A nuclear project is growing in a hostile Arab state with a madman like Gaddafi, and we do not know until we are told,” warned Steinitz at the time.

Former MK Haim Ramon, who was on the panel, said he was tipped off by Syrian President Bashar Assad saying that “We need to reach a strategic parity with Israel.”

“What strategic parity could Syria reach with Israel other than non-conventional weapons?” Ramon told Hadashot. He said it was clear Assad was referring to nuclear weapons.

However, defense officials thought Assad was speaking only of his intent to develop ballistic missiles and chemical weapons.

Aharon Ze'evi-Farkash, a general who headed military intelligence from 2002 until 2006, told Hadashot he didn't remember the events as they had been described in the report. But he added that Syria was not the army's top priority at a time when the Second Intifada was at its peak, the Hezbollah terror group was growing on Lebanese border and concerns were rampant about other countries' nuclear ambitions, likely a reference to Iran.

The committee only made nine copies of its report, and until Hadashot requested the censor declassify it for publication it had never been made public.

Jeffrey,

Actually the large square-top building which has apparently now been removed from the site has been on the site for over FIVE years. Shown below is a piece of an astronaut photo I cropped from an online collection accessible at a NASA website

This photo was taken in September of 2002.

*[Segment of image dated 2002-09-05T08:51:57Z; 2002248.369410Z]*

I am currently looking for older photos online to see if I can find one where the building is not yet present so we can bracket the time frame over which the structure was built. Will keep everyone informed if I find one.

*[EXCERPT OF COMMENT]*

I played around with some shadow geometry and got some interesting tentative results.

If we assume that the truck trailer stands 4 meters tall:

then the “Secondary Structure” stands a reasonable 8 meters (about 26 feet):

But the “Big Box” stands over 24 meters (78 feet) high:

Above is a side view of the “Big Box”. The red arrow points at a person-sized line for comparison

If these calculations are even roughly correct, and the building is, as Syria claims, just a “warehouse”, what are they storing?? Dinosaurs?

<http://www.armscontrolwonk.com/1689/syrian-and-nuclear-weapons-again#comment>

I was just looking at the 24 October post-strike picture and noticed that the line representing the putative water pipe from/to the Euphrates leads not to the former big building, but to the smaller one just south of it.

And indeed, a key ABC News story of Oct 19 (<http://abcnews.go.com/WN/story?id=3752687&page=1>) says, “The official said there was a larger structure just north of a small pump station; a nuclear reactor would need a constant source of water to keep it cool.”

So I wonder if the building on the Euphrates identified as a pump station in [http://www.isis-online.org/publications/SuspectSite\\_24October2007.pdf](http://www.isis-online.org/publications/SuspectSite_24October2007.pdf) might not be just one of two.

Putative is a lovely word to have available in such circumstances as these.

<http://www.armscontrolwonk.com/1689/syrian-and-nuclear-weapons-again#comment>

Stranger and stranger. A couple of comments.

First of all, look at the location of this facility from the big picture:

Notice anything odd about the location? If you zoom in, the river in this section bisects two bluffs. As a consequence, the adjacent land is not subject to flooding and the river likely flows faster and deeper than in the “green” low-lying agricultural areas that predominate to both the north and south all along the Euphrates. If one desired to build a reactor, would this particular section of river not be well suited? A reactor could be placed in close proximity to the river and a deep and narrow channel would provide easy pumping of cooling water.

However, as Yale noted above, pumps require electricity. I’m still trying to obtain hi resolution imagery that will not cost me \$400, but the reported “pump station” would require electrical power from somewhere. Perhaps someone with the requisite imagery could see if there are electrical lines and where they lead.

Finally, at this point I’m relatively convinced this is not a SCUD facility for a few reasons. First of all, Syria already has developed facilities for such missiles – facilities with underground bunkers, wide

paved roads, etc. If the shipment were Scuds, particularly a new variant, why not send them to an established, existing and more secure facility?

Secondly, the razed facility lacks the kind of wide, paved roads and large, paved parking areas that one commonly associates with missile-related facilities.

Additionally, the facility is , well, isolated. What purpose would an isolated scud facility serve that could not be served by Syria's existing and more well developed facilities?

Finally, the indications are that the US and Israel have been watching this facility for some time. One might postulate that in all that time the intelligence community might have imaged or otherwise noticed something scud-related, such as a MAZ parked outside or other Scud-related equipment. No indication of that so far.

Finally, what is this: *[continued on next page]*

I'll put forth some additional conjecture and suggest it might be a concrete mixing plant. Compare to [this](#) and [this](#) and [this](#).

Subject: DigitalGlobe coverage of Syrian site

According to DigitalGlobe's somewhat quirky ordering tool, the only images they have for the Big Box site are the ones listed below. Apparently somebody put in an order for coverage late-July/early August.

Whether the fact that coverage stopped a week before the strike and didn't resume until the ISIS work became public is interesting, but may or may not be significant.

"A considerable amount" being enumerated below. They all appear to be  
near-nadir shots with < 10% cloud cover. I'm slightly tempted to read  
something into the June 2006 coverage, but it's probably best not to.

**Full resolution Ikonos image of 2007-11-23.**

**Shadow heights suggest that the square at the site of the former building is low, perhaps the slab on which the new structure was to be built. Note that a construction crane located slightly to the east of the center of the slab is casting its shadow northward.**

Syria Rebuilds on Site Destroyed by Israeli Bombs

By WILLIAM J. BROAD

Published: January 12, 2008

The puzzling site in Syria that Israeli jets bombed in September grew more curious on Friday with the release of a satellite photograph showing new construction there that resembles the site's former main building.

DigitalGlobe

<http://graphics8.nytimes.com/images/2008/01/11/world/12syria-450.jpg>

**New construction at a disputed Syrian site that Israeli and American analysts judged to be a partially built nuclear reactor.**

[http://www.isis-online.org/publications/Syria\\_11January2008.pdf](http://www.isis-online.org/publications/Syria_11January2008.pdf)

**THE INSTITUTE FOR SCIENCE AND INTERNATIONAL SECURITY  
JANUARY 11, 2008**

Satellite imagery taken January 9, 2008 obtained from DigitalGlobe shows new construction at the site in Syria bombed by Israel in early September 2007. The destroyed building was widely reported to be a nuclear reactor under construction. The new building has dimensions of approximately 60 meters by 60 meters, larger than the destroyed building, which had dimensions of about 47 meters by 47 meters. In addition, the roof on the new building is vaulted at the top instead of flat. The height of the new building was not determined.

The building's purpose cannot be discerned from the satellite imagery. There are trenches and what appear to be pipe sections, east of the building (away from the river). The trenches and pipes can be seen in the imagery for several kilometers. The trenches end at a site that may be a water treatment facility.

IAEA Director General Mohamed ElBaradei has sought permission from Syria to inspect the site, but so far Syria has denied the IAEA access to the site. If Syria allows the IAEA to inspect the site, the inspectors will have a more difficult time looking for evidence of reactor construction, because the new building covers whatever was left of the original building.

Institute for Science and International Security

**ISIS REPORT**

## **The Al Kibar Reactor: Extraordinary Camouflage, Troubling Implications**

**David Albright and Paul Brannan  
May 12, 2008**

***[EXCERPTS]***

This report focuses on the astonishing lengths to which Syrian engineers and architects went to hide the[...] commonly expected attributes *[of a nuclear reactor]* and conceal the building's true purpose. This case serves as a sobering reminder of the difficulty of identifying secret nuclear activities and how too often debate about the veracity of technical assessments is subordinated to political or ideological goals on both the right and left. It should also serve as a call to bolster national and international methods to better detect these facilities. The current domestic and international capabilities to detect nuclear facilities and activities are inadequate to prevent more surprises in the future.

Figure 1. Syrian reactor site after Israeli air strike and after controlled demolition.

Figure 2. Approximate location of key reactor elements overlaid onto August 10, 2007 commercial image.

## Creating a “Boxy” Non-Descript Building

By far the most dramatic feat of concealment of the building’s purpose was the effort to mask the design of the building using fake upper walls and roof. Figure 4 shows the original design of the reactor building, with columns used to suspend what appear to be flimsy camouflaging roofs. These columns were likely later used as the framework for the final fake outer walls and roof. This ground photo dates to before 2003, when GeoEye satellite imagery shows only the boxy structure. The U.S. intelligence community does not have satellite images prior to the completion of the construction of these fake walls and roof, according to US Government experts.

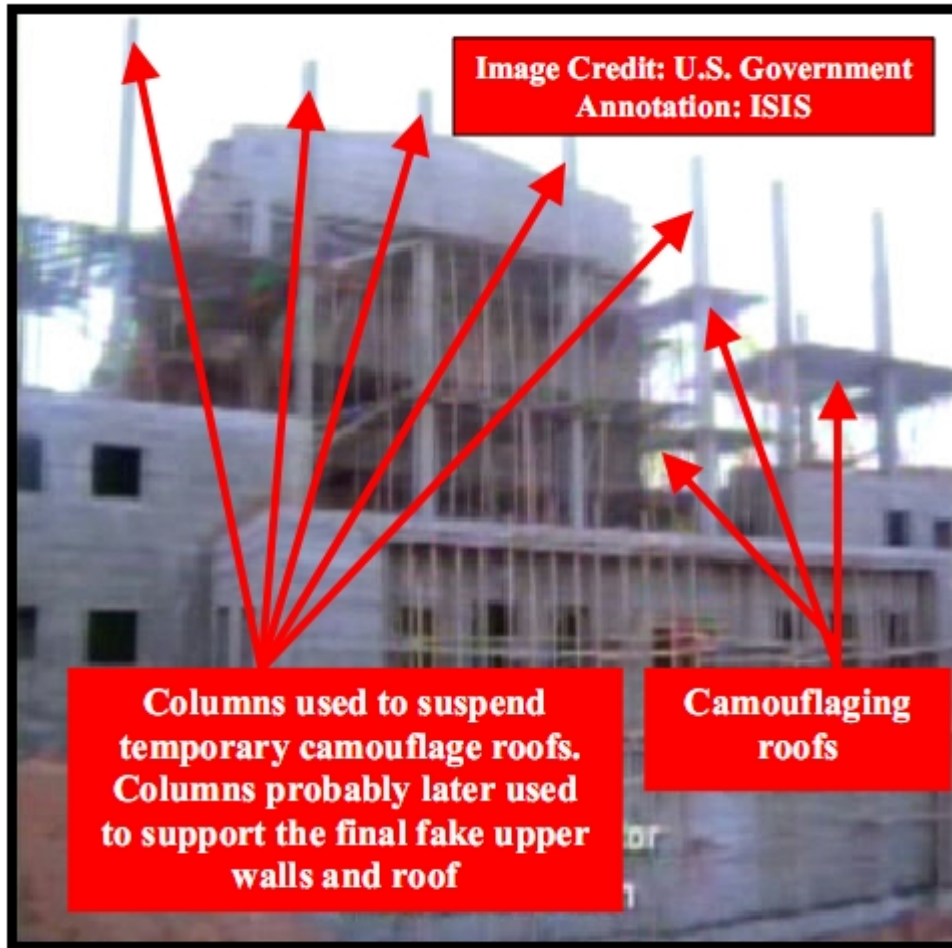

Figure 4. Ground photo of the Syrian reactor building taken before 2003.

Figures 5 and 6 show how the roof of the shorter sides (highlighted in green) was artificially raised up in order to bring these sides level with the top of the reactor building. Doing so alters the original design of the building, which is similar to that of Yongbyon, and transforms it into the box-like structure.

Figure 5. A ground photo of the Syrian reactor building taken before 2003.

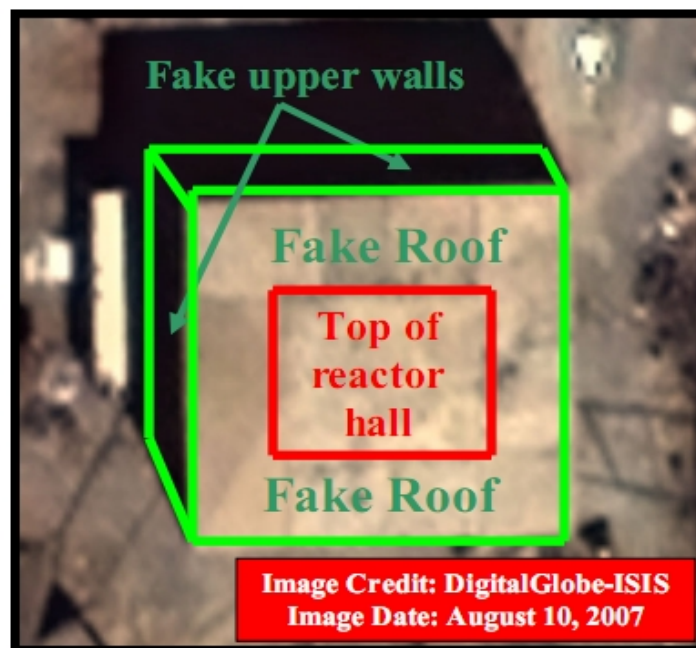

Figure 6. The Syrian reactor building seen in August 2007 in commercial satellite imagery after the fake walls and roof were constructed to make the box.

## Building Extends Underground

A significant percentage of the Al Kibar reactor building was underground. After demolition of the reactor building on October 10, 2007 and removal of the heavy reactor structures, Syria filled in the resulting hole. Figure 11 shows that this hole was quite deep. According to U.S. government experts, the depth of the hole was several tens of meters. In contrast, the Yonybyon five megawatt-electric reactor was built essentially from the ground upwards.

Figure 11. Bulldozers taking dirt from an adjacent hill and pushing it over the edge of the hole and filling it up.

Figure 14. Syrian reactor building from the ground. Photo taken prior to 2003.

## Isolated Site and Lack of Physical Protection

### Isolated Site

The Al Kibar reactor was located in an isolated desert region of eastern Syria. The Euphrates River cuts through this desert, and in many places, villages and industries line the river banks. Syria however, situated the reactor at a point near the river that is likely about as sparse as could be found on the banks of the Euphrates in Eastern Syria. This unlikely location for a reactor helped ensure that Western intelligence agencies would pay little attention to the site, particularly if Syria minimized visible signatures that would attract outside scrutiny. A key signature to minimize was physical protection and the presence of the military. According to U.S. government experts, the Al Kibar reactor site had minimal visible physical protection.

### Earthen Walls

Syria built the reactor at the bottom of a canyon, affording the site a considerable degree of natural isolation. To further increase the site's privacy, Syria created a series of earthen walls at key points around the reactor that would block the view of anyone traveling nearby (see figure 16). These walls were constructed by repeatedly dumping large mounds of dirt in a line and then pushing them from either side with a bulldozer to create a ridge. Some of these walls were created near ridgelines, a difficult feat to accomplish (see figure 17).

Figure 16. Syrian reactor site with earthen walls

**Figure 17. Location of an earthen wall on top of ridgeline.**

The construction of a special transport system is not necessary for this type of reactor. Large internal components do not need to be assembled elsewhere and shipped to the site. In about 2002, Syria assembled the steel reactor liner or vessel at or near the site under a tarp to hide it from overhead surveillance, according to U.S. government experts (see figure 22). It was placed inside the building before installing the roof, perhaps at night. The thin sheets of steel and water piping used in the vessel could have easily been transported to the site in trucks. Other components were probably likewise assembled at the site from easily transportable.

Figure 22. Syrian reactor vessel under tarps.

## **Air Ventilation System**

A nuclear reactor requires an air ventilation system to carry away radioactive gases emitted from the reactor core. A gas-graphite reactor, which uses carbon dioxide gas for cooling, has an even greater need for a robust ventilation system. It must carry away any leaking radioactive carbon dioxide gas. Using a system of air intakes and filters, radioactive gaseous effluents are filtered and then dispersed into the atmosphere through the stack.

Typically, a stack, which is distinctive, is located near or at the reactor building. A ventilation stack is plainly visible towering over North Korea's five megawatt-electric reactor at Yongbyon.

According to U.S. government experts, the reactor's ventilation system was carefully hidden. The air intakes of the ventilation system are assessed to be along one wall of the building, according to these experts (see figure 23). They noted that two rectangular structures located against the wall have louvers at the top through which air can enter.

The building in August 2007 did not have a stack visible (see figure 24). U.S. government experts said that the stack may have been located near the spent fuel pond. Syrian demolition of the building on October 10, 2007 left visible heavy concrete structures. The explosion blew debris and other structures from these hard to destroy parts. One structure visible is what the intelligence community assessed could be the foundation and remaining part of the stack (see figure 25). According to U.S. government experts, a pipe or small stack could have been extended through the fake roof after the reactor started operating. Until that time, the top of the stack may not have been more than a hole or cover in the fake roof, according to U.S. government experts (see figure 24).

Figure 23. The air intakes for the Syrian reactor.

Figure 24. DigitalGlobe satellite imagery from August 10, 2007 of the reactor building. The small dark shaded area could be where the stack would have appeared once the reactor operated, according to U.S. officials.

Figure 25. Post-demolition satellite imagery of the reactor building. The white object near the spent fuel pond may have been the remnants of the concrete foundation or other parts of the stack.

## Electrical System for the Reactor

The Syrian reactor would have needed a supply of electricity. No obvious high power lines are visible in August 2007 commercial satellite imagery of the site and surrounding area, leading many to discount that the site could be a reactor site.

According to U.S. government experts, the reactor did not have a turbine to make electricity. Thus, electrical power must come from outside the site. According to these same experts, the power lines were hidden underground. Such a strategy was also used by Iraq in the 1980s to disguise electrical inputs into its secret uranium enrichment sites using electro-magnetic isotope separation (EMIS) technology.

In the case of this reactor, the U.S intelligence community assessed that the power lines originated at a water treatment plant that is connected to the local electrical grid (see figure 26). The power lines were likely placed in conduits running underground from the treatment plant to the reactor building (see figures 27 and 28).

*[Sourcebook note: The “water treatment plant” is the facility discussed in Appendix C. It is not obvious where the water to be treated was to come from or go to.]*

Figure 26. Image of water treatment facility after the reactor was destroyed.

Figure 29. Wide image of new building and water treatment facility after the reactor was destroyed.

Figure 30. Close-up image of the same area seen in figure 28 between the Syrian reactor site and a water treatment facility after the reactor was destroyed. A trench, lengths of pipe and connected piping can be seen.

Figure 31. Pipeline possibly carrying electrical power lines entering eastern side of Syrian reactor building.

### Water Intake and Discharge

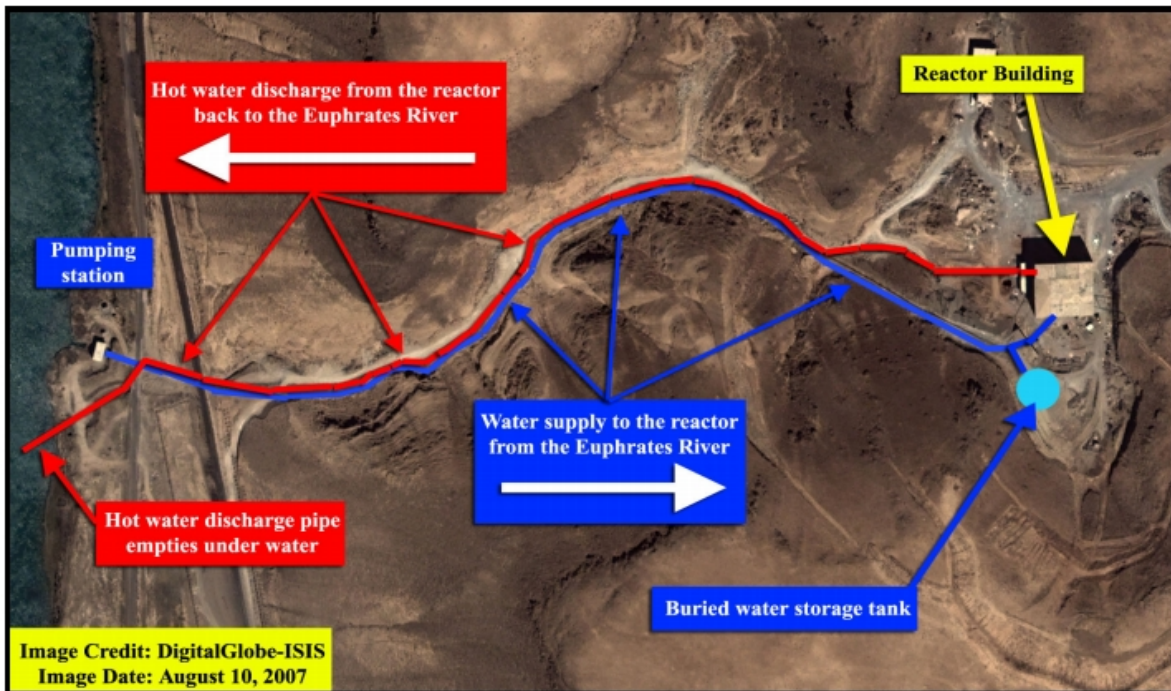

Figure 32. DigitalGlobe satellite image from August 10, 2007.

Figure 33. DigitalGlobe satellite imagery from August 10, 2007 of the reactor building. Cool water is pumped from the river and into a buried water storage tank and the reactor building's heat exchangers. The heat exchangers transfer the heat from the gas to the water from the river. The warm water is then discharged and piped back over to the river.

Figure 34. Buried hot water discharge pipe. According to U.S. government experts, this piping ends under water.

## Summary and Lessons

In building the Al Kibar reactor, Syria used three basic methods to avoid detection: locating the reactor in a remote area, building portions of it underground, and camouflaging the design of the reactor building along with its ventilation, cooling, and electrical supply.

The Syrian strategy worked for years. According to U.S. government experts, U.S. intelligence had determined in 2005 that Syria and North Korea were involved in a project in the province Dayr az Zawr. However, the nature of the cooperation and the location of the site remained unknown. However, suspicions based on earlier obtained information, pointed to some type of nuclear activity taking place in this province.

The 2005 assessment led to an intensified imagery search, which resulted in the discovery of a large unidentified building near the town of Al Kibar. According to a U.S. government expert, it was “odd and in the middle of nowhere,” but analysts could not ascribe the building with a nuclear character, and U.S. intelligence labeled it an “enigma facility.” In the spring of 2007, the building was determined to be the covert nuclear reactor based on photos acquired by U.S. intelligence, reportedly from Israel, that showed the inside and outside of the building.

... U.S. government experts acknowledge that the IC lacks high-quality overhead imagery of the construction site before the building was turned into a non-descript boxy shape. If the United States or other countries had acquired pre-2003 satellite imagery of the site, particularly imagery showing the creation of a false roof, the Syrian construction site would have looked more suspicious and more like a North Korean reactor.

## **Appendix D**

**Frames from 2008-04-24 Intelligence  
Briefing Video**

## Key Points

- Syria was building a gas-cooled, graphite-moderated reactor that was nearing operational capability in August 2007. The reactor would have been capable of producing plutonium for nuclear weapons, was not configured to produce electricity and was ill-suited for research.
- The reactor was destroyed in early September 2007 before it was loaded with nuclear fuel or operated.
- We are convinced, based on a variety of information, that North Korea assisted Syria's covert nuclear activities, both before and after the reactor was destroyed. Only North Korea has built this type of reactor in the past 35 years.

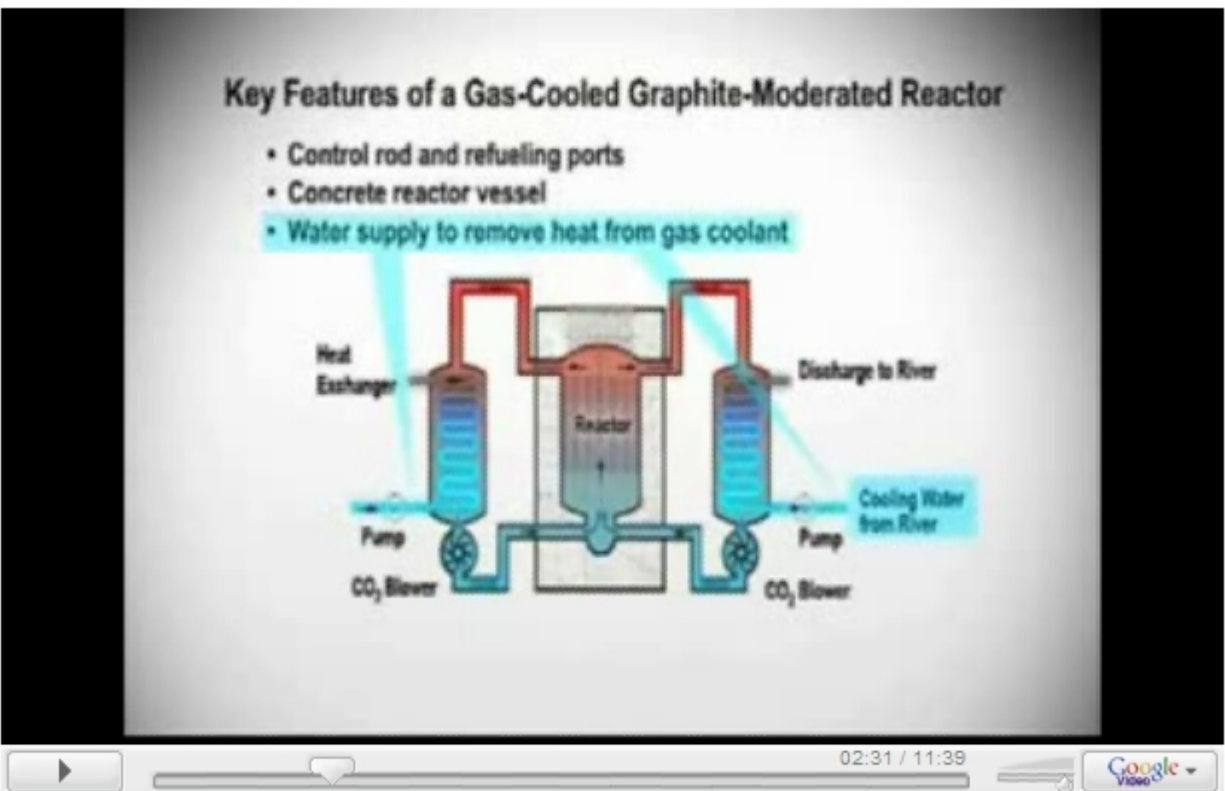

## Key Points

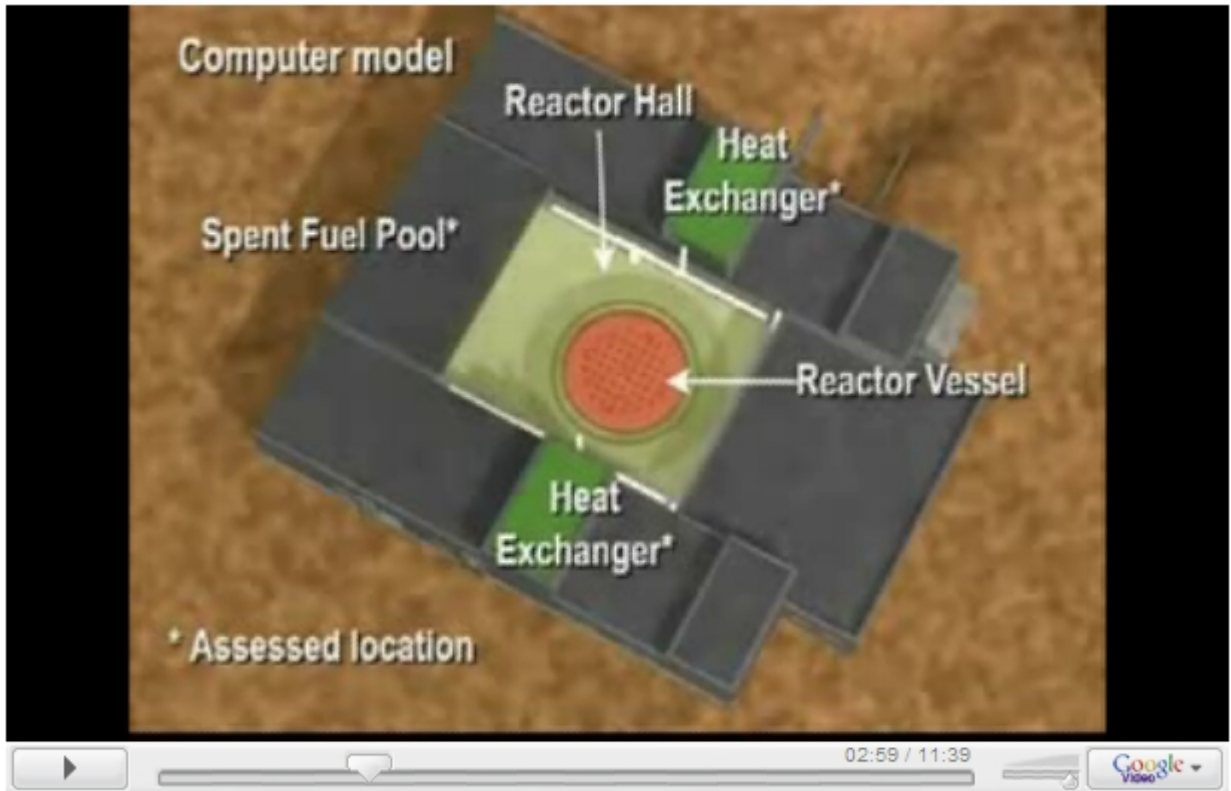

- Features of the facility and its location indicate Syria attempted to maintain its secrecy.
- Syria moved quickly to cover up its covert nuclear activities by demolishing and burying the reactor building and by removing incriminating equipment. These actions probably were intended to forestall identification of reactor debris by international inspectors and are inconsistent with peaceful nuclear intentions.

Pumphouse and pipeline externally complete, early August 2007

Head of North Korean reactor fuel plant with head of Syrian Atomic Energy Commission in Syria

Same North Korean official at the Six-Party Talks

## Syria/North Korea Nuclear Connections

- Senior North Koreans from the Yongbyon nuclear complex made multiple visits to Syria before construction of the Al Kibar reactor began in 2001.
- In 2002, North Korean officials were procuring equipment for an undisclosed site in Syria. North Korea that same year sought a gas-cooled reactor component we believe was intended for the Syrian site.
- A North Korean nuclear organization and Syrian officials involved in the covert nuclear program reportedly were involved in a cargo transfer from North Korea to probably Al Kibar in 2006.

## Syria/North Korea Nuclear Connections

- North Korean nuclear officials were located in the region of the reactor both early and late in 2007. Our information shows that North Korean advisors also probably assisted with damage assessment efforts after the reactor was destroyed.
- A high-level North Korean delegation traveled to Syria shortly after the reactor was destroyed, and met with officials associated with Syria's covert nuclear program.

*Reactor building after 6 September bombing and before 10 October demolition*

Reactor building before completion of curtain wall, perhaps mid-2002

## **Appendix E**

### **Three Additional Sites**

*[Sourcebook note: Possibly beginning as early as February 2008 and confirmed by May 2008, there were reports of three sites in addition to “Al Kibar” that the US urged, successfully, that the IAEA request to inspect. In December 2008, a report in Intelligence Online provided general information on the location of the sites. This appendix attempts to use that information to identify candidate facilities corresponding to the three additional sites.]*

### **Report: Syria has built 3 facilities at site of IAF strike**

By JPOST.COM STAFF

Feb 10, 2008 20:24

Three more installations near the location bombed by IAF planes in Syria have been built, Channel 2 reported on Sunday evening [2008-02-10].

It was unclear what purpose the facilities were to serve but satellite images taken by DigitalGlobe, a private company in Longmont, Colorado, clearly showed three new compounds circling an installation which was built in place of the old one, destroyed by Israel in September 2007.

### **Search Is Urged for Syrian Nuclear Sites**

U.S. Presses U.N. on 3 Alleged Facilities

By Joby Warrick and Robin Wright

Thursday, May 29, 2008; A14

The Bush administration is pressing U.N. inspectors to broaden their search for possible secret nuclear facilities in Syria, hinting that Damascus's nuclear program might be bigger than the single alleged reactor destroyed by Israeli warplanes last year.

At least three sites have been identified by U.S. officials and passed along to the International Atomic Energy Agency, which is negotiating with Syria for permission to conduct inspections in the country, according to U.S. government officials and Western diplomats. U.S. officials want to know if the suspect sites may have been support facilities for the alleged Al Kibar reactor destroyed in an Israeli air raid Sept. 6, the sources said.

[http://www.armscontrolwonk.com/file\\_download/142/gov2008-60.pdf](http://www.armscontrolwonk.com/file_download/142/gov2008-60.pdf)

[Accessed 2008-11-19T19:30Z]

14. Satellite imagery and other information available to the Agency concerning installations at the three other locations in Syria referred to above suggest that those locations may be of relevance to the activities at the Dair Alzour site. As indicated above, the Agency requested access to the three locations on 2 May 2008. Analysis of satellite imagery taken of these locations indicates that landscaping activities and the removal of large containers took place shortly after the Agency's request for access.

## Syria's Secret Nuclear Sites

Intelligence Online, France

Dec 3, 2008

However, the [IAEA] inspectors were barred access to three other sites used for the storage and re-processing of plutonium in Syria. The first reportedly lies in the Homs region close to the Oronte river...

The two other sites that interest the IAEA are in the hinterland, in the Alaouite-dominated region some 75 km from the border with Turkey...

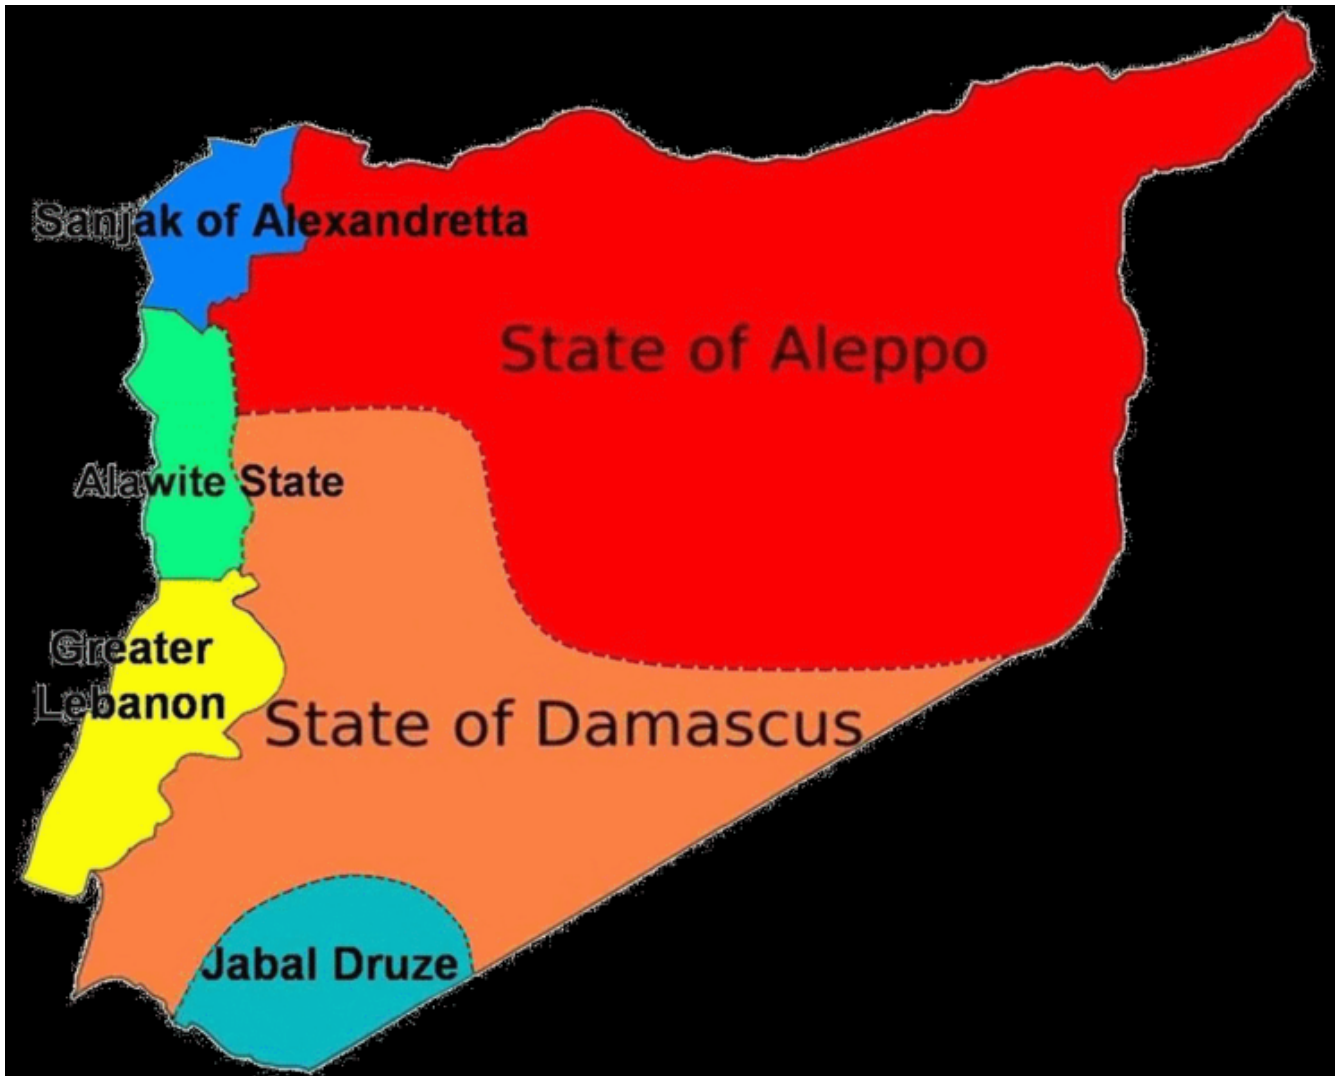

[The French, and presumably original, version reads as follows:]

L'AIEA s'est en revanche vue refuser l'accès à trois autres sites de stockage et de retraitement du plutonium en Syrie. Le premier est situé dans la région de Homs, non loin des rives de l'Oronte...

Les deux autres sites qui intéressent l'AIEA se trouvent dans l'arrière-pays alaouite, à 75 kilomètres de la frontière avec la Turquie...

*[Sourcebook note: Examination of the line running through Alawite territory 75 kilometers from the Turkish border disclosed a substantial facility north of Masjaf. Another, smaller facility of generally similar appearance is located directly south. Both are within all of the indicated DigitalGlobe images ]*

*Northern candidate facility, 35.155 N, 36.347 E on September 15, 2007*

*Southern candidate facility, 35.083 N, 36.347 E on September 15, 2007*

*[Sourcebook note: Examination of the course of the Orontes in the vicinity of Homs revealed no obvious candidate facilities. However, a facility for separating uranium and other impurities from phosphoric acid that occasionally has been mentioned in connection with possible Syrian nuclear activities is located on Lake Homs, a reservoir on the Orontes.]*

As of 1996 preparations for a semi-industrial pilot plant for the removal of uranium from endogenously produced triple super phosphate continued at Homs, Syria under a UNDP-financed IAEA-project. The UN Development Program (UNDP) assisted Syria in a five-year [1996-2001] project worth US\$2.3 million to improve nationally produced phosphoric acid. The IAEA was involved in this project, which set up techniques both for the removal and the recovery of uranium from the acid.

This project, completed 13 September 2001, aimed at designing, constructing, and making operational a pilot plant for the purification of phosphoric acid, and of preparing a feasibility study for a full scale commercial installation to make Triple Super Phosphate fertilizer with reduced uranium content. The Syrian Government showed great commitment to this project through cost sharing. A tripartite contract for the design, manufacture, installation, and commissioning of the pilot plant was signed in July 1997 between the Agency, the equipment supplier, and the Government of the Syrian Arab Republic. The Atomic Energy Agency of Syria was responsible for the building selection and construction.

*[deletia]*

Regardless of what acid is used to produce the wet process phosphoric acid, a considerable amount of dissolved and suspended impurities such as silica, aluminum, magnesium, vanadium, fluorine, chlorine, calcium, arsenic, lead, iron and other organic and inorganic impurities are contained in the acid. The resulting wet process phosphoric acid contaminated by the aforesaid impurities has relatively limited uses, primarily in the fertilizer industry where such impurities are not only not harmful, but can be considered a desirable source of trace elements.

The pilot plant, owned and operated by the Atomic Energy Commission of Syria, was to engage in Uranium recovery from phosphates using the D2EHPA-TOPO process. It was commissioned in February 1999. Extensive training in various forms, e.g., on-the-job training in the country, fellowships scientific visits, built up the necessary confidence and experience of the local staff in all the relevant aspects in the process of purification of phosphoric acid. The project resulted in the improved capability of Syrian staff to partially purify phosphoric acid, and Syrian counterparts were able to obtain the capability to provide their Government with the information required to assess the technical feasibility and the potential economic benefits of producing purified phosphoric acid in Syria. Kilborn Inc. of Canada carried out a pre-feasibility study that concluded that the industrialization of the process was not advisable due to financial considerations.

Nuclear Chronology  
1963-2003

*[EXCERPTS]*

1986-1992

With assistance from the International Atomic Energy Agency (IAEA), the Atomic Energy Commission of Syria (AECS) acquires a micro-plant facility, spare parts and chemicals to enable the recovery of yellowcake uranium on an experimental basis from the phosphoric acid produced at the commercial Syrian General Fertilizer Company Plant at Homs. The Homs plant produces phosphoric acid from phosphatic rock mined in the Charkia and Knifes deposits which contain about 60 to 100 parts per million of uranium.

The AECS plans for this project to be the first step in Syria's nuclear program; subsequent steps are to include a pilot plant, an industrial scale plant and then possibly operations such as refining, conversion, enrichment, and fuel fabrication. The IAEA technical cooperation project includes staff training in the operation of the micro-plant and uranium recovery process.

The AECS also requests assistance from the United Nations Development Program (UNDP) to construct an industrial-scale pilot plant to recover uranium. Canada's Kilborn Inc. carries out a pre-feasibility study to determine whether the basic technology for extracting uranium from phosphoric acid produced at the Homs plant is feasible for an industrial-scale plant. The study concludes that the industrialization of the process is not advisable due to financial considerations.

—"MEAB-Turnkey: SAEC plant in Homs, Syria," Metallextraktion AB, <<http://www.meab-mx.se>>; "Uranium Recovery From Phosphoric Acid: SYR/3/003," International Atomic Energy Agency, <<http://www-tc.iaea.org>>, completed 30/12/1992; "SYR/3/003 – Report on Pre-feasibility Study on the Recovery of Uranium from Phosphoric Acid," International Atomic Energy Agency, Technical Cooperation Report, 12 November 1992; "Technical Cooperation Report for 2001," GC(46)/INF/4, International Atomic Energy Agency, 2001, p. 39, <<http://www.iaea.or.at>>.

1996

Syria signs a contract with the IAEA and an unnamed county that will supply equipment to improve Syria's technical capabilities in removing uranium from triple super phosphate produced in the fertilizer plant at Homs. [The project is completed in 2001.]

—"Technical Cooperation Report for 2001," GC(46)/INF/4, International Atomic Energy Agency, 2001, p. 39, <<http://www.iaea.or.at>>.

1996

The Atomic Energy Commission of Syria (AECS) carries out a preliminary investigation to determine whether it is possible to apply the solvent extraction method to recover uranium from phosphoric acid produced at the Homs plant. Tri-superphosphates are produced at Homs at the rate of 165,000t per year. The investigation concludes that it is technically feasible to recover uranium by this method.

—Khorfan, S. Kouksi, Y. Dahdouh, and A. Shlweit, "Preliminary investigation on the extraction of uranium from Syrian phosphoric acid," International Conference on Uranium Extraction, Chinese Nuclear Society, 1996, via INIS.

2001

Syria is in the process of constructing a radioactive waste processing facility, to manage the waste resulting from the production and application of radioisotopes. Atomic Energy Commission of Syria (AECS) has established a separate, Radioactive Waste Management Division to oversee the collection, treatment and storage of radioactive waste.

—Mohammad Ghafar, "Radioactive waste management facility in Syria," International Conference on Management of Radioactive Waste from Non-Power Applications, IAEA, Report No. IAEA-CN-87/79, 1 July 2001, via ETDEWEB, <<http://www.etde.org>>.

2001

During a meeting of the Standing Russian-Syrian Commission for Trade and Economic, Research and Technical Cooperation, Russian and Syrian officials discuss construction of a \$500 million tri-superphosphate factory near the city of Palmyra. This is part of a larger agreement to develop a plant to produce nitric fertilizers in Deyr ez-Zor and a phosphate fertilizer plant in Homs.

—"Russian, Syrian Officials to Discuss Economic Cooperation," Pravda.ru, 15 May 2001, <<http://english.pravda.ru>>.

May 2001

Bechtel Corp. and Makad International plan to construct a 500,000-ton/year triple superphosphate plant near Palmyra, but delay constructions due to financial constraints. The phosphates for the plant would come from Khunafis Mines.

—Thomas R. Yager, "The Mineral Industries of Jordan, Lebanon and Syria," U.S. Geological Survey, 2001, <<http://minerals.usgs.gov>>.

## **New fertilizer, superphosphate and phosphoric acid factory in Homs – 22/02/2009**

Syriasteps on

Sunday 22 February, 2009

The Syrian Investment Agency recently approved the establishment of a fertilizer, ordinary super phosphate and phosphoric acid factory by "Ahmad Kanaan bin Muhammad and Co" as a shareholding company and will be regulated under Investment Law No 8 of 1997 and therefore will benefit from the exemptions and facilitation provided by the law.

The total capital and working capital of the project is set at 6,619,690,000 SYP of which 5, 5540,661,000 SYP is in foreign currency.

According to company sources, 250 thousand tons annually, 125 tons of ordinary super phosphate and 125 of phosphoric acid, will be produced by the company.

Located in the Syrian governorate of Homs, the project is expected to create 150 job opportunities on three shifts and will be ready to operate in three years.

## **SYRIA - The Fertiliser Sector.**

Publication: APS Review Downstream Trends

Date: Monday, March 13 2000

Demand for fertilisers in Syria has been growing rapidly in recent years. This trend will continue and the country may become a large importer of fertilisers if the government fails to get two projects off the ground.

Syria used to be self-sufficient in fertilisers but now its imports are costing the state about \$120 million/year. The cost of three to four years of imports is equivalent to building a new fertiliser plant.

Running this sector are state-owned companies: the General Establishment for Chemical Industries (GECI), which produces phosphate fertilisers; and the General Fertiliser Company (GFC) which produces nitrogenous fertilisers.

With import substitution being one of the regime's main economic goals, the ministry of industry in 1998 invited the private sector to launch new projects in this sector. Private investment in the fertiliser industry is covered by Law 10 of 1991. Required were two projects: a plant to produce 500,000 t/y of triple superphosphate (TPS) to be located near Palmyra, prepared by GECI; a complex to produce 1,000 t/d of ammonia and 1,750 t/d of urea to be built in the east near the Euphrates River, prepared by GCF.

For the \$400m TPS project, GECI in 1998/99 negotiated with two competing bidders: Dharamsi Mararji Chemical Co. (DMCC) of India and a consortium of SNC Lavalin of Canada, Tecnicas Reunidas of Spain and Simon Carves of the UK. A final government decision on the winner is yet to be taken as both bidders offered good options pertaining to the project's technical aspects and financing.

Usually it takes a long time for the government to decide on such matters. The Kuwait-based Arab Fund for Economic and Social Development (AFESD), among the possible financiers, has expressed concern over the repeated delays in getting this off the ground and the fact that an international project consultant for it has not been appointed.

Bids for the project were first made in 1992. The project was revived in early 1997. As the response was not encouraging, private participation was invited in 1998. The project was originally planned to be built by Bechtel and Makad International, an Oregon-based firm headed by Syrian-born American Elie Mouakad.

The TSP plant is to use phosphate feedstock from the Khunaifis mines, about 50 km south of Palmyra and 160 km south-west of Homs. GECI had reached an initial agreement on the project with Makad in February 1993, after the company agreed to build the plant for \$250m. Makad had a deal with Raytheon Design and Constructors of the US to provide technology for the phosphate processing and for phosphoric acid and TSP production. It had set up a consortium with Bechtel for the plant. Work on basic design and engineering began in early 1994 and was completed in late 1997. But the Bechtel-Makad partnership dropped out in early 1998.

On Feb. 1, 1998, 'Al Baath' newspaper reported that India and Syria were holding talks about plans by Indian companies to invest \$675m in projects to boost phosphate and fertiliser production, as well as to enlarge Syrian ports. One of the Indian companies involved was Aswal, whose Managing Director Anil Bhalla visited Damascus in February 1998.

Syria has substantial reserves of phosphate, a key feedstock for the fertiliser industry. The state company in charge of phosphate extraction is the General Establishment for Phosphate and Mines (GEPM). The government in 1998 announced a plan to boost the output of phosphate from about 2.6m t/y in 1997 to 4m t/y by 2000. It is not clear whether the plan has been executed. Apart from use for the local fertiliser industry, about 80% of the country's phosphate output is exported, mainly to Europe.

For GFC's nitrogenous fertiliser complex, an international tender in February 1998 was issued and companies were invited to submit integrated bids for the construction and operation of the ammonia and urea plants on BOOT basis. Companies were also invited to bid on the basis that the complex would be a joint venture with GFC. Initial plans called for the complex to be near the north-eastern town of Hasaka, to use almost 1 MCM/day of gas from the Omar field and 490 t/y of Euphrates water. Bids for the project were submitted by the June 16, 1998, deadline. But since then the government has not taken a final decision.

## IAEA-TC Project Datasheet

<b>Project Number</b>	<b>SYR/3/003</b>
<b>Project Title</b>	<b>Uranium Recovery from Phosphoric Acid</b>
<b>Objectives</b>	TO RECOVER URANIUM FROM PHOSPHORIC ACID.
<b>Field(s)</b>	(3F) Processing of Nuclear Materials (Historical subject. As of 2004 use 3B)
<b>1st Year of Approval</b>	1986
<b>Project Status</b>	<b>Completed 1992-12-30</b>
<b>Programme Management Officer</b>	Kofi, Laala Anum; Europe Section
<b>Institutes involved</b>	Atomic Energy Commission of Syria (AECS) Location: Damascus
<b>Achievements</b>	<p>Syria's nuclear power programme has been shelved for financial and contractual reasons. The possibility was considered of developing a domestic uranium supply as one component of the overall programme. A commercial fertilizer operation at Homs produces phosphoric acid from phosphatic rock mined from the Charkia and Knifes deposits which contain about 60 to 100 parts per million of uranium. Through this project, the Agency provided the Atomic Energy Commission of Syria (AECS) with a micro-plant facility, spare parts and chemicals to enable yellow cake uranium to be recovered on an experimental basis from the phosphoric acid produced at Homs plant. This was to be the first step in the nuclear power programme cycle; subsequent steps would include a pilot plant, an industrial scale plant and then possibly operations such as refining, conversion, enrichment and fuel fabrication. Five expert missions were organized to train and advise the counterpart staff on the operation of the micro-plant. A Canadian company was later awarded a sub-contract for pre-feasibility evaluation of the micro-plant results with a view to a pilot plant and eventually to an industrial scale plant for uranium recovery from phosphoric acid produced at the Homs plant. Three counterpart staff members were trained during the pre-feasibility studies; two others received fellowship training in Indonesia on the uranium recovery process. The results of the pre-feasibility studies indicate that while the basic technology for extracting uranium from the phosphoric acid produced at the Homs plant is workable, the industrialization of the process is not at present advisable in view of the depressed world market price of uranium. The AECS has submitted a request to the UNDP for assistance in the construction of a pilot plant as the next stage in the uranium recovery process. The counterparts are continuing with detailed investigations on solvent extraction methods for uranium recovery at the AECS.</p>

## **MEAB - Turnkey: SAEC plant in Homs, Syria**

*[Sourcebook note: This picture appears to have been taken before 2003 from the roof of a nearby building approximately at 34.65110 N, 36.62687 E.]*

### **Client**

Syria, SAEC plant in Homs, Syria

### **Problem**

Purification of Green Phosphoric Acid ( $H_3PO_4$ )

### **Solution**

The project was divided into two phases:

#### **Phase 1**

By reacting apatite with sulfuric acid, phosphoric acid and gypsum will result. Most phosphoric acid is produced in this way and normally used as raw material (green acid) to produce fertilizer. A small amount, however is further refined to phosphoric acid of food grade quality.

The green phosphoric acid from a phosphoric acid plant (PAP) contains 25-30%  $H_3PO_4$ . The acid is heavily entrained with impurity cations, among which arsenic, cadmium and uranium are the most poisonous. Also anions, like chloride, fluoride and sulfate must be considered. Selective extraction of phosphoric acid as an adduct complex with TBP and according to the block diagram below has been used to produce acid of food grade. The purification operation starts with addition of chemicals to precipitate arsenic and sulfate in a pre-treatment step. The acid is then cooled and left for an appropriate ageing time. A flocculent is added and the solid content is allowed to flock (precipitate) in a clarifier.

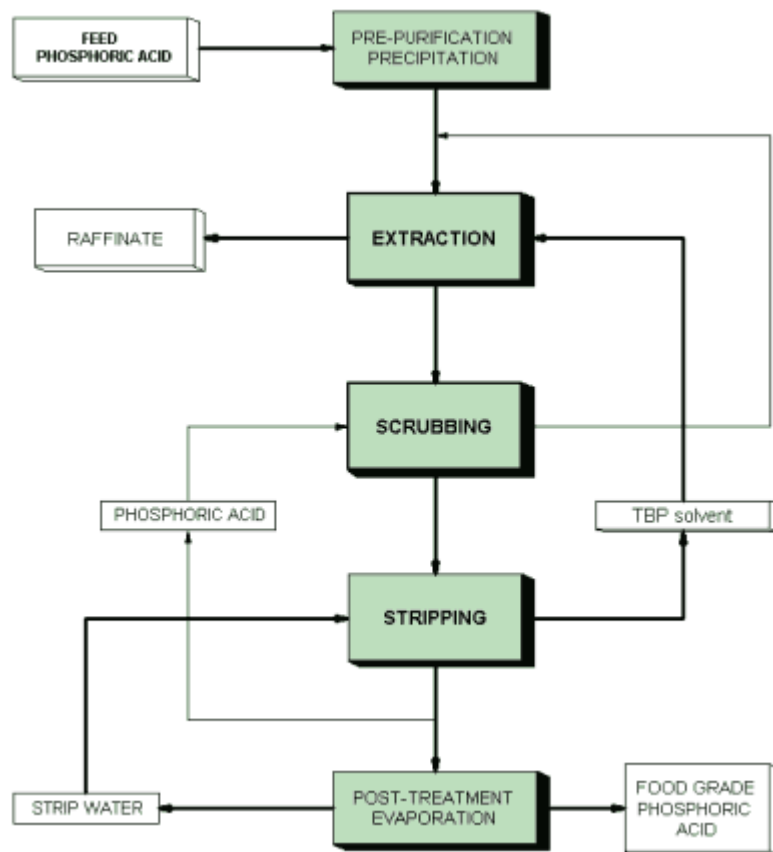

#### **Phase 2**

The clear phosphoric acid is fed to the solvent extraction operation, where about 60% of the acid is extracted counter-currently to an organic solvent containing TBP in kerosene. The resulting raffinate

with most of the contaminating substances left in the raffinate, together with the slurry from the clarifier, is returned to the phosphoric acid plant. In this way, the impurities in the green acid will be returned to the fertilizer production without creating additional environmental problems.

After extraction the organic solvent, loaded with phosphoric acid, is scrubbed with a phosphoric acid solution in equilibrium with the organic solvent. In this way, co-extracted contamination is removed. The scrub liquor is recycled to extraction.

After adjusting the temperature to about 40 °C, the organic solvent is treated with clean water to strip out the phosphoric acid. From this acid, containing about 30% H<sub>3</sub>PO<sub>4</sub>, water is evaporated. The resulting concentrated (85%) phosphoric acid is of good quality, corresponding to the quality of food grade phosphoric acid.

# **Appendix F**

**Members of Congress  
briefed  
September-October 2007**

Sourcebook note: According to the Background Briefing with Senior U.S. Officials on Syria's Covert Nuclear Reactor and North Korea's Involvement given on April 24, 2008,

“We had briefed 22 members of Congress in positions of leadership and chairs and ranking members of key committees last September and October.”

*This Appendix attempts to identify those Members based on explicit indications that particular people were briefed or, more frequently, the positions they held during September and October. It is assumed that, besides the majority and minority leaders of the Senate and House, the leadership of the Armed Services, Foreign Relations and Intelligence Committees would have been briefed ex officio. Explicit indications that particular members were briefed agree, with two possible exceptions, with this assumption.*

*In addition, it is speculated that the leadership of the Subcommittee on Emerging Threats and Capabilities of the Senate Armed Services Committee and of the Subcommittee on Terrorism and Unconventional Threats of the House Armed Services Committee were briefed. This speculation is based on the responsibilities of the Subcommittees and indications that a member, Senator Clinton, was aware of the details of the strike by late September 2007. Since Senator Clinton did not hold a leadership position at the time, it is possible that she acquired the information informally, rather than in an Administration briefing to the Subcommittee. Similarly, Congressman Robert Wexler, a member of the House Foreign Affairs Committee appears to have acquired knowledge of the strike although he was not a member of the Committee leadership.*

*In the following list,*

*+ indicates positive indication of knowledge of details of the strike.*

*(p) indicates leadership position in committee or subcommittee.*

*(s) indicates association by name with details of strike .*

## **Senate**

Majority leader	(Harry Reid)	(p)
Minority leader	(Mitch McConnell)	(p)

### **Armed Services**

## **Assad's Secret Evidence Points to Syrian Push for Nuclear Weapons**

01/09/2015 09:20 PM

By Erich Follath

*[EXCERPTED MATERIAL]*

For years, it was thought that Israel had destroyed Syria's nuclear weapons capability with its 2007 raid on the Kibar complex. Not so. New intelligence suggests that Bashar al-Assad is still trying to build the bomb. And he may be getting help from North Korea and Iran.

*[deletia]*

Now, secret information obtained by SPIEGEL indicates that the world is once again being misled by Assad. Syria's dictator has not given up his dream of an atomic weapon and has apparently built a new nuclear facility at a secret location. It is an extremely unsettling piece of news.

### **Suspicious Uranium Particles**

Back in 2007, it proved impossible to completely quell rumors about the mysterious building complex in the desert and its possible military purpose. In contrast to Israel and Pakistan, Syria is a signatory to the Treaty on the Non-Proliferation of Nuclear Weapons and is thus committed to using nuclear power only for peaceful purposes. And the International Atomic Energy Agency in Vienna demanded access to the site. In June 2008, Assad finally gave in to the IAEA's pressure and experts under the leadership of Olli Heinonen, a native of Finland, were allowed to inspect the destroyed Kibar facility.

It quickly became apparent that Damascus had done everything it could to destroy all traces of what had been going on there. But the atomic detectives from the IAEA were nevertheless able to find suspicious uranium particles -- a discovery that the Syrian government sought to explain away as a potential act of sabotage. Though the IAEA noted that its investigation did not turn up definitive proof, the organization requested access to three other facilities due to ongoing suspicions. The IAEA suspected that the trio of nuclear sites may be connected to Kibar, particularly the suspected enrichment facility Marj as-Sultan, located 15 kilometers north of Damascus. The Syrians refused, angered by what they called "unfounded defamation."

*[deletia]*

### **Continued Pursuit of the Bomb**

The factory had been on the verge of completion and many observers believed at the time that there could be a secret cache of fuel, at least enough for a year, standing by. According to IAEA research, Syria possesses up to 50 tons of natural uranium, enough material for three to five bombs once the enrichment procedure is completed.

The Institute for Science and International Security in Washington D.C. likewise has strong indications for the existence of such stockpiles and expressed its concern in September 2013. "This large stock of natural uranium metal poses nuclear proliferation risks," the institute wrote. "It could be obtained by organizations such as Hezbollah or al-Qaida or undeclared nuclear programs of states such as Iran."

According to findings of Western intelligence agencies, however, the situation is much more explosive than previously assumed. Based on documents that SPIEGEL has in its possession, the agencies are convinced that Assad is continuing in his efforts to build the bomb.

Analysts say that the Syrian atomic weapon program has continued in a secret, underground location. According to information they have obtained, approximately 8,000 fuel rods are stored there. Furthermore, a new reactor or an enrichment facility has very likely been built at the site -- a development of incalculable geopolitical consequences.

Some of the uranium was apparently hidden for an extended period at Marj as-Sultan near Damascus, a site that the IAEA likewise views with suspicion. Satellite images from December 2012 and February 2013 show suspicious activity at Marj as-Sultan. The facility, located not far from a Syrian army base, had become the focal point of heavy fighting with rebels. Government troops had to quickly move everything of value. They did so, as intelligence officials have been able to reconstruct, with the help of Hezbollah, the radical Shiite "Party of God" based in Lebanon. The well-armed militia, which is largely financed by Iran, is fighting alongside Assad's troops.

### **Intercepted Conversations**

Intelligence agency findings indicate that the material was moved to a well-hidden underground location just west of the city of Qusayr, not even two kilometers from the border with Lebanon. They managed the move just in time. Marj as-Sultan ultimately did fall to the rebels, but has since been retaken by government troops.

Since then, experts have been keeping a close eye on the site outside of Qusayr, one which they had largely ignored before, believing it to be a conventional Hezbollah weapons depot. Analysts compared earlier satellite images and carefully noted even the slightest of changes. Soon, it became clear to them that they had happened upon an extremely disconcerting discovery.

According to intelligence agency analysis, construction of the facility began back in 2009. The work, their findings suggest, was disguised from the very beginning, with excavated sand being disposed of at various sites, apparently to make it more difficult for observers from above to tell how deeply they were digging. Furthermore, the entrances to the facility were guarded by the military, which turned out to be a necessary precaution. In the spring of 2013, the region around Qusayr saw heavy fighting. But the area surrounding the project in the mines was held, despite heavy losses suffered by elite Hezbollah units stationed there.

The most recent satellite images show six structures: a guard house and five sheds, three of which conceal entrances to the facility below. The site also has special access to the power grid, connected to the nearby city of Blosah. A particularly suspicious detail is the deep well which connects the facility with Zaita Lake, four kilometers away. Such a connection is unnecessary for a conventional weapons cache, but it is essential for a nuclear facility.

*[Sourcebook note: The facility is at 34.514 N, 36.408 E]*

**This satellite image shows the Qusayr site's link to the power grid, one of many details of the site which have intelligence officials worried that it could be a facility for the construction of a nuclear weapon.**

**For years, it was thought that Israel had destroyed Syria's nuclear weapons capability with its 2007 raid on the Kibar complex. Not so. New intelligence suggests that Bashar al-Assad is still trying to build the bomb. And he is getting plenty of help. Here, a satellite image of the suspected site near Qusayr.**

**This image purports to show the site where a well has been dug. The well connects the facility with Zaita Lake, four kilometers away. Such a connection is unnecessary for a conventional weapons cache, but it is essential for a nuclear facility.**

But the clearest proof that it is a nuclear facility comes from radio traffic recently intercepted by a network of spies. A voice identified as belonging to a high-ranking Hezbollah functionary can be heard referring to the "atomic factory" and mentions Qusayr. The Hezbollah man is clearly familiar with the site. And he frequently provides telephone updates to a particularly important man: Ibrahim Othman, the head of the Syrian Atomic Energy Commission.

The Hezbollah functionary mostly uses a codename for the facility: "Zamzam," a word that almost all Muslims know. According to tradition, Zamzam is the well God created in the desert for Abraham's wife and their son Ishmael. The well can be found in Mecca and is one of the sites visited by pilgrims making the Hajj. Those who don't revere Zamzam are not considered to be true Muslims.

### **North Korean Expert in Syria?**

Work performed at the site by members of Iran's Revolutionary Guard is also mentioned in the intercepted conversations. The Revolutionary Guard is a paramilitary organization under the direct control of Iran's Supreme Leader Ali Khamenei. It controls a large part of the Iranian economy and also plays a significant role in Iran's own nuclear activities. Not all of its missions abroad are cleared with the government of moderate President Hassan Rohani. The Revolutionary Guard is a state within a state.

Experts are also convinced that North Korea is involved in Zamzam as well. Already during the construction of the Kibar facility, Ibrahim Othman worked closely together with Chou Ji Bu, an engineer who built the nuclear reactor Yongbyon in North Korea.

Chou was long thought to have disappeared. Some thought that he had fallen victim to a purge back home. Now, though, Western intelligence experts believe that he went underground in Damascus. According to the theory, Othman never lost contact with his shady acquaintance. And experts believe that the new nuclear facility could never have been built without North Korean know-how. The workmanship exhibited by the fuel rods likewise hints at North Korean involvement.

## **Iran's foreign minister denies helping Syria with nuclear facility**

Roi Kais

Published: 01.11.15, 13:08

Iranian Foreign Minister Mohammad Javad Zarif denied a report in German newspaper Der Spiegel that Syrian President Bashar Assad is building a nuclear facility near the Lebanese border in cooperation with Iranian experts. "The claim is meant to sow fear and lay the groundwork for to enact misguided policy towards Syria," he said at a press conference.
