Recent Acts of Domestic Pipeline Sabotage

Recent acts of sabotage against U.S. pipelines have raised concern about the security of the nation's energy pipeline system and the federal program to protect them. On March 20, 2017, the developer of the Dakota Access Pipeline alleged in a [court filing](#) that it had experienced "recent coordinated physical attacks along the pipeline." On February 26, 2017, law officers fatally shot a man who [reportedly](#) had used an assault rifle to attack the Sabal Trail Pipeline, a natural gas pipeline under construction in Florida. On October 11, 2016, a coordinated group of domestic environmentalists caused the shutdown of [five pipelines](#) in four states transporting crude oil from Canada to the United States. The activists entered locked enclosures to access manual valves, seeking to [stop the flow of oil on these pipelines](#). According to a [press release](#), the activists acted in support of Native American [opposition to the Dakota Access Pipeline](#) and to encourage an "extraordinary shift away from fossil fuels" to avert a "climate catastrophe."

Prior to the October disruptions there had not been a successful physical attack on U.S. oil or natural gas pipelines over the last 15 years. However, in 2011 and 2012, there were two separate attempts to bomb U.S. natural gas pipelines in [Oklahoma](#) and [Texas](#) which were unsuccessful. Natural gas pipelines in British Columbia, Canada, were bombed six times between October 2008 and July 2009 in acts classified by Canadian authorities as environmentally motivated. A 2014 [threat assessment](#) by the Royal Canadian Mounted Police concluded that "petroleum companies are being ... increasingly threatened by violent extremists" with a climate change agenda and that "the most likely targets include ... pipelines."

The Federal Pipeline Security Program

The [federal program for pipeline security](#) is administered by the Transportation Security Administration (TSA) within the Department of Homeland Security (DHS). The Aviation and Transportation Security Act of 2001 ([P.L. 107-71](#)), which established TSA, authorized the agency "to issue, rescind, and revise such regulations as are necessary" to carry out its functions (§101). The Implementing Recommendations of the 9/11 Commission Act of 2007 ([P.L. 110-53](#)) directs TSA to promulgate pipeline security regulations and carry out necessary inspection and enforcement if the agency determines that regulations are appropriate (§1557(d)). Thus, TSA has regulatory authority for the security of natural gas and hazardous liquid (e.g., oil, carbon dioxide) pipelines throughout the United States. In fulfilling these responsibilities, TSA cooperates with the Department of Transportation (DOT)—the federal regulator of pipeline safety

—under a 2004 memorandum of understanding (MOU) and a [2006 annex](#) to facilitate security collaboration. TSA's pipeline program is administered by approximately 12 employees within its Surface Division.

Although the TSA has regulatory authority for pipeline security under [P.L. 107-71](#) and [P.L. 110-53](#), its activities to date have relied upon voluntary industry compliance with the agency's [security guidance](#) and [best practice recommendations](#). TSA has administered a multifaceted program to facilitate these efforts. In 2003, TSA initiated its ongoing Corporate Security Review (CSR) program, wherein the agency visits the largest pipeline operators to review their security plans, inspect their facilities, and provide recommendations. TSA has completed over 140 CSRs. In 2008, the TSA initiated its Critical Facility Inspection Program (CFI), under which the agency has conducted in-depth inspections of all the [critical facilities of the 125 largest pipeline systems](#) in the United States. TSA concluded the initial round of CFI inspections in 2011, having completed a total of 347 site visits. Over the last decade, TSA has also engaged in pipeline security initiatives such as developing training resources, facilitating security drills, and participating in Sector Coordinating Councils and Joint Sector Committees, among other activities. TSA states that it has had "great success" with its voluntary guidelines, [emphasizing their collaborative nature and their flexibility](#) to respond to evolving threats.

U.S. Pipeline Threat Assessment

In a 2011 [pipeline threat assessment](#), TSA stated that, while foreign groups like Al Qaeda have expressed interest in attacking U.S. pipelines, "violent domestic extremists, homegrown terrorists, and lone offenders likely also pose threats to pipeline networks." According to the assessment, domestic extremists "include, animal and environmental activists, disgruntled employees, and lone individuals... often focused on single issues." The assessment concluded, however, "with high confidence that the terrorist threat to the U.S. pipeline industry is low." In a [2016 Federal Register notice](#), TSA stated that it expects pipeline companies will report approximately 30 "security incidents" annually—both physical and cyber. A threat assessment has not been publicly released since 2011, but in October 2016 TSA stated to CRS that "as of this time, TSA has not determined that the terror threat to pipelines in the Homeland has increased."

Issues for Congress

In the 114th Congress, three pipeline security issues came under particular scrutiny: TSA's use of voluntary standards, the agency's pipeline threat assessments, and the resources devoted to TSA's pipeline division. Although TSA believes a voluntary approach to U.S. pipeline security is most effective, in 2010, the National Energy Board of Canada mandated security regulations for jurisdictional Canadian petroleum and natural gas pipelines. Canada's decision to regulate security raises questions as to the relative merits of a voluntary versus regulatory approach. Some policymakers also have questioned whether the TSA devotes enough funding to pipeline security relative to other surface transportation modes. Concerns about the [quality and specificity of federal threat information](#) have long been an issue across critical infrastructure sectors, including pipelines. A September 2016 [report by the DHS Inspector General](#) suggests that the latter two issues are closely linked, concluding that "TSA lacks an intelligence driven, risk-based security strategy that informs security and resource decisions across all transportation modes." In light of the recent security incidents, Congress may reexamine the adequacy of the federal pipeline security program and how the TSA and private industry work together to secure the nation's energy pipeline systems.
